No other attempts were made to eongeal quickfilver until the year $178^{\circ}$, when Mr Hutchins refumed the fubiect with great fuccefs, infor uch that from his ex. periments the freezing point of mercury is now almoit as well fettled as that of water. Preceding philofo,phers, indeed, had not been altogether inatentive to this fulject. Profeffor Braun himfelf had taken great pains to inveftigate it ; but for want of paying the requifite attention to the difference betwixt the contraction of the fluid mercury by cold and that of the congealing metal hy ficezing, he could determine nothing certain concerning it. Others declared it as their opinion, that nothing certain could be determined by merely freezing metury in a thermometer filled with that fluid. Mr Cavendifh and Dr Black firt fuggetled the proper method of obviating the difficulties on this fubject. Dr Black, in a letter to Mr Hutehins, dated Oetubet 5. 1779 , gave the following Hutehins, dated Octubet 5. 1779, gave the folowing "P Prons fow

Coman the operation of conrelationg hew which means the ficitit of nitre, in ponring it upon the frow, fometimes tonched the bulb of the thernometer, and intantly
raifed it much higher; nor did the mereury ever defcend below $206^{\circ}$, which was not half as lar as it had done the day before, though the temperature of the atmofphere had been this day at - $34^{\circ}$ before the commencement of the operation. That in the apparatue, however, funk to -95 . The apparatus was taken out of the mixture for half a minute, in order to examine whether the mercury was perfectly congealed or not, and during that time it fhowed no fign of liquefaction.

The third experiment was made the fame day, and with the freezing misture aied in the laft. By it the point of congelation was determined to be not below 40'.

The fourth experiment was made January 7 th 1782 ; and in it he obferved, that the mercury in the apparatus thernometer, after llanding at $4^{2}$ and $4^{\frac{1}{2}}$ for a confiderable time, fell to 77, not gradually, but at once as a weight falls.

In the lifth experiment the weather was exceffively fevere, fo that it ought to have frozen the metal in the open air ; but this did nut then happen.

At the time of making the fixth experiment, the quickfliver in the open air food at 44 below $O$; and Mr Futchins refolved to make ufe of this opportunity to obferve how far it was poffible to make it defeend by means of cold, oblerving the degrees at the fame time with a firit thermoncter made by Nairne and Blount, with which he had been furnithed by the royal fociety in 1774. In this, however, he did not fucceed; for the mercury never fell below 438, nor the flandard 48 . It flood at $27 \frac{1}{2}$ at the beginning of the experiment. The reafon of this was fuppofed to be, that the atmoliphere was too cold for making this kind of experiments, by reafon of its freezing the thread of quickfilver in the tem of the thermoneter, fo that it became incapable of contraction along with that in the bulb. In other experiments, though the metal in the bulb beerme folid, yet that in the Hem always remained fluid; and thas was enabled to fubtide to a great degree by the dimination of bulk in the folid mercury. That this was really the cafe, appeared from the quickfilver falling at once from - 86 to - 434, when the cold of the free\%ing mixture diminithed, and the temperature of the air becoming about the fame time fome what milder, melted the congealed part in the Atem, which thus had liberty to defecad to that point.

In this experiment, alfo, the mixtures were made in double quantity to thofe of the former; thefe being only in common tumblers, but the mixtures for this experiment in pint-baions. It was obferved that they liquetied fater than in other experiments. He had uffually made then of the coviftence of pap; but though le added fnow at different times, it had very little effict in augmenting the cold, but rather decreafed it. The congrated pieces of metal full to the bottom, as might naturally have been expeited from its great contaction in becoming folid.

From this experiment Mr Hutchins concluded, that the nearer the temperature of the atmofphere approached to the congeading poiat of mercury (io that

N2 88.
a great degree of cold night be eommunieated to the bulb of a thermometer, and yet the quicktilver in the tube renain fluid), he might make the esperment of alcertaining the greatelt cuntaction of mercury to more advantare. With this view, he made another experiment, when the temperature of fome of his thermometers flood as low as - $37^{\circ}$; and after an hour's attendance be perceived the mercury had fallen to 1367; but thee thermometer unluckily was broken, The ther. and its bulb thrown away with the mixture. Profef- moneters for Braun had likewife oblerved, that his thermometers were always hroken when the mercury defeended be-cold. low 600.

The eighth experiment was made with a view to try whether quickfilver would congeal when in contact with the freezing mixture. For this purpofe, he did not ufe the apparatus provided for other experiments, but filled a gallipot made of fint ttone (as being thinner than the conmon fort), containing about an ounce, half full of quicklilver, into which he inferted a mercurial thermoncter, employing another ds an index. Thus he hoped to determine exactly when the quickfilver was congealed, as he had free accefs to it at all times, which was not the cafe when it was inclofed in the cylindrical glafs, the wortted wound round the tube of the thermometer to exclude the air being equally effectual in excluding any inArument from being introduced to touch the quickfilver. He then made a kind of fiewer, with a Hat blunt point, of dried cedar wood, on account of its lightnefs, which he found would remain in the gelatinous freezing mixture at any depth he chofe; but, when inferted into the quickfilver, the great difference betwixt the fpecific gravity of it and that ponderous fluid, made it always rebound upward; and by the degree of refiltance, he could always know whether it proceeded from fluid or folid metal. At this time, however, the experiment did not fucceed; but, at another trial, liaving employed about $\frac{3}{7}$ ths of a pound of metal, and let it remain a confiderable time imineafed in the fame mixture whieh had jut now beea fuppofed to fail, he found that part of it was congealed; and, on poming of the fuid part, no lefs than two-thirds remained fixed at the botom.

The laft experiment which has been publifhed con- ${ }^{13}$ mane Mr Cavencerning the congelation of quickitver by means of difh's ex. frow is that of Mr Cavendifh, and of which he gives periments. an account in the Phil. Tranfact. Vol. lxxiii. p. 325 . Here, fpeaking of the cold of freezing mixtures, he fays, "There is the utmoft reafon to think that Mr Ifutchins would have obtained a greater degree of cold by ufing a weaker nittous acid than he did. Ifound (fays hi) by alduing fnow gradually to fome of this acid, that the addition of a fmall quantity produced times proheat intead of cold: and it was not until fo much was aced by her intead of and ; in and added as to incerafe the heat from 28 to $51^{\circ}$, that fiow to the addition of m se fhow began to produce cold; the firitit of quantity of frow required for this purpole being pret- nitre. ty exatly oue quarter of the weight of the fpint of nitre, and the beat of the fnow, and air of the room, as well as of the acid, being $28^{\circ}$. The reafon of this is, that a great deal of heat is produeed by mixing w.dter with fuirit of nitre; and the flronger the firit is, the greater is the heat produced. Now it appears from this experiment, that before the acid was diluted, $\underbrace{\text { tion, }}$ broken hy cold.

#### Abstract

## C. $\mathrm{O}^{\circ} \mathrm{N} \quad[3 \mathrm{~B}] \quad \mathrm{C} O \quad \mathrm{~N}$

Congela- luted, the heat produced by its union with the water formed from the medting fnow, was greater than the cold produced by the fame; and it was not until it was diluted by the aldition of one quarter of its weight of that fubftance, that the cold, generated by the liater caufe, began to execed the leat generated by the former. From what has been faid, it is evident, that a fieezing mixture made with undiluted acid will not begin to generate cold matil fo much frow is diffulved as to increafe its heat frem 28 to $51^{\circ}$; fo that no greater cold will be producel than would be obtained by mixing the ciluted acid heated to $51^{\circ}$ with fnow of the heat of $28^{\circ}$. 'This method of adding fore gratually is much the bett way I know of finding what Arength it ought to be of," in order to produce the greatet efict portible. By means of this acid diluted in the above mentionedproportion, I froze quickfilver in the thermoneter called $\mathrm{G}(\mathrm{A})$ by Mr Hutchins, on the 2 (th of February 1782 . I did not indeed break the thermometer to examine the fate of the quickfiter therein; for, as it funk: to -II0, it certainly mutt hav been in part frozen; but inmediately took it out, and put the firit thermometer in its room, in order to find the cold of the misture. It funk only to - $30^{\circ}$; but by making allowance of the fpirit in the tube being not fo cold as that in the ball, it appeans, that if it had not been for this caufe, it would have funk to - $35^{\circ}(5)$; which is $6^{\circ}$ below the point of freczing, and is within our degree of as great a cold as that produced by Mr Hutchins.
"In this experiment the thermoneter $G$ funk very rapidly; and, as far as I could perceive, without tlopping at any intermediate point till it cane to the above mentioned degree of - $110^{\circ}$, where it fluck. The materials ufed in making the misture were previsuny cooled, by means of falt and fnow, to near nothing; the temperature of the air was between $20^{\circ}$ and $25^{\circ}$; the quantity of aeid ufed was $4 \frac{5}{2}$ oz; and the glafs in whieh the mixture was made, was furrounded with wool, and placed in a wooden box, to prevent its lofing its cold fo futt as it would otherwife have done. Some weeks before this I made a freezing mixture with fome fpirit of nitre much flronger than that ufed in the foregoing experiment, thongh not quite fo flrong as the undiluted acid, in which the cold was lefs intenfe by $4^{\frac{10}{2}}$. It is true the temper of the air was much leis cold, namely $35^{\circ}$, but the firit of nitre was at lealt as cold, and the fnow not much lefs fo.
" The cold produced by mixing oil of vitriol, properly diluted with fnow, is not fogreat as that produced by fpirit of nitre, though it does not differ from it by fo much as $8^{\prime}$ '; for a freezing mixture, prepared with diluted oil of vittiol, whofe fpeeific gravity, at $60^{\circ}$ of heat, was $1,56 \not{ }^{2}$, funk in the thermometer $G$ to $-37^{\circ}$, the experiment being tried at the fame time, and with the fame precautions, as the foregoing. It was previoufly found, by adding fnow gradually to fome of this acid, as was done by the nitrous acid, that it was a little, but not much itronger, than it ought to Le, in order to produce the greateft effect."

Vol. V. Part I.

The experiment made by Mr Walker, in which he congealed quickfilver ly means of fpirit of nitre and Glauher's falt, without any fnow, concludes the hiftory of the artificial congelation of mercury. See the article Cozo. It now remains that we fay fomething of the congclation of it by the matural cold of the atmolphere.

Dr Blarden, from whofe mater in the Plidofopical ${ }^{16}$ Tranfactons, vol. lxxiii. this account is taken, oblerves, tion of that it was nut till near the year 1730 that thermo- by naturat meters were made with any degree of accuracy; and in coli. four of five years after this, the firlt obfervations were made which prove the freezing of quickfliver. On the acceflion of the Emprets Amne Ivanouna to the throne of Ruffa, three profeffors of the Inperial academy were chofen to explore and deferibe the ditferent parts of her Afratic dominions, and to inquire into the communication betwixt Afia and America. Thefe were Dr Jnha George Gmelin, in the department of natural hiftory and chemiltry ; M. Gerard Frederic Muller, as general hilloriographer; and M. Lonis de lllle de la Croyere, for the department of allronomy; draughtimen and other proper affilants being appointed to attend them. They departed from Petcifurgh ia 1733 ; and fuch as furvived did not return till ten years after. The thermometrical obfervations were comnunicated by Profeffor Gmelin, who firt publiflaed them in his Flora Sibirica, and afterwards more fully in the Jourme of his Travels. An abfract of them was likewife inferted in the Peteriburg Commentaries for the years 1756 and 1765 , taken, after the proffflor's death, from his original difpatches in poffefion of the imperial academy.

In the winter of 1734 and $1735, \mathrm{Mr}$ Gmelin being at Yenceath in $58 \mathbf{1}^{\circ} \mathrm{N}$. Lat. and $92^{\circ} \mathrm{E}$. Long. from Greenwich, firlt obferved fuch a defeert of the mercury, as we know mult have been attended with congelation. "Here (fays he) we firlt experienced the Exceliv truth of what various travellers have related with re-cold of Sifpect to thic extreme cold of Siberia; for, about the beilis. middle of December, fuch fevere weather fet in, as we were fure had never been known in our time at Peterburg. The air feemed as if it were frozen, with the appearance of a fog, which did not fuffer the frocke to afcend as it iffued from the chimnies. Birds fell down out of the air as dead, and froze immediately, unlefs they were brought into a warm room. Whenever the door was opened, a fog fuddenly formed round it. During the day, thort as it was, parhelia and haloes round the fun were frequently feen; and in the night mock moons, and haloes about the moon. Finally, our thermometer, not fubject to the fame deception as the fenfes, left us no doubt of the exceffive cold: for the quick filver in it was reduced, on the 5 th of January O.S. to- $120^{\circ}$ of Fuhrenhtit's feale, lower than it had ever hitherto been obferved in nature."
The next inftance of congelation happened at Yakutik, in N. Lat. 62. and E. Long. 130 . The weather liere was unufually mild for the clinate, yet the 1 r ther-
(A) This was a fmall mereurial thermometer, made by Nairne and Blount, on an ivory fcale, divided at every five degrees, and reaching from $215^{\circ}$ above to $250^{\circ}$ below the cypher.
(B) This is to be underfood of a fpirit thermometer, whofe- $20^{\circ}=40^{\circ}$ of Fahrenheit's mercurial.

## C O N［ 314 ］C O N

Forsela－themonete．foll to $72^{\prime \prime}$ ；and one perfon infomed ちゃった the proffflos 1 y a note，thas the mercury $i n$ his baro－
meter was frozen．the hallened immediately to his houfe to behold fuch a furprifing phenomenon；but though he wras witueds to the fact，the prejudice he en－ tertan．．．againe the poltibility of the congelatom， wo rat not allow him to believe it．＂Not feeling， （fars he），by the way，the fame effects of cold as I had experienced at other times in lefs diftancen，I be－ san，before my arrival，to entertain fufpicions about the congelation of his quickilver．In fact，I faw that it did not continuc in one column，but was divided in diferent places as into litele cylinders，which appear－ ed frozen；and，in fome of thefe diviions between the suicklilver，I perceivedlike the appearance offrozen moi－ Iture．It immedintely occurred to me，that the mercury might havebcen claned with vinegar and fiat，and not fufficicntly dried．The perion acknowledged it had been purified in that manner．This fame quickfilver，taken wht of the barometer，and well dried，would not freeze again，though expofed to a much greater degree of culd，as thown by the thermoneter．＂

Another fet of obfervations，in the coufe of which the mercury frequently congealed，were made by Pro－ feffor Gmelin at Kirenga tort，in $57^{\frac{1}{2}}$ N．Lat． 108. E．Long．；his themometer，at different times，fanding at $-108^{\circ},-86^{\circ},-100^{\circ}, \cdots 113^{\circ}$ ，and many other in－ termediate degrees．This happened in the winter of 1737 and 1738 ．On the 27 th of November，after the thermometer had been llanding for two days at－ $46^{6}$ ， he found it funk at noon to $108^{\prime}$ ．Sufpecting fome miftake，after he had noted down the ubiervation，he inftantly ran back，and found it at $102^{\circ}$ ；but afcend－ ing with fuch rapidity，that in the face of half an hour it had rifen to－ 190 ．This phenomenon，which appeared fo furprifing，undoubtedly depended on the expanfion of the mercury frozen in the bulb of the thermometer，and which now melting，forced up－ wards the fmall thread in the fem．

A dimilar appearance was obferved at the fame fort a few days after；and on the＝gth of December，O．S． He found the mercury，which had been ftanding at $-40^{\circ}$ in the morning，funk to $-100^{\circ}$ at four in the afternoon．At this time，he fays，he＂faw fome air in the thermometer feparating the quickflver for the fpace of abont fix derrecs．＂He had taken notice of of fumilar appearance the preceding evening，excepting that the air，as he fuppoled it to be，was not then col－ lested into one place，but lay feattered in feveral．

Thefe appearances undoubtedly proceeded from a congelation of the mercury，though the prejudice en－ tertained againt the pofibility of this phenomenon would not allow the profeffor even to inquire into it at all．Several other obfervations were made；forme of which were lokt，and the relt contain no farther iu－ formation．

The fecond infance where a natural congelation of mercury has certainly been obferved，is recorded in the tranfactions of the Royal Academy of Sciences at Stockhulm．The wenther，in January 1760 ，was re－ markably cold in Lapland；fothat，on the 5 th of that month，the thermometers fell to $-76^{\circ},-128^{\circ}$ ，or Wwer；on the 23 d and following days they fell to $-58^{\circ},-79^{\circ},-92^{\circ}$ ，and below－ $23^{\circ}$ entirely into the ball．This was obferved it Tornea，Sombio，Ja－
knfief，and Ǔiboki，four places in Lapland，fortated Engelde between the $65^{\text {th }}$ and ， 8 th degrees of N．Lat．and the 2 It and 28 th of E．Long．The perfon who obier－ ved them was M．Andrew Hellant，who makes the fullowing remarks，of themfetres fufficient to thow that the quickflver was frozen．＂During the cold weather at Sombio（fays he），as it was clearfun－fhine， though fearcely the whole body of the fun apseared atove the low woods that covered our horizon，I took a themometer which was hanging before in the flade， and expoled it to the rifing fua about eleven in the forenoon，to fee whether，when that luminary was fo low，it would have any effict up on the inftrument． But to my great furpris，upon looking at it abont noon，I found that the mercury $l_{1 a d}$ entirely fubfided into the ball，though it was ftanding as high as $-61^{\circ}$ at 11 velock，and the \｛cale reached down to 238 bulow o．＂On bringing the infrument near a fire，it prefendy rufe to its ufual height ；and the reafon of its fubfiding before was its being fomewhat warmed by the rays of the fun；which，feeble as they were，had yet fulficiont power to melt the finall thread of congealed mercary in the Atem of the themometer，and allow it to Cubfide along with the rett．Mr Hellant，however，fo little underttroud the reaton of this phenomenon，that he fre－ quently attempted to repeat it by bringing the ther－ mometer near a fire，when the cold was only a few de－ grees below the freczing point of water，but cond ne－ ver fucceed until it fell to $-58^{\circ}$ ，or lower，that is， until the cold was fufficiently intenfe to congeal the metal．The only feeming diffeulty in his whole account， is，that when the mereury had fubfided entirely into the ball of the thermometer，a vacuum or empty foot appeared，which run round the cavity like an air bubble，on turning the intrument ；but this proceed－ ed from a partial liquefaction of the mercury，which muit necellanily melt hirlt on the outfide，and thus c：i－ hibit the appearance jult mentioned．

18
＂The molt remarkable congelation of mercury，which Remark－ has ever yet been obferved，was that related by Dr alde experfo Peter Simon I＇allas，who liad been fent by the Emprefs monts of of Rulfia，with fome other gentlemen，on an expedition fimilar to that of Dr Ginclin．He did not，however， fpend the winters in which he was in Siberia in the coldef parts of that country；that is about the middle of the northern part．Twice indeed he refided at． Krafnoyark，in N．Lat． $56 \frac{1}{2}^{\circ}$ ，E．Long． $93^{\circ}$ ；where， in the year 1772，he had an opportunicy of obferving the phenomencn we fpeak of．＂The winter（fays he）fet in early this year，and was felt with uncommon feverity in December．On the 6th and 7th of that month happened the rereateft cold I have ever experien－ ced in Siberia；the air was calm at the time，and feemingly thickened；fo that，though the nky was in other refpects clear，ihe fun appeared as through a fog．I had only one fmall thermometer left，in which the fale went ro lower than－ $7^{\circ}$ ；and on the 6 th in the morning，I remarked chat the quickfliver in it funk into the ball，except fome fmall columns which ftuck fall in the tube．－When the ball of the thermur meter，as it hung in the open air，was warmed by being touched with the finger，the quickiliver rofe： and it could plainly be feen，that the folid columas fluck and refitted a good while，and were at lenglt puifed upward with a fort of violence．In the mean froze quiekfilver by natural cold; of which he gives the following account. "On the th of January $177^{\circ} 0$, the cold having increared to $-3 t^{\circ}$ that evening at Vytegra, I expofed to the open air three unnces of very pure quickfliver in a china tea-enp, covered with paper, pierced full of holes. Next day, at eight in the moruing, I found it folit, and looking like a piece of catl lead, with a confiderable deprefiion in the middle. Oa atecmpting to locfen it in the cup, my knife raifed thyengs from it as if it had betn lead, which remained Atickirg up; and at length the metal feparated from the brtito: of the cup in one mals. I then took it in my land to try if it would bend: it was fiff like glue, and liruke into two pieces; but my fingers immediate. ly took all fecling, and could fcarcely be reftored in an hown and an half by rubbing with fnow. At eight $\checkmark$ luck a thernometer, made by Mr Leximann of the Aradeny, flood at $-57^{\circ}$; by half after nine it was rifen to-4 $2^{2}$; and then the two pieces of mercury which lay in the eup had lofl fo much of their hardnefs, that they could no longer be broken, or cut into fhaviugs, but refembled a thick amalgam, which, though it became fuid whea preted by the fingers, immecliately afterwards refumed the confiftence of pap. With the thermometer at- $39^{\circ}$, the quickfilver becane fluid. The cold was never lefs on the 5 th than $-28^{3}$, and by nine in the evening it had increated again to- $33^{\circ}$.
$A_{n}$ infance of the natural congelation of quick filver alfo occursed in Jemiland, one of the provinces of Sweden, on the ift of January 1782 ; and laftly, on the 26 th of the fame month, Mr Hutchins obferved the fame effect of the cold at IJudfun's bay. "The
fulject of this curous phonomenon (Gays hej, was Congelit quactalier put into a comnon two-onne vidd, and corked. The vial was about a third part full, and had conftutly been Itanding by the thernometer for a experi month palt. At eight o'clock this norning I ob-mete of Mr fersed it was foozen rather more than a quarter of an Hutchin*. inch thick round the fides and buttom of the vial, the middle part continuing flud. As this was a certair method of finding the point of congelation, I intro. duced a mercurial and a fpirit thermometer intu the fluid part, after breaking off the top of the vial, and they rofe directly and beeame tationary; the former at $40^{\circ}$ or $40^{\circ \frac{1}{2}}$, the latter at $20 \frac{3}{7}$, both below the cypher. Having taken thefe out, I put in two others, $G$ a mercurial one fonnerly defcribed, and a fpirit thermo. meter ; the former of which became fationary at $40^{\circ}$ and the latter at $30^{\circ}$. I then decanted the fluid quiekfilver, to examine the internal furface of the frozen metal, which proved very uncven, with many radii going acrufs; fome of which refembled pin-head:. Urgent bufuefs called me away an hour. On my return I found a finall portion only had liquetied in my abfence. I then broke the vial entirely, and with a lammer repeatedly thock the quackhlver. It beat out flat, yielded a deadith found, and became fluid in lefs than a minute afterwards.- It may be worth remarking, that the quickfilver in one of the thermometere, which had funk to very near 500 , and was then at +tt, very readily ran up and dorin the tube by elevating either end of the inftrument."
thefe are all the well authenticated accounts of the congclation of mereury by the natural cold of the at mofphere. Some others have been publithed; but being either lefs important, or not fo well authenticated, we forbear to mention them. A very confiderable confimation is ubtained from the above liktory, of the theory of congelation delivered by Dr Black, and which is fully explained under the articie Chemestar. On Mr Iutchins's experiments, and on congelation in general, Mr Cavendifh makes many valuable iemarks; the fubftance of which is as follows.
"If a veffl of water, with a thewnometer in it, be Mr Civen. expuled to the cold, the thermometer will hink feveral bin's redegrees below the freezing point, efpecially if the wa marks n: ter be covered up fo as to be deferaded from the wind, congela and care taken not to agitate it; and then on dropping in a bit of ice, or on mere agitation, fpiculx of ice hoot fuddenly through the water, and the inclo. fed thermometer rifes quickly to the freezing point. where it remains fationary." In a note he fays, that though in confurmity to the common opinion he has allowed that "nere agitation may fet the water a freczing, ye: fome experiments lately made by Dr Blagden feem to thuw, that it has not much, if any. effect of that kind, otherwife than by bringing the water in contack with fome fubfance colder than it. felf. Though in gencral allo the ice fhoots rapidly; and the inclofed themomerer rifes very quick; yet he once oblerved it to rife very flowly, taking ap not lefs than half a minute, before it afcended to the freczing point; but in this experiment the water was cuoled not more than one or two degrees below freezing ; and it thould feem, that the more the water is cooled below the freezing point, the more rapidly the ice thoots and the inclofed thermometer rifes."

## C O N

Congeislion.

Mr Cavendith then obferves, "that from the foregoing experiments we learn that water is capable of being conled confiderably below the freezing point, without any congelation taking place; and that, as foon as hy any means a fnall part of it is made to freeze, the ice fpreads rapidly through the whole of the water. The caufe of this rife of the thermometer is, that all, or almoft all bodies, by changing foom a fluid to a folid frate, or from the flate of an elaftic to that of an unelaftic fluid, generate heat: and that cold is produced by the contrary procefs. Thas all the circumfances of the phenomenon may be perfectly well explained; for, as foon as any part of the water freezes, heat will be gencrated thereby in confequence of the above-mentioned law, fo that the new formed ice and remaining water will be warmed, and mult continue to receive heat by the freezing of fref portions of water, till it is heated exactly to the freering point, unlefs the water could become quite folid before a fufficient guantity of heat was generated to raife it to that point, which is not the cafe: and it is evident, that it cannot be heated above the freezing point; for as foon as it cemes thereto, no more water will freeze, and confequently no more heat will be generated. The reafon why the ice fpreads all over the water, inItead of forming a folid lump in one part, is, that, as foon as any fmall portion of ice is formed, the water in contact with it will be fo much warmed as to be prevented from freezing, but the water at a little diftance from it will fill be below the freczing point, and will confequently begin to freeze.
"Were it not for this generation of heat, the whole of any quantity of water would freeze as foon as the procefs of congelation began : and in like mamer the rold is senerated by the melting of ice; which is the caufe of the long time required to thaw ice and fnow. It was formerly found that, by adding fnow to warm water, and firring it about until all was melted, the water was as much cooled as it would have been by the addition of the fame quantity of water rather more than $150^{\circ}$ degrees colder than the fnow; or, in other words, fomewhat more than $150^{\circ}$ of cold are generated by the thawing of the frow; and there is great erafor to believe that juit as mech heat is produced by the freezing of water. The cold generated in the expe:iment jul mentioned was the fame whether ice or Snow was ufed.
" A thermometer kept in melted tin or lead till they become folid, remaias perfealy ftationary from the tirre the metal begins to harden round the fides of the fot till it is entirely fulid; but it cannot be perceived at all to finks below that point, and rife up to it wien the metal hegins to harden. It is not uulikely, howeret, that the great difference of heat between the air and meltel mutal night prevent this effect from taking place; fo that though it was hot pereeived in thefe experiments, it is not unlikely that thofe metals, as well as water and quickfilver, may bear being cool-
ed a little below the freezing or hardening point (for Congeizthe hardening of melted metals, and freezing of wate., feems exactly the fane procefo), without beginning to lofe their illidity."
"' The experiments of Mr Hutchins prove, that quickfilver contracts or diminithes in bulk by freezing; and that the very low degrees to which the thernometers have been made to fink, is owing to this contraction, and not to the cold having been in any de. gree equal to that fhown by the thernometer. In the fourth experiment, one of the thermoneters funk to 450 , though it appeared, by the firit thernometers that the cold of the mixture was not more than five or hix degrees below the point of freezing quickfilver. In the firl experiment alfo, it funk to 448 , at a time when the cold of the mixture was only $2 \frac{1}{2}-$ below that point ; fo that it appears, that the contraction of quicklilver by freezing, muft be at leaft equal to its expanlion by yof degrees of heat. (A) This, howcer, is not the whole contraction that it fuffers; for it appears hy an extraet from a meteorological journal kept by Mr Hutelins at Albany fort, that his thermometer once funk to $490^{\circ}$ below o; though it was known by a firit thermometer, that the cold farcely exceeded the point of freezing quickfilver. There are two experiments alfo of Profeflor Braun, in which the thermoneter funk to $5+4$ and $556^{\circ}$ below nothing; which is the greateft defent he cver obferved without the ball being crackel. It is not indeed known how cold his mixtures were; but from Mr Hutchins's experiments, there is great reafon to think they could nut be many degrees below $40^{\circ}$. If fo, the contraction which quickiilver fuifers in freezing, is not much lefs than its expanfion by $500^{\circ}$ or $510^{\circ}$ of heat, that is, almolt $\frac{1}{2}$ of its whole bulk ; and in all probability is never much more than that, though it is probable that this contration is not always determinate: for a confiderable variation may frequently be oblerved in the fpecific gravity of the fame pitce of metal calt different times over; and almof all calt metdis become heavier by hammering. Mr Cavendith obferved, that on cafling the fame ver 23 piece of tin three times over, its denfity varied from of the dent7.252 to $7.29+$, though there was great reafon to fity of nethink that no hollows were left in it, and that only tals by fre: a fmall part of this difference could proced from the ing. error of the experiment. 'This variation of denfity is as much as is produced in quickfilver by an alteration of 65 of heat ; and it is not unlikely, that the defeent of a thermmeter, on account of the contraction of the quickfiker in its ball by freezing, may vary as much in different trials, though the whole mafs of quickfilver is fiozen withont any racnities.
"The cold produced by mixing fpirit of nitre of ${ }^{24}$ with frow is eutirely owing to the melting of the mistures. fnow. Now, in all probability, there is a certain degree of cold in which the fpirit of nitre, fo far from diffulving fnow, will yield part of its own water, and
(A) "The numbers liere given are thofe fhown by the thermometer without any correction'; but if a proper allowance is made for the ecror of that indrument, it will appear, that the true contraction was $25^{\circ}$ lefs than here fet down; and from the manner in which thermometers have been ufually adjufted, it is likely that in the fth experiment of Mr Hutchins, as well as in thofe of Profefor Baan, the true contraction might equaliy faid fiost of that by observation.".

## CO N [ 317 ] C O N

Congela- fuffer that to freeze, as is the cafe with folutions of common fult ; fo that if the cold of the matcrials before mixing is equal to ihis, no additional cold can be produced. If the cold of the materials is liffo, fome increafe of cold will be produced; bus the total cold will be lefs than in the former cafe, fince the additional cold cannot be generated without fome of the fnow being diffolved, and thercby weakening the acid, and making it lefs able to diffulve mote frow ; but yet the lefs the cold of the materials is, the greater will be the additional cold produced. This is conformable to Mr Hatchins's experiments; for, in the filth experiment, in which the cold of the materials was - $40^{\circ}$, the additional cold produced was only $5^{\circ}$. In the fint experinent, in which the cold of the materials was only $-23^{\circ}$, an addition of at leaft $19^{\circ}$ of cold was obtaintd ; and by mixing fome of the fame firit of nitre with fnow in thes climate, when the heat of the materials was $+26^{\circ}$, Mr Cavendilh was ahle to tink the thermometer to $-29^{2}$, for that an addition of 55 degrees of cold was produced.
" It is remarkable, that in none of Mr Itutchins's experiments the cold of the mixture was more than $6^{\circ}$ of the firit thermometer below the freezing point of quickfilver, which is fo little, that it might incline one to think that the fpirit of nitre ufed by him was weak. This, however, was not the cale; as its fpecific gravity at $58^{\circ}$ of heat was 1,4923 . It was able to diffolve $\frac{\mathrm{I}}{\mathrm{I} .4^{2}}$ its weight of marble, and contained very litele mixture of the vitriolic or marine acid: as well as could be jadqed from an examination of it, it was as little phlogiticated as acid of that ftreugth ufually is."

Acids, efpecially thafe of the mineral kind, powerfully refit congelation. There is, however, a peculiarity with regard to that of vitriul. Mr Chaptal, a fortign chenif, obferved that it condenfed by the cold of the atmofphere, and the cryttis hegan to melt only at $+70^{\circ}$ of his thermometer; which, if Rearrmur's, correfponds to about $47^{\circ}$ of Fahrenheit. The cryftals were unctuous from the melting, acid, and they felt warmer than the neightouring bodies: the form was that of a prifn of fix lides, flatted and terminated by a pyram: of fix fides; but the pyramid appeared on one end öniy; on the other, the cryltal was loft in the general mafs. The pytamid refulted from an affemblage of fix ifofecles triangles: the oil when the sryftal was melted was of a yellowifh black; on redistilling it in a proper apparatus, no peculiar gas came oves. M. Chaptal repeated his experimens with the lighly concentrated acid, but fond that it did not freeze ; that the denfity of the acid which he thought froze molt eafly was to the oil, of the ufual flength for fale, as from 63 and 65 to 66 ; and the neceflery degree of cold abput 19 of Fahrenheit. Oil of vitriol once melted will not cryltallize again with the fame degree of cold.
M. Moré, a confiderable manufacturer of oil of vitriol at Hadimont near Vervier, in the duchy of Limbourg in Germany, attributes this congelation to the addition of nitrous air. The acid of vitriol is ufually feparated from fulphur by burning it in clofe veffels; and the air is fupplied by adding to the fulphur a litue nitre. He found, that by mixing the acid, ca-
pable of being congealed, with water, or employing it for other pupofes, orange-coioured fames, and the fmell of the true nitrous acid, were very evident. When this gas was dellroyed, no degree of cold womld congeal the acid, whatever was its degree of concentration; and the congelation was generally obicered immenately afcer the procefs by which the acid was obtained.

Mr Macquer relates, in the fecond edition of his Chemical Dicionary, article Firridic Acit, that the Duke d'Ayen had ubferved the congration of concentrated vitiolic acid, which had beon expofed to a cold expreffed by 13 oi 14 destrees below o on Reanmur's thermometer; but that mixtures, confifting of one part of the above mentioned concentrated acid, with two or more parts of water, could not be frozen by the cold to which he expofed them, till he had dilued the acid fo much that its denlity was to that of water as $10 ⿻^{\frac{1}{z}}$ to 96 ; in which latter cafe of congelation it is probable that the water only was frozen, as is the cafe in dilute folutions of ditts. Similar experiments were made by M. de Morveau, and with equal fuccefs. Having produced an interfe cold by pouring. fpirit of nitre on pounded ice, he congealed a part of fome vitriolic acid which had been previoully concentrated; but he obferved, that thongh a very intenfe cold had beem matle wfe of to congeal the acid at fryt, it neventhelefs smained congealed in much fmaller degrees of cold, and that it thawed very llouly. This coincides with the obfervations of $M$ Chajetal ; though the latter obferes, that there is fome difference between throng oil of vitriol lowered with water, and that produced of a given frength by rectification. The latter alxays has fome colour; and it will not dilolve indigo in fuch a manner as to carry the colour into the ftuff, thongh the thronger oil, diluted to the fame degree, fucceeds very well. Some ubferiations were allo made by Mr MPİab at Hudfon's Bay, an account of which is given in the Phil. 'Tranf. for 1780 by Mr Cavendih, at whofe defire they had been made. From them it appears, that a vitriolic acid, whofe fpecific gravity was to that of water as $18+3$ to 1000 , froze when expoled to a cold of - $15^{\circ}$ of Fahrenheit'z feale; that another more dilute vitriolic acid, conlil. ing of 629 parts of the furmer concentrated acid, and 351 parts of water, congealed in a temperature of $-3^{\circ}$; and that, when farther diluted, it was capable of fuftaining a much greater degree of cold without freezing at all. In thefe experiments, as well as in thofe of Mr Morveau, it appeared that the whole of the acid did not congeal, but that part of it retained its fuidity ; and on examining the ftrength of that which remained fluid, Mr Cavendim found that there was very little difference between it and the other ; whence he was lect to fuppofe, that the reafor of this congelation does not arife from any differense in ftrength, but on Come lefs obvious quality, and fuch as conllitutes the difference between common and icy oil of vitriol.

In all the experiments hitherto made, however, Mr Cavendith had found fome uncertainiy in detemining the point of eafieft freezing ; neither could he determine whether the cold neceffary for congelation does not increafe without any limitation in proportion to the flrength of the acid. A new fit of cxperimeats

## C ON 1 N [ 318

## C O

Cumben wat theofore wade by Dir Keir io de!emine this
 end of the year 1784 and beginning of 1785 , that fome vitriolic acid, contained in a corked phat, had congealed, while uther boties comaning the fame,
fome dronger and fome weakor, retained their fluidity. As the congelation wats natmally imputed to the extremity of the cold, the was afferwards furpiled to find, when the frolt ceafed, that the acid remained congealid for many days, when the temperature of the atmofphere was fometimes above $10^{\circ}$ of Fahrenheit; and when the congealed a id was brought into a warm room ou purpole to thaw it, a thermometer placed incontact with it during itsthawing continuedidati naryat $45^{\circ}$. Henee he concluded, that the freezing and thawing point of this acid was nearly at $45^{\circ}$; and accordingly, on expoling the liquor which had been thawed to the air at the temperature of $30^{\circ}$, the congelation again rook place in a few hours. From the cincumtance of other parcels of the fame acid, but of different ftrengths, remaining fluid, though they hat been expofed to a mueh greater degree of eold, he was led to believe that there mutt be fome ecrtain thrength at which the acid is more difpofed to congeat taan at any other. 'The fpecific gravity of the acid which had frozen was so that of water nearly as 1800 to 1000, and that of the ftronger acid whieh had not frozen was as $184^{6}$ to 1000 , which is the common denlity of that ufually fold in England ; and there was not the lealt difference, excepting in point of ftrength, between the acid which had frozen and that which had not; Mr Keir haying taken the acid fome wecks before with his own hands from the bottle which contained the latter, and diluted it with water, till it became of the fpeeilic gravity of 1800 .

To render the experiment complete, Mr Keir immerfed feveral aeids of different direngths in meiting fnow, intlead of expofing them to the air; the temperature of which was vaiiable, whereas that of melt. ing inow was certain and invariable. Thofe which would not freeze in melting fnow were afterwards immerfed in a mixture of common falt, fuow, and water; the temperature of which, though not to conflant and determinate as that of melting frow, generally remained for feveral hons at $18^{2}$, and was fometimes feveral degrees lower. The inteintion of adding werer to the fnow and falt was to leflen the intenficy of the cold of this mixture, and to render it more permanent than if the fnow and falt alone were mixed. 'The acids which had frozen in melting foow were five in number; :which being thawed and brought to the temperature of $60^{\circ}$, were fuund on exa. ination to ha ic the following fecifie gravities, viz. 1786, 1784, 1780, 1778, 1755. Tnofe which had not congeaied with the metting fnow, but which did fo with the mixture of Inow, fait, and water, were found, when brought to the temperature of $60^{\circ}$, to be of the fort lowing fpecilic gravities, viz. 1814, 1810, 1804, 1794, 1790, 1770, 1759, 1750. '1hore which remained, and would frecze neither in melting fnow nor in the mixture of fnow, falt, and water, were of the gravities 1846, 1839, 1815, 1775, 1720, 1700, 1010, 1551. From the firn of thefe it appears, that the mediun denfity of the acids which froze with the na-
tural cold was 1780 ; and from the fecond, that at the denftics of 179 and 1770 the acid hat been incapa- follows, that izso is nearly the degree of freugth of eaficll fieseing, and that an increafe or diminution of that denfity equal to $\frac{\sigma^{\frac{1}{2}} \mathrm{t}_{3} \text { th of the whole, renders the }}{}$ acid incapable of freezing with the cold of metting fnow, though this eold is fomething above the freceing point of the molt eongealable acid. From the fecond it appears, that by applying a more intenfe cold, viz. that produced by a mixture of fuow, fak, and water, the limite of the denfities of acids capable of eongelation were extended to about $r^{3}$, th above or below the point of eafieft freezing : and there feems little reaton to doubt, that, by greater angmentations of cold, thefe limits may be further extended; but in what ratio thefe augmentations and extenfions proceed, cannot be determined without many oblervacions made in different temperatures.
"But (fays Mr Keir) though it is probable that the molt concentrated deids may be frozen, provided the cold be fufficiencly intenfe, yet there feems reaj!on to believe, that fome of the congelations which have been obferved in highly eoneentrated aeids, have been effected in confequence of the denfity of thefe acids being seduced neatly to the point of eaty freezing by their having ablorbed moilture from the air: for the Duke d'Ayen and M. de Morveau expofed their acids to the air in eups or open veffels; and the latier even aequaints us, that on examining the pecific gravity of the acid which had frozen, he found it to that of water as 129 to 74 ; which denfity being lefs than that of eafiet freezing, proves that the acid he em. ployed, and which he had previonfly coneentrated, had been actually weakened during the experiment. I have feveral times expofed coneentrated oil of virriol in open veffels in frolly weather; and I have fometimes, but not always, oblerved a congelation to take place. Upon feparating the congealed part, and on examining the feceific gravity of the latter after it had thawed, I found that it had been reduced to the point of ealief freezing. When the eongealed acid was kept longer expofed it gradually thawed, even when the euld of the air increaled; the reaton of which is not to be imputed to the hear produged by the moillure of the air mixing with the acid, but principally to the diminution below the point of eafiefl free. zing, which was oceafioned by the continued ablorption of moinure from the air, and which rendered the acid incapable of continuing frozen without a great inereafe ot culd.
"It appears, then, that the concentration of M. de Morvean's acid, at the time of its congelation, from which ciremanase Mr Cavendifn infers generally that the vitriolic acid fieezes more calily as it is more denfe, is not a trut promile; and that therefore the inference, theugh jultly dedue d, is iavalid. On the contrary, there feems every reafon to believe, that as the dentity of the acids increales beyond the point of eafien fleezing, the facility of the congrelation diminifiss; at lealt to as great dentity as we have ever been alle to obtain the vitriolic acid: for if it were poffible to diveR it encirely of water, it would probably aflume a folid form in any tomperature of the air.

## C O N [ 3 I9 $]$

Conzta- "Eh cryatheation of the vitriolic acie is more on t! 1$)^{\circ}$. lef; Bret. accoreng to the fownefs of the foman
 Some: ones they are very large, ditinety thapeal, and hard 'their flupe is like thole of the common mineral alkuli and Colenite fpar, but with angles different in dimenfions from either of thefe. They are folid, confiting of ten faces; of which the two largelt are equal, parall:l, and oppolite to each other; and are oblique-angled parallelograms o: rhomboids, whole angles are, as near as could be meafured, of 105 and 75 degrees. Between thefe two rhomboinal faces are plived eight of the form of trapeziums; and thur each eryflal may he fuppofed to be compounded of two cogual and fimilar frutums of pyranids josined together by their rhomboidal bafes. They alway fank in the Aluid acid to the battom of the reffel, which fhowed that their dentity was increafed by congelation. It was attempted to detemine their fpectic gravity by adding to this fluid fome comentrated acid, which fould make them foat in the liquor, the examination of whofe fpecific gravity foold afeertain that of the foating cryitals; but they were found to hak even in the molt concentrated acid, and were confequenty denfer. Some of the congealable acid previoully brought to the freezing tomperature was then poared into a graduated marrow eylindrical glafs, up to a ecrain mark, which indicated a fonce equal to that oecupicel by 200 grains of water. The glafs was placed in a nixture of frow, falt, and water; and when the asid was frozen, a mark was rade on the part of the glafs to which it had funk. Having thawed the acid and emptied the glafs, it was filled with water to the mark ro which it had tunk by freezing; and it was then found that 15 grains more of water were required to raife it to the mark expreffing 200 grams ; which fhows, that the diminution of bulk futained by the acia in freczing had been equal to $\frac{1}{13 \cdot 3}$ of the whole. Computing from this datum, we frould eftimate the fpecific gravity of the congealed acid to have been 1924; but as it ewidently contained a great number of bubbles, its real fpocific gravity hat have been confuderably greater than the above calleulation, and cannot eafly te deterninced on account of thefe bubbles. Ly way of comparifon, Mr Keir obferved the alteration of bulk which water contained in the fame cylindrical veffel would fuffer by freezing; and found that its expanfion was equal to about $\frac{1}{x 5}$ th of its bulk. The water had been previouly boiled, but neverthelefs contained a great number of air bubbles; fo that in this refpee there is a confiderable difference between the congelations of water and the vitriolic acid; though perhaps it may arite principally from the bubbles of clatlic fluid being in grater propertion in the cne than the other.
" Greater cold is produced by mixing fnow or pounded ice with the congealed than with the fluid vitriolic acid, though the quantity is not yct determined. The greatelt cold produced by $\mathrm{Mr} \mathrm{M} \cdot \mathrm{Nab}$ at Hudfon's Bay, was effected by mixing fnow with a vitriolic acid which had been previoutly congealed; and to this circumftance $\operatorname{Mr}$ Cavendifh imputes the in ienfity of the cold, as the liquefaction both of the aid and the frow had concurred in producing the
fame eflect; rhate in mixing thaid acids wich fow, Conytas. the thating of the frow is probably the only produc- tion. tive caufe.
"To compare the times reguitite for the lifpefaction of ice and of concrealced oil of vitnin, two equal and fimilar glafes were filled, one with the erongealable vituolic acid, the other with water; and after having immerfed them in a freeotig misture till both were conerealed and rednced to the temperature of $28^{\circ}$, the clates were withdrawn, wiped dry, and placed in a roum vhere the themometer Atood at $62^{\circ}$. The ice thawed in $t^{0}$ minutes, and the acid in 95 ; at the end of which time the themometer, wheh ltood near the glafes, had rifen to $67^{\circ}$. Hence it appears that the congealed acid requires more than twiee the time for its liquefaction that ice does, though it cannot thence be fairly inferred, that the elld generated by the liquefaction of the ice and of congealed acid are in the airove proportions of the times, from the followince conliderations, viz. that as, during the liquefaction of the ice, its temperature remains ीlationary at $32^{\prime}$, and during the lignefaction of the acid, its temperature remains abont 44 or $+5^{\circ}$, it appears, that the ice being confuderably colder that the acid, will take the heat from the contiguous air much fatter. By this experiment, however, we krow that a confiderable quantity of cold is gentrated ty the liquefaction of the acid: ard hence it apears probable, that in producing cold artifialle: by mixing fow with acids in very cold temperatares, it wouk probably be ufe ful to employ a vitriolic acid of the per denity for congedation, and to frecec it previon?y 6 its misture with frow. It inult not, however, be imagined, that the cold generated Dy the mixture of thefe two frozen fubtances is nearly equal to the fums of the colds gencrated by the feparate liquefations of the congealed acid and ice, when funty expuled to a thawing temperature; for the mixture retulting from the liquefaction, confitins of the vitriolic acid and the water of the fnow, appears from the gcnecation of heat whith occurs from the misture of thefe ingredients in a fluid flate, to be fubject to different haws than thofe which rule cither of tice ingredients feparately.
"The vitriolic acid, like water and other fluids, is capable of retaining its fludity when cooled confrderahly below its freezing point. A phial containing fome congealable vitriolic acid being placed in a mixture of falt, frow, and water, a thermometer was foon afterwa:ds immerfed ia it while the acid was yet fluid, on which it quickly funk from 50 to $29^{\circ}$. On moving. the themometer in the fluid, to make it acquire the exact temperature, the mercury was obferved fuddenly to rife; and on looking at the acid, numberlefs fmall cryfals were obferved floating in it, which had been fuddenly formed. The degree to which the mercury then rofe was $+6^{\circ}$; and at another time, while the acid was freezing, it food at $45^{\circ}$."

From thefe experiments ourathor infers, " 1. That the viriolic acid has a point of eafielt freczing, and that this is when its fpecific gravity is to that of water as 1780 to 1000. 2. That the greater or kefs difpofition to congelation does not depend on any other circumfance than the flrength of the acid. 3. That. the freezing and thawing degree of the molt congealable acid is about $45^{\circ}$ of Fahrenheit's fcale. It is, bowever,

## C O N [ 320 ] C O N

Congeia- however, to be obferved, that this degree is inferred
$\stackrel{\text { from the temperature indicated by the thomometers }}{ }$ engerien, immerfod in the freezing and thawing acids; but the congelation of the fluid acid could never be accomplifled without expofing it to a greater degree of cold, cither ly expoling it to the air in frolty weather or to the cold of melting fnow. \&. Like water, this acid polfeffes the property of retaining its fluidity when cooled feveral degrees below the freezing point; and of aifing fuddenly to it when its congclation is promoted by agitation, or by contact even with a warmer thermometer. 5 . That, like water and other congelable fuids, the vitriolic acid generates cold by its liquefaction, and leat during its congelation, though the quantity of this heat and cold remains to be determined by future experiments. 6. That the acid, by congelation, when the circumfances for diftinet cryftallization are favourable, affumes a regular cryfalline form, a colfoderable folidity and hardnefs, and a denfity much greater than it poffefed in its fluid tate."

Befides this fecies of congelation, the virriolic acid is fubject to another, probally the fame deferibed by Bafll Valentine and fome of the older chemits. This is effected in the ordinary temperature of the air, even Peil Trans in fummer; and, according to Mr Keir*, is peculiar vol. inspii. to that fpecies of oil of vitriol which is diftilled from p. 207.
green vitriol, and which is porfeffed of a fmoking qua-
lity in a high degree; "for not only the authors (fays Mr Keir), by whom this congelation has been obferved, have given this defeription of the acid employed, but alfo the late experiments of Mr Dollfuls, feem to how that thes foroking quality is effential to the phenomenon : for neither the acid obtained from vitriol, when deprived by rectification of its fmoking quality, nor the Englifh oil of vitriol, which is known to be obtained by burning folphur, and which does not fnoke, were found by his triais to be fufecptible of this fpecies of congelation. It may, however, be worth the attention of thofe chemifts who have an opportunity of feeing this icy oil of vitriol, as it is called, to obferve more accurately than has yet been done, the freecing temperature and the denfity of the congealable acids; and to examine whether the denfity of this fmoking acid alfo is connected with the ghacial property. It feems alfo further deferving of inveftigation, whetleer there be not fome analogy between the congelation of the fmoking oil of vitriol and the very curious cryftallization which Dr Prietlley obferved in a concentrated vitriolic acid faturated with nitrous acid vapours; and whether this fnoking quality does not proceed from fome marine or other volatile acid, which may be contained in the martial vitriol whence the vitriolic acid is obtained."

Mr Keir alfo obferves, that M. Cornatter has effected the cryftallization of vitriolic acid, by ditilling it with nitrous acid and charcoal; and we can add from our own experience, that a cryflallization inftantly takes place on allowing the fumes of the nitrous and vitriolic acids to mix together; and this, whetlier the former be procured from martial vitiiol or fulphur, and whether it be in a phlogiticated fate or not, concentration in both acids is here the only requifite.

CONGER, in zoology. See Murema.
CONGERIES, a Latin word, fometimes ufed in $\mathrm{N}^{\text {r }} 88$.
our language for a cullection or hicap of fereral par. Congefion ticles or hodies united into one mafs or aggregate.

CONGESTION, in medicine, a mafs or collection of humours, crowded together and hardened in any part of the body, and there forming a preternatural tumor.

Congeftion is effeeted by little and little : in which it differs from diffection, which is more fudden.

CONGIARIUM, Conglary, among medalifts, a gift or donative reprefented on a medal. The word comes from the Latin congius ; becaufe the firft prefents made to the people of Rome conlifted in wine and cil, which were meafured out to them in congii. The congiary was properly a prefent made by the comperors to the people of Rome. Thofe made to the foldiers were not called congiaries but donatives. The legend on medals reprefenting congriaries, is, Cangiarium or Liberalitas. Tiberius gave a congiary of three landred pieees of money to each citizen: Caligula twice gave three hundred fefteres a head: Nero, whofe congiaries are the firll that we find reprefented on medal., gave four hundred.

CONGIUS, a liquid meafure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the una, or fix fextarii. The englius in Englifi meafure contains $2,070,676$ folid inches; that is, feven pints, $4,9+2$ folid inches.

CONGLOBATE gland. Sce Anatomy.
CONGLOMERATE cland. Ibit.
Conglomfkits Flowers, are thofe growing on a branching foot-ftalk, to which they are irrerularly but elofely connected. This mode of inflorefuence, as Linn:eus tems it, is oppofed to that in which the flowers are irreguharly and loofely fupported on their foot-ltalks, hence termed a diffule panicle*. The *see $p_{a-}$ term is exemplified in feveral of the graffes, particu- nife. latly in fome fpecies of the poa, fefcue grafs, and agrodis.

CONGLUTINATION, the gluing or faftening any two bodies together by the intromiffion of a third, whofe parts are unetuous and tenacious, in the nature of glue. Sec Gave.

CONGO, a kingdom of Africa, bounded on the north by the river Zair, or Zarah, which divides it from Loanga; on the fouth by the river Danda, which feparates it from Angola; on the eaft by the kingdoms of Fungono and Metamba, and the burnt mountains of the fun, thofe of chryftal or falt-petre and filver, or (according to Anthony Cavazzi, a late traveller into thofe parts) by the mountains of Coanza, Berbela, and the great mountain of Chilandia or Aqquilonda; and on the welt by that part of the Atlantic ocean called the Ethiopic fea, or the fea of Congo. According to thefe limits, Congo Proper extends about three degrees from north to fouth; lying between 6 ? and $9^{\circ} \mathrm{S}$. Lat. ; but nidens in its breadth inland, by the courfe of the river Zair, which runs winding above two degrees more to the north. Its length from eaft to weft is very uncertain, as no oblervations have been taken of the exact fituation of thofe mountains which bound it.

The hiftory of this kingdom affords but few inte. Hintory un refling particulars. Before its difcovery by the Por-certainanc tuguefe, the hitory is altogether uncertain and fabu-fabulous, lous, as the inhabitants were totally unacquainted with
letters

 letters and learning. So little were they acquainted with chronology, that it is faid they did not even ditlinguifh between day and night; much tefs could they compute their time by moons or years; and therefore could remember paft tranfactions only by faying they happened in fuch a king's reign.The country was difeovered by the Portuguefe in -1484. The difcoverer was named Diego Cam, an expert and bold failor. He was very well received by the natives, and fent fome of his men with prefents to the king; but they being detained by unexpected accidents beyond the promifed time of their return, Cam was obliged to fail away without them, and took with him four young Congoere, as noflages for the fufety of his countrymen. Thefe he tanght the Portuguefe langrage, in which they made fuch progrefs that king Jolin was highly pleafed, and fent them back next year to Congo with rich prefents; charging them to exhort their monarch, in his name, to become a convert to the Cliriltian religion, and to permit it to be propagated through his clominions. A firm alliance was concluded between the two monarchs, which continues to this day, though not without fome interruptions, to which the Portuguefe themfelves have given occalion more than the natives.

Any particular account we have of this kingdom, refts almolt entirely on the credit of Anthony Cavazzi, the traveller above mentioned. He was a capu-chin-friar, a native of the duchy of Modena, and was fent milhonary into thofe parts de propagandre fide, in the year $165 t$, and arrived at Congo the fame year. During his tlay there, his zeal to make converts made him travel through all thefe different kingdoms; and the credit he gained, as well as the great employments he was intruted with, gave him an opportunity of informing himfelf of every thing relating to them with great exactnefs. The cxtent and fitnation, however, he could not polfibly afcertain, for want of inftruments; to him, the dominions of Congoextended a great deal further eaftward and fonthward before the introduction of Chriltianity than afterwards; a great number of the flates that wore under the Congoefe monarchs, either as fubjects, or tributary, having withdrawn their allegiance out of dillike to them on that account. Not content with oppofing the officers and troops that came amnally to raife the tribute impofed by the king, they made fuch frequent and powerfil ineurfions into his dominions, that they obliged him to draw his fores nearer the centre of Congro to prevent an invafion; by which means the kinglom, from an extent of 600 leagues, was reduced to lefs than one 6 hall.
count of Congo Proper being fituated within the torrid zone, elimate is liable to excenteve heats: as it lies on the fouthern ifeafons. - fide of the equinoctial, the feafons are of courfe oppofite to ours. 'They reckon only two principal feafons, the furnmer and winter: the former hegrins in Oetuber, and continues till February or March; during which time the fun's raỵs dart with fuch force, that the atmofphere appears to an Europuan to be in a flame. The exceffive heat, however, is mitigated by the cqual length of the days and nights, as well as by the winds, breezes, rains, and dews. The winter takes nip the other part of the year; and is faid by the natives to Vol. V. Part I.
be proportionally cold, though to an European it would appear hot. Thefe $t w n$ feafons they divide into fox leffer ones, riz. Maffenza, Ncafu, Ecundi, Quitombo, Quibifo, and Quibangrald.

- Maffanza begins with the month of October, which is the beginning of their fpring. 'The rams begin to fall at that time, and continue during the next two, and fometimes three, months. When they do fo, the low lands are commonly overflowed by the extracrdinary floods, and all their corn carried off. A difafter of this kind is commonly followed by a famine : for the lazy inhabitants take no care to lay up :my provifons, although fuch misfortunes happen very frequent'. This firt feafon they reckon commences at the time the plants begin to fpring.

The fecond feafon, Neafu, begins about the end of January, when the produce of their lands has arrived at its full height, and wants but a few days of beins ripened for harveft. This Grft crop is no fooner gathered in, than they fow their fichs afrem, their land commonly yiedding them two harvetts.

The third and fourth feafons, called Ecumli and Quitombo, are frequently blended together towards the midlle of March, when the mure gente rains begin to fall, and continue to do fo till the month of May. Thefe two feafons are dittinguined by the greater or leffer quantity of rain that falls during that interval. During the relt of the time, the air is either very clear, hot, and dry; or the clouds being overcharged with electric matter, burf ont into the molt terrible thumders and lightnings, without yieding the laft drop of rain, though they feem loaded with it.

The two lat, vis. the Quibifo and Ouibangala, make up their hort winter, which conlifts not in frot or fnow, but in dry, blafting winds, which flip the earth of all its verdure, till the next Malfanza begrus to reftore them to their former bloom.

They now divide their year into twelve lunar months, and begin it in September. They have alfo weeks confitting of four day's only, the lat of which is their fabbath; and on they religioutly abtain from every kind of work. This practice, the compilers of the Univerfal Hiftory conjecture to have drifen from Natives exthe extreme lazinefs for which this peeple, and in-cefively indeed all the African nations, are fo remarkable. To dolent. this fhameful indolence alfo is to be afciibed the little produce they reap from their lands, while the Portu. guefe fettled among them, who are at more ;ains in the cultivation of theirs, enjoy all manner of plenty. The natives, however, had rather oun the rift of the mot terrible famines, than be at the tenth part of the labour they fee the Portuguefe take. They feem ro thiuk ic below them to ufe any other excrefes inan thefe of dancing, leaping, hunting, theoning, \&o. ; th: reft of their time they fpend in fooking, and dus. ight idfenefs, commitions the lammas pait of that houfehold affairs to their haves, or, in want of thom. to their wives. Nothngs is more common than to fie thefe poon creatures reiting in the fields and wonds with a child tied to their backs, and faintise wodre their excefive labour and heavy burdens, ci (w!ak is thill wate) houger and thirft. What is yet mone fuprifingly fhametul is, that thouph they have plenty of dumettic animats which they might caln make wis of fur culavating their grounds, and for oilh hab.

## $\mathrm{C} 0 \mathrm{~N} \quad[322] \quad \mathrm{C} O \quad \mathrm{~N}$

Congo. ans ierrices, and though they fee the Portuguefe do it every day to great advantage; yet they will rather fee their tender females liuk under their toil and labour, thon be at the trouble of breeding up any of thele ufe-
8 ful creatures to their affifance.
Fese ables The ground produces variety of grain, but no corn yronfacedin or rice except what is cultivated by the Pustuguefe. Corgo. Their maize, or Indian wheat, grows very Ationg, and is well laden. This, being well ground, thoy make in to bread. or boil with water into a kind of pap. Of this they have four kinds; one of which refembling what we call Fiench wheat, is produced in plenty, and maties fome amends for the wart of indutry in the people. 'They cuntivate alfo a variety of the peale and bean kind: but what they chefy live mpon, as mold furtable to their lazy difpofition, is a kind of nut, lite cur fiberds, which fall to the ground of themfelves, and are to be fonnd every where; every nut that falls to the ground producing a new farub next year. They have fcarcely any fruit-trees but what have been brought thither by the Portuguele. They have various forts of palm-trees, ufeful both by their frnit, leaves, and their juice, which is ealily converted into wine; alfo by affording a kinch of oil with which they deefs their victuals, though the Europeans ufe it only to burn in their lamps. They have allo a valt number of plants and hrubs, which it would be impoffible to delcrite or enumerate. Wheas is the only thing that the ground will not produce. It puffes furth, indeed, the ftraw and the ear; the former of wlich grows high enough, we are told, to hide a man on hortchack, but the latter is empty, wichout one grain fit for ufe. Father Labat, however, who had lived a confidetable time in come of the American iflands, where he had obferved the fame thing, tells us, that he had the curiofity to examine thofe ears more carefully, and had found fome few grains; and that, having fowed them afreth, they produced very long ears, full of large heavy grain. Whence he conjectures, that if the Portugrefe had tried the fame experiment in their African lettlements, it might perhaps have been attended with the fame fuccefs.
Tlacardous In the low lands the grafs grows fo high, rank, cravelling and thick, that it becomes one of the mof dangerous receptacles for wild bea!ts, ferpents, and other venomous infects: on this account travelling is exceedingly hazardous, as they have few beaten roads in the whole coontry, and travellers are obliged to march over it tirrough valt plains, in continual danger of being devoured or ftung to death; to fay nothing of the manifold difeafes produced by the unwholefome dews with which the grals is covered during lome part of the day. The only method of guarding againt all thefe evils effectually, is by letting fire to the graf3 in the hot weather, when it is quite parched by the theat of the fun: but even this cannot be done without the greatel danger; becaule both the wild beals and venomous reptiles, being roufed out of their places of retirement, will fly furioully at thofe who happen to be in the way. In this cafe there is no poffibility of efcaping, but by climbing up the highelt trees, or defending one's felf by tire-arms or other meapons. In fuch emergencies, the natives have a much better chance than the Eurnpeans; the former uring able to climb trees with furgriting fwifinefs;
while the latter muft be affited with rope-laddere, which they commonly caure cheit blacks to carry about with them, and to go up and faten to one of the branches.

10
The flowers are here exceedingly beautiful and nu-Great vamerous. Almoft every field and grove yields a muchriety of nobler profpect than the European gardens can boaft Howers. of, notwithitanding the pains befowed on their cult:varion. The flowers are remarkable, not only for the prodigious variety of their colours, but the valt quantity of heads which grow upon one Aalk. In the day-time, indeed, they leem to have loft their natural fragrancy ; that being in fome meafure exhaled by the heat of the fun: but this is amply compenfated after its lettine, and more efpecially a little .efore its bifug, when their fweetnefs is again condenfed, and levived by the coldnefs and dews of the night, after which they exhale their vainus refiething feents in a much higher degrue than ours. The lilies, which there grow naturally in the fields, valleys, and woods, excel thote of our gardens, not only in their extreme whitemefs, but much more in a delightful fragrancy, without offending the head, as the European lilies do by their faintin fweetnels. The tulips which there grow wikd, though generally called Perfe, have fomething fo furprifingly charming in the vaniety and combination of their colours, that they dazzle the eyes of an inteule beholder: neither do their flowers grow fingly as with us, but ten or twelve upon one talk; and with this double advantage, that they diffule a very reviving and agreceable fweetneis, and cortinue much longer in their full bloom. Of the fame nature are their tuberofes, hyacinths, and other native flowers; which fpring up in vat groups of 100 and 200 from one root, though fonewliat fmaller than ours; fome of them finely variegated, and all of them yielding aa agreeable fmell. The rofes, jeflamines, and uther exutics brought thither from Europe or America, come up likewife in great pertiction; but require a conttant fupply of water, and diligent attendance, to prevent them from degenerating. The American jeflamine, in patticular, inftead of fingle flowers, will grow up by dozens in a bunch; fome of them of an exquilite white, and others of the colour of the molt vivid fire.

A valt variety of animals of different kinds are Animals of found in the kingdom of Congo; the chief of whichdifereni are the elephant. This creature is moftly found in the kindso prowirce of Bamba, which abounds with woods, pafture, and plenty of water ; the elephants delighting much to bathe themfelves during the heat of the day. They commonly go in troops of an hundred or more; and fome of them are of fuch a monftrous fize, that we are sold the print of their hoof hath meafured four, nay froven, Spans in diameter. From the hair of their tails, and that of fome other animals, the natives, efpecially the women, weave themfllves colv lars, braceletos, girctes, \&c. with variety of devices and figures, which denote their quality; and are in fuch elterm, that the hair of two elephants tails is fufficient to buy a Rave. The reafon of this is, that the natives have not the art of taming them, but are obliged to fend fome of their bravelt and flouzeft men to humt them in the woods; which is not done without great labour and danger, they being here exceedingly fierce. The molt common way of hunting
them

## $\mathrm{C} O \mathrm{~N} \quad\left[\begin{array}{lll}323\end{array}\right] \quad \mathrm{C} O \mathrm{~N}$

Congn. Them is by digging deep holes in the ground, the top of which they cover with branches and leaves, as is practifed in mott parts of Afra.

Lions, leopards, tigers, wolves, and other beafts of prey, abound here in great plenty, and do much damage. Here are alfo a valt variety of monkeys of all fizes and fhapes. The zebra, well known for its extreme beaury and fixiftnefs, is alfo met with in this countiy. They lave alfo a variety of buftalues and wild afles: but the dante feems to be an animal peculiar to this kingrdom, It is hlaped and coloured much like an ox, though not fo large. Its fkin is commonly bought by the Portuguce, and fent into Germany to be tanred and made into targets, which are then ealled dantes. The natives make ufe of their raw hide dried to make their thiells; which are fo tough that no arrow or dart can pieree them; and they are allo large enough to cover the whole body. The creature is valtly fwift; and wher wounded, will follow the feent or fonoke of the gunpowder with fuch fury, that the hunter is obliged to climb up a tree with all polfible fpeed : and this retreat he always takes care to fecure before lie vencures to tire. The wounded beaft finding its enemy ont of its reach, Hays for him at the foot of the tree, and will not lin from it ; of which the hunter taking the advantage, difpatches it with repeated fhots. The forells of Congo allo fwarm with will doge, who, like the wolves, prey upon the tame cattle, and are fo fierce that they will attack armed men. Their teeth are exceeding keen and fharp; they nover bark, but make a dreadful howling when

## 13 <br> Ants very <br> dangerous,

 famithed or in purfuit of their prey.Ihis country allo abounds with all the different kinds of birds that are to be found in other warm elimates. One fort, which they call birds of muthe, is greatly efteemed, infomuch that perfons of the highef rank have from time immemorial taken the greateft delight in keeping them in cages and aviaries for the fike of their funptifing melody. On the other hand, as the Congocfe are fupertitions to the lalt degree, there are feveral kinds of birds which they lock upon as ominous, and are fo terrifici at the heht or hearing of them, that if they were going to enter uponever fo momentous an expedition, if they were met in council, or going to engage an enemy with ever fo great an advantage, the flight or cry of fuch birds would throw them into a general panic, and difperfe them in the utmolt hate and confufion. The moit dreadful of the ominous kind are the crows, ravens, bats, and owls. The great owl is the molt terible of all, and to him they give the name of kariam femba, by which words they likewile denote the devil.

Finh of different kinds abound on the coafts of $C$ n. go in great numbers; but the inland parts are infetted. with fuch numbers of ferpents, fcorpions, and other venomous infects, as are perhaps fufficient to overbalance every matural adsantage we have yet mentioned. The mof pernicious and dangerous kind are the ants; of which they reckon no tefo than dix feveral fuecies of different colours and fires; all of them furnidable ou aecount of their prodigions numbers, and the mifchief they do not only to the fruits of the earth, but to men and heafts; whom they will lurround in the night time, and devour even to the very bone. It is a common practice, we are told, to condemn perfons guilty of
fome atrocious crimes to be itripped naked, tied hand
Cong). and foot, and l!rown into a hole where thefo infecta $\underbrace{}_{\text {ace }}$ fwarin; where they are fare to be devoured by them in lefo than 24 hours to the very bones. But crimi. nals are neot the only perfons who are in danger from the jaws of thefe litule devouring infects. People may be attacked by them, as we lave already hinted, in the night time, and while they are fleeping in their beds. 1his obliges the natives to be carefnl where they lie down, and to kindle a fmall fire, or at lealt to have a circle of hurning loot embers sond their beds. This caution is fill more neceffary in the country villages and hamltst, where perfons are otherwife in danger of being attacked by nuilions of them in the dead of the night. In fuch a cafe, the only expedient on fave one's felf is to junp up as foon as one feels the bite, to bruth them off with all poffible fpeed, and thers at once to fet the houfe on fire. The danger is flill greater in travelling through the country, where a perfon is often obliged to take up his lodging on the bare ground, and may be overtaken during the heat of the day with fuch profound Insep, as not to be awaked by the le di. minutive animals till they have made their way throngh the 0kin; and in fuch a cafe nothing will prevent their devouring a man alive, though there were ever fo many hands to affift him: in fuch incredible quantities do thefe creaures abound, notwithitading the great numbers of monkeys who are continually ferreting the ants out of their retreats, and feed upon them with the utmoft avidity. This ean only be aleribed to the natural lazinefs and indolence of the inhabitants; which is fuch, that they not only neglect to rid their lando of them by proper cultivation, but will fuffes their houfes, nay wen their very churchez, to be undermined by them. A nother kind of thefe defruetive vermin lie fo thick upon the paths and highways, that a peofon cannot walk without trading upon, and having his lugs and thighs almont devoured by them. A third fort of a white and red colour, but very fmall, will gnaw their way through the hardefl wood, penctrate into a frong chelt, and in a lithe while devour all the clothes, linen, and every thing that is in it. A fourth fort, fmall and black, leave a molt incolerable fench upon every thing they touch or ciawl over, whether clothes or houlehold-lluff, which are not calily fweetened again; or if they pafs over viet uals, they are entirely fpiled. A fifth fort harbour chiefly on the leaves and branches of trees; and if a man clance to climb up thither to fave himfelf from a wild bealt, he is fo tormented by them, that nothing but the fear of the jaws of the one could make him endure the ftings of the other. A fixth fort is of the flying lind; and is probably one of the former kinds, that live wholly under ground, till nature furnifhes them with wings. After this, they rife in fuch fivarms as datken the air, and would make terrible havoc among all kinds of vegetables, did not the natives come out againtt them in whole companies, and by dint of flaps, and other flat weapons, knock them down hy myiads, and then laying them in heaps, fot fire to their wings, which half broils them for fond. Amidft all this variety of pernicious infects, however, they have one fpecies of a more friendly and profitatle kind, viz. the indultrious bee, which furnithes the inhabitants with honey and wax in fuch plenty, that there is

Ss 2 ferarce

## C O N

Congo. farce a hollow tree, clift of a rock, or chop of the earth, in which their combs are not found in great

Congo very With refpect to the populoufnefs of the kingdom of populcus. Congo, fome authors, writing either from mere conjecture, or at beft precarious inferences, have reprefented it as thinly peopled. The accounts of the miffionaries and Portuguefe, however, are directly oppofite to thefe. They found the country for the moft part covered with $t$,wns and villages, and thefe fwarming with inhabitants; the cities well filltd with people, particularly the metropulis, whisch is faid to contain above 50,000 fouls. The provinces, though not equally populous, yet in the whole make up fuch an amount, as plainly proves, that what is wanting in the one is amply made up by the other. We are told, that the duchy of Eamba is flill able to raife 200,000 fighting mer, and was formerly in a condition to raife double that number; and that the army of the king of Congn, in the year 1665 , conifted of 900,000 fighting men, who were attended by an infinite number of women, chilldren, and flaves. The numbers of the Congoefe will appear the more credible, when we confider the extreme fecundity of their women, the hardinefs with which they bring up their children, and the ftoutnefs and healthinefs of their mell. In fome villages, if the mifionaries are to be credited, the number of children is lo great, that a facher will part with one or two, for any commodity he wants, or even for fome trifing bawble he fancies; fo that the number of naves they fell abroad feldom anounts, communibus annis, to lefs thais i5,000 or 16,000 .

There is fcace a nation on earth that have a higher Congroefe bave a high opinion of themfelves or their country, than the Conopinon of goefe, or that is more hardened againit all convicion themfelves. to the contary, from reafon, experience, or the molt impartial comparifon with other countries in Europe or Afia. Indeed, it is impolfible they fhould think otherwife, when it is one of the furdamentals of their belicf, that the reft of the world was the work of angele, but that the kingdom of Congo, in its full and ancient extent, was the handywork of the Supreme Arehitect; and muft of courfe have vaft prerogatives and advantages over all others. When told of the magnificence of the European and Afiatic courts, their immenfe revenues, the grandeur of their palaces and edifices, the richefs and happinels of their fubjects, the great progrels they have made in the arts and feiences to which their country is wholly a ftranger, they coolIy anfwer, that all this comes valtly fhort of the dignity and fplendor of the kings and kingdom of Congo; and that there can be but cne Congo in the world, to the happinefs of whofe monarch and people all the sell were created to contribute, and to whole treafury the fea and rivers pay their conftant tribute of 'zimDis (or fluells, which are the ir current coin) ; whild other princes mutt condefeend to enrich themfelves by digging through rocks and mountains, to come at the excrements of the earth, fo they ftyle gold and filver which are in fuch reonel among other nations. Accordingly, they inagine, that the natious which come to traffic with them, are forced to that fervile employment by their poverty and the badnefs of their country, rather than induced io it by luxury or avarice; whilt they themfelves can indulge their natural indo-
lence or Moth, though attended with the mof pinching poverty, rather than difgrace the dirnity of their blood by the leaf effort of induatry, which, how laudable and beneficial foever, is louked upon by them as only a leffer degree of flavery. But thoug! they erenerally efteem it fo much below their dignity to apply to any ufeful work, they think it no difgrace to beg or tteal. With refpect to the firlt, thry are faid to be the moft famelefs and importunate beggars in the world. They will take no denial, Spare no cronching, lying, prayers, to obtain what they want, nor curfes and ill language when fent away without it. With regard to the laft, they deem no theft unlanful or fcandalous, except it be committed in a private manner, without the knowledge of the perfon wronged. It is etlecmed a piece of bravery and gallantry to wrench any thing from another by violenee; and this kind of theft is fo common, not only among the vulgar, but alfo among the great ones, that they make no foruple, in their travels from place to place, to Crize not only upon all the provifions they mect with in towns and villages, but upon every thing elfe thai falls in their way. Thefe violences oblige the poor people to conceal the few valuables they have, in fome fecret place out of the knowledge and wach of thote harpies; and they chink themtelics well off if they can efeape a fevere batonading, or other crat ulage trequently inflicted upon them, in order to make them difcover the place of their concealment.

The complexion of the natives, both men and wo. Compleximen, is black, though not in the fame degree; fome on, characbeing of a much deeper black than otners. Their $\begin{aligned} t \in \mathbf{r}, \mathrm{cu} \\ \text { tom, }\end{aligned}$ hair is black and finely curled; fome have it alfo of a dark fandy colous: their tyes are mollly of a fine lively black; but fome ate of a dark iea colour. They have neither flat nofes nor thick lips like the Nubians and other negroes. Their Hature is moflly of the middle fize; and, excepting their black complexion, they nuch nefemble the Portuguefe. In their temper they are miftrulfful, envious, jealous, and treacherous; and where they once take a diftafte or affront, will fpare no pains, nor flick at any means, however bale, to be avenged of, and cuuh their enemy under their feet. There is no fuch thing among them as natural affection. A humand, if an Heathen, may take as many wives as he pleafes; and if a Chritian, may have any number of concubines, whom he nay divance at pleafure, or even fell them thonglr with child. So little regard have they for their children, that there is fcarce one among them who will not fell a fon or a daughter, or perhaps both, for a piece of cloth, a collar or girdle of coral or beads, and often for a bottle of wine or trandy.

The religion of the Congoefe in many parts is down-Religion. right idolatry, accompanied with the molt ridiculous lupertlitions, and the moft ablurd and deteftable sites invented bs their gangas or piefts; and even in thofe parts where Chriftianity is profeffed, it is fo darkened by fuperttitions of one kind or other, that we may jutlly queftion whether the people are any gainers by the exchange.

The government of this kingdom is monarchical, Governo and as defpotic as any in Afia or Africa. Tie kingsment. are the fole proprietors of all the lands within their dominions; and thefe they can difpofe of to whom

## C O N

Congo, they pleafe, upon condition they pay a certain tribute Congregr- out of them : upon failue of the payment of which, tios: guefe and other Europeans have in this country. There are thonght to be about 4000 of them fetted. here, who trade with moll parts of the kingdom. The chicf commodities they bring thither are cither the product of Brazal or Earopean manufactures. The former confitt chelly of grains, fruits, plants, \&c.; the latter of "lurky carpets, Englilh cloth, and other lluffs; copper, brais vellels, fome kinds of blue earthen ware, rings, and ornaments of gold, filver, and other bafer metals; coral, glafs-beads, bugles, and other trinkets; light fluffis made of cotton, woollen, and linen, for cloathing; and a great variety of tools and other utenilis. In retuin for thefe, they carry off a great number fflaves, amounting to 15,000 or 16,000 annually, as we have alruady oblerved. Formerly they ufed allo to carry away elephants teeth, firs, and other commolities of the country; but thefe branches of commerce are now greatly decayed, and the flave-trade is what the Portuguefe merchants principaily depend on.

Cong i, a term applied to tea of the fecond quality.

CONGREGATION, an afembly of feveral ecclefiaftics, united to as to contitute a body.

The term is principally uled for affemblies of cardinals appointed by the pope, and diftributed into fevesal chambers, for the ditcharge of certain functions and jusifdictions, after the manmer of our offices and courts. 'The firlt is the congregation of the holy office, or the inquifion: the fecond, that of juridietion over bihops and regulars; the third, that of comncils; this has power to interpret the council of Trent: the fourth, that of cultoms, ceremonies, precedences, canonizations, called the congregation of rites: the tifth, that of St Peter's fabric, which takes cognizance of all canfes relating to piety and charity, part whereof is due to the church of ist Pcter: the fixth, that of waters, rivers, roads: the feventh, of fuuntains and fecets: the eighth, that of the index, which tamines the books to be primed or corrected : the math, that of the conncil of flate, for the management of the territories belonging to the pope and church (fee Camerlingo) : the tenth, de lono regimine; of which two ladt the caccimu-nephew is chics: the cleventh,
$325] \quad \mathrm{C} O \quad \mathrm{~N}$
that of money: the twelfth, that of bifhops, wherein Cong rega, thofe who are to be promoted to bifhopries in Italy are examined; this is hekl before the pope: the thirteenth, that of contitoria! matters ; the chief whereof
tion
II
Conereve. is the cardinal-dean: the fo meenth, a comgresation for propagating the funh ( Sie College): wim the
 fuits againt chorchmen. 'There is alf, de congecration of alnos, which takes care of eve, $\begin{gathered}\text { thing that re }\end{gathered}$ lates to the faofitconce of some and the flate of the church.

Congregation is alfo ufed for a company or fociety of religious cantoned out of this or that urder; and making, as it were, an inferior order, or a fubdivition of the order itfelf. Such are the congregations of the oratory, and thofe of Cluny, \&xe. among the Benedictines.

The word is alfo ufed for affemblies of pious perfons in manner of fraternities, frequent anong the Jefinits in honour of the Virgin, \&c. It is likewile applied to the andience in a ehuch, parti-ularly as conditing of the inhabitants of the fame parith.

CONGREGATIONMLIS f'S, in church-hiftory, a fect of Proiedants who reject all charel-groverament, except that of a fingle congregation under the direction of one paltor.

CONGRESS, in political affairs, an affembly of commiffioners, envoys, deputies, \&e. from feveral courts meeting to concert matters for their common good.

Congress, in America, is the affembly of delegrates from the United States. See America.

Congress, in a judicial fenle, the trial made by appointment of a judge before furgeons and matrons, in order to prove whether or no a man be impotent, before fentence is paffed for the diffolution of a marriage folicited upon fuch a complaint.

Neither the civil nor camon law makes any mention of the trial of virility by congrefs. It had its origin in France from the boldnefs of a young fellow, who, in open court, having been hard preffed by his wife, demanded the congrefs. 'The judge, furprifed with the novelty of the demand, found it could not be denied, as being the furetl evidence that the cale could admit of. In time it became a branch in the French jurifpru. dence, and was authorifed by decreets and arrets. It obtained for about 120 years; and was annulled by an arret of paliament in 1677 , as being found precarious; fome having farkd under the experiment out of mere modedty and thame, which is found to have the fame effect with actual impotency.

CONGREVE (William), a younger brother of an ancient family in Staffordihire. His father was employed in the ttewardihip of the glat citate of the Earl of Burlington in Ireland, where he relided many years; and our authon was born there in 1672 . Mr Congreve entered into the Midde-Temple when he came to England, and began to tudy the law; but his bias was toward polite literature and poctry. His intt performance was a novel, intituled, Incegnith or Lore and 7n'y reconciled. He foon adter began his comedy of the Old Bachelur; which was the amufement of fome leifure hours during a llow recovery fiom a to of illnefs foon after his return to England; yet was in ittelif fo perfect, that Mr Dryden, on its being fhown to him, dechared lac had never in his hife fecn luch a firll play.

When

Corgreve. When brought on the fage in 1603 , it met with fuch univerfal approbation, that Mr Congreve, though he was but 19 years old at the time of his writing it, became now contidered as a prop to the declining fage, and a riling genius in dramatic poctry. The next year he produced the Double Dealer; which, for what reafon is not obrions, did at meet with for much fuevers as the former. The merit of his firll phy, however, had obtained him the favour and patronage of Lord Halifax, and fome peculiar mark of diftinction from Queen Mary; on whole death, which happened in the clole of this ycar, he wrote a very etegant elegiac paforal. In 169 , when Fetterton opend the new houre in Linculn's-Inn Fields, Mi Congreve joining with him, gave him his comedy of Lowe for Low, with which the company opened their campayn ; and which met with fuch fuccefs, that the inmediately offered the anthor a thare in the management of the boufe, on condition of his furnihing them with one play yearly. 'This offer he accepted; but whether throngli indolence, or that correctnefs whicla he looked upon as neceffary to his works, his Mourning Brihl. did not come outtill t 697 , nor his $H$ av of the World till twoyears after that. The indifferent fuecets this lat mentioned play, though an exceeding good one, met with from the public, completed that difigut to the theatre, which a long conted with Jeremy Collier, who had attacked the inemoralities of the Englin itage, and more efpecially fome of his piecer, had begun, and he determined never more to write for the farge. However, though he quitted dramatic writing, he did not lay down the pen entirely; but occafinally wrote many little pieces both in profe and verfe, all of which atand on the records of literary fame. It is very porfible, however, that he might not fo foon have given way to this difgult, had not the eafinefs of his circumftances rendered any fubfervience to the opinions and caprice of the town abflutely unneceflary to hins. For his abilities having very early in life raifed him to the acquaintance of the Earl of Halifac, who was then the Mrecenas of the age ; that nubleman, delirous of raifing fo promifing a genims above the neceffity of too hafty productions, made him une of the commif. foners for licenting hackney-coaches; or, according to Coxeter, a commiflioner of the wint-licence. He foon after beftowed un him a place in the pipe-office; and not long after gave him a poft in the cuftums woth 600 l . per annum. In the year 171 , he was appointed fecretary of Jamaica; fo that, with all togetiher, his income towards the later part of his life was upwards of 1200 l . a-year.

The greatict part of the lat 20 years of his hife was fpent in cafe and retirement; and he either did nut, or affected not to give himfelf any trouble about reputation. Yet fome part of that conduet might proceed fiom a degree of pride; to which parpofe, T. Cibber, in his lives of the poets, Vol. IV. p. 93. rilates the following anecdote of him: "Whent the celebrated Voltaire was in Eugland, he waited upon Mr Congreve, and paffed fome compliments upon the merit and reputation of his works. Congreve thanked him; but at the fame time told that ingenions foreigner, that he did not choofe to be conidered as an author, but only as a private gentieman, and in that light expeeted to be wifited. Voltaire anfwered, that
if he lad never been any thing but a private gentle- Cungruity. man, in all probability he had never been troubled with that vifit." He obferves, in his own account of the tranfaction, that he was not a little difguted with Io unfeafonable a piece of vanity.
'Towards the clofe of his life he was much afinieted with the gout ; and making a tome to Bath for the benetir of the waters, was unfortunatily overturned in his chariot: by which, it is fuppofed, he got fome inward braile, as he ever after complained of a pain in his fide: and, on his return to bondon, continu. ed gradually declining in his health, till the 19 th of January 1729 , when he died, aged 57 ; and, on the 26th following, was buried in Weitmintter Abbey, the pall being fupported by perfons of the firit diftinction.

CONGRUITY, a fuitablenefs or relation of agree. ment between things.

The terms convruity and propriegy are not applicable to any fingle objeet : they imply a phatity, and obviouly fignify a particular relation between different objects. Thus we currently fay, that a decent garb is fuitable or proper for a indge ; modelt behaviour for a young woman; and a lofty ftyle for an epic poem: and, on the other hand, that it is unfuitable or incongrnous to fee a little woman funk in an uvergromn farthingale, a coat richly embroidered covering courfe and dirty linen, a mana fubject in an elevated ftyle, an clevated fubject in a mean leyle, a frot minifter darning his wife's focking, or a reverend prelate in lawn flee es dancing a hornpipe.

The perception we lave of this relation, which feems peculiar to man, cannot proceed from any other caufe, but from a fenfe of congruity or propriety; for, fuppofing us dellitute of that fenfe, the terms would be to us unintelligible.

It is a matter of experience, that congruity or propriety, wherever perceived, is agreable; and that incunguity ar impropriety, wherever perceived, is difagreeable. The only difficulty is, to afcertain what are the particular objects that in conjunction fuggell thefe relations; for there are many ubjects that do not : the fea, for exanple, rewed in conjunction with a ficture, or a man viewed in conjunction with a mountain, fuggelt not either congruity or iccongruity. It feems nazural to infer, what will be fuand true by induction, that we never perccive congruity nor incongruity but among things that are connected torether oy fome relation: fucin as a man and his action, a principal and his acceforics, a fubject and its urnaments. We are indeed fo franed by nature, as, among things fo connected, to require a cestain fuitablentis or conefpondence, terned congruty or froo prifty; and to le diffleafed when ne find the oppolite relation of imongraity or inpropercty.
If things cometice be the fubjuct of congruity, it is reafomable before-hand to expect, that a degree of congruity fould be recquired proportioned to the degree of the comection. And uion examination we find this to hold in fact: where the relation is intimate, as between a caufe and its effect, a whole and its parts, we require the flrictell congruity; but where the relation is flight, or accidental, as among things jumbled together in the fame place, we require little or no congraity : the ftricieft propriety is re-

## C O N

Congruity quired in b haviour and manner of living ; becaufe a man is connected with thefe by the relation of caufe and effect: the relation hetween an edifice and the ground it fands upon, is of the moll intimate kind; and therefore the lituation of a great houfe ought to be lofty; its relation to neighbouring hills, rivers, planes, being that of propinquity only, denands but a finall fhare of congruity: among members of the fame club, the congruity ought to be coniderab.e, as well as among things placed for fhow in the fame niche: among paffengers in a thage-coach, we require very little congruity; and lefs flitl at a public fpectack.

Congruity is fo vearly allied to beauty, as commonly to be held a fpecies of it; and get they differ fo efientially as never to coincide: beauty, like colour, is placed upon a lingle fubject; congruity upon a pluralay: further, a thing beautiful in itfelf, may, with relation to other things, produce the Itronget fenfe of incougraity.

Congunity and propricty are commonly reckoned fynomyous terms; but they are diltinguithable; and the precife meaning of each muft be afcertained. Congratey is the genus of which propricty is a fpecies; for we call nothing proprizty, but that congruity or fuitabicnefs which ought to fubfill between fenfible beings and their thoughts, words, and actions.

In order to give a full wiew of thefe fecondary relations, we fhall trace them through fome of the mon confiderable primary relations. 'The relation of a part to the whole, being extruncly intimate, demands the utmolt defree of congruity; even the fightelt deviation is difutfor.

Examples of congruity and incongruity are furnilhed in plenty by the relation between a fubject and its ornaments. A literary performance intended merely for amufement, is fufceptible of much ornament, as well as a mufic-room or a play-houfe; for in gaiety, the mind bath a peculiar relift for how and decuration. The mof gurgeous apparel, however improper in tragedy, is not anfuitable to opera-actors: the truth is, an opera, in its prefent form, is a mighty fine thing; but as it deviates from nature in its capital circumftances, we look not for nature nor propricty in thofe which are acceffory. On the other hand, a ferious and important fubject admits not much ormament ; nor a lubject that of itfelf is extremely beautiful: and a fubject that fills the mind with its loftinefs and grandeu1, appears beit in a diefs altogether plain.

To a perfon of a mean appearance, gorgeons apparel is unfuitatle; which, betides the ineongruity, has a Lad effect ; for by contralt it thows the meannefs of appearance in the Atrongef light. Sweetnefs of look and manuer, requires limplicity of defs, joined with the greatell elegance. A flately and majellic air requires funptucus apparel, which ought not to be gaudy, nur crowded with little ornaments. A woman of confummate beaut $y$ can bear to be highly adorned, and yet fhows beft in a plain drefs:

Neeth not the forcign aid of ornamen',
But is whe:s unadum'd, adorn'd the mont. Thumifon's Ayturn, 208.
Congruity regulates not only the quantity of ornament, but ailo the kind. The ornanents that em-
bellifh a dancing room ought to ige all of then gay, Conrruity
No picture is proper for a church but what has religion for its fubject. All the nonaments upon a flield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the flich of Niseza to the military hiftory of the Romans : but this hcane ty is overlooked by Homer: for the bulk of the lealp. ture upon the thith of Achillec, is of the arts of peaco in senerad, and of joy and follivity in particular: the author of ' C lenachus betrays the fome inattention, in defcribing the thield of that young hero.

In fudging of propriety w th regard to ornaments, we muk attend, not only to the nature of the fubject that is to be adoned, but allo to the circumbances in which it is placed: the ornaments that are proper for a ball, will appear not altugether lo decent at public worflip; and the fanse perion ought to drefi differently for a marriage fealk and for a burial.

Nothing is more intimately related to a man, than his fentiments, words, and actions; and therefore we require here the ftrictelt conformity. When we find what we thas require, we have a lively fenfe of propriety : when we find the contrary, out fenfe of im. propriety is nut lefs lively. Hence the univerfal diftadte of affectation, which confits in making a how of greater delieacy and redinement than is fuited either to the character or circumflance of the perfont.

Congruity and proprity, wherever perceived, appear agreeable; and every acreeable object produceth in the mind a pleafant emotion: incongruity and impropriety, on the other hand, are difagrecable; and of courle produce painful cmotion. Thefe emo. tions, whether pleatunt or painful, fonetimes vanifh without any confequence; but more frequently accalion other emotions, which we proceed to exemplify.

When any flight incongruity is perceived in an aco cidental combination of perfons or thimge, as of paffengers in a flage-conch, or of individuals dining at an ordinary; the paiuful emotion of incongruity, after a momentary exilhence, vanilheth without producing any effect. But this is not the cafe of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our entecm ; when improper, we punith hias with our contempt. Let us fuppofe, for example, a generous action fuited to the character of the author, which railes in him and in every fpectator the pleafant emotion of propriety : this emotion generates in the author both felf efteem and joy; the former when he condiders the relation to the action; and the latter when he confiders the good upinion that others will entertain of hin: the fame emotion of propricty produceth in the [pectators cllem for the author of the action; and when they think of themfleses, it allo prodaceth, by means of contall, an emotion of humility. 'To difenver the effects of an unfuitable action, we muft invert each of thefe circumfances: the painful emotion of impropricty generates in the author of the action both humility and thame; the former when he confiders his celation to the action, and the latter when be confiders what others will think of him : the fame conow tion of impropricty produceth in the fpectators contempt for the author of the action ; and it alfo produceth, by means of contrall, when they think os.
thern-

## C O N [ 328 ] C O N

Conem mits themfelver, an emotion of felf-efteem. Here then are many different emotions, derived from the fame action, conlidered in diflerent views by different perfons; a machine provided with many fprings, and not a little complicated. Propricty of action, it would feem, is a chicef favourite of nature, when fuch care and folicitude is befowed upon it. It is not left to our own choice; but, like juftice, is required at our hands; and, like juflice, is enforced by natural rewards and punifments: a man cannot, with impunity, do any thing unbecoming or improper; he fuffers the chaftifiment of contempt inflicted by others, and of thame inflicted by himfelf. An apparatus fo complicated, and fo fingular, ought to roufe our attention : for nature doth nothing in vain ; and we may conclude with great certainty, that this curious branch of the human conltitution is intended for fome valuable purpofe.

A grofs impropriety is puninied with contempt and indignation, which are vented againft the offender by correfponding external expreffions: nor is even the fightell impropriety fuffered to pafs without fome degree of contempt. But there are improprieties, of the flighter kind, that provoke laughter; of which we have examples without end, in the blunders and abfurdities of our own fpecies: fuch inproprieties receive a diferent punifhment, as will appear by what follows. The emotions of contempt and of laughter occafoued by an impropricty of this kind, uniting intimately in the mind of the fpectator, are expreffed externatly by a peculiar fort of laugh, termed al laugh of derifion or forn. An impropicty that thus moves not only contempt, but langhter, is dialinguithed by the epithet of ridicalous; and a laugh of derifion or foom is the punilhment provided for it by nature. Nor ought it to efcape obfervation, that we are fo fond of inflicting this punifment, as fometimes to exert it even againft creatures of an inferior fpecies: witnefs a turkycock fwelling with pride, and ll rutting with difplayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of derition.

We mult not expect, that thefe different impropricties are feparated by dillinct boundaries: for of impropricties, from the nightell to the mort grofs, from the moll rifible to the molt ferious, there are degrees without cnd. Hence it is, that in viewing fome ambecoming actions, ton rifible for anger, and too ferious for derifion, the feectator feels a fort of mist emotiun, partaking both of derifion and of anger; which accounts for an expreflon, common with refrect to the improprity of fome actions, that we know not whether to laugh or be angry.

It camot fail to be cufcrved, that in the cafe of a rifible impropriety, which is always flight, the contempt we have for the offender is extremely faint, tho, derifion, its gratifation, is extremely pleafant. This difproportion betwen a faflion and its gratification, feems not confumaibe th the alogy of nature. In looking about for a fulution, we madt reflect upon what is laid down above, that im improper action not only moves our contempt for the author, but alio, by means of contrat, fwell the good opinion we have of ourfelves. This contributes, more than any other artich, to the plafure we have in ridiculing follies and abfurdities; and accordingly, it is well known, that they who put the greatell value upon themiches N 83.

I
are the mot prone to laugh at othcrs. Pride, whish is Congrnity. a vivid paffom, plealiant in itfelf, and not lefs io in its gratilication, would fingly he fufficieit to account for the pleafure of ridicule, withont horrowing any aid from contempt. Hence appears the reafon of a noted obfervation, That we are the moft difpofed to ridicule the blunders and abfurdities of others, when we are in high fpirits; for in high fpirits, fulf-conceit difplays itfelf with more than ordinary vigour.

With regard to the final caufes of congruity and impropricty; one, regarding congruity, is pretty obrious, that the fenfe of congruity, as one principle of the fine arts, contributes in a remakanle degree to our entertainment. Congruity, indeed, with refpect to quantity, coincides with propoltion: when the parts of a building are nicely adjulted to each other, it may be faid indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards vuluntary agents only, can never be the fame with proportion: a very long nofe is difproportioned, but camot be termed improper. In fome intances, it is true, impropriety coincides with difproportion in the fame fubject, but never in the fame refpect; for cxample, a very little man buckled to a long toledo: confidering the man and the fword with refpect to fize, we perecive a difproportion ; conlidering the fword as the choice of the man, we perceive an impropritty

The fenfe of impropricty with refpect to mitakes, blunders, and abfurdities, is happily contrived for the good of mankind. In the fpectators, it is productive of mirth and laughter, excellent recreation in an interval from buinefs. But this is a trifle in refpect of what follows. It is painful to be the fubject of ridicule; and to punin with ridicule the man who is' suilty of an abfurdity, tends to put him more upon his guard in tine coming. Thus even the moft innocent Glunder is not committed with impunity; becaufe, were errors. lieenfid where they do no hurt, inatiention would grow into a labit, and be the oceation of nuch hurt.

The final caufe of propriety as to moral duties, is of all the moft illuntrions. To have a juft notion of it, the moral duties that refpect others mut be diftinguifhed from thofe that refpect ourfelves. Fidelity, gratitude, and the forbearing injury, are examples of the fint fort ; temperance, modetty, firmuefs of mind, are examples of the other: the former are made duties by the fenfe of gulice; the latter by the fenfe of pro-* priety. Hiere is a final caufe of the fenfe of propriety, that muil roufe our attention. It is undurbtedly the intertit of every man, to fuit his behaviour to the dignity of his nature, and to the fation allothod him by Providence; for fuch rational condut contributes in every refpeet to happine's, by prefervin: health, by procuring plenty, by gaining the etteem of others, and, which of all is the gleatell bleffing, by ganing a julty-founded felf eltecin. But in a matecr fo chential to our well-being, even fulf-iutereit is not relicd on: the pown ful anthority of duty is fuperadded to the motive of interefl. The God of nature, in all things effential to our happinefs, hath obferved one uniform method: to keep us theady in our condat, he hath fortified us with natural laws and principles, which prevent many aberrations, that wouk daily haypen wee we totally furcindered to fo fallible a guice as

## $\mathrm{C} \mathrm{O} \mathrm{N} \quad[329] \quad \mathrm{C} O \quad \mathrm{~N}$

Congriaty. human reafon. Propticty cannot righltly be contidered in another hight, than as the natural law that regulates our conduct with refpect to ourfelves; as juttiee is the natural law that regulates our conduct with reepect to others. We call propriety a law, not lefs than jutiee ; becaule both are equally rules of conduct dat ought to be obeyed : propriety includes this obligation; for to fay an action is proper, is, in other words, to fay, that it ough to be performed; an? to fay it is improper, is, in other words, to fay that it ought io be forborne. It is this very character of oargot and floont that makes juttice a law to us; and the fame charactor is applicable to propriety, thourg perhaps more faintly than to jultice: but the diffrence is in degree only, mot in kind : and we onfht, without heftition or reluctance, to fubmit equall! to the government of both.

Bur it mut, in the next flace, be chferved, that to the fenfe of propristy, as well as of jultice, are annexed the fantions of rewards and pumimnents; which evidently prove the one to be a lawe as well as the other. The fatisfotion a man hath in duing his duty, joined with the elteem and good-will of others, is the reward that belongs to both equally. The punilhments alfo, though not the fame, are neanly allied; and differ in
degree more than in quality. Difobedience to the la:s Congruity, of juttice, is pumithed with remorfe; difobedience to the law of propriety, with fhane, which is remorfe in a lower degree. Every tranfrection of the law of juflice raifes imdignation in the beholder; and fo doth every flagrant tranforeflion of the law of propriety. Slighter impropricties receive a milder punithment: they are always rebuked with fome degree of contempt, and frequentiy with derifion. In general, it is true, that the rewards and punimments annexed to the fenfe of propicty, are fightiter in degree than thofe annexed to the fenfe of jutlice: which is wiflly ordered, leczufe duty to others is alll more effential to fociety than dety to ourfelves; for focicty could not fuldit a moment were individuals not protected from the he dfltrong and turbulcut paffion of their neighbours.
CONI, a frong town of Italy in Piedmont, and capital of a territory of that name, with a grood citadel. The town being divided into two faztions, it furrendered to the French in 1 fit ; but was reflored to the Duke of Savoy foon afier. It is fraied at the confl rence of the rivers Greffe and Sture. E. ## CONICSECTIONS

ARE. curve lines formed by the interfections of a cone and plane.
If a cone be cut by a plane through the vertes, the foction will be a triangle $A B C$, Plate CXLVI. fig. I.

If a cone be cut by a plane paralls to its befe, the fection will be a circle. If it be cut by a plane DEF, fig. I. in fuch a divection, that the fide AC of a triangle paffing through the vertex, and having its bafe BC perpendicular to EF, may tic parallel to DP, the fection is a parabola; if it be cut by a plane 1DR, fig. 2. meeting AC, the fection is an ellipfe; and if it be cut by a plane DMO, fig. 3. which would meet AC extended beyond A, it is an hyperbola.

If any line HG, fig. I. be drawn in a parabola perpendicular to DP, the fquare of HG will be to the fquare of EP, as DG to DP; for let LHK be a fection parailel to the bafe, and therefore a circle, the rectangle LGK will be equal to the fquare of HG , and the rectangle BPC equal to the fquare of EP; therefore thefe fquares will be to each other as their rectangles; that is, as BP to LG, that is DP to DG.

Sect. I. Defcription of Conic Sections on a Plane.

> I. PARABOLA.
"Let AB, fig. 4 . be any right line, and $C$ any point " without it, and DKF a ruler, which let be placed in
" the fame plane in which the right line and point are,
" in fuch a manner that one fide of it, as DK, be ap-
" plied to the right line AD, and the other fide KF
" coincide uith the point C ; and at F , the extremi-
" ty of the fide KF, let be fixed one end of the thread
" FNC, whofe length is equal to KF, and the other
" extremity of it at the point C , and let part of the
" thread, as FG, be brought clofe to the fide KF by
" a fmall pin G; then let the fquare DRF be moved Vol. V. Part I.
" from F towards A , fo that all the while its fise DE
" be applied clofe to the line BA, and in the mean
" time the thread being extended will always be ap" plied to the fide KF, being flopt from going from " it by means of the fmall pin; and by the motion of " the fmall pin $N$ there will be deferibed a certain " curve, which is calted a fomis.parabola.
" And if the fquare be brouglit to its firf given po" fition, and in the tame manner be moved aloug the " line $A B$, from $B$ towards $H$, the other femi-para" bola will be defcribed."

The line $A B$ is called the direarix; $C$, the focus; any line perpendicular to $A B$, a diameter; the point where it meets the curve, its vertex; and four times the ditance of the vertex from the directrix, its latus rectum or parameter.

## 2. ELIIPSE.

" If any two points, as A and B, fig. 5 . be taken " in any plane, and in them are fixed the extremities " of a thread, whofe length is greater than the dif" tance betwecn the points, and the thread extended "" by means of a fmall pin C, and if the pin be moved " round from any point until it return to the place
" from whence it began to move, the thread being
" extended during the whole time of the revolution,
"the figure which the fmall pin by this revolution
"d defribes is called an ellipfe."
The points AB are called the foci; D , the cemtre; EF, the tranfuerfe axis; GH1, the leffer axis; and any other line pafing through D , a dilumetcr.

## 3. H Y P ER B OLA.

" If to the point A, fig. $\sigma$. in any plane, one end " of the rule AB be placed, in fuch a manner, that " about that point, as a centre, it may frcely move; T t
" and
" and if to the other end $B$, of the rule $A B$, be fixed " the extremity of the thread BDC, whore length is " fmaller than the rule $A B$, and the other end of the " thread, being fixed in the point $C$, conciding with " the !ide of the rule $A B$, which is in the fame plane " with the given point $A$; and ket part of the thread, " as $13 D$, be brought clole to the fide of the rule $A B$, " by means of a fmall pin D; then let the rule be " moved about the point $A$, from $C$ towards $T$, the "thread all the while being extended, and the re" maining part coinciding with the fide of the rule " being ftopt from going from it by means of the " fmall pin, and by the motion of the fmall pin D , a " certain ligure is deferibed which is called the femi"byperbola."

The other femi-hyperbola is defcribed in the fame way, and the oppofite HKF , by fixing the ruler to $C$, and the thread to $A$, and defcribing it in the fame manner. A and $C$ are called foci; the point $G$, which bifects AC , the centre; KE , the tranfverfe axis; a line drawn through the centre meeting the hyperbolas, a tranfverfe dianeter; a line drawn through the centre, ferpendicular to the tranfverfe axis, and cut off by the cirele $M N$, whofe centre is $E$, and radius equal to CG, is called the fecond axis.

If a line be drawn through the vertex E , equal and parallel to the fecond axis GP and GO be joined, they are called affymptotes. Any line drawn through the centre, not meeting the hyperbolas, and equal in length to the part of a tangent parallel to it, and intercepted betwixt the alfymptotes, is called a fecond diameter.

An ordinate to any fection is a line bifected by a diameter and the abfeiffa, the part of the diameter eut off by the ordinate.

Conjugate diameters in the ellipfe and hyperbola are fuch as mutnally bifect lines parallel to the other; and a third proportional to two conjugate diameters is called the latus recum of that diameter, which is the firlt in the proportion.

In the parabola, the lines drawn from any point to the focus are equal to perpendiculars to the directrix; being both equal to the part of the thread feparated from the ruler.

In the ellipfe, the two lines drawn from any point in the curve to the foci are equal to each other, being equal to the length of the thread; they are alfo equal to the tranfverfe axis. In the hyperbola the difference of the lines drawn from any point to the foei is equal, being equal to the difference of the lengths of the ruler and thread, and is equal to the tranfverfe axis.

From thefe fundamental properties all the others are derived.

The ellipfe returns into itfelf. The parabola and hyperbola may be extended without limit.

Every line perpendicular to the directrix of a parabola meets it in one point, and falls afterwards within it; and every line drawn from the focus meets it in one point, and falls afterwards withont it. And every line that paffes through a parabola, not perpendicular to the directrix, will meet it again, but enly once.

Every line paffing through the centre of an ellipfe is bifected by it ; the tranfverfe axis is the greateft of
all thefe lines; the leffer axis the leaft ; and thefe nearer the tranferfe axis greater than thofe more remute.

In the hyperbola, every line paflug through the centre, is bilected by the oppofite hyperbola, and the tranfuerfe axis is the leat of all thele lines; alfo the fecond axis is the leall of all the ficond diameters. Every line drawn from the centre within the angle contained by the afymptotes, meets at once, and falls afterwards within it ; and every line drawn through the centre without that angle, never meets it; and a line which cuts one of the affymptotes, and cuts the other extended beyond the centre, will meet bath the oppolite hyperbolas in one point.

If a line GM, lig. 4 be drawn from a point in a parabola perpendieular to the axis, it will be an ordinate to the axis, and its fquare will be equal to the rectangle under the abfciffa MI and latus rectum; for, becaufe GMC is a right angle, GMI is equal to the difference of $\mathrm{GC}^{4}$ and $C M^{\prime}$; but $G C$ is equal to $G E$, which is equal to $M B$; therefore $G M^{9}$ is equal to $B M^{q}-C M^{4}$; which, becaule CI and IB are equal, is ( 8 Euc. 2.) equal to four times the rectangle under MI and IB, or equal to the rectangle under MI and the latus rectum.

Hence it follows, that if different ordinates be drawn to the axis, their 〔quares being each equal to the rectangle under the abfififa and latus rectum, will be to each other in the proportion of the abfeiffas, which is the fame property as was fhown before to take place in the parabola eut from the cone, and proves thofe curves to be the fame.

This property is extended alio to the ordinates of other diameters, whofe fquares are equal to the rectangle under the abfciffas and parancters of their refpective diameters.

In the ellipfe, the fquare of the ordinate is to the rectangle under the fegments of the dianeter, as the fquare of the diameter parallel to the ordinate to the fquare of the diameter to which it is drawn, or as the firt diameter to its latus rectum ; that is, $\mathrm{LK}^{q}$ fig. 5. is to EKF as EFz to GH ${ }^{9}$.

In the hyperbola, the fquare of the ordinate is to the rectangle contained under the fegments of the diameters betwixt its vertices, as the fquare of the diameter parallel to the ordinate to the fquare of the diameter to which it is drawn, or as the firft diameter to its latus rectum; that is, $\mathrm{SX}^{q}$ is to EXK as $\mathrm{MN}^{q}$ to $\mathrm{KE}^{q}$.

Or if an ordinate be drawn to a fecond diameter, its fquare will be to the fum of the fquares of the fecond diameter, and of the line intercepted betwist the ordinate and centre, in the fame proportion: that is, $R Z^{q}$ lig. 6 . is to $\mathrm{ZG}^{q}$ added to $\mathrm{GM}^{q}$, as $\mathrm{KE}^{q}$ to MN'. Thefe are the moll important properties of the conic fections; and, by means of thefe, it is demonftrated, that the figures are the fame deferibed on a plane as cut from the cone; which we have demonitrated in the cafe of the parabola.

## Sect. II. Equatiers of the Conic Seations

Are derived from the above properties. The equation of any curve, is an algebraic expreffion, which denotes the relation betwixt the ordinate and abfciffa; the abfciffa being equal to $x$, and the ordinate equal to $y$.

If $p$ be the parameter of a parabola, then $y^{2}=p$; which is an equation for all parabolas.

If $a$ be the diancter of an ellipfe, $p$ its parameter; then $y^{2}: a x-a x:: p: a ;$ and $y^{2}=\frac{p}{a} \times \overline{a x-n} ;$ an equation for all ellipfes.

If $a$ be a tranfverfe ciameter of a hyperbola, $p$ its parameter; then $y^{2}: a x+x: x: p: a$, and $y^{3}=$ $\frac{p}{a} \widehat{x a x+x i x}$.
If $a$ be a fecond diameter of an hyperbola, then $y^{2}=$ $a a+x: x:: p: a$; and $y^{2}=\frac{p}{a} \times \overline{a d+x x}$; which are equations for all hyperbolas.
As all thefe equations are expreffed by the fecond powers of $x$ and $y$, all conic fections are curres of the fecond order; and converfely, the locus of every quadratic equation is a conic fection, and is a parabola, cllipfe, or hypatula, according as the form of the equation correfponds with the above ones, or with fome other deduced from lines drawn in a differnt manner with refpect to the fection.

## Sect. III. General Properties of Conic Setions.

A tangent to a parabola bifects the angle contained by the lines drawn to the focus and directrix; in an ellipfe and hyperbola, it bifects the angle contained by the lines drawn to the foci.

In all the fections, lines parallel to the tangent are ordinates to the diameter paffing through the point of contact; and in the ellipfe and hyperbola, the diameters parallel to the tangent, and thofe paffing through the points of contact, are mutually conjugate to each other. If an ordinate be drawn from a point to a diameter, and a tangent from the fame point whieh meets the diameter produced; in the parabola, the part of the diameter betwixt the ordinate and tangent will be bifected in the vertex; and in the ellipfe and hyperbola, the femi-diameter will be a mean proportion betwixt the fegments of the diameter betwixt the centre and urdinate, and betwist the centre and tangent.

The parallclogram formed by tangents drawn thro' the vertices of any conjugate diameters, in the fame ellipfe or hyperbola, will be equal to each other.

## Sect. IV. Properties peculiar to the $H_{\text {sperboht }}$.

As the hyperbuta has fome curions properties arifing from its affymptotes, which appear at firt view almolt incredible, we thall briefly demontrate them,

1. The hyperbola and its affymptutes never meet: if not, ket them meet in S, fig. 6 .; then by the property of the curve the rectangle KXE is to $\mathrm{SX}^{9}$ as $\mathrm{GE}^{9}$ to $\mathrm{GM}^{4}$ or $\mathrm{EP}^{4}$; that is, as $\mathrm{GX}^{9}$ to $\mathrm{SX}^{7}$; wherefore, KXE will be equal to the fquare of GX ; but the rectangle KXE, together with the fquare of GE, is alfo equal to the fquare of $G X$; which is abfurd.
2. If a line be drawn through a hyperbola parallel to its fecond axis, the rectangle, by the fegments of that line, betwist the puint in the hyperbola and the affymptotes, will be equal to the fquare of the fecond axis.

For if SZ, fig. 6 . be drawn perpendicular to the fecond axis, by the property of the cuive, the fquare of

MG, that is, the fquare of PE is to the fyluare of GE, as the fyuares $Z(\%$ and the fquare of NG together, to the fquare of SZ or GX : and the fquares of RX and GX are in the fane proportion, bectaufe the triangles $\mathrm{RXG}, \mathrm{MEG}$ are equiangular: therefore the fquares $Z G$ and $M G$ arc equal to the fquare of $R X$; from which, taking the equal fquacs of SX and ZG , there remains the retangle RSV, cqual to the fquare of MG .
3. Hence, if right lines be drawn parallel to the fecond axis, eutting an hyperbola and its afymptotes, the sectangles contained betwixt the hyperbola and points where the lines cut the allymptotes will be $c$ qual to each other; for they are feverally equal to the fquare of the fecond axis.
4. If from any points, $d$ and $S$, in a hyperbola, there be drawn lines parallel to the affymptotes $d a S Q$ and $\mathrm{S} b d c$, the rectangle under $d a$ and $d c$ will be equal to the rectangle mider $Q S$ and $S b$; alfo the parallelograms $d a, \mathrm{G} c$, and $\mathrm{SQG} b$, which are equiangular, and confequently proportional to the rectangles, are equal.

For draw YW RV parallel to the feeond axis, the rectangle $\mathrm{Y} d \mathrm{~W}$ is equal to the rectangle RSV ; wherefore, WD is to SV as RS is to $d \mathrm{Y}$. But becaufe the triangles ROS, AY1), and GSV od W, are equiangular, $W d$ is to $S V$ as $c d$ to $S b$, and $R S$ is to DY as SQ to $d a$; wherfore, $d c$ is to $S b$ as SQ to $d a$ : and the rectangle $d c, d a$, is equal to the rectangle $\mathrm{QS}, \mathrm{S} \%$.
5. The affymptotes always approach nearer the hyperbola.

For, becaufe the rectangle under $S Q$ and $S b$ or $Q G$, is equal to the rectangle under $d a$ and $d c$, or $A G$, and QG is greater than $a \mathrm{G}$; therefore $a d$ is greater than QS.
9. The affymptotes come nearer the hyperbola than any afignable diftance.
Let $\mathrm{S}_{\mathbf{3}}$ be any fmall line. Take any point, as $d$, in the hyperbola, and draw $d a, d c$, parallel to the affymptotes; and as X is to $d$, fo let $a \mathrm{G}$ be to G() . Draw QS parallel to a $d$, meeting the hyperbola in $S$, then $Q S$ will be equal to X . For the rectangle SQG will be equal to the reetangle $d a \mathrm{G}$; and confequentiy SQ is to $d a$ as $A \mathrm{G}$ to GQ.
If any point be taken in the allymptote below Q , it can eafily be fhown that its diftance is lefs than the line X .

## Sect. V. Arcas contained ly Conic Sosions.

The area of a parabola is equal to $\frac{z}{\text { s }}$ the arca of a circumferibed parallelogram.

The area of an cllipfe is equal to the area of a circle whofe diancter is a mean proportional betwixt its greater and lefer axes.

If lwo lines, $a$ id and QS , he drawn parallel to one of the affymptotes of an hypurbola, the face $a$ ( $\mathrm{OS} d$, bounded by thefe parallel lines, the affymptotes and the hyperboha will be equal to the logarithm of $a()$, whofe module is a $d$, fuppoling a $G$ equal to unity.

Sect. VI. Curvature of Copic: Secions.
The curvature of any conic festion, at the vertices of its axis, is equal to the curvature of a circle whofe diameter is equal to the parameter of its axis.

If a tangent be drawn from any other point of a conic fection, the curvature of the fection in that point will be equal to the curvature of a circle to which the fame line is a tangent, and which cuts off from the diameter of the fection, dawn through the point, a part equal to its parameter.

> Sect. VII. Ufes of Conic Scitions.

Any body, projected from the furface of the earth, deferibes a parabola, to which the direction wherein it is projected is a tangent: and the diftance of the directrix is equal to the height from which a body mult fall to acquire the velocity wherewith it is projected: hence the properties of the prarabola are the foundation of gunnery.

All bodies acted on by a central force, which decreales as the fquare of the diftances increales, and impreffed with any projectile motion, making any angle with the direction of the central force, mult deforibe conic fections, having the central force in one of the foci, and will deferibe parabolas, ellipfes, and hyperbolas, accurding to the proportion betwixt the certral and projectile force. This is proved by direct demunitration.

The great principle of gravitation acts in this manner; and all the heavcnly bodies deferibe conic feetions having the fun in one of the foci; the orbits of the planets are ellipfes, whofe tranfverfe and lefler diameters are nearly equal : it is uncertain whether the comets deferibe ellipfes with very unequal axes, and for reurn after a great number of years; or whether they deferibe parabolas and hyperbolas, in which cafo they will never return.

## Sect. VIII. U/as of Conic Seaions in the Solution of Geometrical Probiems.

Many problems can be folved by conic fections that cannot be folved by right lines and circles. The following theorems, which follow from the fimpler prow perties of the fections, will give a fpecinen of this.

A point equally ditant from a given point and a given line, is fituated in a given parabola.

A point, the fun of whole diftances from two given points is griven, is fituated in a given ellipfe.

A point, the difference of whofe dilances from two given points is given, is lituated in a given lyperbola.

## $\mathrm{C} O \mathrm{~N}$

Conici thyodohtes Coniffalx.

CONICHTHYODONTES, or Plectronita, in natural hiftory, one of the three names the follile tecth of hifars are known by.

CONIFER 乍, in botany, an order of plants in the Fragmenta methodi naturalis of Linnsus, containing the following getera, viz. cupreffus, ephedra, equilıam, juniperus, pinus, taxus, thuja.

CONIEEROUS trees, fuch as bear hard dry feedveffels of a conical figure; confiling of feveral woody parts, being motty faly, adhering clofely together, and feparating when aps.

CONIMBRICA (anc. geog.), a town of Lifitania, on the fouth fide of the river Monda; from the ruins of which arafe Coimbur, in its neighbourhood, a city of Portugal. W'. Loag. 9. 5. Lat. 40. 16.

CONINGSECI, a thwn of Suabia in Gërmany, and capital of a county of the fame name. E. Long. 9.23. N. Lat 47. 5 c .

CONJOINT, in a general fenfe, fignifies united or conneted.

Conjoint Degrees, in mufic, two notes which follow each cther inmediately in the order of the feale, as ut and in.

Congonst Tetrachorms, two tetmachords, or fourths, where the fume chord is the higheft of one and the lownt of the vihi.

CONISBAL AE, in natural hiltory, a clafs of fuffls natoralty and efoutially compounded, not inflammable, nor foluble in water, found in detached maffes, and formed of crynalline matter debafed by earth.

Of this clafs there are two orders, and of each of there only one genus. Coniffaix of the firt order are found in form of a naturally regular and uniform powder; all the genuine particles of which are nearly of one determinate flape, appearing regularly concrited, and not fragments of others ones lareer, Coniffate of

## C O N

the fecond order are found in torm of a rude, irregu- Conjugat: lar, and flapelefs powder, the particles of which are never of any determinate figure, but feem broken Conium. fragments of once latger maffes.

To the former genus belong the different kinds of fand: and to the latter the faburre, or gritis.

CONJUGATE diameter, or Axis, of an Ellipfis, the fhortelt of the two diameters, or that bitecting the axis.

CONJUGATION, in grammar, a regular diftribution of the leveral inflexions of verbs in their different voices, moodb, tenfes, numbers, and perfons, fo as to difinguif them from one another. See Grammar and Language.

CONIUM, hemlock: A genus of the digynia order, belonging to the pentandria clafs of plancs ; and in the natural method ranking under the +5 th order, Umitllaba. The partial involucra are halved, and moitly tuiphyllous; the fruit fubglobofe and quinque- Itriated, the frise eremated on each fide. The feecies are three; 1. The maculatum, or greater bemlock, grows naturally on the fides of banks and roads in many parts of Britain. It is a biennial plant which perifhes after it has ripened its feeds. It lath a long taper root like a parinip, but fmaller. The falk is imooth, fpotted with purple, and rifes from four to upwards of fix feet high; branching out toward the top into feveral fmaller thalks, garuifhed with decompounded leaves, whofe lobes are cot at the top into three paris; thefe are of a lucid green, and have a difagreeable fmell. The flalks are terminated by umbels of white flowers, each being compofed of about ten rays or fmall umbels, and have a great number of nowers, which fpread open, each fitting upon a diftinct footfalk; the feeds are fmall and channlled, and like thofe of anifeed. It flowers in Junc, and the feeds ripen in autumn.

## C O N [

Conium 2. The tenuifoliun, with Atriated fecds, differs from the firf in having taller talks, which are not to m:seh fpotted. The lcaves are much narrower, and of a paler green; and this difference is conftant. It is a biennial plant, and grows naturally in Germany. 3. The africanum, with prickly feeds, is a native of the Cape of Good IIope. The plant rarely grows above nine inches high; the lower leaves are divided like thofe of the fmall wild rue, and are of a greyifh colour; thofe upon the 能k are narrowes, but of the fame colour; thefe are terminated by umbels of white flowers, each of the larger umbels bing compofed of three finall ones: the involnernm hath three narrow leaves fituated under the umbel. This flowers in July and ipens feed in autumn, foon after which the plants decay.

Medicinal U/es. The firt fpecics is fometimes applied externally, in the form of decoction, infution, or pouttice, as a difcutient. Thefe are apt to excoriate, and their vapour is to fome particularly difagreeable and hurtful. The flalks are infignifieant, and the roots very virulent. With regard to its virtue when taken internally, it has been generally accounted poifonous; whieh it doubtlefs is, in a ligh degree, when ufed in any confiderable quantity. But Dr Stocrk has lately found, that in certain fall dofes it may be taken with great fafety; and that, without at all difordering the conltitution, or even producing any fenfible operation, it fometimes proves a powerful refolvent in many oblliate dieorders. In feisrhus, the internal and external ufe of hemlock has been found uneful, but then mereury has been generally ufed at the fame time. In open cancer, it often abates the pains, and is free from the conthipating effects of opiuin. It is likewife aled in ferophulous tumors and ulccrs, and in other ulcers that are ouly defined by the term ill-conditioned. It is alfo recommended hy leme in chincough, and various other difeafes. Its common, and perhaps bett form, is that of the powdered leaves, in the dofe at firf of two or thee grains a-day, which in fome eates has been gradually increafed to upwards of two omees a-day, without producing giddinefs. An extract trom the feeds is fid to produce giddinefs fooner than that from the leaves. Henee, while both the London and Edinburgh colleges have given a place to the fuccus fifflatus cieute, into the pharmacupueia of the latter an extractum feminum cicutz is alfo introduced.

CONJUNCT, in a general fenfe, fignifies conjoined, concurrent, or united.

Conyunct Rights, in Scots law. Sce Law, Part III. $n^{\circ}$ elxax. 15, \& ce.

Conjunct, or Confident Perfons, in Scots law. Ibid. ${ }^{\circ}$ clexxiii. 8 .

CONJUNCTION, in aftronomy, the meeting of two or more llars or planets in the fame degree of the zodiac.

Conjunction, in grammar, an indeclinable word or particle, which ferves to join words and fentences together, and thereby hows their relation or dependence upon one another. See Grammar.

CONJURATION, magie words, characters, or ceremonies, whereby evil ipirits, tempeits, \&e. are fuppofed to be raifed, or driven away. The Romifh priefts pretend to expel devils, by preparing holy wa-
ter in a particular manner, and Parinklines it sucr the: poffelled, with a number of conjurations and cxorcifms.

Some authors make the difference between compration and witelaraft to conlift in this; that the former effects its end by prayers and invocation of God's name, \&e. to compel the devil to do what is defired; fo that the conjurer is fuppofed to be at war with the devil, and that evil finit to ast mersly sut of conIlraint : whereas the hater atcains its end by an insmediate application to the devil himfelf; and the devil's complaifance is fuppuled to be the comfequence of fome compact between them, fo that the devil and the witch have a grood underfanding together. Buth thefe, again, differ from cuchantment and forety; in that thefe latter operate licerely and f owly by fpells, charms, \&.c. without ever calling on the devil, or having any conference with him.

Conn. See Cond.
CONNAUCH'I, one of the four provinces of Ireland, bounded on the eall by that of leinter, on the wett by the ocean, on the north and north-wefl by part of the ocean and province of Uliter, and on the fouth and eaft by Munfler. It is about 130 miles in length, and 84 in breadih. It has no rivers of any great note befides the Shannon. It has feveral convenient bays and creeks, and is fertile in many places. It had feveral dangercus bogs, over-run with woods, which are now in fome meafure cleared away. This province proluces abondance of cattle, fheep, deer, hawks, and honey; but the inhabitants being lazy, it is the lealt cultivated of all the four provinces. It concains $t$ archbimopric, 5 bihhoprics, 6 counties, 7 market-towns, 8 places of tiade, 10 boroughs that fend members to parliament, 47,256 houfes, $2+$ old calles, befides fortreffes that have been erected of late, and 330 parifhes. The principal town is Gatway.

CONNARUS, Ceylonsumaeh: A genus of the decanoria order, belonging to the monodelphia chafs of plauts; and in the natural method ranking with thofe of which the order is dubutful. The Atigma is fimple, the capfule bivalved, unilocular, and monofpermous. There is but one feecies, viz. the monocatpos. 'This is a native of India, and rites with a ligneous falk eight or ten fect ligh, which is hard, rigid, and co. vered with a blacs bark, and divides upard into two or tarce branches garnithed with trifoliate leaves, ha. ving long footlalks placed alternate. It is propagated by coutings, and is to be treated in the fame manner with other tender exotics.

CONNECTICUY, a large river in New England, which gives name to one of the tive eulonies of that province (fee the next article). It riles in a fwamp on the height of land, in Lat. $45 \cdot 10$. Long. 4 . E. After a 月eepy courfe of eight or tell miles, it tumbles over four leparate falls, and turning weft keeps clole under the hills which form the northern toondary of * the vale through which it runs. The Amonoofuck and Ifracl rivers, two principal branches of Comecticut river, fall into ic from the ealt, between the latitudes $4 t^{\circ}$ and $45^{\circ}$. Between the towns of Walpele on the eaft, and Weitmintter on the welt, fide of the river, are the great Falls. The whole river, compreffed between two rocks fearcely 30 feet afunder, fhoots with amazing rapidity into a troad bafon below. Over

## CO N

Conncei- thefe falle, a hridge 160 fect in leugth, was built in cur. $1-8$., under which the higheft floods may pats with. out detriment. This is the firlt bridge that was ever exelted over this noble river. Above Decrfield in Maf. fachulets it receives Deenfield river from the $W$, $h$, and Miller's river from the eatt, after which it turns weilerly in a finuous courfe to Fighting falls, and a Iittle after tumbles over Deerlield falls, which are impaflable by boats. At Windfor in Connecticut it receives Farmington river from the well ; and at Hartford meets the tide. From Hartford it palles on in a crooked courle, until it falls into Long Ifland found, between Saybrook and Lyme.

The length of this river, in a flaight line, is nearly 300 miles. Its general courfe is feveral degrees weft of fouth. It is from 80 to 100 roods wide, 130 miles from its mouth. At its mouth is a bar of fand which confiderably obftructs the navigation. Ten feet water at full tides is found on this bar, and the fame depth to Middleton. The ditlance of the bar from this place, as the river runs, is 36 miles. Above Middle. ton are feveral hoals which Aretch quite acrofs the rivir. Only fix fect water is found on the fhoal at high tide, and here the tide ebbs and flows but about eight inches. About three miles below Middleton the river is contracted to about 40 roods in breadth by two high mountains. Almolt every where clfe the banks are low, and fpread into tine extenfive meadows. In the fpring floods, which generally happen in May, thefe meadows are covered with water. At Hartford the water fometimes rifes 20 feet above the common furface of the river, and having all to pals through the abovementioned ftait, it is cometimes two or three weeks before it returns to its ufual bed. Thefe floods add nothing to the depth of water on the bar at the mouth of the river; this bar lying too far off in the found to be affected by them.

On this beautiful river, whofe banks are fettled almof to its fource, are many plealant, neat, well-built towns. Ou its weftern bank, from its mouth northward, are the towns of Saydrook, Hadiam, Middleton, Weathersfield, Hastford, Windfor, and Suffild, in Connecticut; Weft Springfield, Northampton, Hatfield, and Deerficld, in Maffachufets; Guilford, Brattheborough, in which is Fort Dummer, Wefminfer, W"indfor, Hartford, Faillee, Newbury, Brunfwick, and many others in Vermont. Croffeg the river into New Hanpthice, and travelling on the eaften bank, you pafs thruugh TVuodbuiy nearly oppofite to Brunfwick, Northumberland, the Coos country, Lyman, Ortord, Lyme, Hanover, in which is Dartmouth College, Lebanon, Cornilh, Clermont, Charlefton, or $\mathrm{N}^{2}$, Chefterticld, and riany others in New Hamp. thire, Sundealand, Hadley, Springfield, Long Meadow, in Marfachufetts; ant in Connedticut, Enfitd, Eatt Windtor, Eaft Hartford, Glatenbury, Eaft Haddam, and Layme.

This liver is navigable to IFantford, upwards of 50 miles from its month, and the produce of the country for 200 miles abuve is brought thither in boats. The boats which are ufed in this bufinefs are flat-botromed, long, and narrow, for the convenience of going up Aream, and of fo light a make as to be portable in earts. They are taken out of the river at three different carrying places, all of which make 15 miles.

Sturgeon, falmon, and fhad, are caught in plenty Comecto in their leafon, from the mouth of the river npwards, escepting flurgeon, which do not afcend the upper falls; belides a saiety of tinall fifh, fuch as pike, carp, peatch, sec.

From this river are employed three brigs of 180 tons each, in the European trade; and about 60 fail from 60 to 50 tons, in the Weft India trade; befides a few fithermen, and 40 or 50 coafting veffels.

Connecticut, one of the five flates of New England in America; bounded on the north by Maffachufets; on the ealt by Rhode Illand; on the fouth, by the found, which divides it from Long Iland; and on the weft, by the province of New York.

The divifional line between Connecticut and Maffachulets, as fettled in 1713 , was found to be about 72 miles in length. The line dividing Connecticut from Rhode Illand was fettled in 172 S , and found to be about 45 miles. The fea coaft, from the month of Paukatuk river, which forms a part of the eaftern boundary of Connecticut, in a direct fouthweflwardly line to the mouth of Byram river, is reckoned at about 90 miles. The line between Connecticut and New York runs from latitude 4 8. 0. to latitude 42.2.; 72 miles. Connecticut contains about 4674 fquare miles; equal to about $2,960,000$ acres.

This itate is watered by feveral fine rivers, the principal of which are, Conncticut defcribed in the preceding article, Houlatonik, and the Thames. One branch of the Houfatonik rifes in Laneborough, the other in Windfor, both in Berkhlire councy in Maffachufets. It palfes through a number of pleafant towns, and empties into the found between Stratford and Milford. It is navigable 12 miles, to Derby. A bar of hells, at its mouth, obitructs its navigation for large veffels. In chis river, between Salifbury and $\mathrm{Ca}-$ naan, is a cataract, where the water of the whole river, which is $\mathbf{1}$;0 $\mathrm{y}^{\text {ards }}$ wide, falls about fixty feet perpendicularly, in a perfectly white theet. A copious mill arifes, in which floating rainbows are feen in various places at the fame time, exlubiting a feene exceedingly grand and beautiful.

The Thanes empties into Long Ifland found at New. Loudon. It is navigable 14 miles, to Norwich Landing. Here it lofes its name, and branches into Shetucket on the eait, and Norwich or Little river on the weft. 'The city of Norwich flands on the tongue of land batween thefe rivers. Little river, about a mile from its monh, has a remarkable and very romantic cataract. A rock 10 or 12 feet in perpendicular heisht, extends quite acrofs the channel of the river. Over this the whole river pitches, in one entire theet, upon a bed of rocks below. Here the river is comprelfed intoa very narrow channel between two eraggy cliffs, one of which towers to a cunfiderable height. The channei defeends gradually, is yery crooked, and covered with pointed rocks. Upon thefe the water fwiftly tumbles, foaning with the mof violent agitation, 15 or 20 rods, into a brond bafon which fpreads before it. At the botiom of the perpendicular falls, the rocks are curiouny excavated by the conttans pouring of the water. Some of the carities, which are all of a circular form, are five or fix feet deep. The imoothnefs of the water above its defent-the regularity and beauty of the perpendicular fall-tine tremendous roughnefs of the other, and the cragsy, towering cliff which impends the whole, prefent to the view of the fpeetator a fecne indefcribably delightful and majettic. $\mathrm{O}_{3}$ this river are fome of the tinef mill feats in New England, and thofe immediately below the falls, occupied by Lathrop's mills, are perhaps not exceeded by any in the world. Acrofs the motth of this river is a broad, commodions bridge in the form of a wharf, built at a great expence.

Shetucket river, the other brancla of the Thames, four males from iss month, receives Quinnabog, which has its fource in Brimbield in Maflachufecs; thence pafling through Surbridge and Dudly in Maflachufets, it crolfes into Connecticut, and divides Pomfret from Killingly, Canterbury from Plainfield, and Libon from Prefton, and then mingles with Shetucket. In pafling through this hilly country, it tumbles over many falls, and affords a valt number of mill feats. The fource of the Shetucket is not far from that of Quinuabog. It has the name of Willamantik while palfing through Staffurd, and between Tultand and Willington, Coventry and Mansticld. Below Windham it takes the name of Shetucket, and empties as above. Thefe rivers are fed by numberleis brooks from every part of the adjacent country. At the mouth of Shetucket is a bridge of timber $12+$ feet in length, fupported at each end by pillars, and held up in the middle by braces on the top, in the nature of an arch.

The two principal harbours are at Ncw London and New Haven. The former opens to the fouth. From the light-houfe, which flands at the mouth of the harbour, to the town, is about three miles; the brcadth is thrte quarters of a mile, and in fome places more. The harbour has from five to fix fathoms water-a clear buttom-tough ooze, and as far as one mile above the town is entirely fecure and commodious for large fhips. New Haven harbour is greatly inferior to that of New London. It is a bay which fets up northerly from the found about four miles. Its entrance is about haif a mile wide. It has very good anchorage, and two and an half fathoms at low water, and three fathoms and four feet at common tides. The whole of the iea coaft is indented with harbours, many of which are fafe and commodious, but are not fufficiently ufed to merit a defcription.

Connecticut, though fubject to the extremes of heat and cold in their feafons, and to frequent fudden changes, is very healthful. As many as one in 46 of the inhabitants of Connecticut, who were living in 1774, were upwards of 70 years old. From accurate calculation it is found, that about one in eight live to the age of 70 years and upwards; one in 13 to the age of 80 years, and one in about 30 to the age of 90 .

In the maritime towns the weather is variable, according as the wind blows from the fca or land. As you advance into the country, the fea breezes have lefs effect upon the air, and confequently the weather is lefs variable. The fhorteft day is 8 hours and 58 minutes, and the longeft 15 hours. The northwert winds, in the winter-feafon, are often extremely fevere and piercing, occafioned by the great body of fnow which lies conceated from the diffolving influcnce of fun in the immenfe forefts north and aorthweth. The

## 335 ] C O N

clear and ferene temperature of the ney, however, makes amends for the feverity of the weather, and is favourable to health and longevity. Connecticut is generally broken land, made up of mountains, hills, and valteys; and is exceedingly well watered. Some fmall parts of it are thin and barren. It lies in the fifth and fixth northern clinates, and has a ftrong fertile foil. Its principal productions are Indian corn, rye, wheat in many parts of the ftate, oats and barley, which are heavy and good, and of late buck-wheat-flax in large quantities-fome hemp, potatoes of feveral kinds, pumpkins, turnips, peas, beans, \&c. \&c. fruits of all kinds, which are common to the climate. The foil is very woll calculated for patture and mowing, which enables the farmers to feed large numbers of neat cattle and horfes. Actual calculation has evinced, that any given quantity of the boft mowing land in Connecticut, produces about twice as much clcar profit as the fame quantity of the bef wheat land in the fate of New York. Many farmers, in the eallern part of the fate, have lately found their advantage in raifing mules, which are carnied from the ports of Norwich and New London to the Wert India iflands, and yield a handlome profit. The beef, pork, butter, and cheefe of Connecticut, are equal to any in the world.

The trade of Comecticut is principally with the Welt India iilands, and is carried on in veffels from 60 to 140 tons. The exports confilt of horfes, mules, oxen, oak flaves, hoops, pine boards, oak planks, beans, Indian corn, fifh, beef, pork, \&c. Horfes, live cattle, and lumber, are permitted in the Dutch, Danih, and French ports. Beef and fifh are liable to fuch heavy duties in the French iflands, as that little profit arifes to the merchant who fends them to their ports. Pork and flour are prohibitcd. As the ordinance making free ports in the French Wefl Iudia inands extends to all foreigners, the price of molafles and other articles, has been greatly enhanced by the Englifh purchafes for Canada and Nova Sentia ; fo that the trade of Connecticut with the French Weft India ifands is not profitable. Cotton, cocoa, indigo, and fugais, are not permitted to be brought away by Americans. The feverity with which thefe prohibitory laws are adminiilered is fuch, as that thefe articles cannot be fmuggted.

Connecticut has a large number of coafting veffels employed in carrying the produce of the flate to other ftates-To Rhode Ifland, Maffachufets, and New Hamphire, they carry pork, wheat, corn, and rye. To North and South Carolinas and Georgia, butter, cheefe, falted beef, cyder, apples, potatoes, hay, \&c. and receive in return rice, indigo, and money. But as New York is nearer, and the thate of the markets always well known, much of the produce of Connecticut, efpecially of the weftern parts, is carried there ; particularly pot and pearl afhes, flax-feed, beef, pork, cheefe, and butter, in large quantities. Mof of the produce of Connecticut river, from the parts of Maffachufets, New Hampfhire, and Vermont, as well as of Connecticut, which are adjacent, goes to the fame market. Confiderable quancities of the producc of the tallern parts of the Itate are marketed at Bofton and Piovideace.

The value of the whole exported produce and commodities from this flate, before the year 1774, was then eltimated at about L. 200,000 lawful money annually,

## CO N

Cormeat nually. Since this time no accurate eflimate has been cut. made, fo that it is impr fible to tell whether the amount has lince been increafed or diminifhed.

In 179 , the number of fhipping in Connecticut was 180 ; their tonage 10,317 ; feafaring men 1,62 ; befices upwards of 20 fail of coatting veffels, which employed about 90 feamen. This itate has not yet fulty recovered the confution in which it was involved by the late war; fo that the number of fhipping, \&c. has not, at any period fince 177 f , been alcertained with accuraty. It is probable, however, confidering the lufces fultained by the war, the decay of the thip-building bulmefs, ard the rumber of unfortunate fhipwrecks, and loffes by huricanes in the Weft Indies, that the flipping and feamen are not now fo numerous
The number of finping from the port of New London employed in $1=38$ in the European and Weft India
nufacused in our own country, it mary always be procured and ufed in a frefh ttate. The oil is preffed from the feed in the fame manner that cold drawn linfeed oil is obtained from flax-feed, and with as little trouble. Sweet olive oil fells for fix fhillings a quart. Should the oil of the fun-fower fell for only two-thirds of that price, the produce of an acre of ground, fuppoling it to yield only 40 bufhels of the feed, will be L. 32, a fum far beyond the product of an acre of ground in any kind of grain. The feed is raifed with very little trouble, and grows in land of moderate fertility. It may be gathered and fhelled, fit for the extraction of the oil, by women and children.

Connecticut is divided into eight counties, viz. Hart-Civil dwiford, New Haven, New London, Fairfield, Windhan, fians and Litchfield, Middlefex, and Tolland. The countits poplatiop are fubdivided into upwards of 8o townhips; each of which is a corporation, invefted with power to hold lands, choole their own town-officers, to make prudential laws, the penalty of trangrefion not to exceed 20 s. and to choofe their own reprefentatives to the general affembly. The townhips are generally divided into two more parihes, in each of which is one or more places for public worlhip.

Comecticut is the most populous, in proportion to its extent, of any of the thirteen Rates. It is laid out in fmall farms from 50 to 300 or 400 acres each, which are leld by the farmers in fee dimple; and are generally cultivated as well as the nature of the foil will admit. The ftate is chequered with innumerable roads or highways, croffing each other in every direction. A traveller in any of theife roads, even in the moll unfettled parts of the ltate, will feldom pais more than two or three miles without fioding a houfe or cotlage, and a farm under fuch improvements as to afford the necellaries for the fupport of a family. The whole ftate refembles a well-cultivated garden; which, with that degrree of induftry that is neceflary to happinefs, produces the nectfaries and conveniences of life in great plenty.

In 1756, the number of inhabitants in Connecticut was $130,6 \mathrm{II}$; in 177 t , there were 197,356 fouls. In 18 years, the increafe was $67,2+5$; from 1774 to 1782 , the increafe was but 11,294 perfons. This comparatively fmall increafe of inhabitants may be fatisfactorily accounted for from the deftruction of the war, and the numerous emigrations to Vermont, the weftern parts of New Hampfhire, and other tates.
'The inhabitants are almott entirely of Englifh defcent. There are no Dutch, French, or Germans, and very few Scotch or Irifh people, in any part of New England.

In addition to what has been already faid on thefe Character, particulars under Nesv England, it may be obferved, maners, that the people of Connecticnt are remarkably fond of \&c. having all their difputes, even thofe of the molt trivial kind, fettled according to law. The prevalence of this litigious fpirit affords employment and fupport for a numerous body of lawyers. The number of actions entered annually upon the feveral dockets in the ftate, juflifies the above obfervations. That party fpirit, however, which is the bane of political happinefs, has not raged with fuch violence in this flate as in Maflachuifts and Rhode-Ifland. Public proceedings have been conducted, generally, and efpecially of trade, was fur flips, one flow, $5+$ brigantincs, 32 fchouners, and 45 lloogs. The number of torfes and cattle exported from the ditriet round Naw London, from the roth of January 1787 so the woth of January 1,88 , was $69: 7$; blfides jack-affes imported and? exported, not included. From 1786 to 1787 , the nunber was 6671 ; fo that the laft year exceeded the ather 246 . From March 1787 to January $1 ; 88,145+$ horfes, $7000 \times \mathrm{cn}$, and 23 cows, were exported frons the port of Middeton.
The farmers in Connecticut and their families are mofly clothed in plain, decent, homc fpun eloth. Their linens and wollens are manufactured in the family way; and although they are generally of a coarfir kind, they are of a Atronger texture, ard much more durable than thofe imported from France and Great Britain. Many of their cloths are fine and liandfome.

In New Haven is a linen manufactory which flonrifles, and one for cotton is about to be eitablithed. In Eat Hartford is a gliff-work, a fnuff and powder mill, and an iron-work and flitting-mill. Iron works are iftatilin.cd allo at Salibury, Norwich, and other parts of the ftate. At Stafford is a furnace at which is made large quantities of hollow ware and other ironmongery, fufficient to fupply the whole itate. Paper is manufactured at Norwich, Hartford, New Haven, and in Litchfield county. Nails of every fize are made in almont every town and village in Connecticut ; fo that confiderable quantitics can be exported to the neighbouring ftates, and at a better rate than they can be had from Enrope. Ironmongery, hats of the beft kinds, candles, leather, fhoes, and boots, are manufactured in this ftate. We mult not omit to mention wooden dithes and other wooden ware, which are made in vall quantities in Suffield and fome few other places, and fold in almoft every part of the eatiern ftates. Oil-mills, of a new and very ingenious conftruction, have been erceted in leveral parts of the Itate.

It appears from experiments made formerly in this flate, that a buthei of fun-fower feed gields a gallon of oil; and that an acre of ground planted with the feed at three feet apart, will yield between forty and fifty buffels of the fued. This oil is as mild as fweet oil, and is equally agreeable with faltads, and as a medicine. It may, moreover, be ufed with advantage in paints, varnifles, and ointments. From its being ma$\mathrm{N}^{\circ} 8 \mathrm{~g}$.

## C. O N

Connedi- late, with much calinnefs and candour. The peopla cuc. are well informed in regard to their rights, and judicious in the methods they adopt to fecure them.
The clergy, who are numerous, and, as a body, very refpectable, have hitherto preferved a kind of ariftocratical balance in the very democratical government of the tlate; which has happily operated as a check upon the overbearing finit of republicanifm. It has been lamented that the unhapey religions difjutes which have too much prevailed among fome of the clergy, and the too great attention that others have paid to their temporal concerns, to the neglect of their flocks, and an inatention to the qualitications of thofe who have been admitted to the faceed oflice, have, herctofore, contiderably diminithed their influence. It is a pleafing circumfance that the rage for theological difputation is abating; and greater Hrietnefs is obferved in the admifion of candidates to the minilly. Their induence is on the increafe; and it is no doubt to be attributed, in part, to their increafing influence, that an evident reformation in the manners of the people of this tate las taken place fince the peace. In regard to leaning and abilities, the cleggy, at the prefent day, are equal to their predeceffors at any former period.
Reigion. As to ecelcfiallical government and difcipline, cach church is a feparate jurildiction, and claims authority to choofe their own miaitler, to exercife government, and to enjoy gofpel ordinances within itfelf. The clurches, however, are not independent of each other; they are affociated for mutual benefit and convenience. The affociations have power to licence candidates for the minittry, to confult for the general welfare, and to ricommend meafures to be adopted by the churches, but have no authority to enforce them. When difputes arife in charches, councils are called, by the parties, to fettie them ; but their power is only advifory. There are as many affociations in the thate as there are counties: and they meet twice in a year. Thefe are atl combined in one general affociation, who meet anmaily.

All religions that are confiftent with the peace of fociety are tolerated in Connecticut; and a firit of liberality and catholicifm is increafing. There are very few religious feats in this tlate; the bulk of the people are congregationalills. Befides thefe there are epifcopalians and baptills; and formerly there was a fociety of Sandimanians at New-Haven; but they are now reduced to a very fmall number. The epifcopalian churches are refpectable, and are under the fuperintendance of a bihop. There were 29 comgregations of the baptits in 178 \& . Thefe congregations, with thofe in the weighbouring Ifates, mect in affociations, by clelegation, annually.
Chief There are a great number of very pleafont towns, towns. both maritime and inland, in Comecticut. It contains five ineorporated toman or citics. Two of thefe, Hartford and New Haven, are the capitals of the fate. The general aflembly is holden at the former in May, and at the latter in October, amually. See Hartford and Nequ-Havin.

In no part of the world is the education of all ranks of people more attended to than in Connecticat. Almoll every town in the fate is divided into difricts, and each diftrict has a public fchool kept in it a greater

Vol. V. Part I.
or lefs part of crery year. Somewhat more that one Consed. third of the monies ariling from a tax on the polls and rateable eflate of the inhabitants, is appropriated to the fupport of fehools, in the feveral towns, for the education of chideren and yonth. 'The law directs that a grammar fehool fhall be kept in every county town thronghout the fate.
'There is a grammar fehool at IIartford, and another at New Haven, fupported by a donation of governor Hopkins. This vencrable and benevolent ris. theman, in his latt will, dated 1657 , loft in the lands of Theophihus Eaton, Eif; and three others, a legary of L. 1.32 t , " as an encourarement, in thefe formign plantations, of breeding up hopeful youths both at the grammar fehool and college." In 166t, tho Jegacy was equally divided haveen New Haven and Hartford; and grammar fchouls were ereeted, which have heen fupported ever fince.

At Greenticld there is a refpectable academy, un. der the care and influnction of the Rev. 1)r Dwight. At llainticid is another, under the care of the Rev. Mr Benedict. 'This acadomy has flomifined for feseral years, and fumithed a number of ftadents for Yak and Dartmouth collesces. At Norwich and Windham, hikewile, are academies furnifhed with able inlluctors; each of thefe academies have 60 or 70 fcholars.

Yale College was founded in 1700, and remained at Killingworth until 1707 -then at Saybrook untif 1716, when it was removed and fixed at New Haren. Sce New Haven.

On the bank of Connecticut river, two miles from Atins, mi Middleton, is a lead mine, which was wrought during n rals, and the war, at the expence of the flate, and was productive. It is too expenlive to work in time of peace. Copper mines have been difeovered and opened in feveral parts of the ftate, but have proved muprofitable, and are much neglected. Iron mines are numerous and productive. Steel ore has been found in the momntains between Woodbury and New Milford. Talcs of various kinds, white, brown, and chocolate coloned crytals, zink or fpelter, a feminctal, and feveral other foffils and metals, have been found in Connecticut.

All frecholders in the flate ase reguired by law to Mode of give in litts of their polls and rateable eftate, to per- levyng fons appointed in the refpective towns to reccive them, ${ }^{\text {taxes. }}$. on or before the 2oth of Augut annually. Thefe are valued according to law, arranged in proper order, and font to the gencrad aftembly annually in May.

The fum total of the litt of the polls and ratcable oftate of the inhabitants of Comeneticut, as brought inte the general allembly in May 1-87, were as follows:

> Sum total of the fingle lifl
> Affellments,

> One quater of the fourfolds, $47,-9029$
> Total, - I. $1,533,867185 \frac{7}{6}$

On this fum taxes are levict, fo much on the pound, according to the fum propofed to be raifed. A tax of two-pence on the pound would rate L. $12,-52$, ts.

The ondinary anmal expences of governmont before the war amounted to near L. 4000 Sterling, ixclufive of that which was appropriated to the fupport of fchools. 'The expences have fince increafed.

tus7 :nd rentre of jultice. other diforders. At Guilford is a fprine, whofe water, it is faid, when feparated from the fonntain, will evajorate even when put into a botle and trghtly corked.

It is diffecult to fay what is the conftitution of this flate. Contented with the form of government whish originated from the charter of Charles 11. granted in 1662 , the people have not been difoofed to rum the hazard of framing a new conftitution fince the declaration of iadependence. 'They hare tacitly adopted their old charter as the ground of civil government, fo far as it is applicable to an independent people.

Agreeable to this charter, the faprent legillative anthosity of the Rate is velud in a governen, depurygrovenor, twelve afinants or commithos, and the re-
 "Hhe governor, deputy-governor, and afilants, are sinmally chofen ley the fremen it the month of May. The reprefentatisas (their number nut to exceed two trom tach town) are chofen by the fremen (wice aYear, to attond the two annual fentons, on the feconl 'Thuritays of May and October. This atfombly has power tu ereck fudicatorics, for the trial of caufes civil and criminal, asd to ordain and cłablif luws for fetthog the forms and ceremonies of government. By thefe laws the general attembly is dividud into two branches, catled the upper and lower houfes. The spper houfe is eompufed of the goverier, deputy-governor, and affiftants; the lower houfe, of theremerentatives of people. No daw can gafs without the comeurence of buth houles. The judges if the fuperior come liald the ir offices during the pleafure of the general atfenbly. The judges of the county courts, and julices, are annually apprinted. Sherifis are appointed by the governor and council, whort limitation of time. The governor is captain-general of the militia, the deputy-governor fientenamt-general. All other military uffices are appointed by the affembly, and commifioned by the governor.

The mode of elceting the governor, deputy governor, afinants, treafurer, and ficretary, is as follows: The freemen in the fereral towns meet on the Mondsy next after the firit Tocday in April, amnally, and sive in their rotes for the perfons they choole for the faid offices refpeitively, with their nanes written on a piece of paper, which are received and fealed up by a contable in open meeting, the vutes for each office by themfelves, with the name of the town and office written en the outfide. Thefe votes, thas fealed, are fent to the generad alfembly in May, and there counted by a committic from both houfes. All freemen are eligrible to any office in government. In choofing affitants, twenty perfons are nominated, by the vote of each freeman, at the freemen's meeting for choofing reprefentatives in September annually. Tliefe votes are fealed up, and fent to the general affembly in Oetober, and are there counted by a committee of both houfes, and the twenty perfons who have the moll rotes fand in nomination; out of which number the twelve who have the greatell mamber of votes, given by the frecmen at their mocting in Aprit, are in May declared affifants ia the manma above mentioned. "Ihe quabifations of freemen are, maturity in , ears,
quiet and peaceable belaviour, a ciril converfation, and Connedifreetonl eltate to the value of forty thillings per ammom, cus. or forty pounds perfonal eftate in the litt, certidicd by the felect men of the town; it is neceffary alfo that thery take the oath of fidelity to the thate. 'Their names are enrolled in the town clerk's office, and they continue freemen for life, unlefs disfranchifed by fentence of the fuperior court, on conviction of midemeanor.

The conts are as follows: The juttices of the peace, of whom a number are annually appointed in each uwn by the general affembly, have authority to hear and determine civ! actions, where the demand does nut exceed four pounds. If the demand exceeds forty thillings, an appeal to the county is alluwed. They have cognizance of fmall offonecs, and may punith by tine rot exceeding forty thatings, or whipping not exceeding ten tripes, of fitting in the trocks. 'Shere are eight courty courts in the llate, held in the feremal counties by one judese and four jullices of the grosum, who have jurifdictum of all criminal cafes, aring within their refpective connties, where the punimment does not extend to life, limb, or banitment. They have original juridiction of all civil actions which exceed the jurifaction of a julice. Either party nay appeal to the fuperior court, if the demand exceeds twenty pounds, eacept on bonds or notes vonched by two witnelfes.

There are feveral courts of probate in each county, confifting of one judse. The peculiar province of this court is, the probate of wills, grauting adminittration of inteflate cllates, ordering dibribution of them, and appointing guardians for minors, \&c. An appent hes from any decree of this court to the fuperior. court.

The fuperior cout confits of fire judges. It has authority in all eriminal cates extending to life, limb, or banifment, and other high crimes and mifdemeanors, to gant divorces, and to hear and determine all civil actious brought by appeal from the county courts, or the court of probate, and to correct the errors of all inferior cumrts. This is a circuit court, and has two Atated feffions in each county annually. The fuperior and county courts tiy matters of fact by a jury, or without if the paties will agree.

There is a fupreme court of errors, confiting of the deputy governor and the twelve affiftants. Their fole bulinels is to determine writs of error bronght on judgments of the fuperior court, where the error complained of appears on the record. They have two Itated feffions annually, viz. on the Tuefdays of the weeke preceling the itated felfons of the general affembly.

The county court is a court of ehancery, empowered. to hear and determine cales in equity, where the matter in demand does not exceed one hundred pounds. The fuperior court has cognizance of all cafes where the demand exceeds that fum. Error may be brought from the county to the fupcrior court, and from the fuperiort court to the fupreme court of errors, on jublgment in cale's of equity as weli as of law.

The general alembly only have power to grant parduntand seprieves, to grant commilitons of bankruptcy, or protect the perfons and eftates of anfortunate debtors.

## C O N $\quad\left[\begin{array}{lll}3.39 & ]\end{array} \quad\right.$ C O

Oonne日i- The common law of Fingland, fo far as it is applicable to this conntry, is contidered as the common law of this thate. The reports of adjudication in the courts of king's ben h, common pleas, and chancery, are radid in the courts of this tate as authorities; yet the judges do not condider them as conclutively hinding, malefs fonnded on fulid reafors which will apply in this flate, or fanctioned by concurrent adjudications of their own courts.

The feudul fythem of defcents was never adopted in this thate. All the real cllate of intellates is divided equally among the children, males and females, except that the eldelt fon has a double portion. And all ellates given in tail, muft be given to fome perfon then in being, or to their immediate iflue, and fhall become fee-fimple ellates to the iifue of the firt donee in tail. The widow of an inteftate is intitled to a third part of the perfonal eflate for coer, and to hor dower, or third part of the houfes and lands bolongine to the 15 inteflate at the time of his death, during her hif.
Pralice of The practicc of haw in this itate has more fimplicity, but lefs precifon, than in England. Atillants and judges are impowered to iffue writs through the llate, and jultices through their refuective counties. la thefe writs, the fublance of the complants or the declarations mutl be contaned; and if nether of the parties fhow grood reafon for delay, the canfes are heard and determined the fome term to which the writs are returnable. Few of the fictions of law, fo common in the Englith practice, are known in this flate. The plantift ahoy's has bis election to attach or fummon the defendant. Attornics ase admitted and prat litied by the county couls. Previous to their admillion to the bar, they mult fudy two years with a practifing attorney in the thate, if they have had a college education, and three years if they have not; their morals mult be goud, anI their characters unblemihed; and they mult futtain an examination by the attorneys of the court of the county where they are adnatted, and be by them recommended to the court. When admited to the county court, they can pracrice, without other qualifications, in any court in the thate. There are upon an average abont thirteen atomies to cach county, one hundred and four in the itate; a very great proportion for the real exigencies of the people. Yot from the litigious fpirit of the citizens, the mot of them find emphoment and fupport. There is no attorney general, but there is one attorney to the itate in each county.

The prefent territory of Connecticut, at the time of the firtt amival of the Englifh, was poffeffed by the Pequot, the Nohegan, I'odunk, and many other fmaller tribes of Indians.

The Pcouts were mumerous and warlike. Their country cxterded along the fea coaft from Pankatuk to Comecticat riscr. Abont the year 1630 , this powerful tribe extended their conquetts over a confiderable part of Comuthicut, over all Cong Inamd, and part of Narraganfet. Saflacus, who was the grand monarch of the whole country, was king of this nation. The feat of his dominion was at New London; the ancient Indian name of which was Pequot.

The Mohegans were a numerous tribe, and their territory extentive. Their ancient claim, which was
furveydand fettled by commifioners from queen Anme C' nereorin 1705, compromended all New Lomblon cinnty, "xcept a narow thip of about cight miles wike, on tin. fea coaft, almoll the whice of the county of Wind aim, and a part of the connties of Poldul and Hartomed Uncas, dilliaguthed for his fricndfite to the Ligith, was the Sochem of this tribe.

The Podmes inhabited Ean I Fatford, and the circumjacent country. The firl Sedemon of this tribe, of whom the Eughith had any knowlodge, was 'lat tanimoo. He was able to bring into the held more than 200 lighting men, -

The firf grant if Connefticut was made by the Plymonth conncil to the carl of Werwicik, in 1630 , and confrined by his majely in council the fame year. 'Th his grant conprehended all "at part of New Enesland which lies wett from Narraganfett river, 120 miles on the fea coath, from thence, in latitude and breadd? aforefaid, to the fouth fea. The year following, the earl affigned this grant to lord Say and Scal, lurd Brook, and nine othere.

No Englith fettlements were attempted in Connceticut until the year 1633 . When a numere of ladian traders, having purchafed of Zequatfon and Natama. nute, two principal sachems, a tract of land at the mouth of Little river in Windior, buite a houle and fortibed it, and ever affer maintamed their right of foil uron the river.
The fane year, a little before the arrival of the Englih, a company of Dutch traders came to Eartford, ard baik a houfe which tlay called the Hive of Good Itrpi, and erected a fmall fort, in whech they planted two canman. The remains of this fettlement are fill vihble on the bank of Comncticut river. This was the only fettlement of the Dutch in Comnectiont in thefe ancient times. The Dutch, and after thean the province of New Youk, for a long tinse clamed as far eall as the wedtern bank of Comectiont river. It belongs to the proteflicd hiflomian to prove or difprove the juitice of this claim. Douglas fays, "The pare tation line betwern New York and Connecticut, as eftablithed December a. i6fof, rum from the mouth of Memoroncok river, a little wett from Dyram iver, N. N. W. and was the amkient colforly limits of Newo Tork, until Noveruber 23. 1683 , when the line was run nealy the lame as it is now fettled." If Douglas is right, the New Iork claim could not have bean well founded.

In 16:t, Lord Say and Seal, Sc. fent orer a fmall number of men, whobsilt a font at Saybrook, and hild a treaty with the Peguot Indiam, who in a formal mamer gave to the En glith then right to Comenticat river and the adjacent country.

In 16.35 , the llymouth conucil granted to the Duke of Hanilton, all lands between Narraganfett and Connecticut rivers, and back into the comatry as far as Mafaclafets fouth linc. This covered a part of the Eall of Warwick's patent, and occationed fome difpues in the colony. 'There were feveral attempts to revive the Hamiton clam, but were never profecuacd.

In October of this year, about fixty perfons from Newown, Dorchelter, and Watcrown, in Maffachufeis, came and fettled at Hertford, Wethersliehd, and Windfor, in Connecticut ; and the June following the $\mathrm{U} \mathrm{u}_{2}$ fa-

Conacet- famous Mr Hooker and his company came and fetlled cit. at Hartford, and was a friend and father to the colony to the day of his death.

The firl const hek in Connecticut was at Hartford, Ajun 26.1636.

The year i 637 was diltinguifhed by the war with the Pequots. This warlike nation had, for fome time, buen troublefome neighbouts. 'They fulicited the Narmanfetts to join them in extirpating the Englith. They had fuiprized and killed feveral of the Enghifh upon Connecticut river. Thefe threatening appearances and actual hoftilities insuced the three colonies of Maffachufets, Plymouth, and Counecticut, to combine their forces, to carry the war into their combtry, and to attempt the entire deftruction of the whole tribe. Myantonomo, the Narraganfet Sachem, and Uncas, Sachen of the Mohegans, fent to the Englifh and offered their fervice to join with them againft the Pequots. Forces were accordingly raifed in all the colonics ; but thofe of Comecticut, on account of their vicinicy to the enemy, were firt in action. Captain Mafon, with 80 Englinh and 100 Indians from Connecticut river, proceeded by water to the Narraganfett's countiy, where 200 of that tribe joined him. On the 24 th of May, they began their march for Saffacus fort on Pequot, now Thames river. They af$t$ towards determined firft to affault Myfic fort, which was fituated between them and Pequot river. On the moruing of the 2 th of May the attack was made. The Indians, after a midniglit revel, were buried in a deep fleep At the moment of their approach, the centinel happened to be gone into a wigwam to light his pipe. The barking of a dog gave the alarm. The Indians awoke, feized their arrows, and began their hideous yell. They were joined in their tremendous noife by the Indians in the Englifh anmy, who were in the rear and afraid to approach. 'The battle was warm and bloody, and the victory complete. The fort was taken-about 70 wigwams burnt-50 or 60 of the Indians were killed - many were wounded and taken, and the reft efcaped. Saffacus and his warriors at Puquot, Aruck with terror at the news of this defeat, demolifhed their principal fort, burnt their wig. wams, and fled to the weltward. Capt. Stoughton, with 160 men from Maffachufcts, had by this time arrived at Saybrook. He with his forces joined Captain Mafon and purfued the Indians, and overtook and furrounded then in a geat fwamp near Fairfield. A Sachem and ninety-nine women and children came out and delivered themfelves un to their purfuers. 'lerms of peace were offered to the relt: but after a fhort parley they determined, that as they had lived they would die togrether. There were about 80 who made this refolution. Part of thefe efcaped by means of the darknefs of the night. The reft were either killed or taken. In this action the Indians had guns, which is the firlt account of their having ufed them. Saflacus fled to the Mohawks, by whom it is reported he was murdered; but it is more probable that he and his company incorporated with them. Many of the Indiancaptives were unjuflifiably fent to Bermudas and fold for nayes. The Pequot tribe was wholly extinguifled. This fuccefsful expedition fruck the Indians that remained with fuch terror, as reftrained them from open holtilities for near forty years after.

## 340 ] <br> C O N

The Englifh thus obtained the country eaf of the Connedi. Dutch fettlements, by right of conquelt. 'The purcuc fuit of the Indians led to an acquantance with the lands on the fea cualt from Saybrook to Fairlield. It was reported to be a very fine country. This favourable report induced Meft: Eaton and Hopkins, two very refpectable London merchants, and Mr Davenport, a man of diftinguiflad picty and abilities, with their company, who arrived this year (1637) from London, to think of this part of the country as the place of their fettlement. 'Their friends in Maffachufets, forry to part with fo valuable a company, diffuaded them from their purpofe. Influenced, however, by the promiling profpects which the country afforded, and flattering themfelves that they fhould be out of the jurifdiction of a general governor, with which the country was from time to time threatencd, they determined to proceed. Accordingly, in March ${ }^{1} 638$, with the confent of their friends on Connecticut river, they fettled at New Haven, and laid the foundation of a flourifing colony, of which Qumnipiak, now New Haven, was the chisf town. The firft public worfhip, in this new plantation, was attended on Lord's day, April 18. 1638 , under a large fpreading oak. The Rev. Mr Davenport preached from Matt. iii. 1 . on the temptations of the wildernels. Both colonies, by voluntary compact, formed themfelves into diftinct commonwealths, and remained fo until their union in 1665 .

In 1639 , the three towns on Connecticut river, already mentioned, finding themfelves without the limits of any jurifdiction, formed themfelves into a body politic, and agreed upon articles of civil government. Thefe articles were the foundation of Connecticut charter, which was granted in 1662 . The fubitance of the articles, fo far as they refpect the holding of affemblies, the time and manner of electing magiltrates and other civil officers (except that in the old confederation no perfon was to be chofen governor more than once in two years), and the extent of legiflative powers, was transferred into, and eftablifhed in faid charter.

The firlt church was gathered in New Haven this year, and conlifted of feven members. Thefe were chofen by the fettlers after Mr Davenport had preached from the words of Solomon, "Wifdom hath build'ed her houfe, fhe hath hewed out her feven pillars.' Thefe men were indeed the pillars of the church, to whom the reft were added as they became qualified. They were alfo the court to try all civil actions.
'The firft fetticrs in New Haven had all things common; all purchafes were made in the name and for the nfe of the whole plantation; and the lands were apportioned out to each family according to their number and original fock.

At their firlt elcetion, in October 1539, Mr Theoplinus Laton was chofen governor for the dirlt year. 'Their clections, by agreement, were to be annual; and the word of God their only rule in conducting the affairs of government in the plantation.

In $16+3$, the articles of confederation between the four New England colonies, mentioned under the article New Encland, were unanimoufly adopted by the colonies of New Haven and Connecticut.

The Englifh fettlement on Delaware, which was undes

## $\mathrm{C} O \mathrm{~N}$

Conneri- under the jurifdiction of Naw Haven, was furprized cut. by the Swedes, and the people put in irons, under a falfe pretence that they were entering into a confipiracy with the ludians to extirpate the Swedes.
The general court of Now Haven, this ycar, eflablifhed it as a fundamental article not to be difputed, That none be admitted as free burgeffes but church members, and that none but fuch thould rote at elections. They alfo ordained, That cach town choofe from among themfelves judges (church members) to be a court, to have cognizance of all civil actions not exceeding twenty pounds; and of criminal caufes, whare the punifhment was, fitting in the nocks, whipping, and fining not exceeding five pounds. There was fiberty of appeal from this to the court of magitrates. The court of magitrates confited of ath the magiAtrates throughont the colony, who were to meet twice a-year at New Haven, for the trial of all capital canfes. Six made a quorum. The general court was to confift of the governor, deputy-goventor, magittrates, and two reprefentatives from each town. The annual election of oftiecrs of government was at this time cttablifhed, and has ever fince contimed.
The unfettled thate of the colony had hitherto pre. vented their eflablining a code of laws. To fupply this defect, the general court orderd, " That the judicial laws of God, as they were delivered to Mofes, and as they are a fence to the moral, being neither typical nor ceremonial, nor having any refercnce to Caman, thall be accounted of moral equity and generally bind all offenders, and be rule to all the courts in this jurifdiction in their proceedings againtt offenders, until they be branched out into particulars hercafter.'
About this time a war broke ont between the Mohegan and Narraganfett Indians. A perfonal quarrel between Myantonomo, fachem of the Narraganfetts, and Uncas fachem of the Mohegans, was the foundation of the war. Myantonomo raifed an army of goo warriors, and marehed towards the Mohegan country. Uncas by his fpies received timely notice of their approach. His feat of refidence was in fome part of Norwich. He quiekly collected 600 of his bravett warriors, and told them, 'The Narraganfetts munt not cone into our town; we mult meet them.' They accordingly marched about three miles to a large plain, where the two armies met, and halted within bow-thot of each other. A parley was propofed by Uncas, and agreed to by Myantonomo. The fachems met, and Uncas audreffed his enemy as follows. 'You have a great many brave men: fo have I. You and I have quarrelled; but thefe warriors, what have they done? Shall they die to avenge a private quared between us? No. Come like a brave man, as you pretend to be, and let us fight. If you kill me, my men thall be yours; if I kill you, your men thath be mine.' Myantonono replied': 'My men came to fight, and they fhall fight.' Uncas, like an experienced warrior, aware of the refult of the conference from the fupcrior force of his enemy, had presioully ifgnified to his men, that if Myantonomo refufed to fight him in lingle combat, he would immodiately fall, which was to be the fignal for them 10 begin the attack. As foon therefore as Myantonomo had finified his laconic pecch, Uncas dropped: his men inflantly obeyed the

## 341 ] <br> C O N

fignal, and poured in a fhower of arrows upon the un. Conresto fufpecting Narraganfetts, and rufhing on with their horrid yells and favage ficreenefs, put them to flight. Many were killed on the fpot, the reit werc clofely purfued, and fome were precipitately driven down craggy precipices, and dafthed in picecs. At a place called, from this event, Sacbem's flain, Uneas over. took and feized Myantonomo by the floulder. 'rliey fat down tegecther; and Uncals with a hoop called in his men, and the batale ceafed. Donbeful what to do with the royal prifoncr, Uneas and his warriors, in council, determined to carry hims to the governor and council at Hartford, and be advifed by them. Thitherhe was accordingly conducted. The governor haviag advifed with his council, told Uncas, that the Englith were not then at war with the Narraganfetts, and of courfe that it was not proper for then to intermedde in the matter. Uncas was left to do with him as he pleafed. Myantonomo was conducted back to the plain where he was taken, and put to death by Uncas himfelf. The tragic fecme did not end with his death. Uneas, after the manner of the Indians, with his tomanawk cut off a large piece of flefh from the fhomlder of his flaughtered enemy, broiled and eat it, faying, with an air of favage triumph, ' It is the fweetefl meat I ever cat. It makes me have a fluut heart.' His body was afterwards buried, and a pillar erected over it, the remains of which are vilible to this day.

The Narraganfetts were greatly cniraged at the death of their prince, and refolved to take vengeance on the Molegans. The united colonies interpofed to prevent a war between them, but in van. The Naraganferts refolutely declared, they would continue the war until they had Uncas's head. But as Uncas had ever been a friend to the Englifh, they joined him againt his enemies, and were vitorious. Such, however, was the enmity of the Narraganfetts to the Englifh, that they afterwards fent fome of their men to Uncas, with large prefents, to induce him to join with them in a war with the colonies. Uncas replied, " Go tell your king that I will go to Norwich, and advife with Major John Mafon and Mr Fitch ; if they tell me to join him and fight againd the Englith, I will join him." In the war that happened foon after, Uneas affifted the Englifh, and the Narraganfutts were fubdued, and never after were formidable.

In confideration of the faccefs and increafe of the New England colonics, and that they had been of wo charge to the nation, and in profpect of their being in fature very ferviceable to it, the Engliih partioment, March 10. 1643, granted them an exemption from all cuftoms, fubtidies, and other dutics, unti] further order.
In $164+$, the Connecticnt adventurers purchafed of Mr Fenwick, agent for Lord Say and Scal, and Lort Brook, their right to the colony of Cunnceticut, for L. 1 foo.

The hifory of Connecticut is marked with traces of the fame fririt which has been montioned as characterillie of the Maflachufets, in diffenent hare of thair hillory. Indced, as Mallachufets wers the ftock whence Comecticut prosecded, this is to be ex. pected.
The colonies of Connecticut and New Haven, fron: their farl fethement, incrafed maidy; trats of han

## $\mathrm{C} 0 \mathrm{~N} \quad\left[\begin{array}{lll}342\end{array}\right] \quad \mathrm{C} O \quad \mathrm{~N}$

Conerei- were purchafed of the Indian , and new towns fettled cut. from Stamford to situningtom, and far back into dee
 for the conoly, hought of the matives atl hands which had int before been purclafed by paticula town, and made a publie funender of them to the colony, in the piolthe of the remeral affombly. I-wing done thefe things, the colonies petitioned King Charles 1 I. for a clation, and theio petition was gramed. His
 patent moder the rreat feal, ordaning that the colony of Consecticut hould fur ever hewafter be one body corporate and politic, in fact and in name, confirming to them their ancient grant and purchale, and fixing their houndaries as follows, viz. "All that part of his Ma. jelly's duminions in New England, in America, boundad caft by Namaganfett river, commonly called Narrasunfat lal, where the river falleth into the fea; and on the north by the line of Naflachufet phantation, and on the fouth by the fea, and in lungitude as the Ine of the Maffachofers colony, ruming from caft to well, that is to fay, from the faid Namaranfit bsy on the eatl, to the fouth fea on the well part, with the inlands thereuntobelonging." This charter has exer fince romaned the batis of lle govemment of Connecticut.

Such was the ignorance of the Europeans refpeef. ing the geograplyy of America, when they firn affomed the right of giving away lands which the God of nature had long before given to the Indians, that their patents extended they knew not where, many of them were of doubtful confluction, and very often covered eack other in pat, and bave produced innamerable difputes and mifchiefs in the culonics, fome of which are not fetthed to this day. Conmeticue contrned her charter litcrally, and fafing over New York, which was then in poffefion of the fubjects of a Chrition prince, clamed, in latitude and breadth mentioned therein, to the South Sea. Accordingly purchafes were made of the Indians, on the Delaware rive, wed of the weilern bounds of New Yonk, and within the fuppofed limits of Comnecticut charter, and fettlements were made thareon by people from, and ander the jurifdiction of, Connecticat. The charter of Penn$\mathrm{f}_{\mathrm{y}}$ lvania, granted to Williain Penn, in 168 x , covered thefe fettlements. This laid the fountation for a difpute, which for a long time w?s maintined with varmth on both fides. The matter was at lat fubmitted to gentlemen chorea for the purpofe, who decided the difpute in favour of lemd ! ?ania. Many, hawever, flill affert the jumice of the Connecticht dam. Tle flate of Comecticnt has lately ceded to Congrefo all their lands well of lemaflamia, execpta where of 20 mike fquare. This ceflion Congrefs have :acepted, and thercby indubitably cllablithed the right of Connecticut to the relerve.

The colony of New Haven, though anconneet. ect with the colony of Connedticut, was comprehended within the e himits of thair chartor, and, as ahcy conchded, witan their juifliction. But New IFven remonfrated agant their chaim, and cofufd to wate with them until they theold lear fiom Engo jand. It was not umil the jear 1060 , when it was bebeved that the king's commifituncos had a do lign bipon

formed a wion, which has ever fince amicably fubfafed Conacith between then.

In 1672, the haw of the colony were revifed, and the gencral come ordered them to be printed; and alfo, thit "crory family thould buy one of the haw beok: fuch as pay in lifuer, to have a book for 12 d . fuch as pay in wheat, 10 pay a peck and half a book; and fich as pay in peafe, to pay 2 s. a book, the peafe at 3s. the buhtel." Perhaps it is owing to this canly and miverial fpread of law books, that the people of Conmeticnt are to this day for ford of the law. In 1750, the laws of Councticut were again revifal, and publithed in a finall folio volume of 258 parges. Dr 1)onglas obferves, that they wicre the moll metural, $c$ quitable, plain, and concif code of laws for plantations hitherto extant." 'There has been a sevition of them fince the peace, in which they were gataty and very judicionhy dimplifed.

The years 1675 and $16-6$ were ditinguifled by the wars with Philip, and his Indians, and with the Narraganfitts, by which the colony was chown intes great dillects and confuron. The invoads of the enraged farvages were maked with crucd muters, and with fire and devaltation.

In 168 , , the charter of Maffichulets bay and $\mathrm{Pl} \mathrm{y}_{\mathrm{F}}$ month wore taken away, in confequence of (2un warrantos which lad been iffued againt them. The charter of Connedicut would have foared the fane fate, had it not been for -... Widworth, Efy; who, having very artfuily procured it when it was on the point of loing delisered up, burid it under an oak trie in Hartforl, where it remained until all danger was over, and then was dug up and realfumed.

Connecticut has cyer made rapid adrances in population. 'There have been more cmigrations from this than from any of time other thates, and yet it is at prefent full of imhabiants. 'This increale, under the divine bencliction, may be afcrihed to - feveral caufco. The bulk of the inlabitants are indultrious, fagacionio hufondmep. Their farms furnif them with ail the neceimits, mon of the conveniences, and but few of the laxurics, of life. They of courfe are generally temperate, and, if they choofe, can fubfith with as much independenee as is coniflent with happinefs. The fubfillence of the famer is fubitantial, and does not depend on incidented circumitanees, like that of moil other profenoms. There is no necelfity of ferving an aprenticehip to the lafinef, nor of a large tock of money to commence it to adantage. Fatmers, who deal inuch in barter, have lefs need of money than any other clats of people. The cale with which a comfortable fubfilence is obtaincd, induces the humandman to marry young. The cultivation of his fam makes him ttong and heahliful. He toils cheerfally through the day"-cats the fruit of his own labom with a gladfome heart-at night devoutly thanks his bounteous Gool for his daily blellings-retires to rell, and his heep is fweet. Such circumbtances as thefe lave greatly contributed to the amazing increafe of inhabitants in this fate.

Befider, the people live under a free govermment, and have no fear of a $t$ y rant. There are mo overgrown ellates, with rich and ambitious landlords, to have an undue and pernicious influence in the election of civil officers. I'openty is cqually enough divided, and mult

Cinnor.
LIe who has the molt merit, nut he who has the mond money, is generally chofen into pablic oflice. As in. Atanes of this, it is to be oblerwd, that many of the citizens of Connefticut, from the humble walks of life, have arifen to the firt offices in the ftate, and filled them with dignity and reputation. That bale bufinefs of elcectioneering, which is fo dircetly calculated to introduce wicked and defigning men into ofice, is yet but little known in Connecticut. A man who willics to be chofen into office, aits wifely for that end, when he keeps his ca tires to himfelf.

A thirte for learning prevails among all ranks of peopie in the flate. More of the yong men in Connecticut, in proportion to their numbers, receive a public education, than in any of the dates. Ior Trankfin and ofher literary charaters have honoured this Alate by faying, that it is the Athens of Amerion.

The revolution, which foefentially affected the governments of mof of the colonics, produced no very perectible alteration in the government of Connecticut. While under the juridiction of Geat Britain, they elected their own governors, and all fibordinate civil officers, and made their own laws in the fame mannor and with as little control as they now do. Connteticut has ever been a republic, and perhaps as perfect and as happy a republic as has ever cailucd. While other ftates, more monarchical in their government and manners, lave becu under a necefity of undertaking the dificuit talk of altering their old, or forming new conflitutions, and of changing their monarchical for republican manners, Connecticut has uninterruptedly proceeded in her old track, both as to government and maners; and by thefe means has avoided thofe consulions which have rent other ftates into viulent parties.
CONNECTION, or Convesion, the relation or dependence of one thing upon another.

Convectios, or Cominty, in the drama, confits in the joining of the feveral feenes torether.

The connection is faid to be obferved, when the fcenes of an act fucceed one another immediately, and are fo joined as that the flage is never left empty.

CONNECTIVES, in grammar, one of the four fpecies under which, according to Mr Harris, all words may be included. They are of two kinds; and as they commed fentences or words, are called by the different names of conimiaims and frefoffitoms. Sce Grammar.

CONNIVENT valyes, in anatomy, thofe wrinkles, cellules, and vafcules, which ate found in the infode of the two intertines ilium and jcjunum. Sce Anatomy io gr.et feq.
CONNOISSELiR, a French term, of late ufed in Englifh: it literally denotes a perfon well verfed inany thing; being formed of the verb connoitre, "to know, underfand." Ifence it comes to be ufed in our language for a citic, or perfon who is a thorough judge or mafter in any way, particularly in matters of painting and fenlpture.

CONNOR (Bernard), a learned phyfician, was bom in the county of Kerry, in Ireland, about the year 1606. Having determined to auply himflf to the flody

 and then taking a fowr the wh peat pan of Celman, wont to Warfar, where he wat amale fly le
 England, real a comre of lecints in Laman and Oxford, and beceme nambor of the lional beciety and Conage of Phyficians ; afferwart, being invited to Canhrides, he read poblic lertame: thate, and mate various ceperiments in chamitry. Fie has rentered himelfacmorable for a phitofophicaland natical treatife in Latin, entitled Eorargelimn AKdia, i. e. "the Playfian's Gofpel ;" tending to explain the minacles performed by Chrill as natural cevents, upon the principles of natural philofophy. He wrote alfo a hittory of Poland; and diced in 1009 , ased 32.

Connor, a city of Ircland, in the county of Antrim and province of Uliter. W. Long. 6. 30. N. Lat. 5.t. 50.

CONOCARPUS, LUTTON-wOOD: i ganus of the monogynia order, belonging to the pentandria clafs of plants; and in the tatural method ranking under the 4th order, Fgorgrae. The corolla is pentapeta lous; the feeds naked, folitary, inferior ; the fluwers aggonegate. 'There are two fpecies, the erecta and procumbens, buth natives of ibe Well Indies. They rife to the height of abont i 6 feet, but are trees of no beauty, nor is the wood of them ufed for any mechanic purpole in the countries where they grow maturally. They are, howercr, preferved in fone botanic gardens in Britain for the fake of varicty

CONOID, in geometry, a fulid body, generated by the revolution of a conic fection about it 3 aris. See Conic Sections.

CONOIDES, in anatomy, a gland foumd in the third ventricle of the brain, called pingolis, from its refemblance to a piaceaple. See Avatory, no 132.

CONON, the renowned Athenian genemal and ad. miral, flourifhed 304 years before Chritit. See ArtiCA, $n^{\circ} 162,163$. After his defeat by Lyfander, he fled to Evagoras king of Cyprus: after which he put himfif under the protection of Artaserxes king of Perfia; with whofe army le delivered Athens from the oppreffon of trangers, and rebuilt its walls. In the 3 both year of Rome , he beat the Lacedemonians in a fea-fight near Cnidus unon the comall of Alia, de.. prived them of the fovereign rule they had on lea even lince the taking of Athens, and had fonse other confi. derable advantages over them: but falling into the hands of Teribazus a Peran, whomied his glory, he was put to death.

CONOPS, in znolngy"; a genus of infects belong. ing to the ouder diptera, the characters of which are: The roltrum is prorrected, and jointed like a knec. The antennæ terminate $1, y$ a flat and folid articulation, re.. fembling the bowl of a fpoon, with a lateral brifle, which when clofely examined appears to be very hairy. Of this genus there are foreral fpecics. 1. The ca'citrans is to be found every where, efpecially in antumn, when it harafte; the horfers, and drans blood from them with it: dines. 2. 'I he macrocephala might at firgt light be mitaken for a frecies of

CONCUEST，in civil jurifprudence，is the ae－ quilition of property in common by a number of per－ folls．

In fone comutrics they eonfund acquifition with conquett；but，according to the moft geacral aceep－ tation，acquifition is the gaining of unappropriated yoods before the ellablifment of a eommunity： whereas by the term conquef，is ordinarily intended whatever is acquired by a number of períns in com－ munity；or by fome one for all the others．－As it is more efpecially in the union of perfons by marriage that a community of propety takes place；fo it is iu reference to them that wie frequently ufe the word conquif．There are neverthelds conquefts allo ainong other perfons who are in a tacit community or fuciety； fuch as obtain by particular local cuftoms．Accord－ ing to this feufe of the word，it has beco contended by feveral，that William I．claimed this kingdom；that is，not by right of arms，but by right of conqueft or aequett ；under promife of fucceflion made by Edward the Confuflor，and a constract cntered into by Harold to fupport his pretenfions to that fueceffion ：and by old writers，carquy ${ }^{2}$ us，acquifio，and ferquifitio，are frequenty uled as fynonymous terms．

Concest，in the lake of nations，is the accuifi－ tion of fosurignty by force of ams，by fume fo－ reign prince；who reduces the vanquilhed under his cmpire．The right of conquett is derived from the laws of war；and when a people is fubjected，the con－ duct of the conqueror is regulated by four kinds of law．Fift，the law of nature，which dictates what－ ever tends to felf．prefervation；fecondly，our reafon， which teaches us to afe others，as we would be treat－ ad umfches；thirdy，the laws of political focietr，to which nature has not affigned any preeife boundary； lafty，the law whieh is derived from the particular cir－ cumbaness atending the conquef．＇Ihus，a flate congucred by another will be treated in one of the four muthods following：Either the conqueror will continue it under its own laws，and will only chain the astere of civil and ceck fathical foveseignty：or he will impofe a new form of govermment；or be will de－ they the frame of their focicty，and incoporate the innatitats with others；or lie with extemmate them．

CONRAD H．elcetet emperor of Germany in $100+$ ． He was obliged to take the field againit mot of the German dukes who lad rewited from him：and he Fut Ernett duke of Stalian mater the ban of the em－

ぶロッ．
pire．This being one of the earlielt iatances of fuch a profeription，the formula is inserted here for its fingu－ barity．＂Wre decare thy wife a widow，thy childrea orphans；and we fend thee，in the name of the devil， to the four corners of the world．＂It was in the reign of this prince that the German fieds became hereditary． He died in 1030.

Conrab III．emperor of Germany in 113 S．The duke of Bavaria oppofed his election，and being put under the ban of the empire，and deprived of his du－ ehy，he could not furvive his difgrace．The margrave of Aullria was ordered be the Emperor to take pof－ femon of Bavaria；but Vrelli，uncle to the decealed Duke，attacked hinn，and was defeated near the cafte of Winburgh：the battle fought upon this oceafion is famous in hillory，as having given rife to the party names of Guelfos and Gibuelines，afterwards affumed in Italy． The parole of the day with the Bavarians was $W$ lefli， from the name of their general ；that of the Imperia－ lifts Wrollingen，from a finall village where Frederic Duke of Suabia，their commander，had been nur－ fed：by degrees thefe names ferved to diftinguifh the two partics；and the Italians，who could not ac－ cuftom themfelves to fuch rough words，formed from them their Guelphs and Gibbelines．It died in 1152.

Conrsid of Lichtenau，or Abbas Ufpergenlis，was author of an Univerfal Chronology from the creation to 1229 ，continued by an anonymous writer to Cha．V． He collected a fine library，and died about the year $12+0$.

CONRADIN，or Conrad junior，fon of Con－ rad IV．was acknowledged Emperor by the Gibbe－ lines，who received him in triumph at Rome：but Pope Alexander It．had publihed a crufade agan＇t this orphan；and Urban VII．his fucceffor，gave the empire to Charles of Anjou，brother ta Louis IX． king of France；and the unfortunate youth，thourth powerfully fupported even by the Turks，laft a battle， in which he was taken prifoner，and was behealed，by order of his bafe opponent，publiely at Naples in 1220 ， in the 18 th your of his age．In him ended the race of the Dukes of Suabia，which had produced fercial kings and emperors．

CONSANGURNTT，or FindaEn，is defired by the writers on thefe fubjects to be，vinculum forgona－ rum ob eatom firtic deficendentinm；＂the comnction or relation of pertons defcended from the fame llock or common ancettor．＂This confangunity is either lincal or collateral．
limad comfurquinty is that which fubfits between perfons of whom one is delcended in a direct line from the other；as between Juhn Stiks（the profolious in the table of confanguinity）and his father，grandfa－ ther，great－grandather，and fo upwards in the direct afeending line；or between John Stiles and his Fom， grand－fon，great－grandfon，and fo downwards in the darect defecnding line．Every generation，in this di－ rect lineal confangunity，contlitutes a different de－ gree，reckoning either upwards or downwards：the fither of John Stiles is welated to him in the firf de－ gree，and fo likewife is his fon；his grandire and grandfon，in the fecond ；his great grandfire and great－ grandion in the thisd．Thas is the only natural way of
rekunimis

## C O N [ 345 ] C O N

Contangui reckoning the degrees in the direst line; and therefore merons iffue: both thefe iftucs are lineally d feended Confanguinity. univerfally obtains, as well in the civil and canon, as in the common law.

The doctrine of liveal confanguinity is fufficiently plain and obvious; but it is, at the firt view, aflonifhing to confider the number of lineal anceltors which every man has, within no very great number of degrecs: and fo many different bloods is a man faid to contain in his veins, as he lath lineal anceflors. Of the fe he hath two in the firle defeending degree; his own parents: he hatl, four in the fecond; the parente of bis father, and the parents of his mother: : he lath cight in the third, the parents of his two grandlathers, and of his two grandmothers: and, br the fame rule of proguffion, he hath 128 in the feventh; $102+$ in the tunth; and at the 20th degree, or the diftance of 20 generations, every man hath above a million of ancefters, as conmon arithmetic will demonflate (a). This lineal condanguinity, we may obferve, falls frielly within the definition of amsuhm foremarum al coden fitite difoendentium; fince lineal relations are fuch as defeend one from the other, and looth of courfe fiom the fanse common anceltor.

Collateral kinded anfwers to the feme defciption: collateral relations agrecing with the lineal in this, that thicy defcend from the fame flock or anceftor; but differing in this, that they do not difeend the one from the other. Collateral kinfmen, then, are fach as lincally fyring from one and the fame ancellor, who is the firps, or "root," the fites, "trunk," or common ftock, from whence thefe relations are branched out. As if John Stiles hath two fons, who have each a nuVoL. V. Part I. from Joln Stiles as their common ancellor; and they are collateral kinfinen to cach other, becaufe they are 1ity. all defended from this common anceltor, and all have a portion of his lood in their vias, which denominates them confinguincous.

We mult be careful to remember, that the very being of collateral confanguinity confins in this defecnt from one and the fane common anceltor. Theis Titius and his brother are related; why? becaufe both are derived from one lather: 'litius and his fin couhin are related; why? becaure both defeend from the fame grandfather; and his fecond coufin's claim to confanguinity is this, that they are both clerived from one and the fame great-grandfather. In mort, as many ancettors as a man has, fo many common focks he has from which collateral kininaen may be derived. And as we are taught by holy writ, that there is one comple of common anceltors belonging to us all, from whom the whole race of mankind is defoended, the obvious and undeniable confequence is, that all men are in fome clegrec related to one another. For, indeed, if we only fuppofe cach couple of our anceftors to have left, one with another, two children; and each of thofe children to liave left, on an average, two more (and without fuch a fuppofition the human fpecies muft be daily diminifhing) ; we thall find that all of us have now fubfiting near 270 millions of kindred in the 15 th degrec, at the fame diftance from the feveral common ancettors as we ourfelves are; befides thofe that are one or two degrecs nearer to or farther from the common flock, who may amount to as many X x more .
(A) This will feem furprifing to thofe who are unacquainted with the incecafing power of progrefive numbers; but is palpatly cvident from the following table of a geometrical progreffion, in which the firt term is 2, and the denominator alfo 2: or, to fpeak more intelligibly, it is evident, for that each of us has two ancellors in the firf degree, the number of whom is doubled at every remove; becaufe cach of our anceflors has alfo two immediate anceflors of his own.

A morter way of finding the number of aneeftors at any even degree, is by fquaring the number of anceftors at half that number of degrees. Thus, 16 , the number of aneeftors at 4 degrees, is the fquare of 4 , the number of anceftors at two ; 256 is the fquare of $16 ; 65536$ of 256 ; and the number of ancefors at 40 degrees would be the iquare of $1,048,5,6$, or upwards of a million of millions.

## $\mathrm{C} 0 \mathrm{~N} \quad\left[\begin{array}{lll}346\end{array}\right] \quad \mathrm{C} O \quad \mathrm{~N}$

C. ran ni: rare (e) And if this (alculation fhenld appear in-
nity. compatible with the numbu of inhabitants on the earth,
it is beonde, by intemarises aneng the feweal defondents from the fanse ancefor, a lundred or a those fond modes of confanguinity may be confoliduted :n one pufon ; ar he may bestated to us a humded or a thoufard dimerent ways.

The methed of comparing thefe degrees in the eanon low, which we have adupted, is as folluws. We begin at the common ancestur, and reckon downwards; and in whatfoever derree the two perfons, or the nof remote of thom, is dilant from the common anceftor, that $\mathrm{i}_{\text {, }}$ the dessere in which they are related to each other. Thus, Ticins and his brother are related in the firt degree; for from the father to each of them is counted only nee: Titias and his noplew are related in the fucond dagec; fur the nephew is tro degrees emoved fom the common anceftor, aiz. his own grandfather, the father of Titius: or (to give a more illatrions intance from the Englifa annals) King Herry VII. who flew Richard III. in the butle of Dofwurth, was related to that prince in the fith degree. Let the propofitus, therefore in the table of eondanginity: reprefent King Riehard 111 . and the clafs markede, King Herry VII. Now their common fock
or anceftor was King Edward III. the abamen in the fame table: from him to Edmund Dule of York, the froaves is one degree; to Richard Larl of Cambridge, the avis, two ; to Richard Duke of York, the pater, thrse; to ling Richard iII. the prompitis, fuar; and from King Edward II. to John of Gant (a) is ont degree : to John Linl of Sonerdet (e) two ; to John Dake of Somerfet (c) three; to Diararet Countels of Richmons (o) fom; t $\mathrm{Kin}-$ IIonry VI! (1) fue. Which lat-mentioned priace, biag the farthet en mo:id from the common hook, fives the denomination to the degree ofkindred in the eanon and muncipal law. Though according to the compatation of the civilians (who count upwards from cither of the perfons related, to the eommon Atoek, and then downwards again to the othor; reckoninis a derree for each perfon buth afcending and defoending) thefe two pinces were rutaced in the nimh duget: for from King Richard III. to Richard Duke of York is one degree; to Richard Earl of Cambridye two ; to Ednund Duke of York three; to Kine Edward III. the comeron anecltor, four; to Jolon of Gant five; to Julin Earl of Someret lix; to John Duke of Somerfet deven to Marsanet Counted of Richmond eiglat; to Eing İeny VII. nine. See the Table of Confanguinity
(в) This will fwell more confiderably than the fomer ealculation: for here, though the firf term is but $\mathbf{I}$, the eenominator is 4 ; that is, there is ene kinfman (a brother) in the frff degree, who makee, togedher with the propefitus, the two defecodents from the hat couple of ancefors; and in every uther degree, the number of kindred muft be the quedruphe of thofe in the degree which immediately precedes it. For fince each couple of anceftors has two deficendents who increafe in a duplieate ratio, it will follow, that the ratio in which all the defcendents increafe downwards, muf be donble to that in which the ancefors increafe upwards: but we have feen, that the ancefors inereafe in a duplicate ratio: therefore the defeendents mult increafe in a double duplisate; that is, in a quadruple ratio.

| Collutiral Digrees. | Nunter of Kindred. |
| :---: | ---: |
| 1 | 1 |
| 2 | 4 |
| 3 | 16 |
| 4 | 64 |
| 5 | 256 |
| 6 | 1024 |
| 7 | 4096 |
| 8 | 15384 |
| 9 | 25536 |
| 10 | 262144 |
| 11 | 1048576 |
| 12 | 4194304 |
| 33 | 16777216 |
| 14 | 67108864 |
| 15 | $268+35456$ |
| 16 | 1073741824 |
| 17 | $429+967296$ |
| 18 | 17179869184 |
| 19 | 68719476736 |
| 20 | 274877906944 |

This calculation may alfo be formed by a more compendious procefs, wid by fquaring the couples, or half the number of anceftors, at any given degree; which will furnifh us with the namber of kindred we have in the fame degree, at equal diftance with ourfelves from the common foek, befides thofe at unequal dittances. Thus, in the tenth lineal degree, the number of anecfors is 1024 ; its half, or the eouples, amount to 512 ; the number of kindred in the tenth collateral degree amomats therefore to 262144 , or the fquare of 512 . And if we will be at the trouble to recollect the fate of the feveral famlies within our own knowledge, and obferve how far they agree with this aceount ; that is, whether, on an average, every man has not one brother or fifter, four firf-coufms, fixteen fecond-coufins, and fo on; we fhall find, that the prefent calculation is very far from being overcharged.

Confangu- Confanguinity (Plate CXLVI), whercin all the denity, Contcinte.
grees of collateral kindred to the propyfins are computced, as far as the teath of the cirilims and the Ferenth of the canomits inchuive; the former being dittinguilhed by the numeral letters, the latter by the common ciphers.

CONSCIENCE, a fecret teflimony of the foul, whereby is gives its approbation to things that are matmally rod, and condemns thof that are evil. Sce Moral Fhaispory.

A maa of tulegrity will never lifan to any reafon, or give way to sany meafure, or be mificd by any inducement, againtl confience.-The imhabitants of a great town offered Marihal de Tureme 100,000 crowns, upon condition he would take ancther raal, and not marchi his troops their way. He anfwered them, "As your town is not on the road I iniend to march. I cam t accept the money you ofier me."-The Earl of Derby, in the reign of Edward IIl. making a defeent m Gaienne, cartied by form the cuwn of Bergerac, and grave it up to be plundered. A Welch knight happened by chance to light upon the receiver's chice. He fand there fuch a quatity of money that he thourn himeff obliged to acquaint his general with it, imagining that fo great a booty natually belonged to him But he was agrseatly furprifed when the earl iold him, with a pleafant comatenance, that he wifhed him joy of his good furtume; and that he did not make the keeping of his word to drpend upon the great or little value of the thing he had pro-mifed.- In the fiege of Falifi by Camillus general of the Romans, the tchoomafter of the town, who had the childrea of the fenators under his care, Itd them abroad under the pretest of recreation, and carried then to the Roman camp, lajing to Camillu, that by this artifice be had deherect Falifei inter his hands. Camilus abin rring this trachery, obferved, "That there were laws for war as well as for peace; and that the Romans wete taught to make war with integrity not leis that with cumare." He ardered the fchonlmater to be Alripped, his hands to be bound behind kis lack, and to be delivered to the buys to be lathed back into the cumb. The Fakeians, firmenty obflimate in refitance, truck with an act of julice fo alluftrious, delivered themielves up to the Remans; con inced that they would be far beter to have the Rumars for their alles than their enemics.
It is a faying, That no mancrir ofaded his own confcience, but firt er latt it was reven dod upon hita. The powe of confcience inded has teen comarked in
 merable. The following is relued by Mi Furdyec, in his Diellogess on Ed Edationt, as a red cccurvince which happened in a neighboning hace not many ycars agen A jucller. a mation of houd haractu and confurable wath, having wecalion in the way of tis buffefs to trasel at from dillare from the place of his abode, tork aing with him a fervant, in order io take care of his portwantcau. He had with him fome

 Cafin to dimasent in the when, the Sewten waching his apportunity, wok a pilulfirm his mater's balile and thot hin dend on: the foot; then :ited hem of his jewels and money, and hatrins a Forse fore to bis neck, he threw lim into the neacelt camal. With than boo'y he made ofl io a diltat part cif tac conntry, where he had realon $t$.) helieve that weblher he nor his maker were known. There he becgan to trade in a very low way at firf, that his cibeurity might foreen him from obfervation, and in the courfe of a reod many years feemed to dife, by the natmat promefo of budinefs, into wealth and conlideration; fo that his good fortune appeared at once the effect and reward of indufty and virtue. Of thefe he connterfited the appearance fo well, that he gew into groac credit, manited into a good family, and ly lay irs out hio fudden fores diferety, as he faw oceafim, and joming to all an aniverial affability, he wis admitted to a fhare of the govenment of the tonn, and rose from ore polt to another, till at length he was chofen chice magiltrate. In this office lee mintaied a fair character, and continmed to fill it with $n$, fmall applatue, beth as a guromor and ajudge; thll one day as he fat on the bench with fome of has breihen, a caininal was brought before him who was acented of murdering his malter. 'The evidence caroe sur fult, the jury brought in their verdict that the prifoner was guilty, and the whole affembly waited the fentence of the prefident of the court (which he happened to be that day) with great furpence. Mean while he appeared to be in unufnal diforder and agitation of mind, and his colour changed often; at length he avefe trom hia feat, and coming down foom the bench, placed limfelf juit by the unfortunate man at the bar. "You fee betore you (faid he, addretling himitelf to thofe who had fat on the bench with him), a thiking inttance of the jut awards of heaven, which this day, after 30 years concealment, prefents to you a greater criminal than the man jult now found guilty." Then le made an ample contifion of his guik, and of all its aggravations. " Nor can I focl (continued he) any relief from the agonies of an awkened coulcience, hut by requiring that juilice be forila ith done againt me in the mol publice and flymam"one" Wemay cafily fuppole the amoment of ail the affally, and apecially of kis fillow. judges. Howeverathey proceeded, upon this cenfethin, to pafs icntemeerapo him, and he ried with all the fymptums of a penit.ont inind.

Courts of Consulfnce, are courts inr recoreay of fonall debes, conftated by act of palidment in Londom, Wellminfler, 㫮. and other propuband trading difricts.

CONSCRIPI', in Ramin antiquity, an appellation given to the fenators of Rone, who were called conX x :

Jortin

## C O N [ 348 ] C O N

Coniecrs foript fathers, on account of their names being all eneim, tered in one resifter.

CONSECRATION, the af of devoting any thing to the fervice and worfhip of God. The Mofaical law ordained, that all the firt-born, both of man and beafl, flould be lanctitied or confecrated to God. We find alfo, that Johua confecrated the Gibesnites, as Golumon and Divid did the Nethinims, to the fervice of the temple; and that the Hebrews fometimes confecrated their fields and catle to the Lord, after which they were no longer in their poser.

Among the ancient Chrittians, the confecration of chuches was perfirmed with a great deal of pious folemnity. In what manner it was done fur the thee firt ages, is uncertain ; the authentic accomnts reachiny no higher than the fouth, when, in the peaccable reign of Contantine, churches were cvery where built, and dericated with great fllemnity. Some think the confecration confilted in fetting up the fign of the crofs, or in placing a communion-table in the church ; and others, that no more was done than preaching a paingyrical fermon in conmemoration of the founder, and that then they proceeded to prayers, one of which was compofed on purpofe for the church to be confecrated. The Romanits have a great deal of pions Soppery in the ceremonies of confecration; which they bellow on almolt every thing, as belis, candles, books, watir, oil, athe; palms, fwords, binners, pictures, croffes, a fous-dei's, rofes, childitns cloute, Sce.

In England, churches have been always confecrated with parcicular ceremonies, the form of which was It it to the difcretion of the bihop. That oblerved by bilhop Laud, in comfecrating St Cathenine Creed church, in London, gave great offence.

Consecration is particularly ufed for the benediction of the elements in the cutharit.

Consecration, among medalits, is the ceremony of the apotheoks of an emperor, or his tranflation into heaven and reception among the gods. On medals the confectation is thus repefented: on one fide is the emperor's head, crowned with baurel, fometimes weiled ; and the infcription gives him the title of divus: on the reverle is a temple, a buttum, an altar, or an earle taking its flight towards heaver, either from off thic altar, or from a cippus: at other times the emperor is feen in the ais, b rne up by the eagle; the infcription always, crefferatio. Thefe are the ufual fymbols: yet on the reverfe of that of Antoninus is the Antonine coiumn. Ia the apo:heofis of emprefies, in:tead of an calle there is a peacock. As $t$, the ho3.ours rendered thefe princes aftu death, thay were exFhained by the words conjecontio, fater, dicus, and dus. Sometimis arourd the temple or altar are put, menoria felix, or memoriw aterna: for princeffes, afornike, and Fhucrilus rectpta; on the fide of the head, deu, or eia.

CONSENT, in a general fenfe, denotes much the fame with fissent.

Consent of Parits, in the animal economy, an a. greement or iympathy, whereby when oue pant is inmediately affected, another at a diftance becomes affeited in the fame manner.

This mutual accold or confent is fuppofed to be effected by the commerce of the nerves, and their artfuil didrubution and ranification throughout the body. The eftest is fo fenfible as even to come under the
phyfician's cognizance: thus, the fone in the blad- Confentes der, by vellicating the fibres there, will pain and draw them fo much into foafios, as to affect the coats of the bowels, in the fame manner, by the intermediation of nerwors threads, and make a colic there; and alfo extend their twitches fometimes as far as the flomaeh, and occation grievous romitings: the remedy, therefore, in fuch cafes, is to regard the part originally affected, how remote and grievons foever may be the coniequences and fymptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, thofe of the mouth, checks, pracordia, and parts adjacent, \&c. is fuppofed by naturalits to be the inßrument of that particular and extraordinary confent betwetn thole parts. Hence it is, that a favorry thing feen or fmelled excites the appetite, and affets the glands and parts of the mouth; that a flameful tling feen or heard affects the cheeks with Whikes; on the contrary, if it pleafe, it affect the precordia, and excites the mufcles of the mouth and face to langlter; if it grieve, it affects the glands of the eyts, fo as to occafion tears, and the mulcles of the face, putting them into an afpect of crying. Dr Willis, quoted by Mr Derham, imputes the pleufure of hifing, and its eficts, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected an irritation is occationed in the latter. See Sympa. тну.

CONSENTES, the name which the Romans gave to the 12 fuperior gods, the Dii majorum gentum. The word lignifies as much as confentiontes; that is, who confented to the deliberations of Jupiter's council. They were twelse in number, whofe name Ennius has briefly exprefed in thefe lines,

> Ơuro, Vegha, Miarroo, Ceres, Dizna, Vinus, Mars,

CONSEQUENCE, in logic, the conclafion, or what refulto frum reafon or argument. See Conclusion.
The confequence is that other propofition in which the extremes or premifes of a fyllogim are joined, or feparated; and is gaired from what was aifused in the premifes.

This word, in a more rellrained fenfe, is uful fur the relation or connection between two propoticions, whereof one is inferred from the other.

CONSEQUENT, fomething deduced or gathered from a furmer argumentation. But, in a more precife fenfe, it is med for the propofition which cuntains the conclufion, confidered in itfelf, without any regard to the antecident: in which fenfe the confequent may be true, though the confequence be falte. See the preceding article.

CONSERV.ATOR, an officer ordained for the fecurity and prefervation of the privileges of fome citics and communities, having a commifion to judge of and determine the differences among them.

In molt catholic univerfities there are two confervators ; the confervator of royal privileges, or thofe granted by kings; and the confervator of apoltolical privileges, or thofe granted by the pope. The firlt takes cognizance of perfonal and mixed caufes between the tegents, Itudents, \&c. and the latter of firitual. matters between ecclefiatics.

Ancientry

A neiently there were appointed confervators of trea. ties of peace between princes; which confervators became judges of the infractions made on a treaty, and were charged with procuring fatisfaction to be made. Thefe were ufually the fendatories of the feveral powers. In licu of conferators, princes now have recourfe to other indifereat prinees to guarantec their treaties.

Consmeritor of Sicts Privileses, at Campvere, is an officer belonging to the royal Loronglis of Scotland, who takes care of the mercantile aflairs of Scotland, agrecable to the daple contract between them and the States General.

Consforator of the Peace, in the ancient Englith cultoms, was a perfon who had an efpecial charge, by virtue of his, office, to fee the king's peace kept. 'l'ill the erection of juftices of the peace by king Edward III. there ware fevesal perfors who by common law were interefted in keeping the tane: fom having that charge as incident to other offices; and others nimpiy, or of inlelf, called cuflucles, or confervetiors of the pertc. The ctambetain of Cheter is dill a confelvator in that esunty; and petty couftalles are, by the common law, conten vators, see. in the firt fenfe, within their own juifdiction: fo are allo the coroner and the fheriff within their own county. 'lhe king is the principal confervator of the peace withia all his dominions: the lord chancellor, ford treafurer, lord high lleward, lord mathal, lurd high confahle, all the jubtices of the court of king's bench, by their offere, ant the matler of the rolls, by prefeription, are general confervators of the peace through the whole kinesdom, and may commit breaktis of the peace, and bind them in recognifances to keep it.

Conservertor of the Truce, and Sufe Conimet, was an offecer appointed in every iea-port, under the ling's letters patent. His charge was to inquire of all of fences committed againft the king's truce, and lafe conduets upon the main fea, out of the franchifes of the cinque-ports, as the admirals were wont to do, and foch other things as are declared anno $3 \mathrm{Hen}$.V . cap. 6

CONSERVATORIOS, are mufical fehools eflablifhed for the inftruction of childeen in the profeffion of mufic. There are four of thefe at Venice, defigncd for the education of girls, and three at Naples, for the cducation of boys. It has been fugcetted that the operation of caftration was performed in the confervatonios; but the practice is abfolutely prohibited; and the young caftrati are hromght from Licia in Puglia: but before the operation is performed, the ir voices are tried in a confervatorio. The feholars of the Venetian confervatorios have been chicfly celebrated for tatte and neatnefs of execution; and thofe of Naples have had the reputation of being the fust coutrapronijts, or compofers, in Europe.

CONSERVATORY, a term fometimes ufed for a green-houfe or ice-houfe.

CONSERVE, in pharmacy, a form of medicine contrived to preferve the flowers, lerbs, roots, or fruits of feveral fimples, as near as polfible to what they are when feef gathered. See Pharmacy.

CONSIGNMENT, in law, the depoliting any fum of money, bills, papers, or commodities, in good hands; either by appointment of a court of jutice, in
onder to be delivered to the perfons to whom they are Corfignadjulyed; or whantaily, in order to their being re-
ment inited to the pufous ehrey belmer to, or font io the places they are d. figned for.

Conshandene of Gome, in commerce, is the deliveriug or making them over to another: thus, goods are bid to be configud to a fuetur, when tlacy are fent to him to be fold, Sie.; or when a factor fends back goods to lois principal, they atre faid to be configued to him.

CONSISTENCE, in phyfics, that tate of a body wherein its component panticies are to connected or -atanged among themferves, as not to foparare or reccde from each other. It differs from continuity in this, that it implies a rerard to motion or reft, whieh continuity dues not, it being fufficient to denominatz athing continuous that its parts ars contiguous to each other.

CONTSTSTENTES, in church-hiftory, a kind of penitents who were allewed to affit at paryers, but who condel not be admitted to receive the factament.

CONBlsTORY (Confifoutum), firnifies as much as faratorium, a tubuanl: it is commonly ufed for a conacil-houfe of ecelefatical perfons, or place of jusflice in the fpintual court; a fullion or affembly of prelates. And every archbithop and bihop of every diocofe hath a confllowy court beld before his chancellur or commifiay in his cathedral charch, or other convenicut phese of his dincefe, for ecelediaticall eaufes. The bihop's chancillor is the judge of this court, fuppufed to be hislled in the civil and canon law; and in places of the diocele far remote from the bihhop's conliftory, the bifhop appoints a commiflary to judge in all caufes within a certain didrict, and a regifter to enter his deerece, se.

Consistory, at Rome, denotes the college of eardinals, or the pope's femate and council, before whom juliciay cautes are pleaded. Du-Cange cerives the word from conformom; i. e. locas ubi conforitur; ufed chietly for a veltibule, gallery, or anti-chamber, where the courtiers wait for admifion ; and called à conflente multitalime.

The confiltory is the firft eourt, or tisibunal of Rome: it never meets but when the pope plates to convoke it: the pape prefides in it in perfon, mounted on a magnificint throne, and habited in his pontifcalus; on the 1 inht are the candinal-bifhops and prietts, and on the left the eardimal deacons. The place where it is held, is a large hall in the apolloheal palace, where prinees and ambaffidors of kings are received. 'Ihe other prelates, prothonotaries, audicors of the rota, and other offiers, are feated on the lieps of the throne: tl:e counticrs fit on the ground; ambaffadors on the right, and confiftorial and fical adrocates behind the cardinals.

Belides the public confitory, there is alfo a private one, held in a retired chamber, called the domber of papegay; the pope's throne here being only raifed two theps high. Nobody is here admitted but the eardinats, whofe opinions are collected, and called finterces. Here are tirt propofed and paffed all bulls for bithopricks, abbeys, \&c. Hence bifhopricks and abbeys are faid to be confiftorial benefices; in regard, they muft be propofed in the confiltory, hie annates be paiz

Co bingy to the pone, and his bulle taken. Ancienty they weve
Confinac.
$\xrightarrow{C}$ dective; but by the coneordat, which abobines clections, the 5 are appointed to be collated by the prope ahone, on the nommation of the prince.

Consistor: was alfo the name of a court under Cos? 3 ntine, where he fat in perfon. and heard caufes: the members of this count were called comites.

Consistory is alfo utid among the reformed, for a council or affembly of minifters and elders, to regulate their aftairs, dileipline, \&c.

Consistony, or enart Chrifian in the Englifhlaws, is a council of ecelefialtical perfons, or the place of fultice in an ecclefiallical or fpiritual court. Evere arclebihop and bihop has a confllory-court, hull before his chancellor or commifiary, either in his cathedial, in fome ehapel, aine, or putico, belonging thene10 ; or in fome othtr convenient place of his dincefe, for ecck fatical caufes. The firitual court was ancionely, in the time of the Saxons, joined with the county or bunderd court ; and the oniginal of the confilior court, as disicced from thofe enurts, is found in a lay of the conquem, quated hy hod Oke. From this court there lies an appeal to the archb:hop of each province refpectively.

CONSOLATION, one of the places in shetoric whercin the orator endeaveurs to abate and moderate the arief or concern of an ther.

CONBOLE, in atelitecture, an ornament eut upon the key of an arch, which tas a projecture, and on occaforn ferms to fupport little corniches, figures, bults, and rafes.

CONSOLIDATION, in law, the combining and unizing two benefiees into one. Theterm is borowed from the civil law; where it properly tignilies an union of the poffelion, or occupation, with the oropesty. Thus, it a man have by legacy ufum fructum fuedi, and afterwards buy the property, or fee-finple, of the heir; this is called a confolutation.

Consmlination, in medicine, the attion of miting brokin bonez, or the lips of wounds, by means of confolidation jemodies, as they are called: which clemning with a mokerate heat and force, taking comption out of the wound, and preferving the tempenature of the parts, cause the nonifhment to be fitly applied to the part affected.

Among the many inflances of the confolidating power of hood and ian floth, we have a very remarlable one in Batholine's Medical Obfervations. A man b.ing conderaned to have his n fe ent off by the hand of the common executioner, the friends, who wore to be prefent, provided a new loat cf warm bread, which was cut in the midulle, and the nofe received in it as it fell toun the face : the nofe was after this nicely paced win the the arain; and, being lewed on, the white in time confolizated, and lett no other maks of the ignominy than the fear round the whole nofe, and the treme if the ftiches.

CONSONANCE, in mufic See Jntervad.
CONAONAIN 1 , a letter that eanmot be founded whout tome ding'e or double row before or after it ; as $b, c, d, 心$.

CONSORT, De:en Consort. Se RuEEN.
CONSPARACT, in law, lignifies an agreement between two or more, fallely to indict, or proeure to be bulicted, an innowent pericn, of felony.

CONSPIRATORS are, by datute, defincd to be Confirafuch an hide them ive by oath, covenant, or utheral. liance, to afite one another falfely and maticionfly to C witable. indict perfors, or farr!ly to maintain pleas.

Comfpimors in rreaton, are thofe that plot againat the kiny and the government.

CONS'ABLE, according to rome, is a Saxon word, compounded of coning, " king," and faple, which figuilies the "Atay on fupport of the king." But as we borrowed the name as well as the office of Compalie from the Ficreh, Sir William Blacklone is rather inclined to deduce it, with Sir Henry Spelman and Dr Cowth, from that language; wherein it is plainly derived from the Latin comes fleluli, an officer well known in the empire; fo ealled, becaute, like the great conftable of France, as well as the lord high contable of England, he was to regulate all matters of chivaly, tilts, tournaments, and feats of arms, which were performed on horfeback.-The

Lord High Constable of Englatiel is the feventh great uficer of the crown; and he, with the earl marthal of England, were formerly judges of the court of chivalry, called in king Henry lV.'s time Curia Mititaris, and now the court of honour. It is the fountain of the marial lax, and anciently was held in the king's hall. 'The powter of che lord ligh! conflable was formenty to creat, and of which fis improper a ufe was made, that fo early as the 13 th of king Richard II. a tlatute pafted for regulating and abridging the fame, iocrether with the power of the earl marthal of England; and by this Atatute, no plea could be tried by then or tleir courts, that could be tried by the common law of the realin. The office of conitable exitted before the conqueit. After the conquelt, the office went with inheritance, and by the tenure of the manors of Haulefield, Newmen, and Whitenhort, in Gfoncettenthire, by grand ferjeanty in the family of the Bohuns earl of Hereford and Efex, and afterwards in line of Seffirck is heirs-general to them; but in 152 I , this grest fice beeame forfeited to the king in the perfon of Edward Siafford duke of BuckingKam, who was that year attainted for hi hatrafun; mad in confideration of its extunfive power, dignity, and large authonity, both in cime of war and peace, it has never been granted to any penfon, othewife than bac wice, and that to attend at a cormation, or trial by combat. In France, the fame office was alfo fupprefled about a century after by an edict of Louis XIII; thonith it has texn exereifed, in the command of the Marstas.s, by the firt officer in the army.

Lurd high conflable of Sentland was an office of ersat antiquity and dignity. The fint upon record is Hus de Morvtle in the reign of David I. He had two grand prergatives, viz. Fiat, the kecping of the king's word, whicn the king, at his promotion, when he frears fealty, d lisers of him naked. Hence the badge of the contable is a naked ford.-Second, The abfolute and unlimited command of the king's armies while in the field, in the abfence of the king ; but this eommand does not extend to catiles and garnions. He was likewife judre of all crimes commiced within two leagues of the king's houfe, which precinct was called the Chalmer of leace. Though his juridiction came at laft to be exereifed only. as an crimes during the time of parhament, which fome extended likewife

## $\mathrm{C} 0 \mathrm{~N} \quad[35:] \quad \mathrm{CO} \mathrm{N}$

Confable, to all geteral conventions. This office was conferred beritably upon the neble family of Errol, by king Robert Bruce: and with them it Rill remans, being exprefily referved by the treaty of unon.

Inforior Constaplas. From the great ofiec of high confalle is derived that infreme order, firce called the confatios of bondrads and franbifis; the fe were tent ordaned in the 13 th year of lidward I. Wy the flatute of Winehefter ; which, for the conferiation of the peace, and view of armour, appointed that two condebles acond be chofen in every hunded and fanchife. The eare what wenow callconflal lariicapitules or bigh enghablis; becaufe continance of tane, and increafe of peote, \&c. bave occafunel others of like nature, but inferiur antharity, in wory wow, called foty
 reith of Edwad Ith.
'Ille fomer, or modem bigh uequter, are appointel : the court-lects of the frandifio hemened over which they preide; or, in defult of that, hy the

 corthalis have two , flices unitut in then, the one ancient, and the other modern. This ancient oltice is that vi heal-horoweh, ithing man, or borfhulder; who are as anciun at the time of hing Alficd: their mote maden ofice is that of comale merely; which was aprointed fo latcly as the rigu of Funard In. in order to affe the ligh-cometh. Aide in eneral the ancient head-boroughs, tithingem, and bortholders, were made die a to ferve as petty conatables; though not fo gencrally, but tlat in many places they fill continue dittioct onticers from the confables. They are all chofen by the jay at the comt-lat; or if no court-leet be held, are appointed ty two jultices of the peace.

The general duty of all confabies, both ligh and petty, as well as of the wher officere, is to kee? the king's peace in their feveral diltrikts; and to that purpofe they are armed with wery large powers of arrefing and imprifoning, of breaking upen houfes, and the like : of the extent of which powers, eonfidering what manner of men are for the mol part put upon thefe offices, it is perhans very well that they ate generally kept in ignorance. One of their primeipal duties arifing from the hatute of Wincheter, which appoints them, is to keep wateh and ward in their refpective jurifdetions. Ward, guard, or cuforit, is chiefy intended of the day-time, in order to appreiiend rioters, and robhers on the highways; the manner of doing which is left to the diferetion of the juftiees of the peace and the conftable: the hundred being, however, liable for all the robberies commited therein by day-light, for having kept negligent guard. Watch is properly applicable to the night only, (being calld among the Saxons ruach't or wealn) ; and it begins when ward ends, anl ends when that begius: for, by the flatite of Winchefter, in walled towns the gates thall be clofed from fun-fetting to fun-ring ; and wateh flall be kept in every borough and town, efpecially in the funmer feafon, to appreliend ali rogues, vagabonds, and night-walkers, and make them give an account of themflres. The conflable may appoint watchmen at his difcetion, regulatea by the cuflom of the place; and the fe, being his deputies, liave, for the time being, the authority of their priminat.

There are alfo contabies denominated from parti- Cunfalt. cular phaces, as conable of the Tower, of Dover calle, of Wimdur cefle, of the cathe of Carrataron, and many other of the eathes of Thats; whofe office is the faze whith that of the c: R. Mani, or governors of cathe.

Constables of J.gnti:. The city of London is divided into 26 ward, and the word into precincts, in each whereof is a confalle. Thay are smentated by the indabiants of econ precibe on Sa Thoractis day, and combened, or othen ic, at the court of "andmote. Afer confinnation, they are fwom int then ofices at a cour of aldemen, on the mext s. Womday after Twalfid day. Euch as are chofen into the orfice, are obliged to place the king's onm, and the arms of the city, over their doors; and if the, witio in alleys, at the end of fuch allers thand the ftreets, to fighify that a comtidnd lives there, and that they may be thic more cality found when wanted.
 are the puper oficers for excenting their orders. They have powers to fupprefs tumblts, and to approt ond dedinuents and thote who can give no good acount of themfelves, and cariy them to the nest juttice.
CONSTMANCE, a fromg tonn of Gemany, in the circle of buthe, withe himup's fos, whefe bifop is a prince of the onpire. It lias a handfome bidige, and foremal fine Aracturs, as weli faced an pofane. It carries on a grat trale, and is weil fortificd; and thou h it puctends to be an imperial own, the Auftrinus keep a garrifon lure. It is famons for a councilleld lure :a 151 , when there were three popes; but they were all depofed, and Martin V. was eleeted in their romm. The courcil caufed Jerom of Prague to be burnt, though the emperor Sigifmund had given him a fafe condnet ; in purfunce of this maxim, "that no faith is to be keft with leritici." Tacy likewife condumed the doctrae of Wikliff, and ordered his bones to be bursed to jears after he wats dead. However, the inlathiran ts now are Protedants. It is feated on a lake of the fanc nance. E. Long. 9. 12 . N. Lat. 45. 35 .

Constance, a great lake of Gemman, between Sualin and Swifferland. It is so viles in length, and s in breadh. It is croffed ly the river Rhine; and there are fermal towns on its banks.
CONSTANCY, is a genceat feufe, denotes immutablility, or invariablencis.-In ethics, of when applied to the human mind, the term implies reflution or tleadinefs, particularly uider fufferings and the tials of adverfity.

It was the faying of a lieathen plilofopher, That there cansot be imarined apon eartli a fpetacle more worthy the regad of the Cieator intent on his works, than a brave rian fuperior to his fufferings. Nothing indeed can be more noble or hononrable than to have courage enough to execute the commands of reafon and confcience; to maintain the dignity of our nature, and the ftation affromed us; ard to be proof againt poverty, pain, and death itfelf, fo far as rot to do ary thing that is feandalous or finful to awnid them. To be thus, is to be great above title and fortme. This argues the foul of an heavenly extraction, and is worthy the ofspring of the Deity.
Of this vitue the following exampe, related in

## 

Contaile. Eoglith hitary, is here felected, as fuperior perhapa, ali ci-cumftances confidered, in any other upon record.

Sir William Alkew of Keliay, in Lincolnfhire, had feveral daughters. His fecond, named sline, had received a genteel tducation; which, with an agreable figute and good underfanding, remdered her a very proper perfon to be at the head of a family. Her fa. ther, regardlefs of his duuchtes's inclination and happinefs, obliged her to marry a gentleman who had nothiner to tecommend him but his fortune, and who was a mont bigoted Papilt. No fooner was he convinced of his wife's regard for the doctrines of the reformation from popery, than, by the indigation of the prichs, he viofenly drove ber from his houle, though the had born him two children, and her conduct was unexcep:ionable. Abandoned by her hulband, fhe came up to London, in order to procure a divorce, and to make herfelf known to that part of the conrt who either profeffed or were favourers of Proteftantif: : but as Henry VIII. with confent of parliament, had jut enacted the law of the fix articles, commonly called the blondy futute, fhe was eraelly betrayed by her oun hulband; and, upon his information, taken into cullody, and examined concerning her faith. The act above-mentioned demounced death againft all thofe u ho fhould deny the doctrone of tranfublatatation ; or, that the bread and wine made wfe of in the facrament was not converted after confecation into the rad body and blood of Carift; or, mainsain the necelity of receiving the facrament in both kinds; or affim, that it was lawful for prielts to marry; that the rows of celibacy might be broken; that private mafles were of no avail ; and that auricular confeffuon to a prieft was not neceffary to falvation. Upon thefe articles the was examined by the inquiftor, a priett, the lord mayor of London, and the bihop's chancellor; and to all their queries gave proper and pertinent anfwers; but not being fuch as they approved, the was fent back to prifon, where fhe remained eleven days to ruminate alone on her alarming fituation, and was denied the frall confolation of a friendly vifit. The king's council being at Greenwich, fhe was onee more examined by chancellor Wriothefley, Gardiner bithop of Winchefter, Dr Cos, and Dr Robinfon; but not being able to eonvince her of her fuppofed errors, fhe was fent to the Tower. Mr Strype, from an authentic paper, gives us the following thort account of her examination, which may not, perhaps, be unentertaining or ufelefs to the reader: " Sir Martin Bowes (lord mayor) fitting with the council, as molt meet for his wildom, and leeing her ftand upon life and death, I pray you, quoth he, my lords, give me leave to talk to this woman? Leave was granted. Loord Mayor. Thou foolith woman, fayeft thou that the prielt cannot make the holy body of Chrilt? A. Akeru. I fay fo, my lord : for I have tead that God made man ; but that man made God I never read; nor I fuppofe ever Shall read it. Lord Mayor. No! Thou foolifh woman, after the words of confecration, is it not the Lord's body ? A. A/kew. No: it is but confecrated bread, or facramental bread. Lord Mayor. What if a moufe eat it after confecration; what thall become of this moufe? what fayet thou, thou foolifh noman? A. Afkiw. What fhall become of her, fay you, my lord? Lord Mayor. I fay, that the mouft is damned. No 8.
A. A/kes. Alack, poor moufe!" Perceiving that Connabie, fome could not keep in their laughing, the council Cuntantiz. proceeded to the butchery and flanghter that they intended before they came there.-It was ftrongly fufpected that Mrs Ankew was favoured by fome ladies of high rank; and that the carried on a religtious correfpondence with the queen. So that the chancellor Wriothenty, hoping that he might difover fomething that would aford matter of impeachment againft that princefs, the Earl of Hertford, or his Countefs, who all favoured reformation, ordeced her to be put to the rack: but her fortitude in fuffering, and her refolution not to betray her friends, was proof againit that diabolical invention. Not a groan, not a word, could be extorted from her. The chancellor, provoked with what he called her obitinacy, augmented her tortures with his own hands, and with unheard of violence: but her courage and conttancy were invincible; and there barbarians gained nothing by their cruelties but everlafting difgrace and infang. As foon as the was taken fron the rack, the fainted away; but being recovered, fhe was condemned to the flames. Her bones were difloeated in fuch a manner, that they were forced to carty her in a chair to the place of execution. While he was at the ftake, letters were brought her from the lurd chancellor, offering her the king's pardon if the would recant. But fhe refuled to look at them; telling the meffenger, that "fhe came not thither to deay her Lord and Mafter." The fane letters were allo tendered to three other perfons condemned to the fame fate; and who, animated by her example, refuled to accept them. Whererpon the lord-mayor commanded the tire to be kindled; and with favage ignorance cried out, Fiat jufitic, "Let juflice take its corrfe." '1he faggots being lighted, fhe commended ber foul, with the utmoft compofure, into the hands of her Maker; and, like the great founder of the religion the profefsed, expired, praying far ber murdercers, July 16.1546 , about the $25^{\text {th }}$ year of her age.

CONTSTANTIA, a diltrict at the Cape of Good Hope, confifting of two farms, which produce the well-known wine fo much priced in Europe, and known by the name of Cape or Confantia wine. This place is fituated at the diftance of a mile and a half from Alphen, in a bending formed by and nearly under the ridge of hills, which comes from Meuifenmountain, and juft where it ftrikes off towards Houtbay. One of thefe farmis is called Little Conftantia. Here the white Conftantia wine is made. The other produces the red. According to M. De la Cail's account, not more than 60 fissars of red, and 90 of the white Conftantia wine are made, each figgar being reckoned at 600 French pints, or about 150 Swedifh cans; fo that the whole produce amounts to 22,500 cans. As the company are ufed to keep one third of this for themfelves, the remainder is always befpoke by the Europeans long before it is made. At the Cape this wine is feldom feen at table, partly becaufe it is dear, and partly becaufe it is the produce of the country. The red Conftantia wine fells for abont 60 rixdollars the half awin; but the white is ufually to be purchafed at a more reafonable rate. The genuine Conftantia wine is undeniably a very racy and delicate defert wine, and has fomething peculiarly agrecable in the flavour of it. That its fuperiority,

## (1) C [353] C O N

Commantia periority, however, is not owing to any thing peculiar Il in the manner of preparing it, feems extremely pro-Confan- balle ; for then, without dombt, a great deal more of
tine. tine.

Romans who embracel Chrillianity. I lis father, Conftantius Chlorus, rendered himfolf fanous by his vietoriens expeditions to Germany and Britain: upon the abdication of Doclelian, he thared the Roman empire with Galerius Maximinus in 305 , and was at that time at York, where he died in 306 ; having tirt caufed his fon Conftantine the Griat to be proclaimed emperor by his army, and by the Englifh. Calerius at funt refufed to adnit Conftantine to his father's flate in the imperial throne; but after having loft feveral bathes, he confented in 308. Maxentius, who fuececded Galorius, oppofed him: but was defeated, and drowned himfelf in the 'l'yber. The fenate then declared Confantine clief or firg Auguftus, and Licinius his fecond affociate in the empire, in 313. Thefe princes publimed an edict, in their juint names, in favour of the Chrifians; but foon after Licinius, jealous of Conflantine's renown, conceived an implacable hatred againft him, and renewed the perfecutions againlt the Chriftians. This brought on a rupture between the cmperors; and a battle, in which Conftantine was victorions. A hort peace enfued : but Licinius having thanitfully violated the treaty, the war was renewed; when Confantine totally defeating him, he flad to Nicomedia, where he was taken prifoner and Alrangled in 323. Conttantine, now become fole mafter of the wethern and eaftern cmpires, immediately formed the plan of cltablifhing Chriftianity as the relin gion of the ftate; for which purpofe, he convoked feveral ecclefiadical councils: but finding he was likely to meet with great oppofition from the Pagan interett at Rome, he conceived the delign of founding a new city, to be the capital of his Chriltian empire ; fee Constantivople. The glory Confantine had acquired by eftablifhing the Chritian religion, was tarnithed by the part he took in the perfecutions carried on by the Arians, towards the clofe of his reign, againf theis Chiftian bretluen who differed from them: feduced by Eufehius of Nicomedia, he banith. ed feveral eminent prelates; foon after which, he died in 337, the 60th your of his age, and 3 If of his reign.

As to the chancter of Confantine, he was chate, fious, laborions, and indefatigable; a great generat, fuccefsfal in war, and deferving his fuccefs by his flaning valon and by the brightacs of his genius; a protector of arts, and an encourager of them by his beneficence. If we compare him with Augrttus, we fhall find that he ruined idolatry, by the fame precau. tions and the fame addrefs that the other ufed to de. ftroy liberty. Like Auguftus, he laid the fundation of a new empire; but lefs Rilful, and lefs polite, he could mot give it the fane ftability: he weakenerl the bucy of the fate by adding to $i t$, in fome meafure, a fecund head in the fis... Intion of Conftantinople: and tranforting the ecnt: of motion and ftrengeh to near the eatern extremily, he jeft withom heat, and almofl without life, the weftern parts, which foon became a prey to the barbarians. The Pagans were too much his enemies to do him juftice. Eutıopius fays, that in the former part of his reign he was equal to the moll accomplifhed princes, and in the latter to the meanef. The younger Victor, who makes him to have rigned more that 3 I jears, pretend, that in the furt 10 years he was a ho. 1 ; in the 12 fucceeding

fontan:ne In the var 352, the Sarmatims implorse Confan-
 Gotas, irruption into then temitorias, and deltroyed every thins whis ste and fword. 'The emperor readily granted their rameft, and gained a complete victory. Nowr 100, 000 of the ewemy perithed, wither in the bittle, on after it with hungre and cold. In confequence of this werthrow, the Goths were obliged to twe for jeace ; but the ungratedid Samatians no founer Cond themfelves delivered from thein cnemica,
 and raragod the provinces of Nathand Thrace. The cinperor, receiving intelligence of this treachery, retumed with incuedible expedition, cut great numbers of them in pieces, and rbliged tlie relt to fubmit to what temns he was pleafed to impore.

Conflantine feems to have been a prince very lighly refpeled, even by for dillant nations. In 333, ace corthing to Enfelrius, ambaftadmen mived at Comflantinople from the Dhonyes, ladians, Fohmopins, and Per-
 a moth ebigine manner; and larming from the ambenffubis of Enpor bine of Dendia, that tome weregrat
numbers of Chriatims in their matter's dominions, Confan. Conltanome wrote a letter in their behalf to the Per- tinnotwas fian monarch.

## hisiong.

Nest year, the Sarmatians being again attacked by the Guths, found themfelves obliged to fet at liberty and arm their flaves argainft them. By this means they inded overcame the Goths; but the victorious faves turning their arms againt their matters, drove then out of the country. This misfortune obliged them, to the number of 300,000 , to apply for relief to He takes a the Roman emperor, who incorporated with his le-mumber of gious fuch as were capathe of fervic: ; and give fettle- Surmarans ments to the relt in Thrace; Seythia, Macedon, and minny. Italy. This was the lat remarkable action of ComRamine the Great. He died on Mey 25.397, having ${ }^{6}$ divided the empire amons his children and neplews, and divi. is the followine manater. Cuntantine, his eldet fon, fim of the
 comd, hut AM, Syrin, and Ligyta ; and Condams, the younget, Hhyricun, Italy, and fificat. To his ne phew Dolmatios, he gave Thrace, Mdecton, and Achaib; and to king tmmbalians, his other newhew, Ammenia Minor, Iontus, Cappadocia, and the city of Culdrea, which he defied might be the eapital of his kingdom.
ifter the death of Confantine, the army and All lis rela. fruate proclamed his three fons cmperors, withont ti nsmurtaking any notice of his two neplewi, who were foon dered exifter murdered, with julitio Cunfantius the late cm- coptetens peror's brother, and all their friends and adherchts. andewo Thus the fimily of Conlantine was at once reduced ephows. to his three fons, and two nephews Gallus and Julian, the fons of Julius Contantios: and of thefe the former owed his life to a malady, frem which m one thought he cuald recover ; and the latter to his infaney, being then at mof about feven years of arse. The three brodhers divided among themfelvesthe duminions of the deceated princes; but did nut long agrece tosether. In $3 \% 0$, Contantine having in vain folicited Conltans to Confantine yidd part of Italy to him, raifed a condiderable army; invodes the and under preterace of inarching to the affitance of his dominims brother Conttantins, whe was then at war with the of ConPertians, made himfelf mater of feveral places in Italy. flano. INeremon Conltans detached part of his army againtt him ; and Conftantine, being drawn into an ambufcade near Aquileia, was cut off with his whole forces. Is detcated His body was thrown into the river Anfa; but being and killed. afterwards difeovered, was fent to Cuntamtinople, ad intersed there near the tomb of his father.
lisy the defeat and death of his brother, Conftans re- Cunfans mainced fole matter of all the weftern part of the en-fote nather pire, in the quict pofleflion of which he continued till of the Wer. the year 350. This year, Magnentins, the fon of one Magmes, a native of Germany, finding ComRans defrifed by the army on account of his indolence and inMas racuQid alivity, refolved to murder him, and fet up for himfelf. Having found means to gain over the chief of ficers of the army to his defugns, he feized on the Imperial palace at Auturn, and dillributed among the pofulace what fums he found there; which induced not only the city, tut the neighbouring country, to efpoufe lif eaufe. But Contlans being imformed of what had pafied, and dinding himelf umable to refit the ufurper, Hed towards Spain. He was overtaken, however, by Gaifo, whom_Magnentius had fent ufter him with a

Thus Conllantins acquired a right to the whole Roman empire; though one hall of it was feized by Marnentins after the mirder of Condans. 'I loe former had been engaged in a was with the Pertians, in which little advantage was ganed on cither fode; but the Perfans now giviug no more dithabance, the emperor marched againit the ufurpers in the weft. Defides Magnentins, there were at this time two other protenders to the wellern empire. Veteranio, general of the foot in Pamonia, had, on the firt news of telf, which he hilled with hood and flangheter. Musnentios being informed of what lad happened, fent againit this new competitor his chief favourite and prime minifler Matcellimus. Nepotianus receined him with great refolution; a bloody battle enfued between the foldiers of Magnentius and the Romans who had efpoufed the cante of Nepotianus; but the latter being betrued by a fenator, maned Heraclitu, his men were put in flight, and he himfelf killed, after having enguyed the foveregnty andy 28 days. Mancelinus orderced his head to be carried ons the point of a danee thangh the principal itrects of the city ; put to death all thote who had dectased for him; and nader pretene of preventing dillurbanees, commanded a sembal madiecre nentius himelf came to Rome to make the neer, Magnentius himfelf came to Rome to make the neceffary preparations for refitiong Conituatius, who was exerting himidf to the utmolt in order to revenge the death of his brother. In the city he behared mots Tramically, putting to death many perfons of diftinction, in order io feize their eftates; and oh iged the rett to contribute half of what they were worth towads the expence of the war. Having by this means aifed great furs, he affembled a mighty army compofed of Romans, Germans, Gauls, lianks, Eritons, Spaniards, Sec. At the fame time, however, dreading the uncertain iflues of war, he dipatehed ambafadors to Conllantius with propolals of aecommodation. Contlantius fet out from Antioch about the beginning of antumn ; and, paling throwith Contanti- nople, arrived at Heraclea, where he was met by the deputies from Magnemtius, and others from Veteranio, who had agreed to fupport each other in cafe the emperor would hearken to no terms. 'The deputies of Magnentins propord in his name a math between him and Contantia, or rather Conflantina, the ditter of Conflantius, and nidow of Amibalianus; offerins, it the fame time, to Contantits the difter of Magrachtius.

Magnen. tinsa". temparo get Gallus murdered

Magnentius defearcd a fecond time, $k$ !ls athinje. sn! y and timatió. thate he adranced tis Pavia, whore Magnembus gainEl a conliderable advantage over him. Notwithfanding this bof, howeser, Confantins reduced the whole comery bordering on the Po, and Magnentius's men dufered to him in whole troops, delivering up to him the places they had garrifoned; by which the tyrant was to difmeartened, that he left Italy, and retired with all his forces into Gatil. Soon after this, Africa, Sicily, and Spain, declared for Conftantius; upon which Mignentias fent a fenator, and after him fome bihops, to treat of a peace; but the emperor treated the fenator as a lipy, and fent back the bifoops without any anfwer. - Magnentius now finding his affairs defperate, and that there were no hopes of pardon, recruted his amy in the best manner he could, and difatched an afaffin into the Enf to murder Gallus Catar; loping that his deatly would oblige the cmperor to witheraw his forces from Gaul, and march in perfon to the defence of the Eaftern provinces, which vere theatued by the Perfians. The affaflin gained over fome of Gallus's guards; but the plot being difcovered before it could be put in execution, they were all leized and executed as traitors.

In 353, the war againft Magnentius was carrited on with mort vigour than ever, and at latt happily ended by a battle fought in the Higher Danphiny: Nagnertius, being dufated, took thelter in IJons; but the fow luldiers who attended him, defpairing of any further fucceis, refolved to purchafe the emperors favour by dovering up to him his rival, the author of fo calatnitous a war. Accordingly they furromeded the Loufe where he lodged; upon which the tyrant, in delpair, flew with his own hand his mother, kis brother Defderius whom le lad created Cxfar, and fuch of his friends ars relations as were with him; and ther, fixing his fword in a wall, threw himfelf upon it, in order to avoid a more fhameful death which he had reafon to appreherid.

After the death of Magnentius, his brother Decentius Crefar, who was marching to his affittance, and bad already reached Sens, finding limfelf furrounded on all fides by the emperor's forces, chome rather to ftrangle himfelf than fall alive into the hands of his as in enemies. Thus Contantius was left fole matter of fole matice the Roman empire. His panegyrilts tell us, that after of the etr- his victory he behaved wih the greateit humanity, wire. forgiving and receiving into favour his greatelt enemies; but other hiftorians differ confiderably from them, and tell us that Confantius now became haughty, imperious, and cruel, of which many inftances are 26 given.

This year the empire was fubjected to very grievous calamities. Gaul was ravaged by the barbarians beyond the Rhine, and the difoanded troops of Magnentius. At Rone, the populace rofe on account of a farcity of provifions. In Afia, the Ifamrian robbers over-ran Lycaonia and Pamphylia; and even laid fisge to Scleucia, a city of great ftrength; which, however, they were not able to make themlelves matters of. At the fame time, the Saracens committed dreadful ravages in Mefopotamia, the Perfians alfo invaded site province of Authemufia on the Euphrates. But the Ealters provinces were not fo much harafled by
the barbarians as by Gallus Cefar himfelf, who ought Confan. to have protected them. That prince was naturally tinop, bit...n of a crued, haughty, and tyanaical difpoftion; but kattory. being elated with his fuccefies againt the l'erfans, he 27 at latt belaved more like a tyrant ance a madman that Tyranny us a governor. His natural cruchy is fuid to have becal Ginas. heightened by the intigations of his wife Coritantima, who is by Amaianus liyled the Alegara, or "fury of her fex;" and he adds, that her ambinion was equal to lev cruclty. Thus all the provinces and citios in the Kalt were filled with blood and flaughter. No mav, however innocent, was fure to live or enjuy his cllate a whole day; for Callus.s tempar being equally fufpicious and crut, thofe who liad any private enconies tonk care to accufe them of crimes againk the tate, and with Gallus it was the fame thing to be accured at d condemned. At latt the emperorbeing informed from all quarters of the evil conduct of his trother-inlaw, and being at the fame time told that he afpired to the fovereignty, refolved upon his rum. For this end he wrote Retters to Callus and Conftantina, inviting them buth into Italy. Though they had both fufficient seafon to fur the worft, fet they durlt not renture to difobey the emperor's exprefs command. Conllantina, who was well acquainted with her brother's temper, and hoped to pacify him by hor artful intinuations, fut out firlt, leaving Gallus at Antioch: but flte had fuarce entered the province of Bithynia, when fie was feized with a fever which put an end to her life. Gallus now defpairing of being able to appeate his fovereign, thought of openly revolting; but molt of his friends deferted him on account of his inconftant and cruel temper, fo that he was at laft obliged to fubmit to the pleafure of Contantius. He advanced therefor, according to his orders; but at Pe tavium was arrefted, and tripped of ail the enfigns of his dignity: Prom thence he was carried to Flanona, now Fhanat in Dalmatia, where he was examined by two of his molt inveterate enemits. He confefted mott of the caincs laid to his charge; bat urged as an excule the tvil comifts of his wife Confantina. The emperor, provoled at this plea which retlected on his ${ }_{\mathrm{He}}{ }^{28}$ filter, and inlligated by the enemies of Gallus, ligned to deach. a warrant for his exceution, which was perfurmed accordingly.

All this time the emperor had been engaged in a war with war with the Germans : he had marched againt them the Gerin perfon; and though he gained no advantage, the mans. barbarians thought proper to make peace with him. This, however, was but hort-lived. No fooner was the Roman army withdrawn, than they began to make now inroads into the empire. Againft them Conftantius difpatched Arbetio with the flower of the army; but he fell into an ambufcade, and was put ic fight with the lufs of a great number of men. This lofs, however, was foon retrieved by the valour of Arintheus, who became famous in the reign of Va lens, and of two other officers, who falling upon the Germans, without waiting the orders of their general, put them to fight, and obliged them to leave the Roman territories.

The tranquillity of the empire, which enfued on. this repulfe of the Germans, was foon interrupted by a pretended confpiacy, by which in the end a true ove was produced. Sylvanus, a leading man among

Sylvatus detrayed b Arbetio.

He: forced to re been raifed to this polt by Arbetio; but only wiih a defign , remove him from the emperor's prefence, in order to acconplith lis ruin, which he did in the following manner: One Dynames, keeper of the amperor's mules, leaving Giul, begged of Sylvames letters of recommendation to his Eriends at court ; which bein; ir ranted, the taitor crafed all but the fubfeription. He then inferted directions to the friends of Sylvanus $f_{i} r$ the carrying on a confiracy; and delivering thefe forged ketters to the prefect Lampridius, they were by him thowed to the emperor. 'Thus Sylvanus was forced to revolt, and caufe himfelf to be proclaimed enperor by the troops under his command. In the nean time, however, Dyuames having thought proper to forge another letter, the fraud was difcovered, and an enquiry fet on foot, which brought to hght the whole matter. Sylvanas was now deelared innoeent, and letters fent to him by the emperor confirming hin in his polt; but thefe were fearce gone, when certain news arrived at the court of Sylvanus having revolted, and cated himbelf be proclamed emperor. Confantins, thunderftruck at this news, difpatched againit him Urficinus, an officer of great integrity, as well as valour and experience in war ; who forgetting his former character, pretended to be Sylvanus's friend, and thus found means to eut him off by treachery.

The barbarians, who had been hitherto kept quiet by the brave Sylvanus, no fooner heard of his death, than they broke into Gaul with greater fury than ever. They took and pillaged ahove forty cities, and among the relt Cologne, which they levelled with the ground. At the fame time the Quadi and Sarmatians entering leanomia, deftroyed every thing with fire and fword. The Perfians alfo, taking advantare of the abfence of Urfieinus, over-ran, without oppofition, Armenia and Mefopotamia; Profper and Maufonianus, who had fucce-ded that brave commander in the government of the Eaft, being more intent upon pillaging than defending the provinces enmmitted to their care. Confantius, not thimking it advifable to Julian, the brother of Gallus, to the dignity of Crefar. Julian feems to lave been a man of very extrandi- nary talents; for thoughi before this time he had been entirely buried in obfeurity, and converfed only with books, no fooner was he put at the head of an army than ne behaved with the fame bravery. conduet, and experience, as if he had been all his life bred up to the art of war. He was appointed governor of Gaul; but before he fet out, Confantius gave him in marriage his fifter Helena, and made him many valuatle prefents. At the fame time, however, the jealoua emperor greatly limited his authority; gave him written inftructions how to behave; ordered the remerals who ferved under him to wateh all his actions no lefs than thofe of the enemy ; and ftrictly enjoined Julian himfelf not to give any largeffes to the foldicry.

Julian fet out from Milan on the it of December 355, the emperor himfulf accompanying him as far as Pavia, from whence he purfued his journey to the Alps, attended only by 360 foldiers. On his ar ival at Turin be was lirft acquainted with the lofs of Co-
logae, which had been kept coriccaled from the em. Comanperor. Ife arrived at Vienine before the end of the tinopotitan year, and was rectived by the peuple of that city and hiftory. the neighbourhood with extraordinary joy.

In 356, the Larbarian; befieged Sham; to relieve He fetonus which place, Julian mareled with what forces he for Gaul. cond rafe. When he came there, he found the fege railed: on which he went in purluit of the barbarians to Auxerre, crofling with no fmall danger thick woods and forelts, from Auserre to Tioies. On his march lee was furrounded on all fides by the barbarians, who moved about the country in great bodies; but he put them to flight with an handful of men, cut great numbers of them in pieces, and took fome prifoners. From Defeats the 'Iroies he hatened to Kheims, where the main body barbarianto of the army, commanded by Marcellus, waited his arival. Leaving Rhems, he took his route towards Decempagi, now Divze, on the Seille in Lorrain, with a delign to oppole the Germans who were buly in ravaging that province. But the enemy attacking. his rear mexpectedly, would have cut of two legions, had not the relt of the army, alarmed at the fudden noife, tumed back to their affilance. A few days afterwards he defeated the Germans, though with great lufs to his own army; the victory, however, opened him a way to Cologne. This eity he found abandused by the barbarians. They had neglected to fortify it: but Julan commanded the ancient fortifications to be repaired with all $p$.ffible expedition, ferairs and the lowfes to be rebuilt; after which he retired tions of to Sens, and there took up his winter-quarters. This Cologne. year allo Conltantins entered Germany on the fide of Rhatta, laid walte the country far and wide; and obliged the barbarians to fue for peace, which was readily granicel. The fame year be enacted two laws; ldolatry by one of which it wins dcelared eapital to facrifice, declared or pay any kind of worfhip, to idols; the other, grant- carital by ing the effects of condemmed perfons to belong to consan their chidden and relations within the third degree, escept in cafes of magie and treafors; but this latt one he revoked two years after.

In the beginning of the year 357, the barbarians befieged Julian a whole month in Sens; Marcellus, the commander in chit $f$, never once offering to aftith him. Julian, however, fo valiantly defended himfelf with the few forees he had, that the barbarians at latt retired. Afert this, Conttantius declared Julian eontmander in ehicf of all the forces in Gaul; appoimting under him one Severus, an officer of great experience, and of a quite different difpofition from Marectlus. On his arrival in Gaul, Julian received him with great joy, raifed new troops, and fupplied them with arms which he luckily found in an old arfenal. The em. peror, refolving at all events to put a llop to the terrible devalations committed by the barbarous mations, chieny by the Alemans, wrote to Julian to march directly agrainlt them. At the fame time he fent Barbatio, who had been appointed general in place of Sylvanus, with a body of 25 or 30,000 men, ont of Italy, in order to inclofe the enemy between two armies. The Leti, howerer, a German nation, paffing between the amies, advanced as far is Lyons, hoping to furpile that wealt!y city; but mecting with a warmer reecption than they expected, contented themfeives with ravaging the country all round it. On the firt

quite uninhabie:ble, as they could demontrate if they place; but that the country be had alloted them was
quite uninhabie:ble, as they could demmitrate if they were but alluwed to crofs the river, and lay their com-
plaints before him. This requeat was tra:ted: but were but allowed to crofs the river, and lay thicir com-
plaints before him. This requet was tra:tid ; but while he afended his tritumal, the batbanams unexpecterly fell upon lis gruards fword in hand, killed try was then reltored to the Sarmatians who were its original polfeff.rs.

This year is alfo remarkable for a very haughty embafy from Syoor king ot Pelfas. The ambrif dor, named Narkes, brought a letter, in which the Perfian monarch fylled himfelf "king of kinge, brother of the fun and mom," \&e. He acepuanted the emperor that he might lawfotly ialife on having all the comenties beyond the river Siymm in Maudon dulirered up to him; but hat his demands flouid feem unreafunable, be woutd be contented with Areaenia and Mefopotamia, which had been mon mjonty taken from his grandfather Naries. He added, that witis juftice was done him, he was reflued to aftert his ripht by force of arms. Thishetter was prifented to Combitius wrapped up in a pitce of white lik; hut lie, without entering into any neguciation with the ambultador, wrote a letter to Sapor, in which he whid him, hat as he had maittained the Romay dominions in their full extent, when he was poffefed only of the Ear, he cond not fuffer than to be curtailed now when the wais mater of the whole empire. In a few days, however, he feat another letuer with rich prefems; beine very delirous at lear to pat off the war tiil he had fecured the northern provinces againt the incurliens of the barbarians, that he might then empluy all the forces of the empire againt to furnidable an enemy. This embaty proved unfuccefoful, as did alfo another which was feat foon after. The latitambaffadors were imprifoned as fpies, but afterwards difmifted unhurt. By a law of Contantius dated in $35^{\circ}$, all magicians, augurs, aftrolorers, and pretenders to the art of divination, were declared enemies to mankind ; and lish of them as were found in the court cither of the emperor or of Julian, he commanded to be put to the torture, and fpecified what torments they were to wadergo.

In 359, Juitian continued his endeavours for relieving the proviace of Gaul, which had fuffered fo much from the incurfions of the barbarians. He erected matazines in different places, vifited the citics which had fuffered mof, and gave orders for repairine their walls and fortifications properly. He then crofted the Rhinc, and purfeet the war in Gernary witi gieat feveral of them, and the emperor with dificulty faved himfelf by flight. The rell of the troops, however, foon teck the alarm, and furrouncing the Limigantes,
cut them all of to a man. This year ConiRantius in. Confanftitnerl a court of inquifition againtt all thofe who tinophlitia confulted leathen orictes. Dunles Catena, a noted butory. and eriel informer, was slifpatched into the Eint to SI profecute them; and Modellui, thenconnt of the E itt, The heaand equally remarkable for his sucity, wa; appuinted rhens crueds judere. Elis tribural was crocked at Boyilupalis in lyperfeDustine, whither perfons of buth fexes, and of cuted. every tank and condition, were daily dagged in crowds tron all parte, and either conlined in dungeons, or sorn in pieces in a molt cruel and barbarous manmer by rackis or culalicly executed.

In 359, Sapor king of Perfa began hollilities, be- The Perfo ing encunraged thereto by the abfence of Urficinus, a:s begin whon the emperor had recallad, and appointed in his mokntiete roon one Sabisiants, a perfon very unfit for fuch an office. IDuring this canpaing, however, he made wey littk prosefs; having only talien two Roman foute, and defroyed the city of Amida, the liege of which is faid to have colt lim 32,000 men. On tle firt news of the Palian invation, Conllantios had thourlat proper to fomd Urbeinssintuthe Eaft ; but his comemics presentud him froma recevivis the fupplies necolary for carrying on the war, fo that be found
 the porghis of the l'vilans. Onhis retura, hewas naexpechadi; "hored with the lofs of Amisa, and all the diluters that ham hatyened during the campaign. 'I'wo judzes were apponted to inyuite into his conduct; but they, beino ereatures of his enemies, left the matter dublidul. Oin this Iflicious was fo manh exafferatca, that he appcailed to the emperor, and in the deat of pallon, let fill fome niguarded expreffione, which heing immediatcly canicd to the emperor, the trencral was deprived of all his employments.

Conilantiun reblved to marein next gear in perfon $C$ nften againtt the Perdians; but in the mean time, dreading marches in to encounter fo formidabl? an enemy, he applied him-poriona-
Celf wholly to the aftimbling of a miglity army, bje fanthem. which he night be aule fully to cope with them. For this purpofe he wrote to Julian to fend him part of his forses, without confidering that by fo doing lie left the province of Criul expored to the ravages of the barbarians. fuian reiolved immediately to comply with the emperor's onders; but at the fame time io abdicate the cignity of Cxfar, that he night not be biamed for the lofs of the prownee. Accordingly be luffered the teft fuldiers to be drauglited out of his army. They were, however, very urnilling to leave 5 . him, and at laft proclaimed hin emperos. Whether damedron. this was done ablolutely againk Julian's confeni or not perwr. is nncertain; but he wrote to the eniperor, and pelfua. ded tie whole army alfo to fend al letter along widh his, in which they acqusinted Cunfantius with what had hata enci, and entreated him to acknuwkedge Julian as his y3rtner in the empire. Bur this was politively re. fu\{ad by Comatatius, who begas t) prepare For war. Julian then, deingins to be before lanel with the cmperor, caufeck his troup; take an oash of allegiance to himible, and with furprifing expedition made himbels mafter of the whole country of llyricun, and the important pais feparating that conntry frum 'Thrace. Contamius was thonder-ftruck with this news; tut hearimg that the Perdans had retirse, he marches

Coman- with all his forces againg lis compctitor. On his arlinepulitan rival at Tarfus in Cilicia, he was feizet with a feve. haftery.
$5 s$ Confiantius narchesa-Cllicia, at the foot of Mount Taurus. Ifere he was grin? him, obliged to ftop by the violence of his diforder, which 56
julia' re. itoser the heathen religion. increafed every day, and at laft carried him off on the $13^{\text {th }}$ of November 361 , in the 45 th year of his age.

By the d ath of Conftantius Julian now became matter of the whole Roman empire without a rival. He had been educated in the Chriltian religion; but fecretly apoftatized from it long before, and as foon as he faw himfelf maller of Ilfricum, openly avowed his apoflafy, and caufed the temples of the gods to be opened. When the meffengers arrived at Naiffas in Illyricum, where he then was, to acquaint him wih his being fole mafter of the enpire, they found him confulcing the entrails of victims concerning the event of his journey. As the omens were uncertain, lie was at that time very much embarrafted and perplexed; but the arrival of the meffengers put an end to all his fears, and he immediately fee out for Conttantinople. At Heraclea he was met by almolt all the inhabitants of this metropolis, into which he made his public entry on the 1 th of December 361 , being attended by the whole fenate in a body, by all the magillates, and by the nobility magnificently dreffed, every one tettifying the utmoft joy at feeing fuch a promifing young prince raifed to the empire without bloodfhed. He was again declared emperor by the fenate of Conttantinople; and as foon as that ceremony was over, he caufed the obfequies of Conftantius to be performed with great 57 pomp. fters.

The firf care of Julian was to inquire into the conduct of the late emperor's minifters. Several of thefe, having been found guilty of enormous crimes, were condemned and exccuted, particulariy the noted informer Panhs Catena, and another named Apodams, were fentenced to be burnt alive. Along with thefe, however, was put to death one Urfula, a man of unexceptionable character, and to whom Julian himfelf was highly indebted. He had been fupplied with money by Urfula unknown to the emperor, at the time when he was fent into Gaul with the title of Cefar, but without the money neceffary for the Support of that dignity. For what reafon he was now put to death, hiftorians do not acquaint us. Julian himfelf tells us, that he was executed without his knowledge.

The emperor next fet about reforming the count. Reforms the court.
was a Pagnn, and immediately on his acceition to the Confan. thone, if flored the heathen religion. He invited to tinopolatan court the philofophers, magicians, \&c. from all jarts; neverthelefs he did not raife any perfecution arrainit the Chritians. On the contrary, he recalled from ba- 59 nithment all the orthodox bithops who had been fent philufuinto esile during the former reign; but with a de- phers. mafign, as is olferved both by the Chriltian and Pagan gicians, \&c, writers, to raife difturbances and fow differfions in the church.

As the Perfians were now preparing to carry on Marches a the war with vigour, Inlian found himfelf under aganh the neceflity of marching againft them in perfon. But Perfans. before he fet out, he enriched the city of Conftantinople with many valuable gifts. He formed a large harbour to fletter the mips from the fourliwind, built a magniticent porch leading to it, and in another porch a ftately library, in which he lodged all his books. In the month of May, A. D 36z. he fet out for Antioch; and on the firf of January renewed in that city the facrilices to Jupiter for the fafety of the empire, which has been folung omitted. During his fay in this city, he continued his preparations for the Perfian war, eresting magazines, making new levies, and above all confulting the oracles, arufpices, magicians, Esc. The oracles of Delphi, Delos, and Dodona, affored him of victory. The arnfpices, indeed, and moft of his courtiers and officers, did all that lay in their power to divert him from his intended expedition; but the deceitful anfwers of the oracles and magicians, and the defire of adding the Pcrian monarch to the many kings he had already feen lumbled at his feet, prevalied over all other confiderations. Many mations fent deputies to him offering their alfiltance ; but thete of fers he rcjected, teling them that the Romana were to affilt their allies, but food in no need of any affitsance from them. He likewife rejected, and in a very difobliging manner, the offers of the Saracens; anfwering them, when they complained of his llopping the pention paid them by other emperors, that a warlike prince had fleel, but no gold ; which they refenting, joined the Perfars, and contimed faithful to them to the lath. However, lie wrote to Arfaces hing of Armenia, enjoining him to keep his troops in readinefs to execute the orders he thould foon tranfmit to him.

Having made the neceffary preparatious for fo im-Coofes the portant an enterprife, Iulian fert orders to his troops Euphraces, to crofs the Euphrates, deligning to enter the enemy's country before they had the leatl notice of his march; for which purpofe he had flaced guards on all the roads. From Antioch he proceeded in Litarba, a flace abont 15 leagues difant, which be reached the lame day. Fiom thence lie vent to Beræa, wherehe halted. a day, and exhorted the council to reftore the worlhip of the geds; but this exhortation, it feems, was complied with tut ly , few. From Berrea he procceded to Bature: and was better pleafed with the inhabitants of the latter, becanfe they had, before his arrival, icHlored the worthip of the gods. 'lhese he oficed facrifices; and having immolated a great number of victims, he purbed the next day lis journey to Hierapolis, the capital of the province of Euphatefiana, which he reached on the oth of march. Here be lodged in the houfe of ore for whom he had a parti. cular efteem, chiehy becaufe neither Conlantan nor

Connan- Gallus, who had both lodged in his houfe, had been tinopulitan hinory.
able to make him renounce the wornip of his idols. As he entered this city, 50 of his foldiers were killed by the fall of a porch. He left Hierapolis on the $1^{\text {th }}$ of March ; and having paffed the Euphrates on a bridge of boats, came to Batnx a fmall city of Ofrhoene, about to leagues from Hierapolis; and here 50 more of his foldiess were killed by the fall of a ftack of ftraw. From Batne he proceeded to Carrbre; where, in the famous temple of the moon, it is faid he facrificed a woman to that planet.

While Julian continued in this city, he received advice that a party of the encmics horfe had broke into the Roman territories. On this he refolved to leave an army in Mefopotamia, to guard the frontiers of the empire on that fide, while he advanced on the other into the heart of the Perfian dominions. This army confifted, according to fome, of 20,000 , according to others, of 30,000 chofen troops. It was commanded by Procopius, and Sebaftian a famous manichean who had been governor of Egypt, and had perfecuted there, with the utmoft cruelty, the orthodox Chriftians. Thefe two were to join, if poffible, Arfaces king of Armenia, to lay wafte the fruitful plains of Media, and meet the emperor in Affyria. To Arfaces Julian himfelf wrote, but in the moft difobliging manner imaginable, threatening to treat him as a rebel if he did not execute, with the utmoft punctuality, the orders given him; and at the conelufion told him, that the God he adored would not be able to fcreen him from his indignation.

There were two roads leading from Carrhx to Perfia; the one to the left by Nifibis; the other to the right through the province of Affyria, along the banks of the Euphrates. Julian chofe the latter, but caufed magazines to be erected on both roads; and, after having viewed his arny, fet out on the 25 th of March. He paffed the Abora, which feparated the Roman and Perfian dominions, near its conflux with the Euphrates; after which he broke down the bridge, that his troops might not be tempted to defert, feeing they could not return home. As he proceeded on his march, a foldier and two horfes were ftruck dead by a flafh of lightning; and a hion of an extraordinary fize prefenting himfelf to the army, was in a moment difpatched by the foldiers with a fhower of darts. Thefe omens occafioned great difputes between the philofophers and arufpices: the latter looking upon them as inaufpicious, advifed the emperor to return; but the former refuted their arguinents with other smore agiceable to Julian's temper.
Having paffed the Abora, Julian entered Affyria, which he found very populous, and abounding with all the neceffaries of life; but he laid it wate far and near, deflroying the magazines and provifions which he could not carry along with him; and thus he put it out of his power to return the fame way he cane ; a flep which was judged very impolitic. As he met with no army in the field to oppofe bim, he advanced to the walls of Ctefiphon, the metropolis of the Perfian empire ; having reduced all the flrong holds that lay in his way. Here, having caufed the canal to be cleared, which was formerly dug by Trajan between thefe two rivers, he conveyed his fleet from the forner to the latter. On the banks of the Tigris he was op.

Vol. V. Pati I.
pofed by the enemy. But Julian paffed theat river in Confan. fpite of their utnolt efforte, and drove them into the tinopritith city with the lofs of a great number of their men, he hiftory. himfelf, in the mean time, lofing only 70 or 75 .

Julian had now advanced fo far into the enemy's Begins his country, that he found it neceffary to think of a re- retreat, hat treat, as it was impolible for him to winter in Per- is difucufed fia. For this reafon he made no attempt on Cteli- provifions phon, but began to march back along the banks of the Tigris, foon after he had paffed that river. In the mean time the king of Perfia was affernbling a formidable army, with a defign to fall upon the Romans in their march; but being defirous of patting an end to fo deftructive a war, he fent very advancageous propofals of peace to Julian. Thefe the Roman emperor very imprudently rejceted; and foon alter, deceived by treacherous guides, he quited the river. and cntered into an unknown country totally laid wafte b" the enemy, and where he was continually haraffed by Xirong partics, who in a manner furrounded his army, and attacked him fometimes in the front, and fomctimes in the rear. A fill worfe ftep he was perfuaded to take by the treacherons guides already mentioned; and this was to burn his fleet, left it fhould fall into the hands of the enciny.. As foon as the flect was fet on fire, the whole army cried out, that the emperor was betrayed, and that the guides were traitors employed by the eneny. Julian ordered them immediately"to be put to the rack, upon which they confeffed the treafon; but it was too late. The fleet was already in flames; they could by no means be extinguifhed; and no part was faved except 12 veffels, which were defigned to be made ufe of in the building of bridges, and for this purpofe were conveyed over land in waggons.
The emperor thus finding hinfelf in a flrange country, and his army greatly difpirited, called a council of his chief officers, in which it was refolved to proceed to Corduene, which lay fouth of Armenia, and belonged to the Romans. With this view, they had not proceeded far when they were met by the king of Perfia, at the head of a very numerous army, attended by his two fons, and all the principal nobility of the kingdom. Several tharp encounters happened, in which, though the Perfians were always defcated, yet the Romans reaped no advantages from their victories, but were redueed to the laft extrenity for want of provifions. In one of thefe firmifies, when the Romans were fuddenly attacked, the emperor, eager orepulic the enemy bered to the founded to repulfe the enemy, haftened to the field of batte in a sudden without his armour, when he received a mortal wound attack by by a dart, which, hrongh his arm and fide, pietred fle Perhis very hiver. Of this wound he died the fame wight, fians. the 26 th of June 363 , in the 32 d year of his age, after having reigned fearce 20 montlis from the time he became fole matter of the Roman empire.

As Julian had declined naming any fuccefor, the ${ }^{6}, 7$ choice of a new emperor devolved on the army. They raifan unanimoufiy chofe jovian, a very able conmander, the catpire. whofe father had lately refigned the polt of comes domeficorum, in order to lead a retired life. The valour and experience of Jovian, howerer, wicre dint fufficient to extricate the Roman ariny from the difieulties in which they had been plunged by the impradence of his predeceflor. The famine raged in the Zz Cation

Conftn camp to fuch a degree, that not a fungle man would

Concludes
a peace
with the
Fesfians. have been left alive, had not the Perfans unexpectedly fint propofals of peace. Thefe were now received with the utmort joy. A prace was concludad for 30 years; the terms of which were, that Jovian floukd rufore to the Perfians the five provinces which had been taken from them in the reign of Dioclelian, with feveral callles, and the cities of Nifibis and Singara. After the conclulion of the treaty, Jovian purfued his march without molettation. When he arrived at Antioch, he revoked all the laws that had been made in the former reign againit Chritianity and in favour of paganiim. He efpoufed alfo the caufe of the orthodox Chritians againf the Arians; and recalled all thofe who had been formerly banifhed, particularly Athana. fius, to whom he wrote a very obliging letter with his own hand. It is generally believed alfo that Athanafius, at the delire of Jovian, now compofed the creed which ftill goes by his name, and is fubferibed hy all the bifhops in Europe. But this emperor Eid not live to make any great alterations, or even to vichofen einperor,
chorfes Valens for hi, partner. fit his eapital as emperor ; for in his way to Conftantinople he was found dead in his bed, on the 16 th or $17^{\text {th }}$ of February 364, after he had lived 33 years, and reigned feven months and 40 days.
After the death of Jovian, Valentinian was chofen emperor. Immediately on his acceffion, the foldiers mutinied, and with great clamour required him to choofe a partner in the fovereignty. Thongh he dis not intantly comply with their demand, yet in a few days he chofe his brother Valens for his partner; and, as the empire was threatened on all fides with an invafion of the barbarous nations, he thonght proper to divide it. This famous partition was made at Mediana in Dacia; when Valens had for his fhare the whole of Afia, Egypts, and Thrace; and Valentinian all the Weft; that is, Illyricum, Italy, Gaul, Spain, Britain, and Africa.

71
Procopius sevolts.

After this partition, Valens returned to Conftantinople, where the beginning of his reign was difturbed by the revolt of Procopius, a relation of Julian. On the death of that emperor, he bad fled into Taurica Cherfonefus for fear of Jovian ; but not trufting the barbarians who inhabited that country, he returned in difyuife into the Roman territories, where having gained over an eunuch of great wealth, by name Eugenius, lately difgraced by Valens, and fome officers who commanded the troops fent againft the Goths, he got himfelf proclained emperor. At frit he was joined only by the loweft of the people, but at length he was acknowledged by the whole city of Conftantinople. On the news of this revolt, Valens would have abdicated the fovereignty, had he not been prevented by the importunities of his friends. He therefore difpatched fome troops againft the ufurper; but thefe were gained over, and Procopius continued for fome time to gain ground. It is probable he would finally have fucceeded, had he not become fo much elated with his good fortune, that he grew tyrannical and infupportable to his own party. In confe-

12
${ }^{7} 3$
War with the Goths. quence of this alteration in his difpofition, he was firf abandoned by fome of his principal officers; and foon after defeated in battle, taken prifoner, and put to death.

This revolt produced a war betwixt Valens and the Goths. Ihe latter, having been Solicited by Proco-
pius, had fent 3000 men to his affiltanee. On hear. Conftan. ing the news of the ufurper's death, they marched tinupolitan hack; but Valens detached againtt them a body of hitwry. troops, who took them all prifoners notwithftanding the rigorous refitance they made. Athanaric, king of the Goths, expoltulated on this proceeding with Valens ; but that emperor proving obtinate, both parties prepared for war. In 367 and 369 , Valens gained great advantages over his enemies; and ohliged them to fue for peace, which was coneluded upon terms vary adrantageous to the Romans. The reft of this reign contains nothing remarkable, except the cruelty with which Valens perfecuted the orthodox clergy. The latter fent 80 of their number to hinn, in order to lay their complaints hefore him; but he, inftead of giving them any relief, determined toclergy ecput them all to death. But the perfon who was or- clefiafics dered to execute this fentence, fearing leit the pub- deat tol lic exceution of fo many eccleliaftics might raife difturbances, ordered them all to he put on board a hip, pretending that the emperor had ordered them only to be fent into banifhnent; but when the veffel was at fome diftance from land, the mariners fet fire to it, and made their own efeape in the boat. The fhip was driven by a !trong wind into an harbour, where it was confumed and all that were in it. A perfecution magician was alfo commenced againt magicians, or thofe who perfecuted. had books of magic in their cultody. This occafioned the deftruction of many innocent perfons; for books of this kind were often conveyed into libraries unknown to the owners of them, and this was certainly followed by death and confifcation of goods. Hereupon perfons of all ranks were feized with fuch terror that they burnt their libraries, left books of magicfhould have been fecretly conveyed in amongft the others. In 378 , the Goths, whom Valens harl admitted into Thrace, advanced from that province to Macedon and Theffaly, where they committed dreadful ra vages. They afterwards blocked up the city of Conftantinople, plundered the fuburbs, and at laft totally Valens dedefeated and 1-ill the emperor himielf. The day er the and silled the enper by lodged in Adrianople, the barbarians laid fiege to that place: but being quite flrangers to the art of befieging towns, they were repulfed with great flaughter; upon which they dropped that enterprife, and returned before Conflantinople. But here great numbers of them were cut in pieces by the Saracens, whom Maria their queen had fent to the affitance of the Romans; fo that they were obliged to abandon this defign likewife, and retire from the neighbourhood of that city.

By the death of Valens, the empire once more fell into the hands of a fingle perfon. This was Gratian, Gratian who had held the empire of the Weat after the death takes Theo of Valentinian. He repulfed many barbarous nations who threatened the empire at that time with diffolution; but finding himfelf preffed on all fides, he foon refolved to take a colleagne, in order to eafe him of fome part of the burden. Accordingly, on the $19 t h$. of Janary 379, he declared Theodofus his partner in the empire, and committed to his care all the provinces which had been governed by Valens.

Theodofius is greatly extolled by the hitorians of thofe ages on account of his extraordinary valour and picty; and for thefe qualifications has been honoured

## $\mathrm{C} O \mathrm{~N} \quad\left[\begin{array}{lll}3^{63}\end{array}\right] \quad \mathrm{C} O \mathrm{~N}$

Confan- with the firname of the Great. From the many perfeinopolitan cuting lawb, liowever, made in his time, it would feem bivery.
that his piety was at leaft very much mifguided; and that if he was naturally of a hmmone and compaffonate difpofition, fupertition and paffion had often totally obfeured it. He cert:inly was a man of great conduct and experience in war, and inceed the prefent ftate of the empiec called for an exertion of all his abilities. The provinces of Dacia, Thrace, and Illyricum, were already lont; the Gochs, Taifali, Alans, and Hunns, were mafters of the greatell part of thefe provinces, and had ravaged and haid wate the reft. The Iberians, Armenians, and Perfians, were likewife up in arms, and ready to take advautage of the diftracted itate of the cmpire. The few foldiers, who had furvived the late defeat, kept within the Alrong holds of Thrace, witlout daring fo much as to lock abroad, much lifs fuce the victorions enemy, who mo$\mathrm{v} \in \mathrm{d}$ about the country in great bodies. But notwithftanding this citical fituation, the hiftorians of thofe tumes give us no account of the tranfactions of the year 379. Many great battles indeed are faid to have been fought, and as many vistories obtained by Theodofius; but the accounts of thefe are fo confufed and contradictory, that no ftref's can be laid upon them.

In the month of February 380 , Theodofus was feized with a dangerus maldy, fo that Gratian found timfelf obliged to carry on the war alone. This emperor, apprehending that the neighbouring barbarians might break into fome of the provinces, concluded a peace with the Goths, which was confirmed by Theodolius on lis recovery. The treaty was very advantageous to the barbarians; but they, difregarding all their engagements, no fooner heard that Gratian had left Illyricum, than they paffed the Danube, and breaking into Thrace and Pannonia, advanced as Car as Ma-
ligns on the dominions of Valentinian. As Theodefias at that time found himfelf in danger from the barba. rians, he not only forbure to attack ivaximus after this declatation, but even achomodedged him for his partner in the empire. It was not lons, however, be- Wha in. fore the ambition of the ufurper pronneted him to valesthe break his promife. $1 n 387$, he patted the Alps on a manns ald fudden; and meeting with no oppulition, marched to nan. Milan where Valentinian ofually relided. The young prince hed firft to Aquikia; and from thence to Theffalonica, to implore the protution of 'lheodolius. The latter, in aniwer to Valentinian's letter, informed him, that he was not at all furprifed at the progrefs Maximus had made, becanfe the ufurper lad protected, and Valentinian lad perfecuted, the orthodox Clrillians. At laft he prevailed on the young prince to renounce the Arian herefy whicl he had hitherto maintained; after which Theodofius promifed to afiitt him with all the furces of the Eait. At firlt, however, he fent meffengers to Maximus, earnetlly exhorting lim to reflore the provinces he had taken from Valentinian, and content himfelf with Gaul, Spain, and Britain. But the ufurper would hearken ${ }^{52}$ to no terms. This very year he befieged and took Hisfucef: Aquilcia, Quaderna, Bonovia, Mutina, Mhegium, Placentia, and meny other cities in Italy. The following year he was acknowledged in Rome, and in ail the provinces of Africa. Theodofius, therefore, finding a war inevitable, fpent the remaining months of this and the beginning of the following year in making the neceffary preparations. His army conifited chiefly of Goths, Huns, Alans, and other barbarians, whom he was glad to take into the furice in order to prevent their raifing difturbances on the frontiers. He defeat-Defcated ed Maximus in two battles, took him prifoner, and put and put to him to death. The ufurper had left his fon Vietor, death by whom he created Augullus, in Gaul, to ave the inhabi- Theodotants in his abfence. A gainft him the emperor difpatched Arbogatles, who took him prifoner after liaving difperfed the troops that attended him, and put himto death. The victury was ufed afterwards by Theodofius with great clemency and moderation.

In 389, 'Theodofius took a journey to Rome; and, The temeaccording to Prudentius, at this time converted the flee in A. fenate and people from idolatry to ChiRianity. The texandria, next year was remarkable for the deltruction of the and celebrated temple of Serapis in Alexandria; which, throughout according to the defcription of Ammianus Marcellinus, dolltypt, furpafled all others in the world, that of Jupiter Capitolinus alone excepted. The reafon of its being now dettroyed was as fullows. Theophitus, biflop of Alexandiria, having begged and obtained of the emperor an old temple, formerly, confecrated to Bacchus, but then ruined and forfaken, with a dcfign to convert it into a church, the workmen found among the rubbifh feveral obfcene figures, which the bithop, to ridicule the fupertition of the Heathens, ca. .fed to be expofed to public view. This provoked the Parans to fuch a degree, that they few to arms; and falling unexpectedly upon the Chrillians, cut great numbers of them in paices. The latter, however, foon took arms in their own detince; and being fupported by the few foldiers who were quartered in the city, began to rerel force by force. Thus a civil war was kiudled, and no day paffed without fome encounter. The Pa-

Confan. gans ufed to retire to the temple of Serapis; and linnpolitan thence fallying out unexpectedly feized on fuch Chri-
hifory. hiftory.

- ftians as they met, and, dragging them into the temple, either forced them by the molt exquifite torments to facrifice to their idol, or, if they refufed, racked them to death. As they foon expected to be attacked Ey the emperor's troops, they chofe a philofopher named 0 IJmpus for their leader, with a defirn to defend themfelves to the lat extremity. The emperor, however, would not fuffer any punifiment to be inflicted upon them for the lives of thofe they had taken away, but readily forgave them: however, he ordered all the temples of Alcxandria to be immediately pulled down, and commanded the bithop to. fee his orders put in execution. The Pagans no fooner heard that the cmperor was acquainted with their proceedings than they abandoned the temple, which was in a fhort time deftroyed by Theophilus; nothing being left except the foundations, which could not be removed on account of the extraurdinary weight and fize of the Atones. Not fatished with the deftruction of the Alexandrian temples, the zealous bithop encoutaged the people to pull down all the other temples, oratories, chapels, and places fet apart for the worfhip of the Heathen gods throughout Egypt, and the flatues of the gods themferes to be either burnt or melted down. Of the innumerable Aatues which at that time were to be found in Egypt, he is faid to have fpared but one, rviz. that of an ape, in order to expofe the Pagan religion to ridicule. On his return to Conftantinople, Theodofins ordered fuch temples as were yet kanding to be thrown down, and the Arians to be every where $\varepsilon_{5}$ driven out of the cities.
ralentinian In $30^{2}$, Valentinian, emperor of the Weft, was nurdered treacheroufly murdered by Arbogaftes his general; by Arbergafes. who raifes Fu. genus. 5 the tmgire. who, though he might afterwards have eatily feized on the fovereignty himfelf, chofe to confer it upon one Eugcnins, and to reign in his name. This new ufurper, though a Chriftian, was greatly favoured by the Pagans, who were well apprized that he only bore the title of emperor, while the whole power lodged in Arbogates, who pretended to be greatly attached to their religion. The arafpices began to appear anew, and informed him that he was dettined to the empire of the whole world; that he would foon gain a complete victory over Theodofus, who was as nuch hated as Eugenins was beloved by the gods, \&c. But though Eugenins fumed to favour the Pagans, yet in the very beginning of his reign he whote to St AmBrofe. The huiy man did not anfwer his Jetter till he was prefled by fome friends to recommend them to the new prince; and then he wrote to this infamous ufurper with all the refpect due to an emperor. Soon after his accethion to the empire, Eugenius fent deputies to 'lheodofius; and they are faid to have been received by him in a very obiging manner. He did not, however, intond to enter into any alliance with this ufurper, but immediatcly began his military preparations. In $39 t$, he fet out from Conftantinople, and was at Adrianople on the 15 h of June that year. He bent his march through Dacia, and the other prorinces between 'Thrace and the Juhian Alps, with a defign to force the pafles of the fe mountains, and break into Italy befure the army of Eurtnius was in a condition to opeote him. On his asrival at the Alps, he
found thefe paffes grarded by Flavianus prefect of Italy, at the head of a coniderable body of Roman troops. Thefe were utterly defeated by Theodofius, who thereupon croffed the Alps and advanced into Italy. He was foon met by Eugenius; and a bloody battle enfued, without any decifive advantage on either fide. The next day the emperor led his troops in perfon againft the enemy, utterly defeated them, and took their camp. Eugenius was taken prifoner by his own men, and brought to Theodotius, who reproached him with the murder of Valentinian, with the calamities he had brought on the empire by his unjult ufur pation, and with putting his confidence in Hercules, and not in the true God; for on his chief tandard he had difplayed the image of that fabulous hero. Eugenius begged earneftly for his life; but while he lay proftrate at the emperor's fect, his own foldiers cut off his head, and carrying it about on the point of a fpear, fhowed it to thofe in the camp, who had not get fubmitted to Theodofus. At this they were all thunderftruck; but being informed that Theodolius was ready to receive them into favour, they threw down their arms and fubmitted. After this, Arbogates, defpairing of pardon, fled to the mountains; but being informed that diligent fearch was made for him, he laid violent hands on limfelf. His children, and thofe of Eugenius, took fanctuary in churches: but the emperor not only pardoned, but took the opportunity of converting them to Chritianity, rettored to them their paternal eltates, and raifed them to confiderable emplojenents in the dlate. Soon after this, Theodofus appointed his fon Honorius emperor of the Weft, affigning him for his thare Italy, Gaul, Spain, Africa, and Welt Illyricum. The next year, as he prepared for his return to Conftantinople, he was feized with a dropfy, owing to the die great fatigucs he had undergone during the war. As foon as he perceived himfelf to be in danger, he made his will; by which he bequeathed the empire of the Eaft to Arcadius, and confirmed Honorius in the porfethon of the Wett. He likewife contirmed the pardon which he had granted to all chofe who had borne arms againt him, and remitted a tribute which had proved very burdenfome to the people; and charged his two fons to fee thefe points of his will executed. He died at Milan on the 17 th of January 395, in the 16 th of his reign and 50 th of his age.

From the time of Theodofus to the time when the Empire uz Roman empire in the Wedt was totally deftroyed by furped by the Goths, we find but very little remarkable in the Bafilicuso hiltory of Conftantinople. At this time the eaftern empie was ufurped by Baflifeus, who had driven out Zeno the lawfut emperor; being affited in his confpiracy by the emprcfis Verina his fifter. Zeno Aed into Ifauria, whither he was purlued by Illus and Trecondes, two of the ufurper's generals ; who having ealily defeated the few troops he had with him, forsed the unhappy prince to fhu: himfelf up in a caltle, which they immediately invelted. But in a flort time Bafihfeus having difobliged the people by his cruelty, avarice, and other bad qualities, for which he was no keis remarkable than his predeceffor had been, his generals joined with Zerio, whom they reltored to the throne. After his relloration, Zeno having got Batilitcus into his power, confued him in a caftle of Cippadocia together with his wife Zenonides, where they both

Confan- perifhed with hunger and cold. This happened in the uncpolitan riftery.

90 Is rarved to deach 91 Great are at Comfan tinople. year 467 , after Banlificus had reigned about 20 months. During the time of this ufnrpation a dreadful fire hap. pened at Conitantinople, which confumed great part of the city, with the library containing $\mathbf{1 2 0 , 0 0 0}$ vo. lumes; among which. were the works of Homer, written, as is faid, on the great gut of a dragon 120 feet long.

The misfortanes which Zeno had undergone did not work any reformation upon him. He till conti- nued the fame ricions courfes which had given occafrun to the ufurpation of Bafilifeos. Other confpiracies were formed againlt him, but he had the good fortune to efcape them. He enzaged in a war with the Oltrogoths, in which he proved unfucce?fful, and was obliged to gield the provinces of Lower Dacia and Moctia to then. In a fhort time, however, Theodoric their king made an irruption into Thract, and advanced within 15 miles of Contantinople, with a defign to befiege that capital: but the following year, $\ddagger 85$, they reticed in order to attack Odoacer king of Itaiy; of which country Thendorio was proclained king in 493. The emperor Zeno died in the gear 481, in the 65 th year of hio age, and 17 th of his reign.
92 9 The Roman empire had now for a long time been the Roman on the decline: the ancient valour and military difcipline which had for fuch a long time tendered the Romans fuperior to other nations, had greatly degenerated; fo that they were now by no means fo powerful as formerly. The tumults and difurders which had happened in the empire from time to time by the many ufurpations, had contributed alfo to weaken it very much. But what prosed of the greateft detriment was the allowing vait fwarms of babbatians to fettle in the different provinces, and to ferve in the Roman empire in feparate and indeperdent bodus. This had proved the immediate calle of the difflution of the weftern empire; but as it affected the eaftern parts leis, the Conftantinopulitan empire continutd for upwards of 9 -o years atter the weftern one was totally diffolved. The weak and imprident adminitration of Zeno, and Araftafius a ho !ucceeded him, had seduced the eatern empire $\|$ ill mure; a.d it might pelfibly .have expired in a thort tine atter the welfern one, had not the wile and vigorous concuct of Julin, and his parner Jultinian, 16 vived in fome meafure the ancient martial firit which had origitally raifed the Roman empire to its highert pitch of grandeur.

Juttio afcended the throne in $5 \mathrm{t} \%$. In 52 I be engaged in a war with the Perfans, who had all along been very formidable cremies to the Roman name. Againft them he employed the fannous Belifarius; but of him we hear nothing remarkable till after the acceflion of Julinian. This pritace was the nephew of Juftin, and was by him taken as his parterer in the empine in 527 ; and the fame year Jultin died, in the 77 rh year of his age and ath of his reign. Juftinian being now fole mafter of the empire, bent his whole force againft the Perlians. The latter proved fuccefs. ful iu the firt engagenien; but were foon afier ustenly defeated by Behiarius on the froniers of Perha, and likewife by another general named Dorstions in Armenia. The war continued with various fuccefs during the full five years of Jutinian's reign. In the fixth year a peace was concluded ugon the following
term3: 1. That the Roman emperor fhould pay to Coirhoes, the king of Perlia, 1000 pounds weight of gold. 2. That both princes fhould reitcre the places they had taken during the warso 3. That the commander of the Roman forces hould no longer refide at Daras on the Perfian frontiers, but at a place called Confantina in Melopotamia, as he had formerly done. 4. That the Iberians, who had fided with ihe Romans, fhould be at liberty to return to thcir owa country or itay at Conitantinople. This peace, concluded in 532, was fyled fermal; but io the cuent proved of very Thort duration.

About this time happened at Conflanticople the $\mathrm{Greate} 9{ }^{95}$ greateft tun:ult mentioned in hiftory. It began among n the in the different factions in the cirens, but ended in an Comannopen rebellion. The multitude, highty difiatiofied with tas the the conduct of John the prefetus pratorio, and of 'frebonianus then quelor, foreed Hypatius, nephew to $\mathfrak{l l}$, emperor Anaftaius, to accept the empire, and proclaimed him with great folemnity in the forum. As the two zbove-mentioned minifters were greatly abhorred by the populace on zecount of their avarice, Juftinian immediately difcharged them, hoping by that means to appeafe the tumult : but this was to far from anfwering the purpofe, that the mulitude only grew the more outragcous upon it; and molt of the fenators joining them, the emperor was fo much alarmed, that he had thoughts of abandoning the city and making his efcape by fea. Iff this dilemma the emprefs Theociora encouraged and perfuaded him rather to patt with his life than the kingdom; and he at lat refolved to defend himfelf to the utmoil, with the few fenators who had not yet abandoned him. In the mean time, the rebels having attempted in vain to force the gates of the palace, carried Hypatius in triumph to the circus; whe:e, while he was bebolding the fpurts from the imperial throne, amidt the fhouts. and acclamations of the people, Belifarius, who had been recalled from Perlia, entered the city with a confiderable body of treops. Being then apprifed of the ufurpation of Hypatius, he marched flaiaht to the circus; fell fword in hand upon the difarmed multitude; and with the affllance of a band of Heruli, h:eaded by Mundus governor of Illericum, cut about 30.cco of them in pieces. Hypatits the warper, and Pompeius anuther of the nephews of Aualtatios, wen taken prifoners and carried to the cmperor, by whofe orders they were hoth beheaded, and their bodres call into the fez. Their eftates were conbicated, ana likewife the eitates of fuch fenators as had joined with thein; but the emperor caufed great part of theit lands and effects to be afterwards rellored, together with their honours and dignities, to their children.

Jutinian having now no other enemy to contend with, turned bis arms againft the Tandals in Airica, and the Gothe in Italy; both which provinees be recovered out of the hands of the barbarians *. But te. - Sce E.r. fore his general Betifarius had time to eftablifi folly bryand the Ruman fower is Italy, he was recalled in order to coote carry ua the war agaialt Cofrhues kiag of Pertas Anotice Whu, in ceflance of the treaty fornchy indudul in w. 532, entered the Roman dominiuns at the head of athe pu powerful army. The fane year, howewer, a peacelaris. was concluded between the wo mations upon the following concitions: f. That the Romatrs thould, with-

Connan. inepolita a kiftory.

(-nithe in two numths, pay to the Perian king 5000 pounds t nomben weight of gold, and an annual pention of 500 . 2. That hiferer: the Perlians thonlat relinquith a! clain to the fortrets of Daras, and maintain a body of troups to guard the Cafpian gates, and prevent the barbarians from breaking into the empire. 3. That upon payment of the above-mentioned fum, Cuthoes thould immediately withdrav his troops from the Roman dominions. The treaty being figned, and the ftipulated fum paid, Cofrhnes began to march back again; but by the way phundered feveral cities as if the war had itill contimed. Hereupon Jutioian refulved to purfue the war with the utmon vigour ; and for that purpole difpatched Belifarius into the eaft. But foon after he was obliged to recal him in order to oppofe the Goths
9. Who had gained great advantages in Italy after his deDate con-parture. Pie Pertian war was then carried on with LLased. indifferent fuccefs till the year 558, when a peace was concluded upon the emperor again paying an immenfe fum to the enemy. The fame year the Huns, palfing the Danube in the depth of winter, marehed in two bodies directly for Conkantinople; and laying wafte the countries through which they paffed, came, without meeting the lealt oppofition, within 150 furlougs of the city. But Belifatius marching out againt them with an handful of men, put them to fight; the emperor, however, to prevent them from invading the empire anew, agreed to pay them an annual tribute, upon their pronifing to defend the empire againtt all other barbarians, and to ferve in the Roman armies when required. This was the laft exploit peaformed by Belifarius, who on his rcturn to Conftantinople was difgraced, ftripped of all his employments, and confined to his houfe, on pretence of a confpiracy againt

- See Berifouius. the emperor *. In the year 565 a real confpiracy was formed againl Juthinian, which he happily efeaped, and the conlpirators were executed ; but the emperor did not long furvive it, being carried off by a natural death in 565 , in the $39^{\text {th }}$ year of his reign.

Uuring the reign of Jultinian, the majelty of the Roman empire feemed to revive. He recovered the provinces of Italy and Africa out of the hands of the barbarians, by whom they had been held for a number of years ; but after his death they were foon lott, and the empire tended falt to diffolution. In 50 .) Italy was conquered by the Lombards, who held it for the fpace of 200 years. Some annends, however, was made for the lofs by thie acquifition of Parfarmenia; the inhabitants of which, being perfecuted by the Perlians on account of the Chriltian religion which they profeffed, revolted to the Romans. This produced a war between the two nations, who continued to weaken each other, till at laft the Perfian monarchy was utterly overthrown, and that of the Romans greatly A See $A r a$ reduced by the Suracens $\dagger$. Thefe new enemics atbes. tacked the Romans in the year $6 \mathbf{j}_{2}$, and purfued their conquefts with incredible rapidity. In the face of four years they reduced the prosinces of Egypt, Syria, and Paletine. In $\sigma_{4} 8$ they were alfo matters of Mefopotamia, Phemicia, Africa, Cyprus, Aradus, and Rhodes; and having defeated the Roman fleet, commanded by the emperor Conttan's in perfon, they concluded a peace on condition of keeping the vaft extent of territory they had feized, and paying for it 1.000 nummi a-year.

An expetition againt the Lombards was about this time whertaken, but with very little fuccefs, a hody of $\pm 0,000$ Romans being almoit entirely cat off by one of the Lonbard generals. In 671 the Saracens rdvaged Eeveral prorinces, made a defcent in Sicily, took and plandered the city of Syracuie, and over-ran the f whole illand, dettroying every thing with lire and fword. In like manner they laid wate Cilicia; and baving pafed the winter at Sinyrna, they entered Thrace in the winter of the year 672, and laid fiege 100 to Conftantinople itfelf. Here, however, they were nople berepulfe: with great lofs: but next fpring they renew- fieged by ed their attempt, in which they met with the fame cens. bad fuccels; many of their hips being burnt by the fra-fire, as it was called, becaufe it burnt under water; and in their return home their flect was wrecked of the Scyllxan promontory. At lalt a peace was concluded for 30 years, on condition that the Saracens fhould retain all the provinces they had feized; and that they fhould pay to the emperor and his fucceffors 3000 pounds weifht of gold, 50 flaves, and as many choice horfes.

## 101

This peace was fearce concluded, when the empire Empire in. was invaded by a new enemy, who proved very trouble- vaded by fome for a long time. Thefe were the Bulgarians; the Bulgawho breaking into Thrace, defeated the Roman army fent againft them, and ravaged the country far and wide. The cmperor confented to pay them an annual penfion, rather than continue a doubtful war ; and allowed them to fettle in Lower Mofia, which from them was afterwards called Bulgaria. In 687, iney were attacked by Jultinian II. who entered their country without provocation, or regarding the treaties formerly concluded with them. But they falling fuddenly upon him, drove him out of their country, and obliged him to reftore the towns and captives he had taken. In 697, this emperot was depofed; and in his exile fled to Trebelis king of the Bulgarians, by whom he was kindly entertained, and by whofe means he was reftored to his throne; but foon forgeting this favour, he invaded the country of the Bulgarians, with a defign to wrell from them thofe provinces which he had yiclded to them. He was attended in this expedition by no beiter fuecefs than his ingratitude defer- They deved his army being uerly defeated and he himfelf fat Juthiobliged to make his efcape in a light vefirl to Conitantinople. T'ue Dulgarians continued thein iaroads and ravages at diffitent times, generally defeated the Romans who ventured to oppofe them, till the year 800, the feventh of the reign of Nicephorus, when they furprifed the city of Sardica in Mcefa, and put the whole garrifon, conlifting of 6000 men , to the fword. The emperor marched againlt them with a confiderable army: but the enomy retired at his approach; and he, inftead of purfuing them, re:urned to Conftantinople. Pwo years after, he cutered Bulgaria at the head of 103 a powerful army, dellroying tvely thing with fire and try cruel:' fovord. The king offered to conclude a peace with ravaged by him upon homourable tewns; but Nicephorus, reject- Nice hoing his propofals, continued to wafte the country, de- rus. ftro;ing the cities, and putting all the inhabitants, without diftinction of fex or age, to the fword. The king was fo much affeeted with theit cruelties which were exercifed on his fubjects, that he fent a fecond embaffy to Nicephorus, offring to conclude

ros nued to be very formidable enemies to the empire, till Theirconn the year 979, when they were attacked by Bafilins 11 . try invaded The Bulgarians were at that time governed by a king by Balitnamed Samuel; who having ravaged the Roman territories, as was the common practice of his ation, Baflius fent agantl him one Nicephorus Uranus at the head of a powerful army. Uranus, leaving his baggage at Lariffa, reached by long marches the Sperchius, and encamped with his whole army over againft the enemy, who lay on the oppofite bank. As the river was greatly fwelled with the heavy rains that had lately fallen, Samuel, not imagining the Romans would attempt to pafs it, fuffered his troops to roam in large parties about the conntry in quelt of booty. But Urarus having at length found out a place where the river was fordable, paffed it in the dead of the night without being petceived. He then fell upon the Bulgarians who were left in the camp, and lay for the moft part aneep; cut great numbers of them in pieces; took a great number of prifoners, with all their basgage; and made himlelf matter of their camp. Samuel and his fon were dangeroufly wounded; and would have been taken, had they not all that day concealed themfelves among the dead. The next night they fole away to the mountains of 原tola, and from thence made their efcape into Bulgaria. The following year the emperor entered Bulgaria at the had of a numerous and well-difciplined armv; defeated Samuel in a pitched battle, and took feveral ftrong cities. The emperor himfelf, however, at laft, nar. rowly efcaped being cut off with his whole army; being unexpectodly attiacked by the Bulgarians in a narrow pals. From this danger he was relieved by the arrival of Nicephorus Xiphias, , overner of Philpopolis, with a confiderable body of troops; who falling upon the enemies rear, put them to fights. Bafihus number of captives, caufed their eyes to be pulled out, leaving to every hundred a guide with one eye, that he might conduct them to Samuel. This focking fpectacle fo affected the unhappy king, that he fell into a deep fwoon, and died two days after. The Ro. man emperor purfued his conquetts, and in the face of two years made himfelf matter of moll of the ene-
mies ftiong holds. He defeated alfo the fucceffor of The coun. Samuel in feveral engagements; and having at laft killed him in battle, the Bulgarians Cubmitted themfelves without referve. The valt treafures of their frinces were by Bafilius diltributed among his foldiers by way of donative. Soon aftcr, the widow of the late king, with her fix danghters and three of her fons, furrendered themfelves to the Roman emperor, by whom they were received with the utmoft civility and refpect. This obliging behaviour encouraged the three other fons of the late king, and moft of the
mountains, co fubmit, and throw themfelves on the tinomolitan cinperor's mercy.

Ifatzes, however, a perfon nearly allied to the royal 108 family, who had ditimguithed himielf in a very emi- Ibazzes anent manner duing the whole courle of the war, re- lonchulds fufed to fubmit, and Aed tos a lleep and craggy moun. out. tain, with a defign to defend himfelf there to the laft extremity. Balifins endeavoured to caufe him fubmit by fair means, but he equally defpifed both threats and promifes. At laf Eultathius Daphnomelus, whom roo Batilius had lately appointed governor of Achridus by a take the chief city of Bulgaria, undertook to Cecure himgen. by a noft defperate and improbable fcheme. Without communicating his defign to any, he repaired, with two perfons in whom he could confide, to the monntain on which Ibatzes had fortified himlelf. He hoped to pafs undifcuvered among the many ftrangers who flocked thither to celebrate the approaching feaft of the Virgin Mary, for whom lbatzes had a particu. lar veneration. In this he found himfelf miflaken; for he was known by thie guards, and carried before the prince. 'To him he pretended to have fomething of importance to communicate; but as foon as Ibatzes had retired with him into a remote place, Daphnomelus threw himfelf fuddenly upon him, and with the affifance of the two men whom he had brought with him, pulted out both his eyes, and got fale to an abandoned caltle on the top of the hill. Here they were immediately furrounded by the troops of lbatres; but Daphomelus exhorting them now to fubmit to the emperor, by whom he affured them they would be well recsived, they congratulated Daphnomelus on his fuccefe, and fuffered him to conduct the unhappy Ibatzes a prifoner to Bafilius. The unperor was no lefs furprifed than plealed at the fuccefs of this bold attempt; and rewarded Daphnomelus with the government of Dyrrhachium, and all the rich moveables of his prifoner. After this, laving accomplifhed the entire reduciion of Bulgaria, he returned to Confantinsple with an incredible number of captives; where he was received by the fenate and people with all poffible demonftrations of joy.

All this time the Saracens had at intervals invaded the Roman dominions, and even attenipted to make themfelves mafters of Conftantinople. Their internal divifions, however, rendered them now much lefs formidable enemies than they had formerly been; fo that fome provinces were even recovered for a time out of their hands; though the weak and diftracted fate of the empire rendered it impoffible to preferve fuch conquefts. But in 10.45, the empire was invaded by an iro enemy, not very powerful at that time indeed, but whopire menby degrees gathered ftrength fufficient to overthrow ded by the both the Roman and Saracen empires. Thefe were the 「urks. Turks; who having quitted their ancient habitations Account of in the neighbourhood of mount Caucafus, and paffedthem,
the Cafpian ftraits, fettled in Armenia Major, about the year 844. There they continued an unknown and defpicable people, till the inteltine wars of the Saracens gave them an opportunity of aggrandizing themfelves. About the year io30, Moliammed the fon of Simbracl fultan of Perfia, not finding himfelf a match for Pifaxis fultan of Babylon, with whom he was at war, lad

hillory.
the command of one Tangrolipix, a leading man among hillory, them. By their affiftance Mohammed defeated his adverfary; but when the Turks defired leave to return home, he refufed to part with them. Upon this they withdrew without his confent to a neighbouring defart; and being there joined by feveral difentented Perfians, began to make frequent inroads into the fultan's territories. Againt them Mohammed immediately difpatehed an army of 20,000 men; who, being furprifed in the night, were utterly defeated by Tangrolipix. The fame of this vietory drew multitudes to him from all parts; fo that in a Rort time Thangrolipix faw himelf at the head of 50,000 men. Upon this Mohammed marched againft them in perfon, but was thrown from his horfe in the beginning of the engagement, and killed by the fall; upon which his men thew down their arms, and fubinitted to Tangrolipix.

After this victory the Turkifh general made war apon the fultan of Babylon: whom he at length flew, and annexed his dominions to his own. He then fent his nephew, named Cuthe-Mofes, againt the Arabians;
Whisy de. but by then he was defeated, and forced to fly tofeat the Ro wards Media. Through this province he was denied mans. a paffage by Stephen the Roman governor: upon which Cutlu-Mofes was obliged to force a paffage by encountering the Roman army. Tbefe he put to flight, took the governor himfelf prifoner, and without any further oppofition reached the confines of Perfia, where lef fold Stcphen for a flave. Returning from shence to Tangrolipix, he excufed, in the beft manner he could, his defeat by the Arabians; but at the fame time acquainted him with his victory over the Romans in Media, encouraging him ta invade that fertile country, which he faid might be eafily conquered, as it was inhabited by none but women, meaning the Romans. At that time Tangrolipix did not hearken to his advice, but marched againft the Arabians at the head of a numerous army. He was, however, attended with no better fuccefs than his nephew had been; and therefore began to reflect on what he had told him.
ris Soon after he fent Afan his brother's fon with an army A Turkinh of 20,000 men to reduce Media. Purfuant to his orarmy en- ders, the young prince entered that country, and tirely cut off.
${ }_{1 i}{ }_{4}$ They arzin
invad the enpire. committed every where dreadful ravages: but being in the end drawn into an ambuth by the Roman generals, he was cut off with his whole army. Tangrolipix, no way dif-ouraged by this misfortune, fent a new army into Media near 100,000 Arong; who after having ravaged the country without oppofition, laid fiege to Aitza a place of great trade, and therefore reckoned the moft wealthy in thofe parts. Not being able to reduce it by any other means, they fet it on fire; and thus in a flort time it was utterly deflroyed: the buildings being reduced to afhes, and 150,000 of the inhabitants perilhing either by the flames or the fword. After this Abraham Halim, half brother to Tangrolipis, hening that the Romans, reinforced with a body of troops under the command of Liparites governor
nis of Iberia, had taken the field, marched againt them, An obti- and offered them battle; which they not declining, nute engrent.ent.
per to purfue the fugitives, as their general Liparites was taken prifoner. The emperor, greatly concerned for the captivity of Liparites, difpatched ambaffadors with rich prefents, and a large fuin of money to redeem him, and at the fame time to conclude an alliance with Tangrolipix. The fultan received the preCents; but generoully returned them together with the money to Liparites, whom he fet at liberty without any ranfom ; only requiring him, at his departure, never more to bear arms againft che Turks. Not long after, Tangrolipix fent a perfon of great authority among the Turks, with the character of ambaflador, to Conttantinople; who having arogantly exhorted the emperor to fubmit to his mafter, and acknowledge himfelf his tributary, was ignominiouly driven out of the city.
Tangrolipix, lighly affronted at the reception his ambaflador had met with, entered Iberia while the emperor Conftantine Monomachus'was engaged in a war with the Patzinace, a Scythian nation. Having ravaged that country, he returned from thence to Media, and laid fiege to Mantzichierta, a place defended by a numerous garrifon, and fortified with a triple wall and deep ditches. However, as it was fituated in an open plain country, he hoped to be matter of it in a Mort time. But finding the befieged determined to defend themfelves to the laft extremity, he refolved to raife the fiege, after he had continued it 30 days. One of his officers, however, named Alcan, prevailed on him to continue it but one day longer, and to commit the management of the attacks to him. This being granted, Alcan difpofed his men with fuch Rill, and fo encouraged them by his example, that, notwithlanding the vigorous oppofition they met with, the place would have probably been taken, had not Alcan been llain as he was mounting the wall. The befieged, knowing him by the richnefs of his armour, drew him by the hair into the city, and cutting off his head threw it over the wall among the enemy : which fo difheartened them, that they gave over the affault and retired. The next fpring Tangrolipix returned, and ravaged I- raifed beria with the utmoft eruelty, fparing neither fex nor age. But on the approach of the Roman army he retired to Tauris, leaving 30,000 men behind him to infelt the frontiers of the empire. This they did with great fuccefs, the borders being through the avarice of Monomachus unguarded. Till the time of this emperor, the provinces bordering on the countries of the barbarians had maintained, at their own charge, forces to defend them; and were on that account exen!pted from paying tribute: but as Monomachus exacted from them the fame fums that were paid by others, they were no longer in a condition to defend themfelves.

In 1063 died the emperor Conftantine Ducas, having left the empirc to his three fons, Michael, Androuicus, and Conftantine : but as they were all very young, he appointed the emprefs Eudocia regent du- The 118 ring their minority, after having requited of her an prefs Eudo. oath never to marry; which oath was with great fo- cia forced lemnity lodged in the hands of the patriarch. Cortan- a woman, broke into Mefopotamia, Cilicia, and CinpEnorolitan hiftory.
padocia, deftroying all with tire and fword. The cmprefs was no way in a condition to oppofe them, the greater part of the army baving been difonded in her huband's life-time, and the troops that were aill on fout being undifciplined, and altogether unfit for fervice. The concern which this gave the emprets was aggravated by the feditious fpeeches of a difcontented party at home, who repeated on all occalions that the prefent tate of affairs required a man of courage and addrefs at the helm, infead of a weak and helplefs woman; and as they inagined the emprefs, would never think of marrying, in confequence of the oath the had taken, they hoped by thefe Speeches to induce the people to revolt, and choofe a new emperor. This Eudocia was aware of ; and therefore determined to prevent the evils that threatened heifelf and lice family, by marrying fome perfon of merit who was capable of defeating her enemies both at home and abroad. At this time one Romanus Diogenes, a perfon of a mott bcautifut afyect, extraordinary parts, and illutrious birth, being accufed of afpiring to the empire, tried and conviited, was brouglit furth to reccice fentence of dcath. But the cmprefs, touched with compaffion at his appearance, gently upbraided him with his ambition, fet him at liberty, and foon after appointed him commander in chicf of all her forces. In this tation lie acquitted himinflf fo well, that the emprefs refolved to marry him if the conild but recover the writing in which her oath was contained out of the hands of the patriarch. In order to this, fhe applied to a favourite eunuch; who going to the patriarch, told him, that the enprefs was fo taken with his nephew named Burdus, that fhe was detcrmined to marry and raifc him to the empire, provided the patriarch abfolved her from the oath the had taken, and convinced the fenate of the tawfulnefs of her marriage. The patiarch, dazzled with the profpect of his nephacr's promotion, readily undertook to perion both. He firft obtained the confent of the fenate by repreferting zo them the dangerous tate of the cmpire, and exclaiming againit the rafh oath which the jealoury of the late emperor had extorted from the emprefs. We then publicly difcharged her from it; relkored the writing to her; and exkorted her to marry fome deferving object, who being entrulted with an abfolute authority, might be capable of defending the empire. The emprefs, thus difeharged from her oath, married a few days after Romanus Diugenes; who was thereupon proclaimed emperor, to the great difappointmeat of the patriarch.

As the new emperor was a man of great acivity and experiencc in war, he no fooner faw himfelf velted with the foverign pores, than he took upon him the command of the army, and paffed over into A fia with the few forces he could aftemble, recruiting and inuring them on his march to military difeipline, which had been utterly neglected in the preceding reigus. Oa liis arrival in this contincnt, he was informed that the tures had furprifed and plundered the city of Neocerfanen, and were retiring with their booty: On this news lic badtued after them at the head of a chofen bodv of light armed troops, and came up with then on the third day. As the Turks were marehing in diferder, withost the leat appretention of an encom. WOV. Yart I.

Romanus cut great mambers of thom in pieces, and Confancatily recovered the booty; after which he purfued his tino ontan math to Aleppo, which he sctook from them, tore- liik: ther with Hisrapolis, where he built a ftrong eallle:

As he was returning to joir. the forcea he lad hefegana acebehind him, he was met by a numerous budy of 'lurks, cond vituwho atiemped to cut ofl his retreat. At firt he pre- ${ }^{1 \%}$ tended to decline an engagement through fear; but attacked them afterwards with fuch vigour when they lealt expected it, that he put them to flight at the firlt onfct, and might have gained a complete victory had he thought proper to purfue whem. After this, feveall towns fubmitted to him; but the fealon being now far fpent, the emperor returned to Conltantinople. The following year he pafted over into Afia early in the firing; and being informed that the Turks had facked the rich city of Iconium, befides gaining other confiderable advantages, the marched in perfon againit them. Bat the Turks, not thinking it advifable to mey ${ }^{125}$ wait his comingr, retired in great hafte. The Arme-agan dcnians, however, encouraged by the approach of the featel. emperor's army, full upon the eueny in the plains of Tarlus, put them to fight, and fripped them boty of their baggage and the booty they liad taken. The fpring folluwing the emperor once more entered Afia at the head of a confiderable army which he had raifed, and with incredible pains difciplined duritg the winter. When the two armies drew near to each other, Axan, the Turkifh Sukan, and Son of the famou; Tangrolipix, fent propofals to Romanus for a lating and honourable peace. Thefe were imprudently rejec The lio. ted, and a defperate engagenome criced, when, iunans it. fpite of the utmont efforts of the emperor, his anmy fated and vas roated, and the himfilf wounded and taken pri- the empe. funer. When this nets was brought to Axan, he could farcely believe it; but being convinced by the appearance of the royal captive in his prefence, he tenderly embraced him, and adorexed him in an uffee. tionate manner: "Crieve not (tid he), moid noble emperor, at your misfortune; for fuch is the chanc: of war, fometimes overwhachning one, and fometimes another: you fall hase no occaftor to complain of your captivity ; for I will not ufe you as my pifone, but as an emperor." The Turte was as good as his word. He lodged the emperor in a royal pavilion; affigned him attendants, with an equipage fuitable to his quality; and difcharged fuch prifoners as he delired. After he had for fome days entertained his royal captive with extraordinary magnificence, a perpetual peace was concluded betwixt them, and theemperor difmifled with the greateft marks of bonour inaginable. He then fet out with the 'Iurkifh ambaffador for Conftaminople, where the peace was to be ratified; but by the way he was informed that Eudocia had been driven from the throne by Inh the brother of Conftantine Ducas, and Pfellus a leadine 127 man in the fenate, who had confined her to a monf Eudocia detery and prochimed her eldeft tery, and prochamed her eldett fon, Michael Ducas, confined in
emperor. On this intelligence, Romanus retired to monate a frong cattle near Theodoliopolis, where he hoped in ry. a dhort time to be joined by great numbers of his friends and adherents. But in the mean time John, who had taken upon him to act as guardian to the young prince, difpatched Andronicus with a confulerable army againlt him. Andronicus having eafily de.

 acaininvale the empire.130

## They deft: the Ru-

 anns. he was chefly bifieged, and at lath obliged to farender. Andmoicus carvied his prifoner into Phrygia, where he fell dangerouny ill, being, as was fufpected, fecretly poiloned. But the poilon being too flow in its upration, fohn ordered his eyes to be put out; Which was done with fuch crutty that he died ioon after, in the year 1067 , having reigned three years and eight months.Axan was no fooner informed of the tragical end of his filend and ally, than the refolved to invale the empire anew; and that not with a defign only to plunder as furmerly, but to conquer, and keep what he thad once conquered. The emperor difpatched againft lim Ifaac Comnenus, with a confiderahle arny; but he was utterly defeated and taken prifoner by Axan. Another army was quickly lent off under the command of John Ducas the emperor's uncle. He gained at fint fome advantages, and wrould probably have put a flop to their conquefls, had not one Rufelius, or Urfelius, revolted with the troops he had under his command, caufed himfelf to be proclaimed emperor, and reduced Ceverd cities in Phrygia and Cappadosia. Againt bim John marched with all his forces, fuffering the Turks in the mean time to purfue their conquefts; but coming to an engagement with the rebels,
15 r . his army was entirely defeated, and himfelf taken priThes gaisa foner. Notwith!tanding this victory, Rufelins was fo scond vit much alarmed at the progrefs of the Turks, that he not w the common eneny, by whom they were both defeated and taken piloners. Axan, however, was for fome time prevented from purfuing his conquelts by CutlaMofes, nephew to the late T'angrolipix. He had revoited againit his uncle; but being deleated by him in a pitched battle, had taken refure in Arabia, whence he now retumed ai the head of a confiderable army, in order to difpute the fovereignty with Axan. But whice the two armics were preparing to engage, the kalif of Babylon, who was flitlooked upon as the fucetfor of the ereat prophet, interpofed his authority. Exe reprefented the dangers of their inteftine diffenfoos; and by his mediation, an agrecment was at laf concluded, on condition that Axan thould enjoy undifwhed the monarchy lately left lim by his father, and Cuth-Mofes fhould pofiefs fuch provinces of the Roman empire as he on his fons hould in procefs of time conquer.

After this agreement, both the Turkifh princes turned their forces againt the empire; and before the
332 year 107\%, made themfelves mafters of all Media, Lycaotia, Cappadocia, and Bithynia, fixing the capital city of their empire at Nice in the latter province. During all this time, the emperors of Conftantinople, as will as their fubjects, feemed to be in a manner infatuated. No nocice was taken of the great progrefs made by thefe barbarians. The generals were ambitious only of feizing the tottering empire, which feemed ready to fall a prey to the Curks; and, after it was obtained, fpent their time in oppreffing their fubjects, rather than in making any attempts to repulfe the enemy.

At laft Alexius Comnenus, having wrelted the empire from Nicephoru Botoniates, in 1077, began to
prepare for opyofing fo formidable an enerny. But Cumamtefore he fet out, as his foldiers had committed great tinopolian outrages on his acceffion to the empire, he refolved hiftory. to make confeffon of his fins, and do ofen penance $13{ }^{\circ}$ for thofe he had fuffered his army to commit. Ac-alcxius cordingly he appeared is the attire of a penitent be- Comnctus fore the patriarch and feveral other ecclefiattice, ac- Popstheir knowhedged himfelf guilty of the many diforders that progref. had heen committed by his foldiers, and begged of the patriarch to impole upon him a penance fuitable to the greatnefs of his crimes. The penance enjoined him and his adherents by the patriarch was to fatt, lie upon the ground, and practife feveral other auteritics for the fpace of 40 days. 'This command was religioufly obeyed, and the emperor then began to prepare for war with fo much vigour, that Solyman, the Tuskif fultan, fon and fucceffor to Cultu-Mofes, difpatched ambdifadors to Alexius with propolals of peace. Thete were at firll rejected; but the emperor was at latt glad to accept them on certain advice, that Robert Guifchard, duke of Puglia and Calabria, was making great preparations againf him in the Weft.

To this expedition, Rubert was incited by Michael Robert Ducas. That prince t:ad been depoled by Nicepho. Guifchard's ru Botoniates, and torands the end of the ufurper's exiedition reign fled into the Wett, where he was received by tmperor. Robert, who was prevailed upon to favour his caufe. For this purpofe; Robert made great preparations; and thele were continued $\epsilon$ ven after the depolition of $\mathbf{1}_{35}$ Botoniates. He failed with all his forces from Brun-He parfes dufnum; and landing at Buthrotum in Epirus, made over into himifelf matter of that place, while his fon Bohemond Epirus and with part of the aımy reduced Aulon, a celebrated Defleyes port and city in the country now called Alluania. um. From thence they advanced to Dyrbbehium, which they invelted both by fea and land; but met with a matt vigorous oppolition from George Pateologus, whom the emperor had entrutted with the defence of that important place. In Ipite of the utmot efforts of the enemy, this commander held out till the arrival of the Venetian fleet, by whom Robert's navy commanded by Buhemond was utterly deleated, the admiral himfelf having narrowly efcaped being taken prifoner. After this vietory, the Venetians landed without lofs of time, and being joined by Paleologus's men, fell upon Robert's troops with fuch fury, that they deltroyed their works, burnt their engines, and forced them back to their camp in great diforder. As the Venetians were now mafters at fea, the befieged were fupplied with plenty of provifons, while a famine began. to rage in the camp of the enemy; and this calamity was foon followed by a plague, which in the face of three months is faid to have deftroyed ten thoufand men. Nothwithllanding all thefe difafters, however, Robert did not abandon the fiege: having found means to fupply his famifhed troops with provifions, he continued it with fuch vigour, that the courage of the befieged began at lait to fail them; and Paltolugus fent repeated meffages to the emperor, acquainting him that he would be obliged to furrender unlefs very fpeedily affifted. On this Alexius marched in perfon to the relief of the cit $y$, but was defeated with great. lofs by Robert. The whole right wing of Alexius's army, finding themfelves hard preffed by the enemy, fled ta a church dedicated to St Michael, imagining they

 furenders church, which was burnt to ahes with all who were in it. The emperor himfelf with great difficulty made his ceape, leaving the enemy maters of his camp and all his baygage. Som after this defeat, the city furrendered; and Alexis being deftitate of refources for carrying on the war, feized on the wealth of churehes and munalt ries, which gave much offence to the clergy, and had like to have occafioned great difturbances in the Impetid city. At the fame time, Alexius cotering into an alliance wih Henry emperor of Germany, perfuaded lim in invade the dominions of Robert in Italy. At firl Henry met witb great fuccels; but vas fonn overcome, and driven out of that country by Robert. Bohemord, in the man time, reduced feveral places in Illyricum; and, having defeated Alexius in two pitched battles, entered Theffaly, and fat down before Luriffa. This place, being defended by an officer of great courage and experience in war, held out till the emperor came to its relicf. Soon after his arrival, he fourd means to draw a trong party of Bohe- mond's meen into an ambureade, and cut them off al motl entirely. Hosever, in the battle which was fought a few days after, Bohemond had the atvantage: but his troops mutinying and refuling to carry on the war, he was obliged to return to Italy. Alexius taking advantage of his abfence, recovered leveral citics; and being informed that Rubert was making great preparations againtt him, he had recourfe once more to the V'enetians. By them he was afilited with a powerful fleet, which defeated that of Robert in two engagements; but being foon after furprifed by him, they were defeated with the lofs of almon their whole navy. Robert is faid to have ufed his vitery with great barbarity, putiing many of his prifoners to death with unheard of torments. The Venetians equipped a fecond flect; and joining that of the emperor, fell unexpectedly upon Robert's navy, who were riding without the lealt apprehenfion in Dulnotum, funk mot of his thips, and took a great number of prifoners, his wife and younger fons having narrowly efcaped falling into their hands. Rubert made great preparations to revenge this defeat; but was prevented of by death from executing his defgns: and, after his deceafe, his fon Roger did not think proper to purfue fo dangerous and experfive a war. He therefore recalled his troops, and the places which had been conqueted by Rotert and Bohemond fubmitted anew to the emperor.This war was fcarce ended, when the Scythians pafing the Danube laid walle great part of Thrace, committing every where the greatelt barbarities. Againt them the emperor difpatehed an army under the command of Pacurianus and Branas. The latter infifted upon engaging the enemy contrary to the opinion of his colleague; and his rafhnefs caufed the lofs of the greater fart of the army, who were cut off by the Scythians, together with the two generals. Talisius, an officer who had fignalized himfelf on many occafions, was appointed to command the army in their room. He fell upon the enemy as they lay fecurely in the neighburthood of Philippopolis, cut great numbers of them in pieces, and obliged the relt to retire in great confufion. The following fpring, how.
cver, they retumed in fuch numberi, that the empe- Confont. ror refolved to marele againt them in perfon. Ac- timpoletan cordingly he fet out for Adrianople, and from thence hianre. to a place culled Lamed. Here, contrary to the at- :is vice of his beet officers, he ventured a battle; in which ine Ren. he was utterly defeated with the lofs of vat numbers onangoteof his men, he himfilf efaping with the umoll difi- fested. culty. The next year he was attended with no better fuccels, his army being entircly defeated with the lofs of his camp and bargage. In the year followine, Ther 40 108p, the emperor retrieved his credit; and gave the the defere Soythans fuch an overthrow, that very few claped the Sop thithe general haughter. Notwithtanding this difater, atso however, they again invaded the empire in 1003. 'I'o this they were encouraged by an impotor called Leo, who pretended to be the tideft fon of Romanm: Diogenes. The young Prince had beea flain in a battle with the Turks; but as the Scythians only wanted a pretence to renew the war, they received the impoltor with joy. By a dtatagem, however, Ico was murdered; and the seythians being afterwards overthrown in two great battles, were obliged to hab. mit on the emperor's own terms.

Sinee the ycar 1083 , the war had been carried on The Hithy with the Turks with valious faceefs; but now an af- War. fociation was formed in the Wett againf thefe infidels, which threatened the ntter ruin of the Turkith nation. This was oceationcd by the fuperitition of the Chriftians, who thought it a meritorious action to venture their lives for the recovery of the Holy Land, poffers fed at that time by the Tuks and Saracens. Had the wettern princes been properly affited by the emperors of the Eat in this undertaking, the Turks had undoubtedly been unable to refift them; but fo far from this, the Latins were looked upon by them as no lefo enemies than the 'lurks; and indeed whatever phaces they took from the infidels, they never thought of rettoring to the emperors of Conflantinople, to whom they originally belonged, but erected a number of fmall independent principalities; which neither having fuficient lrength to defend themfelves, nor being properly fupported by one another, foon hecame $5_{42}$ a prey to the Turks. In the year 1203, happened a Dreatful drcadful fire at Conltantinople, occafioned ly fomefire at ConLatin foldicrs. 'Thefe had plundered a mofque, which tantinon's. the Turks refiding in Contlantinople had been fuffered to build there. For this reafon they were attacked by the infidels; who being much fuperior to them in number, the Latins found themfelves obliged to fet fire to fome houfes, in order to make their ticape with fafety. The llame fereading in an initant from freet to flreet, reduced in a thort time great part of the city to afhes, with the capaeious ftore-houfes which had been built at a vaft expence on the quay. The late emperor laac Angelus, who had been reltored to his throne by the Latins, died foon after their departure from Conftantinople, leaving his fon Alexius fole mafter of the empire. The young prince, to difcharge the large fums he had promifed to the French and Venetians for their affilance, was obliged to lay heavy taxes on his fubjects; and this, with the great efteem and friendhip howed to his deliverers, raifed a general difcontent among the people of Conitantinople, who were forn enenies to the Latins. This encouraged John Ducas, furnamed MIutzuplius, from his joined

「anan- anl sicco cyobrow, to attempt the foversignty.
 hicn:

143 - I11 121. い'ilu fran richeses setur. figu: in exceution: and trangled the young prince with his own ham?. Ifter this he proteate a halelt to the people: toll thean what he had drone, which he prevended was in onder to fecure their libertics; and earneftly intruated them to choofe an emperor wha had courage enongh to defend them againt the La- tins that were ready to opprefs and enhare them. On this he was indantly faluted emperor by the ir sontant makitude ; bat this ufuepation proved the ruin of the city. The Latins immediately refolved to revenge the deatly of the young prince; and, as they had been So often betrayed and retarded in their expeditions to the Holy Land by the emperors of Conttantinople, to make themfelves maters of that city, and feize the empire for themfelies. In confeguence of this refolution they muftered all their forces in Alia, and having croffed the ftaits, laid liege to Confantinople by fea and land. The tyant, who was a man of great comage and experjence in war, made a vigorons defence. The Jatins, however, after having battered the walls for feveral days together with an incredible number of engines, gave a general affault on the sth of Apr:l 120 . The attack latled from break of day till three in the aftemoon, when they were forced to retire, after having tot fome of their engines, and :igreat number of ren. The affult was neverthelefs renewed 14. Sour days after ; when, after a warm difpute, the The sity tulsen and pindered Ey the Latins.
with Eaphrojere, the wife of Alexius Augerus a itce Conianufurpor, and her dithoter Euloxis, for whof fake he tiopuhitan had abandoned his dawtul wife.

 ons family; and, for hisemineat ferrices, diltinguilhed with the title of Cafar. He had heen fent again't Alexius Anselus ducpot of Epirus, who now attempted to recover fome places in Theffaly and Greece from Michael Palcologes, one of the Greck emperors, that, fince the capture of Conkantinople, had kept their court at Nice; and to try whether he could on his mäch furprife the inperial city itfelf. Alexius, having paffed the flraits, encamped at a place called Ropegina, where he was informed by the natives that a ftront body of the Latins lad been fent to the Lege of D.plonufa, that the garrifon was in great want of provilions, and that it would be no difficult matter to furprife the city. Hercupon the Greek general refolved at all events to aitempt it ; in which he was encouraged by fome of the inhabitants, who, coming privately to his camp, ofiered themfelves to be his guides. He approached the walls i.t the dead of the night, which fome of his men fealed without being oberved; ard, killing the centries whom they fomd afleap, opened one of the gates to the rett of the arny. The Greeks rufhing in, put all they met to the fwoid; and at the fame time, to create more turrur, fet fire to the city in four different places. The Latins, condoding from thence that the cnemy's forces were far more numerons than they really were, did not fo much as attempt either to drive them oat, or to extinguifh the flames. In this general confufion, the emperor Baldwin, quitting the enfigns of majelty, fled with Jutinian the Latin patriarch, and fome of his intimate friends, to the fea-fide; and there, embarking on a fmall vellel, falled firt to Eubuea, and afterwards to Venice, leaving the Greeks in full poffifion of Confantinoplc. When news of this furprifing and altogether unexpected fuccefs of Alexius were firt brought to Palcologus, he could farce give credit to it; but receiving foon after letters from Alexius inim. felf, with a particular account of fo memorable an. event, he ordered public thanks to be returned in all the churches, appeared in public in his imperial robes, attended by the nobility in their beft apparel, and ordered couriers to be difpatched with the agreeable news into all parts of the empire.

Suon after, having fettled his affairs at Nice, he fet Entry of ${ }_{146}$ out for Conftantinople with the emprefs, his fon An-Michael dronicus, the fenate, and nobility, to take poffefion Palcogolus. of the imperial city, and fix his relidence in that place that had originally been defigned for the feat of the enftern empire. Having pafled the ftrats, he advanced to the golders gate, and continued fome days without the walls, while the citizens were buied in. making the neceffary preparations to receive him with a magnificence fuitable to the occation. On the day appointed, the golden gate, which had been long that up, was opened, and the entperor enteling it amid! the repeated acclamations of the multitude, marched on foot to the great palace. He was preceded by the bithop of Cyzicus, who carried an image of the Virgin Mary, fuppofed to have been done by St Lake, and

## $\therefore \mathrm{N} \quad[373] \quad \mathrm{C} \mathrm{O}$

conisn followed by all the great officers, nobility, and chicf tiogu ditan hisory. ee refor is to its for mer grandeur. citioens, pompoully dreffed. Public thanks were agein return din the church of St Suphia, at which the"emperom alfited in perfon, with the clergy, the fenate, and nobility. Thefe exercifos were fucceded by all forts of rejoicings; after which the emperor cart fully furveyed the imperial city. This furvey greaily atlayed his joy. He faw the Atately palaces and other magnificent buildings of the Roman emperors lying in ruins; the many capacious buiddings that had heen liniory. erected by his predeceffors, at an immenfe charge, deltroyed by fire, and other uavoidahle accidents of war; feveral ftreets abandoned by the inhabitants, and choaked up with rubbifh, \& c. Thefe objects grave the emperor no fmall concern, and kindled in him a defire of relloring the city to its former lultre. In the mean time, looking upon Alexius as the refterer of his country, he canfed him to be clad in magnificent robis; placed with his own hand a crown on his head; ordered him to be conducted throughtlie city, as it were in triumph; decreed that liur a whole year the name of Alexius fhould be joined in the public prayers with his own : and, to perpetnate the memory of to great and glorious an action, he commanded his ftatue to he erected on a fately piliar of marble beforeathe church of the Apofles. His rext care was to re-peoule the city, many Grecek familica laving withdrawn from it while it was held by the Latins, and the latias now preparing to recurn to their refpective conatries. The former were recalled bone; and the latter, in regard of the gieat tade they carried on, were allowed many valuable privileges, which induced them not to remove. The Grecks were allowed to live in one of the moft beantiful guarters of the city, tu be governed by their own laws and magifrates, and to liade withont paying cuftoms or taxes of any kind. Great privileges were likewife granted to the aatives of Venice and Pifa, which encouraged them to lay atide all thoughts of removing, and the trade they carried on proved afterwards highly advantageous to the itate.

It was not long, however, before thefe regtilations ware aliered. The emperor being foom afier informed that Buldwin, lately expelled from Condantinople, had married his daughter to Charles king of Sicily, and given him, by way of dowry, the imperial city itfelf, he ordered the Genoefe, who were become very numerons, to remove firf to Heraclea, and afterwards to Galata, where they continued. As for the Pifans and Venetians, who were not fo numerous and weal. thy, they were allowed to continue in the city. Pa. lcologus, though he had caufed himfelf to be proclaimed emperor, and was poffeffed of abfolute fovereignty,

148
manicated him; anc he would in all pobaritity have heen drival from the thane by at combination of the ti weltern priores, had he net engaged prpe Tiban IV. to efpnute his coufe, by ponifing wo lubmit limefelf and his dominions to the 1 , atin colurch. 'I'hns, indeed, Union he divericd the prefent form; but this proceeding the efert canfed the greatell diturbances, not onsy in Conltan- and Latia timople, but thronghout the whole empire, nor was churches. Pateologus able to reeoncile his fubjects to this union.

Ia $124_{3}$ Michael died, and was fucceeded by his fon Andronicus. His firft thep was to reftore the ancient Greck ceremonies, thinking he could not begin his reign with a more popular act. But thus he involved himelf in dificulties titil greater than before. Though Michael had not been able fully to reconcile his Creek futjects to the Latin ceremonies, yet he had in fome degree aecomplithed his purpofe. The Latins had got a confiderall footing in the city, and defended their cermonies whith grat oblinacy; fo that the empire was again thown into a ferment by this inyrudent Rep.

150 Diffived.
Conlan- was as yet only guardian to the young emperor John Lafcaris, then about 12 . years of age. But having now fettled the ftate, and having gained the affetions both of natives and foreigners, he began to think of fecuring himlelf and his pofterity in the full enjoyment of the empire; and for this reafon cruelly ordered the eyes of the young prince to be pat ont, pretenting that none but himfelf had any right to the clyy or empire of Conftantinople, which he alone had ucover. 3 out of the hand of the Latins.

This piece of treachery and inhmanisy involved him in great troubles. The patriarch immediately excom. encroachments on the empire, which had it not been the ?rarks. for the crufades publifhed againd them by the Pope, they would in all probability have made themfelves mallers of before this tine. 'ibley were now, however, very fuccefffully oppofed by Conftantine tie emperor"'s brocher : but his valour rendered him fulp.eted by the emperor; in confequence of which lie was thrown into prifon, along with feveral perfons of great dillinction. On the removal of this brave commander, the 'Turks, under the famous Othoman, made themfelves mathers of feveral places in lhrygia, Cania, and Bithynia; and, among the rett, of the city of Nice. 'Io put a thop to their congmells, the emperor dipatched againt them Philanhopenus and Libadarius, two officers of great esperience in war. The former gained fome advantages over the enemy ; but being elated with his fuccefo, caufed himfelf to be proctamed emperor. This rebellion, however, was ion fuppretled, Pailanthropenus beng betrayed by his own men: but the Turks taking advantage of thefe intertine commotions, nut only extended their dominions in Aha, but conguered mon of the inands in the Mediterranean; and, being mafters at fea, iufetled the coalls of the empire, to the utter ruis of trade and commerce.

From this time the Roman empire tended faf to diffolution. After the revit of Philanthropenus, the emperor could no longer truft his fubjects, and therefore hired the Maffagetes to affit him: but they, behaving in a carelefs manner, were firft defeated by their enemica, and afterwards turned their arms againdt thofe they came to affut. He next applied to the Catalans, who behaved in the fame manner; and having ravaged the few places left the emperor in Aha, returned into Europe, and called the Turks to their affiltance.

This happened in the year 1292, and was the firt Their 52 appearance of the Turks in Europe. This enterprize, Their firt hovever, was unfuccefsful. Having loaded themfelves in Euroz:. with booty, they offered to depart quietly if they were alloweit a fate paflage, and thips to tranlpurt them to Atis. 'To this the imperor, willing to get rid of fuch troblatione guetts, radily coulentod, and oedered the
veflel.

 :inopuran But the Greek officers oblerving the immenfe boaty - 它な. wi:h which they ware loaded, refoived to fall unon them in the night, and cut them all off at once. This feheme, however, was not managed with fuch fecrecy but that the Turks had notice of it, and therefore prepared for their defence. They firtt furprifed a atrong calle in the neighbourhood, and then found mans to asquaint their countrymen in Alia with their dangerous hituation. Their brethren, enticed with the hopes of booty, were not long of coming to their aliftance; and having croffed the Hellefpont in great numbers, lavaged the adjacent conntry, making excurtions to the very gates of Contaninople. At lant the empewor determiaed to root them out; and accordingly marched againt them with all his forces, the country people focking so hin from all quarters. The Turks at fift gave themidves over for loft but finding the Greeks negligent of difcipline, they attacked their army unexpectedly, utterly defeated it, and made themfelves mafters of the ca:np. After this unexpected vietory, they continued for two years to ravage Thrace in the moft terrible manner. At laft, however, they were defeated; and being afterwards thut up in the Cherfonefuc, they were all cut in pieces or taken.

Soon after new commotions took place in this unhappy emrire, of which the 'Turks did not fail to take the advantage. In 1327 they made themfelves mafters of mott of the cities on the Mreander; and, among the reft, of the ftrong and important city of Prula in Bithynia. The nest year, however, Orhoman, who may juflly be Ayled the founder of the Turkifh monarchy, being dead, the emperor laid hoid of that opportunity to recover Nice, and fome other important places, from the infidels. But thefe were loft the year following, together with Abydus and Nicomedia: and in 1.330 a peace was conclurled upon condition that they fhould keep all their conquelts. This peace they obferved no longer than ferved their own purpofes; for new commotions breaking our in the empire, they purfued their conquefts, and by the year 1357 had reduced all Alia. They nest paffed the Hellefpont under the conduct of 5 lyman the fon, or as nthers will have it, the brother of Otchanes, the fucceffor of Othoman, and feized on a ftrong cafte on the European fide. Soon after the Turkifh fultan died, and was fucceeded by Amurath. He exrended the conquefts of his predeceffors, and in a hort time reduced all Thrace, makiisg Adrianople the feat of his empire. A- murath was hain by treachery in a little time after, and was fucceeded by his fon Bajazet. This prince greatly enlarged his dominions by new conquetts. In a fhort time he reduced the countries of 'Theffaly, Macedon, Phocis, Pcloponnefus, Myin, and Bulgaria, driving ont the defpots or petty princes who ruled there. Elated with his frequent victories, he began to look upon the Grcek emperor, to whom nothing was now left but the eity of Conftantinople and the neighbanring country, as his vaffal. Accordingly he feni him an arrogant and haughty meffage, commanding him to fay a yearly tribute, and Cend his fon Manuel to attend him in his military expeditions. This demand the emperor was obliged to comply with, but died foon after in the year 1392.

Manuel no fooner heand of his father's death than
he haftened to Conflantinople, without taking leave of Comfan. the fultan, or acquainting him with the reafons of his timpolitas fudden departure. At this Bajazet was fo highly of- hiftory. fendect, that he paffed with great expedition out of Bithynia intn Thrace, ravaged the country adjoining Bajazer beo to Conftantinople, and at laft invelted the city itfelffieges Cornbuth by fea and land. In this extremity Manuel had lanti:ogic, recourfe to the weftern princes; who fent him an army of 130.000 men, under the command of Sigifmund king of Hungary, and John count of Nevers. Bur though the wettern troops proved at firlt fuccefsful, they were in the end defeated with great flaughter by Dajazet, who then returned to the liege with greater vigour than ever. As he found, however. that the eitizens were determined to hold out to the laft, he applied to Jobn, the fon of Manuel's elder brother, who had a better title to the crown than Ma. nuel himfelf. With him he entered into a private agreement, by virtue of which Bajazet was to place John upon the throne of Conftantinople; on the other hand, John was to deliver up the city to the l'urks, and remuve the imperial feat to Peloponnefus, which the fultan promifed to relinquifh to him and his pofterity. At the fame time he fent deputies to the inhabitants of Conltantinople, offering to withdraw his army, and ceafe from further holtilities, provided they expelied Manuel and placed John upon the throne. This propolal rent the city into two factions; but Manuel prevented the mifchiefs which were rady to enfue, by a veluntary relignation, upon condition that he fhould be allowed to retire to whatever place he thought proper with his wife and children.

With this condition Jchn readily complied; and Nlanuel having received him into the city, and conducted him to the palace, fet fail for Venice. From thence he went to the courts of all the weftern princes to folicit their affitance againt the Turks, whofe power was grown formidable to all Emrope. He was every where recived with the greatelt demonltrations of efteem, and promifed large fupplies; all ChriAlendom being now alarmed at the progrefs of the infidels.
In the mean time Bajazet did not fail to put John in mind of his promife; but the citizens refuling to comply with fuch a fcandalous treaty, the fiege was renewed, and the city affaulted with more fury than ever. When it was already reduced to the laft extremity, news were brought the fultan that Tamerlane, the victorious Tartar, having over-run all the Eaft with incredible celerity, had now turned his arms againft the Turks, and was preparing to break into Syria. Bajazet, alarmed at the danger that threatened him, raifed the fitge in great hafte, and advanced gaintt Tamerlane with a very numerous and well-dif. ${ }^{156}$ ciplined army ; but the Tartar totally defeated and took feated and him prifoner after having cut moft of his men in pieces: taken priand thus Confantinople was preferwd for the prefent. forer by

But this relicf was of thort duration. In 1424 therane. city was again befieged by Amurath. II. The inha-Amurath bitants detended themfelves with great bravery ; but befieges mult in the end have fubmitted, had not the emperor nople. prevailed upon the prince of Caramania to countenance an impoltor and pretender to the Turkith throne. 1:8 This obliged Amurath to raife the fiege, and march The ficge with all tis forces againft the ufurper, whom he foon raifed. reduced.

## $\mathrm{C} O \mathrm{~N} \quad[375] \quad \mathrm{CO} \mathrm{N}$

Confan reduced. Having then no other cnemies to contend thopolitan with, he entered Macedon at the head of a powerful hiftory.
$\xrightarrow{\sim}$ near, he took and plundered Theffalonica, as he did alfo nort of the cities of Etolia, Phocis, and Barotia. From Greece he marched into Servis; which country he foon reduced. He next bruke into the dominions of the king of Hungary, and belieged the frong city of Beigrade; but here he met with a vigorous repulfe, no fewer than 15,000 Turks being nain by the Chilftians in one fally, whichobliged the fultan to drop the eaterprize and retire.

In his retreat he was attacked by the eelebrated John Hunniades, who cut great numbers of his men in picees, and obliged the relt to fly with precipitation. Not long after he gained a ftill more complete victory over the enemy in the plains of Tranfylvania, with the lofs of only 3000 of his own men, whereas 20,000 of the Turks were killed on the fitld of battle, and almoft an equal number in the purfuit. Amurath, who was then at Adrianople, fent an army into Tranfylvania far more numerous than the former; but they were attended with no better fuccels, being cut off almoft to a man by the brave Hungarian. He gained feveral other vietories no lefs remarkable; 160 is atan but was lalt entirely defeated in $1+48$; and with defeated. empire. The unhappy emperor was now obliged to pay an annual tribute of 300000 afpers to the fuhtan; and to gield up to him fome flrong holds which he ftill held on the Euxine Sea. However, as he doubted not but Amuratil would foon attempt to become mafler of the city itfelf, he renewed the union between the Greek and Latin churches, hoping that this would induce the weftern princes to affit him in the defence of the eity againt the Turks. This union produced great diturbances, which the emperor did not long furvive, but died in $14+8$, leaving the empire, now conlined vithin the walls of Cundantinople, to his brother Conftantine.

Amurath the Turkih fultan died in 1450, and was fucceeded hy his fon Mohammed. In the beginning of his reign he entered into an alliance with Conftantine, and pretended a great defire to live in friendthip with him and the other Cnillian prinees; but no fooner had he put an end to a war in which he was engaged with Ibrahim king of Caramania: than he built a trong fort on the European fide of the Bofpho. rus, opponite to another in Alia; in both of wisich he placed ftrong garrifors. Thefe thu cidiltes commanded the Straits; and the former being but five rriles from the city, kept it in a manner blocked up. 'Ihis foon proauced a mifundertanding between bim and the emperor, which ended in the fuege of the city. The fiege commenced on the fixth of April 1453. Mohammed'e numerouz forces covering the plains being it up by lea. The emperor, however, had taken care to fecure the haven, in which were three large fhips, 20 fmall ones, and a great number of galleys, by means of a chain drawn crofs the entrance. Mohammed began the fiege by planting batteries as near the city as he could, and raifing mounts in feveral pla. ces as high as the walls themfelves, whence the befieged were inceflantly galled with howers of arrous.

He had in his camp a piece of ordnance of prodigious Con?tans lize, which is faid to have carsied a ball of 100 pounds tinopolitan weight made of hard black fone brought from the hiltory. Euxine Sea. With his vall piece the enemy made feveral breaches in the walls; which, however, were repaind with iacredible cxpedtan by the beficged. But Mohammed, the better to carry on the lieque. cauld new levies to be made throughout his extentive dominions, by which his army was foon increafed to near 400,000 men; while the garrion confilled undy of 9000 regular troops, 2ic. 6000 Greeks and 3000 Genoefe and Yenctians. As the enemy contimued to batter the walls day and night without intermifion, a great part of them was at latt beaten down; but whre the 'Turks were bufy in filling up the diteh, in order to give the affait, a new wall was buit. This thew the tyrant into a prodigious rage, which was greatly heightened when he faw his whole fleet wor fled by fure thips, four of which were laden with corn from Peluponnefus, and the others with all manner of provilions from the ille of Chios. Thite opened thembeives a way through the whole Tukkith Rect; and, to the inexprefible joy of the Chritians, at lait got fafe into the harbour.

The Turks attempted feveral times to force the ha. ven; bet all their efiorts proving ineffectual, Mohammed formed a defign of conveying 80 galleys over land for the face of eight miles into is. This he accom-

ven. plifhed by means of certain engines, the contrivance of a renceado; and having then either taken or fuak all the onips contained in it, he caufed a hridge to be built over it with furpring expedition By this means the city was laid open to an affault from that fide likewife. The place was now affaulted on all fides; ant Conftantine being well apprifed that he could not lons hold out againt fuch a mighty fleet and fo numerous an army, fent deputies to Mohammed, offering to acknowitdre himfell his vaffal, by paying bim yearly what trikate ha Mould think proper to impofe, provi. did he raifed the fiege and withdrew. The tyrant anfwered that he was determined at all events to become mather of che city: but if the emperor delivered it isp forchwith, he woukl yicld up to him Pcloponnefus, and other provinces to his brothers, which they fhould enjoy peaceably as his friends and allies: but if he hold oat to the laft extremity, and fuffered it to be taken by affant, he would put him and the whole non bility to the frord, abandon the city to be plundered by his foldieas, and carry the inhabitants into captivity.

This condition was afhly rejected by the emperor, who therchy involved himfelf and all his fubjects in the moll terrible calamity. The fiege was renewed with more vigour than ever, and continued till the 25 th of May; when a report being feread in the Turkifh camp that a mighty army was adrancing in full march to the : muing relief of the city under the cond of the celeb in the relief of the city under the conduct of the celebrated TuikifJohn Hunniades, the common foldiers, feized with a camp. panic, began to mutiny, and prefs Mohammed in a tumultuous manner to break up the fiege. Nay, they openly threatened him with death, if be did rot immediactly abandon the enterprize and retire from before the city, which they defpaired of being able to reduce before the arrival of the fuppofed fuccours. Moham. med was upon the point of complying vith their de-

made when to wats advieid by Zagan, a Tukifí officer of great intrepidity, and an irreconcikable enemy to the Chriftian name, st give without lofs of time a gen ral affath. To this he faid the foldicry, however mutina:es, would not be asede, provided the fultan folemnly promifed to abandon the city to be phundered by them. As fuch an advice belf fuited the hinmonr of Mohemmed, he readily embraced it ; and caufed a proclamation to be publifhed throughout the camp, declaring, that he gave up to his foldiers all the wealth of that opulent city, requiring to himfelf only the empty houle's.

The defire of pinnder foon got the better of that fear which had feized the. Tukith army; and they ununimoully defured to be led on to the attack. Hereupon Contantine was fummoned for the latt time to deliver up the eity, with a promife of his life and liberty ; but to this he anfwered, that he was unalterably determined either to defend the city or to perifh with it. The attack began at three in the morning on Tuefday the 29th of May; fuch troops were firit employed as the fultan valued leat, and denigned them for no other purpofe than to tire the Chritians, who made a prodigious havock of that diforderly multitude. After the carnage had lathed fome hours, the Janizaries and other freth troups advanced in good order, and renewed the attack with incredible vigulur. 'The Chriftians, fummoning all their courage and refolution, twice repulfed the enemy: bat being in the end quite fpent, they were no longer able to fland their ground; fo that the enemy in feveral places brake into the city. In the mean time Juftiniani, the commander of the Genodie and a fclect body of Greeks, having reccised two wounds, one in the thigh and the other in the hand, was fo difheartened, that he caufed himfelf to be convered to Galata, where he foon after died of grif. His mon, difmayed at the fudden fight of their general, inmentiately quitted their polts and fled in the utmoit confuion. However, the emperor, attended with a fow of the moit refolute among the nobility, atill kept his polt, ftriving with unparallelad refolution to uppole the multitude of tarbarians that now broke in from every quarter. But being in the end overpowered with numbers, and fecing all his frituds lie dead on the ground, "What! (ericd he aloud), is there no Chrifmakt alive to atrike of my head?" He had farce uttered thefe words, when one of the enemy, nut knowing him, gave him TGO a decp eut ar: is the face with his fabre; and at the 5or.
fame time. another coming behind him, with a blow on the back part of his head haid him dead on the cround. After the dath of the emperor, the sew Chritions that wese left alive betook themfelve's to figle; and the Turks, meeting with no futher oppofition, entered the city, wizeh they filled with blood and nax. hate. They gave no quarter, but put all they met to the Fines, whout dittinction. Mamy thes: fands took vefore in the chareh of St Sophia, but they were ail maffacred in the: atylum by the enaged hatbamans; who, promptid by their matura oruchy, thee defire of revenge, and lowe of hoots, fared no place wor perfon. Noft on ate nobility arere, by the iultan's orders, cut off, and the rest kept for purpofes more grievous than death itfelf. Many of the inhabitants.

means to mate thcit cecape while the Thas wede ina fied in phandering the city. Thefe embarking on five tia mips then in the harbour, arrived fafe in Italy; where, with the thudy of the Greek tongue, they revived the liheral feiences, which had lung been negleeted in the Weft. After the expiration of three days, Moham. med commanded his foldiers to forbear all forther hotitities on pain of death; and the: put an end to as cruel a pillage and maffacre as any mentioned in 1 i i ftory. The next day he made his public and triumphal entry into Condantinople, and chofe it for the feat of the Turkif empire, which it has continnied to be ever fince.

This city is now called by the Turks Ifampol, and Prefent by the Greeks I/fampoli' or Stampoli. It is feated at fate of the the eaitern extremity of Romania, on a fmall neck of cityland which advances towards Natolia, from which it is feparated by a ehannel of a mile in breadth. The fea of Marmora wathes its walls on the fourl, and a gulph of the channel of Conftantinople does the fame on the nowth. Jt is delightfully lituated between the Black Sea and the Archipelago, from whence it is fupplied with all nectilaries. The grand feignior's palace, called the Seraglio, is feated on the lea-fide, and is furrumded with walls fanked with towers, and feparated from the city by canals. It is faid the harbour will ealily hold 1200 thips. The number of houles muit needs be prodigious, lince one fire has burnt down 30,000 in a day, without greatly changing the afpee of the eity. However, in general, they are but mean, efpecially on the outide, where there are few or no windows; and the freets being narrow, gives them a melancholy look. They reckon that there are 3770 flreets, imall and great: but they are feldom or never elcan; and the people are infifted with the plague almofl every year. The inhabitants are half Curks, two-thinds of thp other half Chritians, and the reft Jews. Here are a great number of ancient munmments lith remaning, and partieularly the fuperb temble of Suphia, which is tumed into a mofque. and far turpaffes all the relt. The ltrect called Allri anople is the longelt and broadeft in the city; and the tazars, or bezclleins, are the makets for felling all forts of merchandize. The old and the new are pretty near each other ; and are large fquare buildings, covered with domes, and fupported by arches and pilafters. The new is the bett, and contains all forts of goods which are these expofed to fate. The market for thax:s, of kuth fexes, is nut fir off; and the Jews are the principal merihants, who bring them here to be fold. There are a great nomber of young girls brouglit from 1 lungary, Greece, Candia, Rufia, Mingrelin, and Georgia, for the fervice of the Turka, whu gearrally buy there for their feraghos. The great iquore, nua the mofque of fitan Bafazet, is the place for public divetion, where the jugglers and mountebanks phay a greut variey of tricks. The citcumferonce of this city is by fome raid to be 15 mites, and by M1 Tournefint 23 miles: to which if we add the fuburb, it nay le Sit mike in conpals. The fuburb called Pero is coaningly stuated; and is the place where he ambalfadms of England, France, Venice, and Holland, relide. This city is built in the form of a miangle; and as the eromon rifes gradually, there is a view of the whole town fom the kea. "ine pablic

 innpolitan hifory. Nos.Confat buiidings, fuch as the palaces, the mofques, bagnios, and caravanfaries for the entertainment of flrangers, are many of them very magniticent. E. Long. 29.20. N. Lat. 4 1. 4 ,

CONSTAT, in law, the name of a certificate which the clerk of the pipe and auditors of the exchequer make at the sequeft of any perfon who intends to plead or move in that court for the difcharge of any thing : and the effect of it is, the certifying what does confare upon record touching the matter in queftion.-A conftat is hetd to be fuperior to a certificate; becaufe this may err or fail in its contents; that cannot, as certifying nothing but what is evident upon record.

Alfo the exemplification under the great feal of the inrolment of any letters patent is called a conllit.

CONSTELLATION, in aftronomy, a fyttem of fevcral flars that are feen in the heavens near to one another. Aftronomers not only mark out the hars, but, that they may better bring them into order, they dittiuguifh them by their fituation and polition in refpect to each other; and therefore they diftribute them into afterifms or conftllations, allowing feveral ftars to make up one conftellation : and for the better diftinguifhing and obferving then, they reduce the conftellations to the forms of animals, as men, bulls, bcars, \&c.; or to the images of fome things known, as of a crown, a harp, a balance, \&c.; or give them the names of thofe whofe memories, in confideration of fome notable exploit, they had a mind to tranfinit to future ages.

The divifion of the ftars by images and figures is of great antiquity, and feems to be as old as aftronomy itfelf: for in the moft ancient book of Job, Orion, Arcturus, and the Fleiades, are mentioned; and we meet with the names of many of the conftellations in the writings of the firft poets, Homer and Hefiod.

The ancients, in their divifion of the firmament, took in only fo much as came under their notice, diftributing it into 48 conttellations; but the modern aftronomers comprehend the wholly farry firmament, dividing it into three regions. See AstronomyIndex.

CONSTERNATION is defined by ethical writers to be an excefs of horror, owing to the ill government of our admiration and fear: of fuch an immoderate degree of fear as confounds the faculties, and incapacitates a perfon for confultation and execution.

CONSTIPATION, in medicine, a hardnefs of the belly, with great coflivenefs. See Costriveness.

CONSTITUENT part, in phyfology, an effential part in the compofition of any thing, differing little from what is otherwife called element or principle.

CONSTITUTION, in matters of policy, fignifies the form of government eftablifhed in any country or kingdom.

Constitution alfo denotes an ordinance, decifion, regulation, or law, made by authority of any fuperior, ecclefiaftical or civil.

Vol. V. Part I.

Apafolical Constryustors, a collection of regula. tions attributed to the apoftles, and fuppofed to have been colle eted by St Clement, whofe name they likewife bear.

It is the general opinion, however, that they are fpurious, and that St Clement had no hand in them. They appeared firt in the 4th age, but have been much changed and corrupted fince that time. They are divided into eight books, confiting of a great number of rules and precepts, relating to the duties of Chritians, and particularly the ceremonies and difcipline of the church. Mr Whifon, in oppofition to the general opinion, afferts them to be a part of the facred writings, dictated by the apofles in their me.t. ings, and written down from their own mouth by St Clement ; and intended as a fupplement to the New Teitament, or rather as a fyftem of Chriftian faith and polity. The reafon why the Conftitutions are fufpected by the orthodox, and perhaps the reafon aifo why their genuinenefs is defended by Mr Whiton, is, that they feem to favour Arianifm.

Constitution, in a phytical fenfe, fignifies the particular temperature of the body.

It is curious to oblerve, fays Dr Percival, the revolution which hath taken place, within this century, in the conftitutions of the inhabitants of Europe. Inflammatory dileafes more rarely ${ }^{\text {cccur, and, in general, }}$ are much lefs rapid and violent in their progrefs than formerly (a) ; nor do they admit of the fame antiphlogiflic method of cure that was practifed with fuccefs 100 years ago. The experienced Sydenham makes 40 ounces of blood the mean quantity to be drawn in the acute rheumatifm ; whereas this difeafc, as it now appears in the London hofpitals, will not bear above half that evacuation. Vernal intermittents are frequently cured by a vomit and the bark, without venefectio. ; which is a proof that at prefent they are accontanied with fewer fymptoms of inflammation than they were wont to be. I'his advantageous change, however, is more than counterbalanced by the introduction of a numerous clafs of nervous ailinents, in a great meafure unknown to our anceftors; but which now prevail univerfally, and are complicated with almolt cvery other ciftemper. The bodies of men are enfecbled and enervated; and it is not uncommon to oblerve very ligh degrees of irritability, under the external appearance of great ftrength and robuftnefs. The hypochondria, palfies, cachexies, dropfies, and all thofe difeafes which arife from laxity and debility, are in our days endemic every where; and the hylterics, which ufed to be peculiar to the women, as the name itfelf indicates, now attack both fexes indifcriminately. It is evident that fo great a revolution could not bcefleted without a concurrence of many caufes; but amongt thefe (according to Dr Percival), the prefent general ufe of tea* holds the firft and principal - See Tes. rank. The fecond place may perhaps be allowed to excefis in fpinituous liquors. This pernicious cuftom, in many inttances at leail, owes its iffe to the former, $3 \mathrm{~B} \quad$ which,
(A) The decreafe in the violence of inflammatory difeafes may perhaps in part be afcribed to the prefent improved method of treating them. Moderate evacuations, cool air, acefcent diet, and the liberal ofe of faline and antimonial medicines, are better adapted to check the progrefs of fevers, than copious bleejiags, has. mulating purgatives, and profufe fweats excited by theriaca and mithridatc.

Conft:cqor which, by the lownefs and depreffion of ipirits it ac" " cafions, renlery it aimolt neceflary to have recousfe to $\underbrace{\text { Confuliz. }}$ fome bing cordial and exhitarating. And hence procred thore odious and difgracenal hahits of inamperance, with which many of the fufter fex are now, alis! chareable

CONSTRICTOR, an apptlation given to feveral mufets, on acenant of their conflringing or clofing fone of the oritices of the bolly.

CONSTRICTION, in geomery, is the danwing fach lines, fuch a figure, \&c. as are previoully neceffary for making any demontration appear more plain and undeniable.

Constremtion of Equations. See Eevations.
Coystruction, in grammar; fyetax, or the arrangingand conmeting the words of a Eatence ac-cordi-a to the males of the language. Sec Grammar, and Language.

The conftrection is generally more fimple, eafy, and diret, in the modern tongues than in the ancient: we have very ferv of thofe inverfons which occafion fo much embarreffent and obfarity in the Latin; our thou hats are ufolly delivered in the fame order wherein the imaginatiun conceives them: the nomantive cafe, for intance, always precedes the verb, and the vers ques before the oblique cafes it governs.

The Greeks and La: is, M. St. Evremont obferves, wfully end their periods, where, in good fenfe and reafon, they fould have begun; and the clegance of their language confite, in fome meafure, in thas capricions arrautement, or rather in this tranipolal and diforder of the words. See Language.

Constheotion of Sintuts, among lan yers. See Law, Part $11 n^{\circ}+9$

CONSUALIA, in antiquity, feafts which were hed among the ancients, in honour of the god Confus i, e. Neptune: difierent from thofe other folls of the fame deity called Neptunalia. They were introduced with a magnificent cavalcade, or proceffion on horfeback; becaufe Neptune was r-puted to have lirtt taught mon the ufe of horfes; whence his furname of storn, Eiqujfirs.
Evander is faid to have frot infituted this feat : it was re-elablithed by Romulus, under the nane of Conjus; becaule it was fome god under the denomination of Confus, that fuggefted to him the rape of the Sabines. It is faid, that it was with a view to this rape that he made that eftablihment. This, however, is certain, that it was to this feall all his neighbours were :avited: when, taking advantage of the folemnities and facrifices, he feizid the women. To daw the greater concoure of people, he gave ont, that he had found an aftar hid under groond, which he intended to confecrate, with facrifices to the god to whom it had been originally erected. Thofe who take upon them to explain the mytaries of the heathen theology. fay, that the altar hid under giound, is a fymbil of the lecret defign of Romulus to feize his netighbours wives.

The confualia were of the number of feafs called facred ; as being conferated to a divinity. - Originally they were not dillinguiflad from thofe of the Circus: Whence it is, that Talcrius Maximus fays, that the rape of the Sabines was effected at the games of the Circus.

Plotarch obferves, that during the days of this fo- Confuhfastemnity, horfes and affes were left at reft, and were tial dreffd up with crowns, \&c. un account of its being Conful. the fedf of Neptumus Equellis. - Fettus fays, the cavalcude was performed with males; it being an opinion, that this was the firlt animal ufed to draw the car.
Servius gives us to underfand, that the confualia foll on the $13^{\text {th }}$ of Augult; Plutarch, in the life of Ron:ul s, places them on the s8th, and the old Roman culerdar on the 2 it of that month.

CONSUBOTANTIAL, in theology, a term of like import with co-effential ; denotiar fomething of the fane fubitance with another. The orthodox believe the Son of God to be confubitantial with the Father.
 the fathers of the councle of Antioch and Nice, to exprets the arthodos doct tine the mare precitly, and to ferse as a barrier and precaution againt the cirurs and fubtleties of the Arians; who ouned every thing escepting the confubtantiality.

The Arians allowed, that the word was God, as having been made God; but they denied that he was the fame God, and of the fame tuollance with the Father: accordingly they exerted themielves to the vtmott to abohin the ufe of the word. The emperor Cunftantime ofed all his authority with the bifhops to have it expurred out of the dymbols; but it ittll maintained utelf, and is at this day, as it was then, the dilinguithing criterion between an Athanatian and an Arian.

Sandius will have it, that the word confubfantial was unknown till the time of the council of Nice; but it is certain it bad beco before prupofed to the council of Antioch, wherein Paulus Samofatenus had been conderated; though it had there the fortune to be rejected. Curcellaus, on the other hand, maintains, that it was an imnowation in doctrine in the council of Nice, io admit an expreffion, the ufe whereof had been abolifhed by the council of Antioch.

According to St Athanafus, the word confubtantial was only condemned in the council of Antioch, inafmuch as it implied the idea of a pre-exiftent mat. ter, prior to the things formed thereof: now, in this fenfe, it is certain, the Father and the Son are not confubilanial, there having been no pre-exitent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church with reyard to the manner of the change made in the bread and wine in the eucharift. The divines of that profeflion maintain, that after confecration, the body and blood of our Saviour are fubilantially prefent, together with the fubflance of the bread and wine, which is called confuoftantiation, or impanation.

CONSUL, the chief magiftrate of the Roman commonwsath, invclied with regal authority for the fpace of one year. They were two in number, called confuls a confulundo, and annually chofen in the Campus Martius. The two firf cunfuls were L. Jon. Brutus, and L. Tarquinius Collatinus, chofen in the year of Rome 244, after the expulfion of the Tarquins. In the firft times of the republic the two confuls were always chofen from Patrician fanilies or noblemen, but the peo-

## C O N [ 379$] \quad \mathrm{C} O \mathrm{~N}^{2}$

Conful. ple ubtained the privilege in the year of Rome 388 , of electing one of the contuls from their own body, and fometin.s boih were plebeians. The firfl conful among the plebeians was L. Sextius. It was required that every candidate for the confulthip fhould be 43 years of age, called legitinum tempus. He was always to appear at the election as a private man without a retinue, and it was requifite before he canvaffed for the office to have difcharged the functions of yureltor, edile, and prator. Sometimes thele qualifications were difregarded. Val. Corvinus was made a conful in his $23^{d}$ year, and Scipio in his $24^{t h}$. Young Marins, Pompey, and Auguftus, were allo under the proper age when they were invelted with the office, and Pompey had never been quatlor or prator. The pawer of the confuls was unbounded, and they knew no fup rior but the gods and the laws; but after the expiration of their office their conduct was minutely ferutimized by the people, and mifbehaviour was often pumhed by the laws. The badges of their oflice was the fratexta, a robe fringed wich purple, afterwards exchanged for the toga piota or palmata. 'They were preceded by 12 lictors carrying the fafios or bundles of thicks, in the middle of which appeared an axe. The axe, as being the characteriltic rather of tyanny than of freedom, was taken away from the fafces by Valerius Poplicola, but it was reftored by his fueceftor. They took it by turns monthly to be preceded by the lictors while at Rome, left the appearance of two perfons with the badges of royal authority fhould raife apprehentions in the multitude. While one appeared publicly in Atate, only a crier walked before the other, and the lictors followed behind without the faices. Their authority was equal; yet the Valerian law gave the right of priority to the older, and the Julian law to him who had molt children : and he was generally called conful major or prior. As their power was ab. folute, they prefided over the fenate, and could convene and difmifs it at pleafure. The fenators were their counfllors; and among the Romans the manner of reckoning their years was by the name of the confuls, and by MI. Tull. Cicerone et L. Antonio Confulibus, for inflance, the year of Rome 689 was always underflood. This cultom lafted from the year of Rome $24+$ till the 1294, or 541f year of the Chriftian era. In public affemblies the confuls fat in ivory chairs, and held in their hand an ivory wand called fifina eburnous, which had an eagle on its iop as a fign of dignity and power. When they had drawn by lut the provinces over which they were to prelide diaring their confulThip, they went to the capitol to offer their prayens to the gods, and intreat them to protect the republic; after this they departed from the city arrayed in their militay drels and preceded by the lictors. Sometimes the provinces were afigned them without drawing by lot, by the will and appointment of the fenators. At their departure they were provided by the fate with whatever was requifite during their expedition. In their provinces they were both attended by the 12 lictors, and equally invelted with regal authoridy. They were not permitted to return to Rame swithout the fpecial command of the fonate; and they always remained in the province till the arsival of their fucceffor. At their retuin they harangued the people, and
fotemuly proteded that they hat done nothing a mint the lawis or interct of their comotry, bue hide frith. fully and diligently endeavored en promese the erreat nels and weltare of the flates No nan could be conful two following years; yct this intlitution was fometimes broken, and wie lime Marias reedeeted confet after the expiration of his office dorine the Cimbrian war. The office of confut, for dignlier datiog the times of the commonwedth, becance a metce title under the cmperurs, and retainad nothing of ita anthority but the ufelefis enfigna of origiad dignity. Even the duration of the office, which was originally anmud, was reduced to two or three months by J . Cafar ; but they who were admitted on the liff of January donmina. ted the ycar, and were called ordimoin. Their fuccerfors during the year were diftinguither by the name of fufferi. 'liberius and Claudius abridgad the time of the confuithin; and the emperor Commodus made no lefs than 25 confuls in one year. Contantine the Great renewed the original inllitution, and permised them to be a whole year in office.

Consul, at prefent, is an officer chablifhed by viro tue of a commillion from the king antl other princes, in all forcign commeries of any confideratle trade, to facilitate and difpatch bulaefs, and proctet the merchants of the nation. The confuli are in keep up a corrcfpondence with the miniters of England refiding in the courts whereon their consulate depends. They are to fupport the commerce and the interett of the nation; to difpole of the fums given and the prefents made to the lords and principals of places, to ubtain their protection, and prevent the infulte of the natives on the merchants of the nation.

CONSUMMATHON, the end, period, or completion of any wonk. Thus, we fay, the confumation of all things, meaning the end of the world. By the incan naiion, all the prophecics are faid to be corifummatea. See Prophecy, and Accomplishment.

Covscmmation of Marriage, denotes the laft act of marriate, which makes its accomplihment; or the mo't intimate uninn between the married pair, \&e.

CONSLMPTION, in medicine, a uord of very extentive fignilication, implies all diforders that bring any decay or wate upon the conflitution; but in muit commonly ufed for the phothifis futmonalio. Sece Midicine Iitedx.

Cunsumpton, infariery. Sce Parriergy, f viii.
COivSUS, the pagan gud of counfel. He had an altar under ground in the great circus at Rome, to flow that coundel onght to be kept fectet. See Consualia.

CONTACT, is when one line, plane, or body, is made is tonch another; and the pares that do chus tonch are ealled the points or pleces of contuct.

CONTAGION, in plylic, the commmicating a dileafe from one body bo another. In fome diieates it is only effected by an immediate coniact or tonch, as the venom of the pox; in others it is conveyed by infected clothes, as the itch; and in uthers it is fuppofed to be tranfmitted throngle the air at a confiderable diftance, by means of Iteans or ellnvia exfiping from the fick, as in the plague and other peltilentid dilorders, in which cale the air is faid to be contagions, though this has been difputed.

Consini 11
Conteri $n$.

## $\mathrm{CO} \mathrm{N} \quad[380] \quad \mathrm{C} O \quad \mathrm{~N}$

Conempla. CONTEMPLATION, an act of the mind, where${ }^{\text {tioa }}$ by it applies itfelf to confider and reflect upon the Continence. Works of God, nature, \&c.

CONTEMPORARY, or Cotemporary, a perfon or thing that exifted in the fane age with another. Thus, Socrates, Plato, and Ariftophanes, were contemperaries.

CONTEMPT, in a general fenfe, the aft of defpifing, or the llate of being defpifed.

Contempt, in law, is a difobedience to the rules and orders of a court, which hath power to punifh fuch offence; and as this is fometimes a greater, and fometimes a leffer offence, fo it is punifhed with greater or lefs punifhment, by fine, and fometimes by imprifonment.

CONTENT, in geometry, the area or quantity of matter or face included in cettain bounds.

CONTESSA, a port-town of Turkey in Europe, in the province of Macedonia, fituated on a bay of the Arclipelage, about 200 miles weft of Conftantinople. E. Long. 25 o. N. Lat. 4i. o.

CONTEXT, among divincs and critics, that part of feripture or other writing which lies about the text, before or after it, or botb. To take the full and genuine fenfe of the text, the context hould be regarded.

CONTEXTURE, a word frequently ufed in fpeaking both of the works of nature and art; and denoting the difpotition and union of the conftituent parts with refpect to one another.

CONTI, a town of Picardy in France, with the title of a principality. It is feated on the river Seille, in L. Long. 2.17. N. Lat. 49. 54 .
CONTIGUITY, in geometıy, is when the furface of one body tonches that of another.

CONTIGUOUS, a relative term underfood of things difpofed fo near each other, that they join their furfaces or touch. The houfes in ancient Rome were not contiguous as ours are, but all infulated.

CONTINENCE, in ethics, a moral virtue, by which we refitt concupifence. It fhould feem that shere is this diltinction between chaftity and continence, in that it requires no effort to be chatle, which refults from conftitution; whereas continence appears to be the confequence of a victory gained over ourfelves. The verb cortince, in the Latin, fignifies "to reAtrain." The term, however, is moft ufually applied to men; as ibafity is to women. Sce Chastity.

Continence is a virtue that makes but an inconfiderable figure in our days. However, we ought not to lofe our ideas of things, though we have debauched our true relinh in our practict: for, after all, folid virtwe will keep its place in the opinion of the wife and fentible part of mankind. And though cuftom has not made it fo feandalous as it ought to he to infnare innocent women, and triumph in the falliehood; fuch actions as we fhall relate mult be accounted true gallantry, and rife higher in our efteem the farther they are temoved from our imitainn.
Iivy, $\mathrm{F} \%$. ATuximus, $\&<$
pital of the Carthaginian empire in Spain. His mea. Continences. fures were fo judiciounly concerted, and with fo much courage and intrepidity purfued, both by fea and land, that notwithitanding a bold and vigorous defence, the capital was taken by florm. The plunder wias immenfe. Ten thoufand free-men were made prifoners; and above 300 more, of both fexes, wete teceived as hoftages. One of the latter, a very ancient lady, the wife of Mandonius, brother of Indibilis king of the Ilergetes, watching her opportunity, came out of the crowd, and, throwing herfelf at the conqueron's fect, conjured him, with tears in her eyes, to recommend to thofe who had the ladies in their keeping to have regard to their fex and birth. Scipio, who did not underfland her meaning at firll, affured her that he had given orders that they fhould not want for any thing. But the lady replied, "Thufe conveniences are not what affect us. In the condition to which fortune hath reduced us, with what ought we not to be contented? I have many other apprehentions, when I confider, on one fide, the licentioufnefs of war; and, on the other, the youth and beauty of the princeffes which you fee here before us; for as as to me, my age protects me from all fear in this refpect." She had with her the daughters of Indibilis, and feveral other ladies of high rank, all in the flower of youth, who confidered her as their mother. Scipio then comprehending what the fubject of her fear was, "My own glory (fays he), and that of the Roman people, are concerned in not fuffering tbat virtue, which ought always to be refpected wherever we find it, fhould be expoled in my camp to a treatment unworthy of it. But you give me a new motive for being more ftrict in my care of it, in the virtuous folicitude you fhow in thinking only of the prefervation of your honour, in the midtt of fo many other objects of fear." After this converfation, he committed the care of the ladies to fome officers of experiesced prudence, frictly commanding that they fhould treat them with all the reiptet they could pay to the mothers, wives, and daughters, of their allies and particular friends. It was not long before Scipio's integrity and virtue were put 10 the trial. Being retired in his camp, fome of his officers brought him a young virgin of fuch exquifitc beauty, that fhe drew upon her the eyes and admiration of every body. The young conqueror flarted from his feat with confufion and furprize; and, like one thunderflruck, feemed to be robbed of that prefeace of $\min 3$ and felf.poffeffon fo neceflary in a general, and for which Scipio was remarkably famous. In a few moments, having rallied his ftraggling (pirits, he inquired of the beautiful captive, in the mott civil and polite manner, concerning her country, birth, and connections; and finding that the was betrothed to a Celtiberian prince nained Allucius, he ordered both him and the captive's parents to be fent for. The Spanifh prince no fconer appeared in his prefence, than, even before be fpoke to the father and mother, he took hims alide; and, to remove the anxiety he might be in on account of the young lady, he addreffed him in thefe words: "You and I are young, which admits of my fpeaking to you with more liberty. Thofe who brought me your future fpoufe, affured me, at the fame time, that you loved her with extreme tendernefs; and hes beauty left me no room to doubt it. Upon which.

## $\mathrm{C} O \mathrm{~N} \quad\left[\begin{array}{lll}38 \mathrm{I}\end{array}\right] \quad \mathrm{C} \mathrm{O} \mathrm{N}$

Continence. reflecting, that if, like your, I had thought on making an engagement, and were not wholly engroffed with the affairs of my country, I thould defire that fo honourable and le sitimate a paffion thould find favcur, I think myfelf happy in the prefent conjuncture to do you this fervice. Though the fortune of war has made me your malicr, I defire to be your friend. Here is your wife: take her, and may the gods blefs you with her. One thing, however, I would have yon be fully alfured of, that the has been amongtt us as the would have been in the houfe of her father and mother. Far be it from Scipio to purchale a loofe and momentary pleafure at the expence of virtue, honour, and the happinefs of an honeft man. No: I have kept her for you, in order to make you a prefent worthy of you and of me. The only gratitude 1 require of you for this inellimable gift is, that you would be a friend to the Roman people." Allucius's heart was too full to make him any anfwer: bue throwing himelf at the gencral's fect, lie wept aloud. The captive lady fell into the fame polume; and remained fo, till the father burit out into the following words: "Oh! divine Scipio! the gods have given you more than human virtue! Oh! glorious leader! Oh! wondrous youth! does not that obliged virgin give you, while the prays to the gods for your profperity, raptures above all the tranfports you could have reaped from the polferion of her injured perfon?"

The relations of the young lady had brought with them a very confiderable fun for her ranfom: but when they faw that fhe was reftored to them in fo generous and godilike a manner, they intreated the conqueror, with great earneftefs, to accept that fum as a prefent ; and declared, by his complying, that new favour would complete their joy and gratitude. Scipio, not being able to refilt, fuch warm and earneit folicita. tions, told them that he accepted the eift, and ordered it to be laid at his fect: then addrefliug himfelf to Allucius, "I add (fars he) to the portion which you are to receive from your father-in-law this fum; which I defire you io accept as a marriage prefent."

If we coufider that Scipio was at this time in the prime of life, unmarried, and under no relifaint, we cannot but acknowledge, that the conqueft he made of himfelf was far more glorions than that of the Carthasinian empire: and though his treatment of this captive prince was not mure delicate and generous than what might jufly be expeeted from a perfon endowed with reafon and reflectuon; yet confidering how few there are in his circumitances who would have acted as he did, we cannot but applaud his conduct, and propofe him as a fuitable example to future ages. Nor was his virtue unrewarded. The yonng prince, charmed with the liberality and politenels of Scipio, went into his country to publith the praifes of fo generous a victor. He cried out, in the tranfports of his gratitude, "That there was come into Spain a young hero like the gods; who conquered all things lefs by the force of his arms than the charms of his vitule and the greatnefs of his beneficence." Upon this repoit all Celtheria fubmitted to the Romans; and Ailucius returned in a flout to Scipio, at the head of I 400 choien horfe, to facilitate his future conquedts. To render the marks of his gratitude flill more durable, Allucius caufed the action we have juft related to be
engraven on a filver hield, which he prefented to Scipio; Continenes. a prefent infinitely more eftimable and glorious than all his treafures and triumphs. This buckler, which Scipio carried with him when he returned to Rome, was loft, in paffing the Rhone, with part of the bagrage. It continued in that river till the year 1665 , when fome fihermen found it. It is now in the king of France's caóinet.
2. The cincumfance which raifs Alcxander the Great above many conquerors, and, as it were, above himfelf, is the ufe he made of his vietory after the battle of HIus. 'Ihis is the mon beautiful incident in his life. It is the point of view in which it is his in terelt to be confidered; and it is impoffible for him not to appear truly great in that view. By the visto :y of ltus he becance poffored of the whole Perfint empire: not only Syligambis, Darius's mother, wahis captive, but alfo his wife and daughters, princeffe: whofe beanty was not to be equalled in all Alia. A Inander, like Seipio, was ia the bloom of life, a con. queror, free, and not yei engarged in inatimony: neverthetefs, his camp was to thofe princefles a facred afylum, or rather a temple, in which their chatlity was fecured as under the guard of virtue iefelf; and fo highly revercu, that Darius, in his expiring nooments, hearing the kind treatment they had met with, could not help lifting up his dying hands towards heaven, and wifhing fuccefs to fo wife and generousa conqueror, who could govern his paffions at fo critical a time. Plutarch informs us more particulally, that the princeffes lived fo retired in the camp, aceording to their own dedire, that they were not feen by any perfon except their own attendants; nor did any other perfon dare to approach their apartments. After the firt vilit, whi:h was a refpectful and ceremonious one, Alexander, to avoid expofing himfelf to the dangers of human frailty, made a folemn refolution never to vifit Darius's queen any more. He himfelf informs us of this memorable circumftance, in a lotter witten by him to Parmenio, in which he commanded him to put to Phutarb. death certain Macedonians who had forced the wives of fome foreign foldiers. In this letter was the following paragrapl1: "For as to myfflf, it will be found that I neither faw nor would fee the wife of Darius; and did not fuffer any one to fpeak of her beauty before me."
3. Hocrates informs us, that Nicocles, king of Sa Jamin, gloried in never having known any woman be. foles his wife; and was amazed that all other contracts of civil locisty ihculd be treated with due regard, whilt that of marriage, the moft facred and inviolable of obligations, was broken through with impunity; and that men thould not bluh to commit an infidelity with refpect to their wives, of which, thould their wives be gulty, it would throw them into the utmont anguilh and fury.
4. Heury VI. king of England, though mphappy in his fam:ly and government, was neverthelefs pofifed of many virtues. Iife was fo remarkable for his cha. stity, that before his marriage he would wot allow any lady of a fufpicious charafter and unguarded condur. to irequent the court: and having obierved one day fome ladies with their bofoms uricovered, he turned away his cyes from the indecent object, and reprinand Re\%, od them dmartiy in the fupple diate of the times;

Cortinenecs Fy, fy (faid he), for thame; forionth ye be to Contingent. blame."
5. In the reign of king Charles If. when licentiournefs was at its lecight in Britain, a yeoman of the guarde refuled the milltefs of a king. The lady, who was diffatisfied with her noble lover, had fixed her eyes upen this man, and thought the nad no more to do than fpeak her pleafure. He got out of her way. He refured to undertland her; and when fhe prefied tim further, he faid, "I am married." The flory reached the king, with all its circum\{tances: but they who expected an extravagant laugh upon the occalion were difappointed. He fent for the perfon : he found him a gentleman, though reduced to that mean ftation; and "Odds fifl, man (fays he), though I a:n not honeft enough to be viituous myfelf, I value them that are." He gave him an appointment, and refpected him for life.
6. The extreme parts of Scotland, whofe people we defpife for their poverty, are honell in this refpect to a wonder; and in the Swede's dominion, towards the pole, there is no name for adultery. They thought it an offence man could not commit againft man; and have no word to exprefs it in their language. The unpolifhed Lapland peafant, with thefe theughts, is, as a human creature, much more refpectable than the gay Biton, whofe lieart is ilained with vices, andeAtranged from natural affection; and he is happier. The perfect confidence mutually repofed between him and the honeft partner of his breaft, entails a fatisfaction even in the louefl poverty. It gilds the lumble heart, and lights the cabin; their homely meal is a facrifice of thanks, and every breath of fmoke arifes in incenfe. If hand be laid upon hand, it is fure affection; and if fome infant plays about theirknees, they look upon him and upon each other with a dolight that greatnefs feldom knows, becaufe it feels diftruft.

CONTINEN'r, in general, an appellation given to things continued without intertuption; in which fenfe we fay, continent fever, \&kc.

Continent, in geography, a great extent of land not interrupted by feas, in contradifinetion to ifland and peninfula, sec. See Geograpay.--Sicily is faid to have been anciently torn from the continent of Itafy; and it is an old tradition, which fome of our antiquaries ftill have a regard to, that Britain was formerly a part of the continent of France.

The world is ufually divided int) two great continents, the old and the new. Whather there exils in the foutbern bemifphere another continent, or the vilule be only an immente watery region, is a queftion that for near three centuries has engaged the atrention of the learred as well as the commercial world, and given rife to mans interelting voyages and difoweries; concerning which, fee the aticle South Sea.

CONTINGENT, fomething cafual or unufual. Hance biture comingent, denotes a conditional event which may or may not happen, according as circumRances fall out.

Contingent, is alfo a term of ralation for the quota that falls to any perfon upon a diviton. Thus each prince of Germany in time of war is to fumilh fo
many men, fo much money, and munition, for his con. Continued tingent.

CONTINUED, or Continual, in a general fenfe,
Contorias. means inceffant, or procteding without interruption.

Continued Fever, is fuch a one as fornetimes remits, but never intermits or goes entirely off till its period.

Continued Bafs, in mufic, thus called, fays Rouffeau, becaufe it is continued through the whole piece. Its principal ufe, befides that of regulating the harmony, is to fupport the voice and preferve the tone. 'They pretend that it was one Ludurico I'iana, of whom a treatife fill remains, who towards the end of the latl century firlt put the continued bafs in practice.

Contanuen Proportion, in arithmetic, is that where the confequent of the firft ratio is the fane with the antecedent of the fecond; as $+: 8:: 8: 16$; in contraditinction to diferete proportion.

CONTINUITY, is defined by fome fohoolmen the immediate cohcion of parts in the fame quantum ; by others, a mode of body, whertby its estremities become one; and by others, a thate of body refulting from the mutual implication of its patts. There are two kinds of continuity, mailematical and phyfical. The firft is merely imaginary, lince it fuppofes real or phyfical parts where there are none. The other, or phyfical continuity, is that late of two or more particles, in which their parts are fo mutually implicated as to contitute one enintermpted quantity or continum.

CONTINUO, in mutic, fignities the thorongh baf, as luffo continuo is the continual or thorough bas, which is fometimes marked in mulic-books by the letters B. C.

CONTOBABDITES, a fect in the fixth century. Their firt teader was Severus of Antioch; who was fucceeded by John the grammarian furnamed Philoponns, and one Theodorius whole followers were alfo called 7 Recollfiums. Part of them, who were willing to receive a bouk compoled by Theodofius on the Trinity, made a feparate body, and were called Contolabidits, from forse place, which Nicephorus does not mention, but which muft appremty have been the place where they held their affemblies. 'The Contobabdites allowed of no bilhops; which is the only circumbance given us concening them.

CONIOR, Condor, or Cundur, the American name of a fpecies of Vultur.

CON CORSION, in general, fignifes the aation of twiting or wreting a member of the body out of its natual fitustion. Rope-dancers acculom themelves to centorlions of their limbs from their youth, to render the fibres of their articulations las, and fupple to all kinds of poltures.

Contorshes, in medicine, has many fignifications. 1. It denotes the iliac paifun. z. Au incomplete diflocation, when a bone is in part, bui not entirely, forced from its articulation. 3. A diflocation of the vertebre of the back fide-ways, or a crookednefo of thefe vertebre. And, 4. A diforder of the head, in which it is diawn tuwards one fide, either by a fuafnodic contraction of the mufcles on the fame fide, or a puify of the antagnait muicles on the other.

CONTORTIE, the name of the zoth order in Lin.
naus's

## $\mathrm{C} \quad \mathrm{O} \quad \mathrm{N} \quad\left[\begin{array}{lll}383\end{array}\right] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{N}$

Contour nxus's Fragments of a natural metherd, confling of bent to one fode. This order contains the tallowing genera, viz. echites, cerbera, gardenia, genipa, aicrocnemum, nerium, periplec?, rawolfit, taberusemontana, vinca, apocynum, afolepiss, comelaris, ceropegia, cymurhmm, plumeria, fapetia.

CONTOUR, in painting, the outline, or that which defines a figure.

A great part of the nill of the painter lies in managing the contours well. Contour, with the Italian painters, figrifies the lineaments of the face.

CONTOUTRNE, in heialdry, is ufed when a beat is reprefented ftanding or running with its fate to the fanifter fide of the efutcheon, they being alwass fuppofed tol buk to the rint, if not otherwife expreffed.

CON POURNIATED, a tem among antiquarics applied to medals, the edges of which appean as it momed in a ldth. This fort of work feems to have hall its origin in Greece; and in have been delosud to perpetuate the memories of great men, particularly thofe who had bore away the prize at the folemn games. Such are thofe remaining of Homer, Solon, Euclid, Pythesoras, Socratex, and feveral athetre.

CONTRABAND, in commeree, a prohibited commodity, or merchandife bourht or fold, imported or exported, in prejudice to the laws and ordinances of a ftate, or the public prohibitions of the fururign. Contraband goods are not only liable to confication themfelves, but alfo fubject all other allowed merchandie found with them in the fame box, hale, or parcel, together with the horfes, waggons, \&c. which conluct them. There are contrabands likewife, which, befides the forfeiture of the goods, are attended with feveral penalties and difabilities.

CONTRAC C , in a general fonfe, a mutual confent of two or more parties, who voluntarily promife and oblige themfelves to do fomething: pay a certain fum, or the like. All donations, exchangts, leales, \&c. are fo many diferent contrads.

Contract is particulaly ufed in common law, for
an agreement or covenant between two, with a lawful conlideration or caufe. Ac, if I fell my horfe for money ; or covenant, in confideration of L. 20 , to make you a leafe of a farm ; thefe are good contracts, becaufe there is quid pro qua.

Ufurious Contkact, is a contract to pay more interelt for money than the laws allow. See Usury.

Thofe contracts are faid to be null which the law prohibits the making of; fuch are all contracts between perfons incapable of contracting, as minors, religions, lunatics, wives without confent of their hufbands, sic.

Contract is alfo ufed for the inftument in writine, which ferves as a proof of the coufent granted, and the obligation paffed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were written, either by the parties themfelves, or by one of the witnelfes, or by a domellic fecretary of one of the parties, whom they called a notary, but who was no public perfon as among us.

The contract, when finilhed, was carried to the magiltrate, who gave it a public authority by rectiving it inter atta, into the number of acts under his ju-
ridagion; giving cach of the patics a cony thereof, Contradule tranteribed by his clerks on dom, Ric equer, amb Conraft Coled with his feal. If ich maerive paif ${ }^{\text {b }}$ iuto Conrat. France, where it watued a long tim.

CONTRACTILE FORC: i at propery or prover inherert in cetain bolies, whown, wheo exented, they are eabled to draw themfelven tup as ain to their former dimenfona.

CONTRACl'ION, in phyfice, the di iniming the exteme or damentions a body, or tha cateling its parts to approteh nearer to each oflno: in which fenfe it fands oppered to dilatation or expandian.

Contraction is frequently uied, by anammical writers, to expref the fhrinking up of a fibec, or an affemblage of fibres, when exturded.

Comphifons and iputnopiceed from a preternatural contration of the fithers of the raufles of the part convulfed. On the contrary, paralytic diondors grnerally proced from a tho great laxneds of the fibres of the parts affected; or from the want of that degree of contraction necefary to perform the natural motion or attion of the part. In the frit, therefore, the animal fivits are fupoofed to fow, either in too great a quantity, or irregularly ; and, in the lat, the animal fpirits are cither denied a free paffare into the part affected, or the tention of the fibrillæ is fuppofed infufficient to promote the circulation.

Contpaction, in grammar, is the reducing of two fyllables into one, as can't for cannot, fould'j for frouldif, Re.

CONTRADICTION, a fpecies of direct oppoftion, wherein one thing is found diametrically oppofite to another.

CONTRADICTORY propositions, are oppofites, one of which imports a mere and naked denial of the other.

Seeming contradictories is when the members of a period quite difagree in appearance and found, but perfectly agree and are confllent in fenfe: thus,
"Cowards die many times before their death:
"The valiant never taltc of death but once."
Suakespeare.
CONTRAFISSURE, in furgers, a kind of fracture, or fifure, in the cranium, which fometimes happens on the fide oppofite to that which received the blow, or, at lealt, at tome diftance from it.

CONTRAINDICAIION, in medicine, is an in。 dication whicl forbids that to te done which the main fcope of a difeafe points out.

Suppofe, e. gr. in the cure of a difeale a vomis were judged proper ; if the paient be fubjeit to a vomiting of blood, it is a lufficient contraindication as to its exhibition.

CONTRARIETY, an oppofition between two things, which imports their being contrary to one another; and confift in this, that one of the terms implies a negation of the other, either mediately or immediately; fo that contarity may le faid to be the contral, or oppuftion of two things, one of which inports the abfence of the other, as love and hatred.

CONTRAST; oppoftion or diffimilitude of figures, by which one contributes to the vilibility or effect of the others. See Rejemblasice.

Contrat Contrast, in painting and fculptare, expreffes an Coserotier. oppofition or differnce of pofition, attitude, Eُc. of none two more figures, contrived to make variety in a painting, $\mathcal{E}_{c}$ as where, in a groupe of three figures, one is flown before, another behind, and another fideways, they are faid to be in contraft.

The eontrall is not only tn be obferved in the pofitinn of feveral figures, but alfo in that of the feveral members of the lame figure: thus, if the right arm advance farthent, the right leg is to be hindermoft ; if the cye be directed one way, the arm to go the contrary way, $\mathcal{E}_{0} c$. The contralt mult be purfued even in the drapery.

Contrast, in architecture, is to avoid the repetition of the fame thing, in order to pleafe by variety.

CONTRATE-whezl, in watch-work, that dext to the crown, the tecth and hoop whereof lie contrary to thofe of the other wheels, from whence it takes its name. See Warch-Making.
CONTRAVALLATION, or the Line Contra. vallation, in fortification, a trench guarded with a parapet, and ufually cut round about a place by the behegers, to fecure themfelves on that file, and to flop the fallies of the garrifon. See Fortifica. tion.

CONTRAVENTION, in law, a man's failing to difeharge his word, obligation, duty, or the laws or cultoms of the place.

CONTRAYERTA, in botany. See Derstema.
CONTRE, in heraldry, an appellation given to feseral bearings, on account of their cutting the fhield contrary and oppofite ways: thus we meet with con-tre-bend, contre-chevron, contre-pale, $\xi_{c} c$. when there are two ordinaries of the fame nature oppofite to each other, fo as colour may be oppofed to metal, and metal to eolour.

CONTRIBUTION, the payment of each perfon's quota of the part he is to bear in fome impofition, or common expence. See Contingent, E̛c.-Contributions are either involuntary, as thofe of taxes and impols; or voluntary, as thofe of expences for carrying on fome undertaking for the intereft of the community.

Contributions, in a military fenfe, are impolitions paid by frontier countrics to fecure themfelves from being plundered, and ruined by the enemy's army. The peafants till their ground under the faith of contributions, as fecurely as in time of profound peace.

CONTRITION, in theology, a forrow for our fins, refulting from the reflection of having offended God, from the fole confideration of his gooduefs, without any regard to the punilhment due to the trefpafs, and attended with a fucere rcfolution of reforming them. The word is derived from the Latiu conterere, to break or bruife.

CONTROL is properly a double recriter kept of aEts, iffues, Sic. of the officers or commintioners in the revenue, army, \&c. in onder to perceive the true flate thereof, and to certify the truth, and the duc keeping of the acts fubject to the enregitement.

CONTROLLER, an officer appointed to coatrol or overfee the accounts of other officers: anj, on oc. $\mathrm{N}^{*} \mathrm{~g}$.
cafion, to certify whether or no things have been con- Controller trolled or examined.

In Britain we have feveral offeers of this name; as controller of the King's houfe, controller of the navy, controller of the cuftoms, controller of the mint, \&ic.

Controlefr of the Hanaper, an officcr that attends the lord chancellor daily, in term and in feal-time, to take all things fealed in leathern bags from the clerks of the hanaper, and to make the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the fame, and fo charge the clerk of the hanaper with them.

Controzler of the Houfeholl, the fecond officer under the lord fteward. The name of his office comes from the Erenel word contrerouler. His office is to control the aecounts and reckonings of the Green Cloth, of which board he is always a member. He carries a white flaff, and is always one of the privycouncil. He has L. 107:17:6 a-year wages, and L. 1092: $2: 6$ board-wages.

Canffoller of the Pipe, an officer of the exchequer, that makes out a fummons twice every gear, to levy the farms and debts of the pipe. See Pipe and Exchequik.

Controleers of the Pells, twa officers of the exchequer, who are the chamberlain's elerks, and keep a control of the pell of receipts, and goings out.

CONTUMACY, in law, a refufal to appear in court when legally fummoned, or the difobedience to the rules and orders of a court having power to punith fuch offence.

CONTUSION, in medicine and furgery, any hurt of the body that is inflicted by a blant inftrument. See Surgery.

CONVALESCENCE, in medicine, the infenfable recovery of health; or that fate in which, after the cure of a diforder, the body which has been reduced, has not yet regained its vigour, but begins to refume its powers. Proper aliments conduce to the re-eftablithment of the languid faculties; but as the tone of the bowels is weakened, the digeflive faculty is not equal to its office, which is fhown by light fweats over the whole body; and the fmallett excefs in this rofpect is oftentimes the oceafion of dangerons relipfes. A perfon in this flate is like a taper relamined, which the lealt degree of wind is fufficient to extinguifh.
CONVALIARIA, or hill of the $V_{\text {aleser, }}$ in botany, a genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under Sarmentacen, or inth order. The corvila is fexfid; the berry fpotted and trilocular. The feccies are eight, three of which are natives of Britain, riz. the maillis, or may-lily; the multiflora, or folomon's-feal ; and the polygonatum, of fwect-finelling folomon's-feal. They are plants of confiderable beauty, and may eafily be propagated by their creeping roots.
CONVENARUM URbs, or Lugdumum, (anc. geog.) a town of the Convenae, a people of Gallia Na:bunenfis, at the foot of the Pyrenecs. Its origin was owing to the Sertorian war, Pompey compelling the robbers of the Pyrenees and fugitive laves to fetHe

Conven- the there, (Pliny). It food wear the latid of the Gatic'e ronne. Now Si Bertrud, in Gafcony. E. Long. $30^{\prime}$, 1 Cutive
eual. Lat. $43^{\circ} 15^{\prime}$.

CONVENTICLE, a diminative of convent ; de- noting, properly, a cabal, or fecret affembly, of a part of the monks of a convent, to make a brigue or purty in the election of an abbot. From the ill ufe of thene afremb!ies, the wond is come into difrepute ; and now flands for any mifchicvons, feditious, or irreguk affembly. F. Doucine obferes, the uccidentals always efteemed the fifth general council a unlawful conventicle.

The term conventicle is faid, by fome, to have been fint appli:d in Eugland to the fchools of Wickliff, and has been fince ufed to dignify the religions affemblies of all in that country who do not conform to the eftablithed doetrines and worhip of the chureh of Ensland.

Py 22 Car. II. cap. 1. it is enact•1, That if any perfons of the age of 16 years, fubjects of this kingdom, fhall be prefent at any conventicle, where there are fise or more affembled, they thall be fined 5 s . for the firt offence, and 10 s . for the fecond; and perfons preaching incur a penity of L. 20. Alfofuffering a meeting to be held in a houfe, \&e. is linble to L. 20 penalty. Jultices of peace have priwer to enter fuch houlcs, and feize pertons affembled, zoc. And if they neglee their duty, they fhall forfeit L.roo. And if any cuntable, ixc. know of fuch meetings, and do not inform a jultice of peace, or chief magitrate, \&ic. he thall forfeit L.5. But the If W. and M. cap as. ordains, that proteftant diffenters fhall be exempt from penalties: though, if they meet in a houle with the doors locked, barred, or bolted, fuch diffenters faall have no benefit from I W. and M. Cfficers of the government, \&e. prefent at any conventicle, at which there thall be tell perions, if the royal family be not prayed for in exprels words, thall forfeit L. +0 and be difabled; (Stat. ro Anne, cap. 2.)

CONVENTION, a treaty, contract, or agrement between two or more parties.

Convention is alfo a name given to an extraordinary affembly of parliament, or the eftates of the realm, held without the king's wit. Oi this kind was the convention parliament which reflered Charkes II. This parlament met above a month before his retum, and fat full leven months after his reftoration, and enacted fertral laws dill in force, which were confirmed by itat. 13 Car. II c. 7 . and c. 1 t. Such alfo was the convention of eftates in 1989 , who, upon the r-treat of ling Jamis II. came to a conctuiton that he had abdicated the throne, and that the sighe of facecfion devolnal to King William and queen Mray; wherebenon lacir alfembly expirced as a conveation, and was cenverted into : protiament.

Covrentiov of lahates, in Scotland, was partly of the nature of a farlament; but difering in this, that the former cond! only lay ontares, while parliament could buth impole taxes and make laws.

CONVINNLUAL, fomethins bulonging to a convent or momalery. See Monistery, and Coeno. bite.

Covventual is particularly ufed for a relicious who actually relijes in a convent ; in contradillinction to thofe who are only guefts, or are entertained there, Vol, V. I'att 1.
or in pafteftom of benclices depenting on the houfe. Sec Monk.

CUNVENTLS jurbom, were conts of jutice chabliheot in the Roman prownes; with a refort or extent of juriflictiss, circumferbed anl contas. withia certain limits of diterict, whither all who were of the refurt whe to repair lor jultice. The unfatfonable affectation of changing forins of war intornms of civil courts, provid the ruin of Varus and of theree legions in Germany, (Florus). Conenthan agert, is to hold a court of juntice.

CONVERGING or Conmergent Limes, in geometry, are fuch as continually approach neater one another, or whefe ditances become itill lefs and lef. Thefe are uppofed to divergent liaes, the dillances of which becone conitinally greater: thofe lines whica converge one x":y, diverge the wher.

Con"erging Rays, in optics, thore ays that, iffuing from divers points of an object, incline towards ano. ther, till at lat they meet and coofs, and then become diverging rays.

CONVERSAAI'ION, or DISCOURSE, fignilies an interlucution betwecn two, or among more perfons i with thes dilliacion, that converfation is uled for an general intercourfe of fentinents whatever, whereas a difcourle means a converiation limited to fome particular fubject.

There is no part, perbaps, of focial life which at: fords more real fatisfaction than thofe hours which one pafies in rational and mureforved converfation. That converfation, however, may anfwer the ends for which it was dengned, the parties who are to join in it muft come together with a determined clolution to pleafe, and to be plealed.

In the conduct of it, be not eager to interrupt o. thers, or uneafy at being yourlife interrupted; fince you locals cithen to amufe or inilruct the company, or to receive thofe bentlits from it. Give all, therefore, leare to rpeak in turn. Hear with patience, and anfwer with precifion. Inattention is ill manners ; it thows contempt ; and contempt is never forgiven.

Trouble not the company with your own private concerns, as you do not love to te tivmbled with thate of others. Yours ate as little to them as theirs are to you. You will need no other rule wherby to jusge of this matier.

Contrive, but with dexterity and propriety, that each perfon may have an oppontunity of difourfing on the fubject with which he is beft acquinted. He will be pleafed, and yen will be infomed. By obferving this rule, every one has it in his power to affit in rendering converfation ayrevable; fiace, though be may nut choofe, or he qualifica, to fay much limfelf, he can propofe queftions to thofe wha are able to anfwer them.

Avoid tonies, unkes thort, pointed, and quite a frio pos. He who deals in them, liys Switt, mute either have a very lage theok, or a gond memory, or mutt often change lis company. Sonse have a fot of them Arung together like omions; they tille pofferime of the concafation by an eary introdaction of one, and then you mult have the whule rope ; an! thare in an and of every thing elfe, peritars for that mecting, though you may hat luand al tion ofy thmes before.

Tiald often, but not lons. 'The takent of harangu36
|1
Convera. (110

Converis- ing prisate company is infupportable. Senators and :1on $!$ barrifters are apt to be guilty of this fault ; and members who never harangue in the houfe, will often do
it unt of the houle. If the majority of the company be naturally filent, or cautious, the converfation will flas, unlels it be often renewed by one among them who can llart new fubjects. Forlear, however, if poffible, to broach a fecond before the firft is out, left your fock fhould not laft, and you fhould be obliged to come back to the old barrel. There are thofe who will repeatedly crofs upon and break into the converfation with a freth topic, till they have touched upon all, and exhaufted none. Econony here is neceffary for moft people.

Laugh not at your own wit and humour; leave that to the company.

When the converfation is flowing in a ferious and ufeful channel, never intcrrupt it by an ill-timed jeft. The frtam is feattered, and cannot be again coilected.

Difcourfe not in a whifper, or half-voice, to your next neighbour. It is ill-breeding, and, in fome degree, a frand; converfation-ftock being, as one has well obferved, a joint and common property.

In reflections on abfent people, go no favther than you would go if they were prefent." "I refolve (fays bifhop Beveridge) never to fpeak of a man's virtues io his face, nor of his faults lehind his back :"-A golden rule! the obforvation of which would, at one troke, banifh flattery and defamation from the earth.

CONVERSE, in mathematics. One propofition is called the converfer of another, when, after a conclufion is drawn from fomething fuppofed in the converfe propofition, that conclution is fuppofed; and then, that which in the other was fuppofed, is now drawn as a conclufion from it : thus, when two fides of a triangle are equal, the angles under thefe fides are equal; and, on the converfe, if thefe angles are equat, the two fides are equal.

CONYERSION, in a moral fenfe, implies a repentance for a temper and conduct unworthy wur nature, and unfecoming our obligations to its Author, and a refolution to act a wifer and a better part for the future.

Converston, in uar, a military motion, whereby the front of a battalion is turned where the flank was, in cafe the buttation is atracked in the flank.

Conrtrsior of Equations, the farme with reduction of equations by multiplication. See Algegra.

CONVERT, a perfon who has uncurgone a conreafion.

Compert is chiefly ufcd in refpect of changes from one religion, or religiuns $\sqrt{\text { ect, }} \mathrm{t} 0$ another. Converts with relation to the religion turned to, are denominated apofluies with regard to that they have relinquifhed.

The Jews formerly converted to Chrifianity in England, were called converfos. Henry III. buikt them a honfe in London, and allowed them a competent lubfiltence for their lives; which loufe was called domus converforum. But the number afterwards increafing, they grew a burden to the cruwn; upon which they were diftributed among the monaltrics: and after the expution of the Jews under Edward 111 . the domus convorform was given fur keeping of the rolls.

CONVERTS, in a monaftic lenfe, are lay-friars, or brothers, admitted for the fervice of the houfe; without orders, and not allowed to fing in the choir. Till the elcventh century, the word was uled for perfons who embraced the monkifh life at the age of difcretion; by which they were diftinguifhed from thofe devoted in their childhood by their parents, called obluti. But in the eleventh century, when they began to receive into monalteries illiterate perfons, incapable of being clerks, and only dettined for bodily labour, the fignification of the word was neceffarily changed. F. Mahillon obferves, that it was Jolm firt abbot of Y'allombrofa who firft introduced thefe brother-converts, diftinguifled by their fate from the monks of the choir, who were then either clerks or capable of becoming fo.

CONVEX, an appellation given to the exterior furface of gibbous or globular bodies; in oppolition to the hollow imer furface of fuch bodies, which is callect comave: thus we fay, a convex fricze, lens, mirror, fuperticies, \&c.

CONVEXITY, the exterior furface of a convex, i.c. gilbbous and globular thing ; in oppofition to concavity, or the inater furface, which is hollow or depreffed. See Concave.

The word is of particular import in catoptrics and dioptrics; where it is applied to mirrors and lenfes.

A convex mirror reprefents its images fmaller than the objects; as a concave one reprefents them lurger: a convex mirror reflects the rays from it, diverging; and therefore difperfes and weakens their effect : as a concave one reflects them converging, fo as they concur in a point, and have their effect increafed: and by how much the mirror is a portion of a fmaller filece, by fo much does it diminifh the objects, and difperfe the rays the more. See Mirror.

A convex lens is either convex on both fides, called a conveno-convex; or it is plain on one fide and convex on the other, called a flunc-conerex; or concave on one fide and cunvex on the other, called a con-arro-concate, or concavocontex, as the one or the other fuface prevails, i.e. as this or that is a portion of a fmaller fohere. Ali convex lenfes inflect the rays of light in their paffage, i. c. fend them out from their convex furface converging, fo as that they concur in a point or focus. Hence all convex lenfes magnify, i. c. reprefent their images larger than their objects: and this the more as they are portions of fmaller fpheres.

CONVEYANCE, in lav, a deed or inftrument that palfes land, \&c. from one perfon to another.

CONV1CT, in common law, a perfon that is found. guilty of an offence by the verdict of a jury. See the following article.

CONVICTION, in law. When a jury has given a verdict upon trial, finding the prifoner guilty, he is faid to be conaicel of the crime whereof he tands indicted. See Trial.

When the offender is thus convicted, there are two collateral circumftances that immediately arife. I. On a conviction in general for any felony, the reafonable cxpences of profecution are by fatuie 25 Gco II. c. $3^{6 .}$ to be allowed the profecutor out of the county-ftock, if he petitions the judge for that purpofe; and by flatute 27 Geo. II. c. 3 . poor perfons, bound over

## - C O N

Zonviation to give evidence, are likewife intitled to be paid their charges, as well without conviction as with it. 2. On a convition of larciny in particular, the profecutor Glall have reflitution of his goods by virtue of the ftatute ar Hen. VIII.c. ir. For by the cummon law there was no reflitution of goods upon an indianant; becaufe it is at the fuit of the king only; and therefore the paty was enforced to bring an appeal of robbery, in orden to have his goods again. But, it being confidered that the party proferuting the offender by indistment, deferees to the full ats much encourasement as he wha profecutes by appal, this thatute was made, which enacts, that if any perfon be consiand of lariny by the evidence of the paty robbed, he fledl have fall rellitution of his money, goods, and chattels, or the walue of them out of the offender's goods, if he his any, by a wit to be granted by the juftices. And the contraction of this act having been in great meafure conformable to the law of appals, it has therefore in pratice fuperfeded the ufe of appeals of larcing. For inllance, as formerly upon appeals, fo now upon indictencots of laviny, this writ of retitution hall reach the goods fo ftolen, nutwithlanuing the property of them is cndeavoured to be altered by fale in market overt. And though this may feem fomewhat hard upon the baycr, yet the rule of $\mathrm{l}_{\mathrm{d}}$ is, that fpoliatus delet ante onniai refinu, efpecially when he has ufed all the difigence in his power to convict the felon. And, fince the cafe is reduced to this hard necelfity, that cither the owner or the buyer mull fuffer; the law prefers the right of the owner, who has done a meriturious act by purfuing a fcon to condign puniflment, to the right of the buyer, whofe merit is only negative, that he has been guilty of no unfair tranfaction. And it is now ufual for the court, upon the convicion of a felon, to order, without any writ, immediate reflitution of fuch goods as are brought into court, to be made to the feveral profecutors. Or elfe, fecondly, without fuch writ of rellitution, the party may peaceably retake his goods wherever lie happens to lind them, unlefs a new property be fairly acquired therein. Or, lafly, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover againt him for his grods, and recover a fatisfaction in damages. But fuch action lies not before profecution; for fo felonies would be made up and healed: and alfo recaption is unlawful, if it be done with intention to fmother and compound the larciny; it then becoming the heinous offence of theft-bote.

It is not uncommon, when a perfon is convicted of a mifdemeanour, which principally and more immediately affects fome individual, as a battery, imprifonment, or the like, for the court to permit the defendant to Spenk auilb the proficutor, before any judgement is pronounced; and if the profecutor declares himfelf fatisfied, to inflict but a trivial punifhement. This is done to reimburfe the profecutor his expences, and make him fome private amends, without the trouble and circuity of a civil action. But it is furely a dangerous practice : and, though it may be entrult$\epsilon d$ to the prudence and diferetion of the judges in the fuperior courts of record, it ought never to be allowed in local or inferior juriddictions, fuch as the quar-ter-feffions: where profecutions for affaults are by

387 ] $\quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{N}$
this means too frequently commenced, rather for pri- Conviaion vate lucre than for the great ends of public juftice. Above all, it hould never be fuffered, where the teflimony of the profecutor hinfelf is neceffary to consiet the defoudant: for by this means the rules of evidulve ate enticly fubverted; the profecutor becomes in effect a plantiff, and yet is fuffered to bear wienefs for himflf. Nay, even a coluntary fergivenels by the party iujured, ought not, in true policy, to intercept the itroke of jullice. "This (fays an cligane writer who pleads with equal trength for the cortumb,y, as for the lenity of punifome:t), may be an at of goud nature and humanity, but it is contriry to the grod of the public. For dilhough a private citisen may difpenle with fatisfaction for his prisate injury, he caunot remure the neceffity of public example. The right of punithing belongs not to any onc individual iil particular, but to the focity in genetal, or to the fovereign who repocents that focitiy; and a man may renounce his own pertion of this right, but he cannot give up that of others."

Convictiov, in theologr, exprefes the firft degree of repentance, wheren the finner becomes fermlible of his guilt, of the cril unture of lin, and of the danger of his own ways.

CONVOCATION, an affembly of the clergy of Eugland, by their reprefentatives, to confult of eccleinatical maters. It is leld during the feffion of parhiancont, and confils of an upper and a lower houfe In the upper lit the biflops, and in the lower the inferior cleagy, who are reprefented by their proctors; contilting of all the deans and archuleacons, of one proctor for every chapter, and two for the clergy of every diocef, in all $1+3$ divines; viz. 22 deans, 53 archecacons, $2^{2}$ prebendaries, and $4+$ proctors of the diocelian elergy. The lower houfe choofes its prolocutor; whofe bufiness it is to take care that the members attend, to collect their debates and votes, and to carry their refolutions to the upper boufe. The convocation is fummoned by the king's writ, directed to the archbifhop of each province, requiring him to fumsmon all bilhups, deans, archdeacons, \&c.
The power of the convocation is limited by a flatute of licury VIII. They are not to make any canons or ecclefiallical laws without the king's licence ; nur, when permitted to make any, can they put them in execution, but under feveral reflrictions. They have the examining and cenfuring all heretical and fehifnatical books and perfons, \&c. but there lics an appeal to the king in chancery, or to his decegates. 'The clergy in convocation, and their fervants, have the fame privileges as members of parliament.

Since the year 1665 , when the consacation of the clergy gave up the privilege of taximg themfctes to the houfe of commons, they feldom have been alloned to do any bufinefs; and are generally prorogued from time to time till diffulved, a new onc being gencrally called along with a new parliament. The only equivalent for giving up the privilege of taxing themfelves, was their heing allowed to vote at elections for members to the houle of commons, which they had not before.

CONVOLUTION, a winding motion, proper to the trunks of fome plants, as the couvolvulus, or bindweed ; the clafpers of vines, bryony, \&c.

## $\mathrm{C} O \mathrm{~N}$

Cornenivi 149

CONVOLTULUS, bind-verd: A genus of the pentandria order, belonging to the monegrnia clafs of plants; and in the natural method ranking under the 29th order, Canpronucat. The corolla is campmulacel and plated; there are two Higmata; the capfuce is hilocular, and the cells are difpermous. Of this gemus there is a great mumber of fipecies, the molt remamble of which are the following.

1. The fef iunt, or large white bind-weed, is often a troublcfome wed in gutens, when its ronts are interwoven with tlofe of trees and fhrubs, or muder hedges, as every finall piece of root is apt to grow. It flourimes mider monit hedges, and hath white or purplifh bleffons. 2. The Eummonia, or Syrian hindweed, grows naturally in Syria. 'The routs are thick, oun doip into the ground, and are covered with a datk bark. The lranches extend on cuery fide to the dilance of to or 12 feet; they are liender, and trail on the ground, and are gaminted with narrow, arow-poliated leaves. The flowers are of a pale yllow, and come ont from the lide of the lrancles. two fitting upon each lung funttak: thefe are ficececded by roundifh feed-veffels, having three celts fitled with feeds. 3. The parpureus, or convoivuns major, is an annual plant growing naturally in Alia and America, but has bee long cultivated in the Priting gardens. If thefe plants are perperly fupported, they will rife 10 or 12 feet high in warm fammers. There are three or four lafting varicties: the moal common lath a purple flower; the others have a white, a red, or a whitifh-blue flower, which latt hath white feeds. They flower in June, July, and Auguft, and their feeds ripen in autumn. 4. The nil, or blue bind-weed, rifcs with a wwining falk 8 or 10 feet high, garnifitel with heart-fhaped leaves, divided into three lubes, which end in harp points. Thefe are woolly, and fland upon long foot-Italks. The flowers alfo come out on long foot-ftalks, each futaining two flowers of a very deep blue colour, whence their name of anil or indigo. 'This is one of the molt beautiful plants of the genus: it flowers all the latter part of the fummer: and in good feafons the fecus ripen very well in the openair. 5. The battatas, or Spanifh potatoes, hath efculent roots, which are annually imported from Spain and Portugal, where they are greatly cultivated for the table; but they are too tender to thrive in the open air in Britain. Their roots are like the common potato, but require much more room: for they fend out many trailing falks, which extend fix or eight feet every way; and at their juints fend out roots which in warm countries grow to be very large bulbs; fo that from a fingle root planted 40 or 50 large potatoes are produced. 6. The canarienfis, with foft woolly leaves, is a native of the Canaries; but hath long been prefervedin the Britifh gardens. It hath aftrong fibrous root, from whence arife feveral twining woody falls, which, where they have fupport, will grow more than 20 feet high, ganifhed with oblong heart-fhaped ieaves, which are coft and hairy. The flowers are produced from the wings of the leaves, fevtral flanding upon one foottalk. They are for the molt part of a pale blue; but there is a rariety with white flowers. They appear in Junc, July, and Augult, and fometimes ripen feeds here. 7. The triculor, or convolvulus minor, is a native of lortugal; but hath long been
cultivated in the gardens of this country. It is an an- Convolvan'al plant, which hath feveral thick herbaceous filks $\qquad$ growing about two feet long, which do not twine like the other forts, but decline toward the ground, upon which many of the lower tranches lie protrate ; they are gernifhed with crar-fhaped leaves, which fit clofe to the branches: the foothllks of the fowers come ort juit above the leavs of the fame joint, and at the fame fide of the ftalks. They are about two inches long, each fumaning one large open lecll-fiaped flower, which in fome is of a tine blue colour with a white bottom; in others they are pure white, and fome are beautifully cariegated with both colours. The white flowers ate lucceeded by whice feeds, and the blue by dark-coloured feeds; which diference is pretty conikant. 8. The foldanclla, or fea-biudweed, Ityled altu traf ha merrinu, grows naturally on the fea-beaches in many parts of Enghand, but cannot be long preferved in gardens. It hath many fmall white ftringy roots, which fipread wide and fuad out feveral weak trailing branches. Thefe twine about the neighbouring plants like thofe of the comnon bindweed, garnimed with hidney-fhaped leaves like thofe of the leffor calaadine. The fluwers are produced on the fide of the branchus at each joint. They are of a reddifh purple colvur, and appear in july. They are fucceeded by round capfules, having three cells, each containing one black feed. 9. The turpethum is a native of the ifland of Ceylon. This hath feflyy thick roots which faread far in the ground, and ahound with a milky juice that flows out when the roots are broken or wouluded, and foon hardens into a refinous fubthance when expofed to the fun and air. From the rout fhoot furth many twining branches, which twill about each other, of the neighbouring plants, like the common bindweed. They are garnithed with heart-fhaped leaves that are fuft to the touch, like thofe of the marfmallow. The flowers are produced at the joints on the fide of the ilalks, feveral ftanding together on the fame footftalk: they are white, and fhaped like thofe of the common great bindweed, and are fucceeded by round capfukes, having three cells containing two feec's each. 10. The jalappa, or jalap, ufed in medicine, is a native of Haleppo in Spanifh America, fituated between La Vera Cruz and Mexico. It hatha large root of an oval form, which is full of a milky juice; from which come cut many herbaceous twining Atalks riling eight or ten feet high, garnihed with variable leaves; fome of them being heart-fhaped, others angular, and fome obloug and pointed. They are fmocth, and fland upor long footitalks: the flowers are fhaped like thofe of the common greater biedweed, each footfalk fupporting only one flower.

Culture. The tirft and fecond forts are propagated by feeds, which muft be fown on a border of light earth. The ficond fort mult have fome tall ftakes placed near them for their branches to twine about, otherwife they will fprcad on the ground and make a bad appearance. The third fort is aunual, and mult be propagated by feeds fown on a hot-bed in the firing, and towards the end of May they fould be planted out in warm borders, and treated in the fame manner with the former. 'The fourth fpecies is fometimes propagated in this country. The roots muft be planted on a liot-bed in the fpring; and if the plants

## C 0

Convolvs- ate covered in bad weather with glafice, they will prohus Cork. duce flowers and fome frall bulbs from the joints of the halks : but if they are expofed to the open air, they feldom grow to any lige. The fifh is propagated by layins down the young fhonts in the fpring, which generaliy put out roots in the e or fons months: they mut thea be taken from the obl plants, and each pliced in a feparate pot, which is to lef fut in the thade till they have taken new root: after whilh they may be placed with wher hardy green-houfe plants till autumn, when they hould be removed into the greenhoufe, and afterware treated in the fame manner as myrtles and other green-houle plants. The turbith and jalap are too ten 'er to live in this comutr', unkefs they are contlantly kept in a thove. 'The ofler fipecies require no particular diredions for their eultivation.

Uies. The root of the firll fort is a very acrid purgative to the luman race, hut is eaten by hows in liorge qu metiets without any detriment. The infpifater! jaice of the fecond fuecies is ufed in medicine at a trong pargative; as are alfo the roots of the jaluppa and turpethum. The fildandla has likewife been ufed with the fame intention. Half an ounce of the juice, or a drachun of the powder, is an achid purge. The leaves applied externally are frid to diminifh drop ficai fwellings of the fict. See Scammony, Jalap, and Turpeth.

CONVOY, i: naval affars, one or more fhips of war, empluyed to accompany and protect menchant frips, and prevent their being infulted ly pirates, or the enemies of the flate in time of war.

Covroy, in military matters, a body of men that guard any fupply of men, money, ammunition, or provilions, conveyed by land into a town, army, or the like, in time of war.

CONUS, a rove, in botany : a frecies of fruit or fealy feed-veficl, fo termed by Tombefort and other botanifls. Limneus has fublituted strobules in its place.

CONVULSION a preternatural and violent contraction of the membranons and mufcular parts of the body. See (the Inatx fubjoinced to) Menchaf:

CONVAY, a market-tuwn of Cacraarsouthire in North Wales, fituated near the memuth of a river of the fame name, 15 miles wed of St Alaph. W. Long. 3.50. N. Lat. 53. 20.

CONYZA, fleabane; a genas of the polygamia fuperfua order, belonging to the fyngenetia clafs of plants; and in the natural method ranking uader the 49 th order, Compsifitu. The palpus is fimple, the callyx imbricated and roundih, the corollula of the radius trifid. There are 19 feceies, none of which merit any particular defeription.

CONZA, a town of the kingdom of Naples in Italy, fituated on the farther principate, on the river Offanto, 50 miles fouth-ean of the eity of Naples. E. Long. 16.0. N. Lat. 41.O. It is the Set of an archluifop.

COOK (Sir Anthony), defecnded from Sir Thomas Cook lord mayor of London, was born in 1506 , and fuppoied to have been elucated at Cambridge. He was fo tminent for his learning, picty, and prudence, that the guardians of king ECward VI. appointed him
to be his chief inftruetor in learning, and to form his maners. He hatl four daughters; and heing iefolvod to have fors by cducation, let he fould have none byobith, he tanght in dumbeers thorelefons by night that he had infliled into the prince by cay: he whs happy in his endearoure, ab they proved learned in Greek and Latin, and qually dillinguined by virtue, piety, and good fintunc. Mildred was married to the great lond lameigh ; Ann to Si Nicholas Baeon, lord keeper of the great feal ; Eliabeth to Sir John Ruffel, ton and heir of Francis can of Redford ; and Catharine to Sir EIenry Killigrew. He lived in exile during the Marian perfecution; and returaing on the accellion of queen Elizabeth, fpent the ret of his days in peace and honour, dying in 157 t.

COOK (Captain James), ne of the noft celebrated navigators ever producd by Britain or any other country, was the fon of James Cook, fuppofed to have been a native of the eounty of Northumberland. His Alation was no liggher than that of a fersart in hufoandiy, and he was married to a woman in his own fphere of life at Morton, a village in the North riding of Yokfaire. I rom this place they remored to another village in the fame riding named Alorth, where Captain Couk was burn on the 27th of Octuber 1728. He was one of nine children, all of whom are now dead eseept a daughter, who mariced a lifherman of Redar. He reeeived the firt rudiments of educatiou from the schowmintefs of the village; and aftertel wards, on his lather's removal to Great Ayton, he was put to a day fchool, at the expence of Mr Skottow, his father's cmployer, where he was inltructed in writing and in a few of the fult rules of arithmetic. Before the age of thirteen lie was bound appreatice to Mr W. Sanderfon, a haberdafher or fhopkecper at Stiaiths, about ten niles from Wlitby: but fome difagrement taking place between him and his matter, he indulged his own inclination in binding himfelf apprentice to Meffrs Walkers of Whithy, who bad feveral veffels in the eoal trade; and after ferving a few years longer in the fituation of a common failor, he was at lengthe raifed to be mate of one of Mr Walker's thirs. During all this period it is not recollected that he exlibited any thing peculiar either in his abilitics or conduct.

Early in the year 1755, when hofilities broke out between France and England, Cook cuteted on board the Eagle of fixty guns, to which weffll sir Hugh Pallifer was foon after appointed, who foon diflinguinhed him as an active and diligent feaman; and his promotion was forwarded by a letter of recommendation which was written by Mr Olvadethon, member for Scarborough, at the requen of feveral neighbours, in Mr Cook's favour. On the 15 th of May 1759, he was appointed mafter of the Mercury, which foon after failed to America, and joined the feet under Sir Charles Saunders at the memorable fiege of Quebec. His interelt with the admiralty appears even then to have been very flrong; for on Mr Onaldefton's letter he was appointed mafter of the Grampus floop ; but the proper inatter having mexpeciedly returned to her, the appeintment did not take phace. Four day's after he was made mafter of the Garland; when upon inquiry it was found that he could not join hor, as the In59, he was made mafter of the Mcrcury. On this occation he was recommended by Captain Pallifer to a diffcult and dangerons forvice, viz. to take the forundings of the river St Lawrence, between the illand of Oiteans and the notth fhore, which he performed in the moft complete manner; and foon afterwards he was employcd to furvey the molt dangervus parts of the river bclow Quebee : thefe were his firtt cfforts with the pencil. After this expedition he was appointed, on the 22d of September, matter of the Northumberland, fationed at Halifax, where be firft tead Euclid, and applied to aftronomy and other branches of foience. In the yeal 1762 he was with the Northumberland, alititing at the recapture of Newfoundland; and in the latter end of the fame year he returned to England, and married, at Barking in Effex, Miis Elizabeth Batts. Early in 1763 , when admiral (then Captain) Greaves was appointed governor of Newfoumdland, Mr Cook went out with him to furver the coants of that illand. At the end of the feafon he retumed to England; but in the beginning of 10 的, Sir IJugh Pallifer being appointed governor of Newfoundtand and Labradore, Mr Cook accompanied him in the fame capacity of furveyor, and had the Grenville fehooner to attend him on that bulinefs; ia this fituation he continued till 1767.

While Mr Cook remained on this flation, he had an opportunity of exhibiting publicly a fpecimen of his progrefs in the fudy of altronomy, by a thort paper printed in the 57 th volume of the Philofophical Tranfactions, intitucd "An olffervation of an eclipfe of the fun at the inand of Newfoundlaud, Augult 5. 1706, with the longitude of the place of oblervation deduced from it." Mr Cook's obfervation was made at one of the Burgeo iflands near Cape Ray, in N. Lat. $47^{\circ} 5^{\prime} 19^{\prime \prime}$, and by the comparifons of it made by Mr Mitchel with an ubfervation of Dr Hornby at Oxford, it appeared to have been accurately done: and Mr Cook at that time obtained the character of an able aftronomer.

In the mean time a fpirit for geographical difcoveries, which had gradually declined lince the beginning of the 17 th century, began to difover itfelf antw. Two reyages of this kind had been performed in the reign of George II. the one under Captain Middleton, the other hy Captains Moore and Smyth, with a view to difcover a norihwell pafage through Hudfon's Bay to the Eaft Indies. Two others, under Captains Byron, Wallis, and Carteret, had been undertaken foon after the conclufion of the peace in 1763 by order of his prefent Majefty; and before the return of thefe navigators, who were ordered to fail round the world, anuther woyage was refolved upon for attronomical purpoites. It having been calculated that a tranfit of Vemus over the fun's difk would happen in 1769 , a long nocmorial to kis Majefty was prefented by the Royal Society; in which they fet forth the great iuportance of making proper obfervations on this phenomenon, the regard that had been paid to it by the different courts of Europe; and intreating, among other things, that a veffel might be fittcl out, at the expence of government, for convering proper perfons to fome of the Friendly Iflands, in order to make the neceflary obfervations. This being complied with on the part of his Majefty,

Alexander Dalrymple, Efq; an eminent member of the Royal Society, was appointed to take the comunand of the bark appropriated for the purpofe. In the exccution of the project, however, an unexpected diffculty occured. Mr Dalrymple, fenfible of the impoffibity of guiding a velfel through unknown and dangerous feas without any proper command over the crew, demarded a brevet commifion as captain of the veffel, in the fame manner as had formerly been granted to Dr Hilley in a voyage of difcovery made by him. This commifion Sir Edward Hawke abfolutely refufed to lign; declaring, when prefled upon the fubject, that he would rather fuffer his right hand to be cut off than truft any of his Majefty's fhips to a perfon who had not been properly bred to the fervice: and in this proceeding he feemed to be jutitied oy the mutinous behaviour of Dr Halley's crew; wha, denying the legality of his authority over them, had involved him $\mathrm{in}_{1}$ a very difagreeable dipute, and which was attended with pernicious confequences. Mir Dadrymple, on the other hand, being equally determined in his refufal to proceed without fhe authority in quefion, there was a necefinty for finding out fome perfon of fcience who inight alfo be fiee from the objcetion made by Sir Edward Hawke. Mr Cook thercfore was propuled by Mr Stephens; and his yecommendation being fcconded by Sir Fingh Pallificr, he was immediately appointed to direct the expedition: and on this occation was promoted to the rank of licutenant in his Majefy's fervice.

Mr Cook's commifion as licutenant was dated May 25.1768 ; a veffle of 370 tons, named the Eindeavour. was provided for him; and while the necefiny preparations were making for the royage, Captain Wallis returned. It having been recommended to this gentleman to fis upon a proper place for making the aftronomical obfervations, he had accordiugly chofen the inand named by him George's I/ancil, but lince known by the name of Otabeite; judging alfo that Port Roval harbonrin it would afford an eligible fituation. Thes propofal being accepted, diretions for the purpofe were accurdingly given to Mr Cook, with whom Mr Charles Green was joined in the aftronomical part ; the latter having been affinant to Dr Bradlyy in the Royal Obfervatory at Greenwich, and thus judged to be every way qualifed fur the office. The lieutenant was likewife accompanied by Mr lanks, now Sir Jofeph Banks, Dr Solander, \&c. The principal defign of the voyage was, as has already been hinted, to make obfervations on the tranfit of Venus; but this being done, Mr Cook was directed to make further difcoveries in the Pacific Ocean; and on the 30th of July 1768 he fet fail on his expedition. An account of the voyage, and the difcoveries made during the time of it, is given in the next article: here it is fufficient to oblerve, that thronghout the whole Mr Cook approved himfelf an able feaman; and from his behaviour both to his own people and to the favage nations he occafionally met with, fhowed a moft exact regard to the rules both of julice and humanity: On his firit arrival at Otaheite, the following regulations were drawn up for his people, which he took care fhould be punctually obeyed: I. To cndeavour, by every fair means, to cultivate a friendhip with the natives, and to treat them with all imaginable humanity. 2. A proper perfon cr perfoas

## $\mathrm{C} O \quad \mathrm{O}$

Cook. to be appointed to treat with the natives for provifions, fruits, sic. and no other perfon belonging to the flip to do fo without leave. 3. Every perfon on fhore to attend punctually to his daty, and to pay properattention to his tools or ams; and if loth throurth negligenee, to lave tlae full value charged agamelt his pay, with fuch farther punilmment inficted as occitfion might require. 4. The fame penalty to be inflicted on every one who thould enbeczle, trade with, or offer to trade with, any part of the thips flores; and, 5. No iron to be given in exchange for any thing but provifions. His rigid adherence to thefe rules was manifelted in feveral inftances, particulanty by fovercly punifhing the fhip's butcher, who had threntened the life of a woman, wife to one of the chiels of the ifland, for refufing a ftone batehet on the terms he propofed. On ereeting their ubfervatory, in erder to go through the allronomical uperationc, an accident happened which had like to have difenneeted the whole fcheme. 'This was the Jufs of their quadrant, which had been flulen by fone of the natives; but, chiefly through the exertions of Mr Banks, it was recovered, and the obfervations made accondingly. Scarce was this accomplifacd, however, befort another theft of the natives demanded the moll ferious confideration of the eommander. Some of them taking advantage of the atention of the oficers being otherwife engaged, took the opportunity of breaking into one of the ftore-rooms, and lleating from thence a bag of fike nails of no lefs than an hundred weight. 'This was a mof important aflair ; for as thole nails were of great eftimation among the Indians, the polfeffion of fuch quantity mull undoubtedly have much leffened their value, and thus rendered provifions of every kind greatly dearer on the illand than before. One of the thieves therefore leing difcovered, was punifhed with 200 lathes: notwithonding which he obftinately refufed to difiover any of his accomplices. Repeated thefts eommithed afterwards required all the wifdom and refolution of Mr Cook to conduct himfelf in a proper manner. After due confideration, he fudged it to be a matter of importance to put an end to thefe practices at once, by doing fomethines which might engage the natives themfelves to prevent them for their common interett. This, however, he was not at prefent able to accomplifh; nor indecd did it feem poffible to prevent them without uning firearms, which from motives of humanity he atill determined to avoid. At haft, after a flay of three months, when preparing to take his leave, the mont difagreeable adventure took place that he had hitherto met with. 'This was the defertion of two of his people, who baving married young wonnen of the country, determined to take up their refidence in it. Mr Cook was now obliged to feize forne of the chitfs, and to inform them that they could not obtain their liberty unlefs the deferters were recovered. This at laft pioduced the defied effect; the deferters were given up, and Mr Cook fet fail, along with Tupia (who had formerly been the prime minifter to Oberea, a princefs of the illand) and a boy of 13 years of age, both of whom were detirous of accompanying him to England.

While Mr Cook proceeded to vifit others of the South Sea Iflands, Tupia oocafonally ferved as an in.
terpreter. On his arrival in New Zeatand, Mr Cook found the people extrencly hoftile and infulent. At their very firf necting, one of the natives having thecatened to dare his lanee into the boat, was the deanl. Another, haviag carried of MMr (Breen's hanger, was fired at with fimall thot, wad upon his litll refaring to reftere $i$, was firud at with ball and killad. This, however, produced very little culset on the reth, who oficed to make an attack upen them, hill feveral muikets were fircd with finall thot, which wounded three or four more. Next day the commander, haviner determined to fonce fome of the matives on beard, in order to conciliate their affection hy kind treatment, directed his men to follow two canoes whom lee perecived ander way blione him. One made her diape, but the other, ant offerving the boats in purfint, was overtaken; on which the Cavages plied their oars fo bridy, that the thip's boats were mot able to keep up with them. I'npia, whofe language the Now Zealanders underflood, called to them to return, with affurances that no hart thould be dune them ; but they continated their fight without minding him. A malket was then fired uer their heads with a view to intiaddate them, but upon this they prepard to light; and on the coming up of the boats began the atack with fo much vigour, that the lientenant's people were obliged to fire upon them with ball, by which four out of feven that wese in the buat were killed, and the other three jumpord into the water, and were taken on buard.

This part of Mr Couk's conduet feems inconfatent with that humanity for which he was in general to eminently dillinguihnd; he was aware of the cenfure. and makes the following apolugy. "Thefe people certainly did not deferve death for not chooling to consfide in my promifes, or not confenting to come on board my boat, even if they had apprehended. no dangur: but the nature of my fervice required me to obtain a knowlodge of their country, which I could no othervife ubtain but by forcing into it in an boflite mamer, or gaining amifion through the confdence and good will of the people. I had alrady trice the power of prefents withuat effect ; and I was now prompted by my defire to avoid farther hullilitics, to attempt to get fume of them on board; the only method we had feft of comrineing them that we intended them no harm, and hud it in our power to contribute to their gratification and convenience. Thus far my intentions certainly were not criminal; and tho' in the contcf, which I had not the leaft reafon to expeet, our victory might have been eomplete without fo great an expence of life ; yet in fuch fituations, when the command to fire has once been given, no man can pretend to rellrain its exeefs, or preferibe its cffect."

Notwithtanding the difaller juft mentioned, to which the three New Zealanders, who were taken on board, had been witnefles, they were foon conciliated, and begran to fing with a degree of talte that furprifed the Englifh gentlemen. They were boys, the oldelt about Ig and the youngelt about in; but no kindnefs which could be thown them was in any degree effectual to bring about a reconciliation with the reft. On the contrary, having perceived the fhip in fome diftrefs, they inflantly fhowed a difpofition to make an attack; and from this they were only prevented by
the fring of a bour-pounder charged with grape thot. Even this did not produce any pernment eficet; ansther attacts was determined mpon, and would undoubttaly have been made, had not 'Tupid informed them, that if thes perfited in the attempt, the arms of their adverfaries, tise thumder, would detroy every one of them. This was enforced loy the fire of another formefounder with grape thot, which fpreadiras wide in the water, torified them to fuch a degree that they befan to paddle away as fatt as pofible. Notwithltand. ing this, however, fome intercourfe began to take place ; but in every inftance the New Zealanders manifetted their hoftility and treachery in fuch a manner as howed that they were not to be gained by fair means. At lait an attempt to carry of 'rayeto, I'upia's boy, rendered it ablolutely neceflary to fire upon them in order to refcue him from eertain deftruction, fome of the favages herring got him into a canoe, where they held him down by villence. In confequence of this one of the fasages was killed on the foot, and feveral more wouded, by the difohave of mumets from the boats; 'l'aycto recorered his liberiy, jumped into the water, and fwan to the flip. Some partial intercomfe again too's place: but fill it appeared that the imnate rancour of thefe favages was neither to be fubcued by fair means nor foul; and it was only by the powerful argunents of cannon and mufkery that they eould be kept from attempting to do mifchisef.

From the acconnt of this royage publithed by Dr Hawkefworth, indued, it appears, that a coadiderable number of farages perifhed in a manner fimitar to that above mentioned, and they feem to have manifetled a more hoftile bchaviour than afterwards: on thofe melancholy oeeafions, however, it is obferved to the honour of Mr Cook, that his humanity was eminently conipicuous teyond that of the common people, who all along howed as much inclination to deftroy the Indians as a fportiman docs to kill the game lee purfucs.

While Mr Cook confted the illunds of New Zealand, lee was fometines in the mon imminent danger of being thipwrecked. In the latitude of $35^{\circ}$ fouth, and in the midt of fummer in that climate, he mot with fuch a gale of wind as he farce ever experienced before; fo that he was no lefis than three weeks in gettine tenleaguts to the wenward, and two mone lefore he could get 30 leagues futher. Fortunately, how. ever, they were all this time a confiderable way from bund, otherwili it is probable that the thom noult have prosed fatal.

In Cook having fpent fix montlis in croumavigatiox and fully exploring the inands of Now Zocaland, he dulud from thate on the 3 eft of March 1-0. It muit be oifowni, however, that the extreme holtility manifefice by the inhabitancs in that part of the ilaus where he fint amied, was not univerfally diffufed, but that a fiencly intereourfe was for a long tiree main-
 New Zenlard heproctedud to New Holland, whi on tide 2 oth of Aprif came in loght of Botany Bay. Etre aib thein enderoms to induce the matives to have any intercoure with them poned inetfectual, tho happily there was no blood fpit in any quarrel.

Dwing their navegation round New Folland, the ivo 20.
coath of which are full of dangerous rocks and froals, our navigaturs were bronght into a more perilous fituation than ever; and from which the efalpe was fo extraordinary, that it deferves a parti-ular relation. This happened on the 10 oth of Jone 1770, as they purfued their coure from Trinity Bay, and newry in the latitude affigned to the illands dicovered by $Q$ (niros. At that time they had the advantage of a line breeze and a clear moonlight; and in ttanding off from hix till near niae o'lock, the thip had deepened her water from $1+$ to 21 fathoms; but while the navigators were at fupper, it fuddenly fholed to 12,10 , and 8 fathoms, in the fpace of a few minutes. Evary thing was then ready for putting the fhip about, when they fuddenly got into deep water again, and eontinned in 20 and 21 fathoms fo: lome time, fo that the gentlemen went to bed in perfect fecurity. A little before eleven, however, the water fhoaled at once from 20 to 1 If fathoms; and beforc the land could be heaved again, the thip itruck, and remained immoveable, excepting as far as the was heaved $u$, and down and dathed againt the rocks by the furge. The alam was now taniverfal, and not indecd without the greatelt reafon. It appeared that the wefel had been lifted over the ledge of a rock, and lay in a hollow within it, where there were in fome places from three to four fathoms water, and in others faree as many fect: the fleathing boards were disjoined, and floating round the hip in great numbers; and at laft the falle keel alfo was deftroyed, while the rock kept grating her bottom with fuch force as to be heard in the fore hore-room. It was now neceflary to ligh en the thip as much as poffible; and this was done with all expedition to the amount of more than 50 tous. In the morning of the I th of fune they cifcovered the land at about eight teagues diftance, without any thand between, on which they could have been fent dilore in the eve:st of the Gipg gome to pieces, that fo they miglit have been carried to the madin land by turas. T'o add to their diftreis, the thip drew fo mich water, that it could fearce be kept under by three pumps. Lanty, it appeared, that even the rifing of the tide, on which they had uthinately depencoul for rekef, was infufficient to anfwer the purpore, as the day tide foll contiderably froot of that in the night-time. Having therefore lightened the hip fill farther, by throwing ont every thing that could poobibly be fpared, they waited with patience for the neat tide; when, after incredible exertion, the fin rifrited, and they got her over the kdge of the rock into deep water. By continual labour, howeser, the men were at haff fo mech exhauted, thatethey could not fland to the pumps more than die or hix minntes at a tume; after which they threw themfloes flat on the deck, though a dream of water betwest three and four inches deep ran over it ; and mathe itation they hy till othere, exhauted as well as themfclices, touk their places, on which they fartod up again, and renewed their esertions. In this dreadfuh (xtremity Mr Monkhout, a midihipman, propeled the expedient of fothering the fhar, as it is caled, by which ontars he faid that he had feen a merchast finip oronght from Virginia to Lonton after the had fpring a leak that admited more than four feet water in an hour. The expedient being approved of, it was put in execution in the fulluwing inanner. He'
tood

Eoos took a lower fludding fait, and having mixed a large quantity of oakuns and woul togsther, ftitched them down by handfuls as lightly as pollible; the whole being aftervards fpread over with the dung of the theep and other filth. The fait was then hauled under the fhip's botom by means of ropes which kept it ex. tended. When it eame under the leak, the wool and oakum, with part of the fail, were forced inwards by the preffure of the water, which thus prevented its own ingeefs in fuch an effectual manner, that one puinp, inftend of three, was now fufficient to kecp it under. Thus they got the Rip into a convenient port on the coaft of New Holland, where there was an oppontunity of fully repairing her defects. Here they difcovered that their prefervation had not been owing entirely to the expedient above mentioned; for one of the holes was in a great meafure filled up by a piece of roek which had broken off and fluck in it ; and this hole was fo large, that had it not been filled up in the manner juft mentioned, they mult undoubtedly have perifhed notwithtanding all the afiftance that could have been derived from the pumps.

The dangers they fuftained in navigating this coat were immurcrable, infomuch that for very near three months they were obliged to have a man conflantly in the chains heaving the lead. They were always entangled among rocks and hoals, which cond not have failed to deftrey a lefs experienced navigator ; and even Mr Cook, with all his fagacity, could not fometimes have extricated himfelf, had ie not hen for the favourable interpofition of fome natural events, which no human penetration could forefee or have the lcaft dependence upon. Of this we fhall only give the fuljowing intance. Having at latt, as they thought, got fufcly over the valt recefs of funk rocks with which the coatt of New Holland is furromeded, they flateured themefves that all danger was pafied, and the watt fwell of the water convinced them that they were now in the open ocean. The remembrance of former dangers, however, indueed them frequently to take the precaution of founding; notwithftanding which, in the latitude of ahout $144^{\frac{2^{\circ}}{2}} \mathrm{~S}$. they found themflves one morning onty about a mile dittant from the molt hideous breakers, though the fea all around was unfathomable. Their fituation was rendered the more dreadful by its being a dead calm, at the fame time that they were carried towards the rock with fuch rapidity, that by the time they had got the frip's head turned by means of the boats, the was fearcely soo yards ditant from it. Their only refource then was to tow the fhip, if poffible, by means of the boats and pinuace, out of a fituation fo very perilous; but all their efforts would have been unfuccefsful, had not a breeze of wind fprung up, which, though too light to have been noticed at any other time, was found to fecond their efforts fo effectually, that the hip began to move perceptibly from the reef in an oblique diuction: during the time that this breeze lalled, which was not more than ten minutes, they lad made a conliderable way. A dead calm fucceeding, they Began to lofe grouud, and in a little time were driven within 200 yards of the rocks: but fortunately the breeze returned, and lafted ten minutes more; doring which time a fmall opening was perceived in the reff at the diflance of about a quarter of a

Voz. V. Part I.
milc. The mate being fent ost to cxamine this opening, reported that it was not more than the length of the thip in breadth, but that there was fmooth water within. On this it was dttermined to pufh into it by all means. The attenpt failed of fuccefs; as, juft when they had bronght the mip with great labour to the mouth of the opering, they found a current fetting out from it by reafon of the tide now begiming to ebb. But though their hopes were difappointed in getting through the opening, they were, by the current fetting out from it, driven in a very fhort time to the difanee of a quarter of a mile from the roeks; and by dint of towing and other exertions, they were got by noon to the diftance of two miles. This temporary deliverance, however, afforded but frall profpect of being utimately relieved. They had fill no other expectation than of being forced back into their former fituation by the return of the tide: but happily they now perceived another opening about a mile to the weltward. Mr Hicks the lieutenant being fent to examine this opening, returned with an aecount of its be. ing narrow and hazardous, but capable of being pafo fed. To this place therefore the flip was directed by every pomble means; and a light breeze happening to fpring up, they fortunatcly reached it, and were inftantly hurried through with great rapidsty by the current of the returning tide; which, had it not been for this opening, would undoubtedly have dafhed them to pieces againtt the rocis.

From the time they quitted the coaft of New Hoiland till their arrival at Batavia in the ifland of Java, our navigators met with no other danger but what is common in fea-voyages. 'I'hey were obliged to flay for fome time at this place to repair their damages; aud on viewing the condition of the fhip, found they had more reafon than ever to admire the manner in which they had been preferved. Both the falle - ke:t and main-keel were greatly injured; groat pait of the heathing was torn off; feveral of the planks were much damaged, and among thefe there were two, and hall of another, which for fix feet in lengtin were not abuve the eighth part of an inch in thicknefs, betides being peretrated with worms quite to the timbers. Here the crew were exceffively amoyed by ficknefs, which obliged them to remain much longer than they would othervife have done: and it is worthy of notice, that every one of the crew was ill excepting the fail-maker, an old man between 70 and 80 years of age, and who was drunk every night. Poor 'Tupia, with his boy Tayeto, fell facrifices to the unhealthinefs of the climate, as well as the furgcon, three feamen, and Mr Green's fervant. Nor did the evil flop here; for on their fetting out from Batavia, the feeds of difcafe which had been received there broke out in the molt violent and fatal manner, infomuch that in the courfe of about fix weeks there died one of Mr Banks's affiftants, by name Mr Sporing, Mr Parkingfon his natural hiftory painter, Mr Green the aftronomer, the boatfwain, carpenter, and mate; Mr Monktuate the midhipman, the corporal of the marines, two of the carpenter's crew, and nine feamen. Even the jolly y old fail maker could now hold ont no longer ; but whether his death might not in fome meafure be attributed to his being lefs plentifully fupplied with liquors than
formerly,

## C O O [ 30t ] CO G

Cook. fotmerly, might have deferved inquiry. Thefe unfortunate events probably made a confiderable impreffon on Mr Cook's mind ; and perhaps induced him to direct his attention to thole methods of preferving the health of feanen which he afterwards pat in execution with fo much fuccefs. After tonching at St Helena, they continued their royage for England, where they arrived on the Ith of June 1771; and on the 20th of Augult the fame year, his Majelly teftifed his approbation of Mr Cook's conduct by appointing him a captain in the navy. On this occafion Mr Cook wifhed to have been advanced to the rank of puft-captain, which, though not more profitable than the other, is more honourable; but this being inconfitent with the rules of puferment in the nary, the eanl of Samewich, at that time at the head of the ad. mivalty, could not agree to it.

Captain Cook was not allowed to remain long inactive. The idea of a fouthern comtinent had long been entertaned, and Mr Dalrgmple had renewed the attention of the public towards the queftion, by his hiftorical collection of voyages to the Pacific Ocean, publifhed in two quarto volumes, one in 15\%0, the other in 1 :71. Tu determine the matter finally, Captain Cuok was argain fent out: and the object of this voyage was not merely to fettle the quedtion juit menciontd, but to extend the geography of the globe to its utmolt limits. That the undertaking might be carricd on with the greater advantage, it was determinell to employ two thips, on the choice and equipment of which the utmoft attention was beftowed. The fuccefsful voyage which had already been made in the Endeavour, fuggefted the idea of that hip being a proper model for the two which were to be fent ont ; and the opinion of Lord Sandwich concurring with the genetal idea, two veffels, conftrueted by the fame perfon who had built the Endeavenr, were purchafed for the voyage. Thefe were about 14 or 16 months old at the time they were purchafed; and in the opinion of Captain Cook, were as fit for the purpofe as if they had been but newly built. The larger of the two, of 462 tons burden, was named the Refolution; the fmaller, of $33^{6}$ tons, had the name of the Adrenture: the complement of men on board the former, of which Captain Cook was commander, being II2; on the latter, commanded by Mr Tobias Furneaux, 81. In their equipment, every article that conld be fuppofed necefliary, however much out of the common line, was procured, and every circumflance that could be fuppofed to contribute to the fuccefs of the voyage was attended to in the moft ferupulous manner. Befides the ufual ftores and provifions, all of which were of the beft kinds, the flips were furnifhed with malt, four-krout, falted cabbage, portable Soup, falop, multard, marmalade of carrots, beer, and infpiffated wort. Mr Hodges, an excellent landfcape painter, was engaged to make drawings and paintings of fuch objeets as required them. Mr John Reintold Forfter, with his fon, were buth engaged, in order to explore and collect the natural hiftory of the countries through which they pafied; and lallly, that nothing might be wanting to render the voyage as complete as pollible, Mr. Willian Wales and Mr William Bayley were engaged by the board of longitude to make cedeltial ubleryations. They were furnifed with the
bef iutruments of every kind, and among rhe relt with four time-pieces; three couftructect by Mr Arnold, and one by Mr Kendal on Mr Harrifon's principles.

At Plymouth Captain Cook received his inftructions; which were not only to fail round the grove, but to fail round it in high fouthern latitudes, and to make fuch traverles as might finally refolve the queftion concerning the fouthern continent. In purfuance of thefe inftructions be fet fail on the 13 th of July 1772 , and on the 29 th of the fame month reached the Madeiras. As he proceeded afterwards in his royage, he made three puncheons of beer from the infpiffated wort carried out along with him, and found it excellen:ly to anfiver the purpore, provided the material could lave been kept without fermentation in its infpifated flate; but as this was found impoffible, the expedient ferms to have failech. In this voyage, however, the Captain uled with the greateft fuccefs fuch methods as appeared likely to contribute to the preferwation of the health of his men. In rainy weather, he took care that the fhip thould be aired and dried by means of fircs made between the decks, the damp places were froked, and the poople were ordered to air their bedding, and wath and dry their clothes, whenever an opportunity offered. Thus he reached the Cape of Good Hope without having a fingle man dick. Having left it, and lept on his courfe to the fouthward, he foon began to meet with cold and !tormy weather, by which he loft almoft the whole of his live ftock of fleecp, hogs, and geefe. The bad effects of this termy weather upon the men were guarded againlt by an addition to their clothing, and giving them a dram on particular occafions. On the fisth of December, being in the latitude of $50^{\circ} 40^{\prime}$, he fell in with illands of ice, and continued among them in various latitudes till the I 7 th of January 1773 ; when he fet fail for New Zealand, which he reached on the 27 th.

The reception of our mavigator by the New Zealanders was now much more friendly than in the former voyage, fo that there were no contelts with the natives; nor did Captain Cook oblerve any one of thofe whom he had feen before, neither was there the fmalleft remembrance of former hoftilities. Having ftaid in this country till the 7 th of June, our navigators fet fail for Otaheite; but during the voyage the crews of both hhips were attacked by the feurvy. Thofe of the Adventure were in a very fickly flate; the cook was doad, and 20 of her belt men incapable of duty. On board the Refolution matters were much better; and the only reafon that could be conjectured for the difference was, that the people of the Adventure had been in an habit of body more inclined to the furvy than thofe of the Refolution, and had eat fewer vegetables. Here it was obferved, that the averfion of feamen to a change of diet is fo great, that it can only be overcome by the fteady and perfevering example of a commander. While he remained at New Zealand, the Captain had difcovered a tree which greatly refembled the American black fpiuce. Perfuaded, therefore, that it would be attended with effects equally falutary on the health of the people, he employed them in brewing beer from it. This was done while they continued at Duky Bay, in order to fupply the want of vegetables, which were not to be

## $\mathrm{C} O \mathrm{O} \quad[39 \%] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{O}$

procured there ; but on removing to Queen Charlotte's Sound, they were more fortunate. Captain Cook himfelf went to look out for antif:orbutic vergetalles; and returned in a very thort time with a boat-load of fcurvy-grafs, celery, \&c. Thefe were boiled with the peas and wheat; and though fome of the people difliked them at firft, they foon became fo lenfible of their good effects, that they cheerfully followed the example of the relt; and the freedom of the crew from the fcurvy and other dittempers was by every one attributed to the New Zealand fpruce beer and vegetables. From this time forward the Captain had fearce occation to give orders for gathering vegetables when they came to any land.

During this voyage Captain Cook experienced another narrow cfeape from hlipwreck. Being becalmed at the diftance of half a league from a reef of rocks ncar Ofnaburg Inand, it was found neeeffary to order out the boats to tow off the fhips; but this was found impoffible. The calm continuing, and the lituation of our navigators becoming every moment more dangerons, the Captain attempted to get through an opening in the reef which he had judged practicable: but on approaching it, found that there was not fufficient depth of water; at the fame time that the draught of the tide through it forecd the thip thither in a manner fearce to be refifted. One of the warping maclints, with about 400 fathoms of rope, was thicn ordered out, but did not produce any effect. They were within two cables length of the breakers, and no bottom could be found for cafting anchor. Having no other refource, however, they did drop an anchor ; but before it took hold, the Refolution was in lefs than three fathoms water, and ftruck at cery fall of the fea, which broke violently clofe under her Itern, threatening deflraction to every one on board. At lat the tide cealing to act in the fame direction, the boats were ordered to try to tow off the refiel ; in which being affited by the land-breeze, which forturately furung up at that inftant, they with much labour fucceeded.
Having fent a confiderable time in the South Sea iflands, Captain Cook returued to New Zealand, and from thence fet fail for the fouthern part of the continent of America. Here he explored all the iflands in the neighbourhood, and then returned to England, where he arrived in laficty on the 30th of July 177, laving been abfent three years and 18 days; and in all that time loft only one man, who died of a confumption probably begun before he fet out on the voyage.

The reception our navigator now met with was fuited to his merit. He was immediately raifed to the rank of polt-captain, and foon after unanimoufy elected a member of the Royal Society; from whom he received the prize of the gold medal for the beft expeimental paper that had appeared throughout the year. It was the cultom of Sir John Pringle, at the delivery of this medal, annually to make an elaborate difcourle, containing the hiftory of that part of feience for which the medal was given; and as the fulject of Captain Cook's paper (the means of preferving the health of feamen) was analogons to the profeflion of Sir John Pringle himfelf as a phyfician, he had the greater opportunity of difplaying his eloquence on the occalion.

The fpech he made was in the higholl degrec honourable to Captain Cook. He remarked, that the Society had wever mote meritorionfly bethowed the medal than on the perfun who now received it. "If (fayshe) Rome decreed the civic crown to him who fased the life of a fingle citizen, what wraths are due to the man who, laving himfelf faved many, perpetuates in your Tranfactions the means by whicls Britain maj" now, on the mote diltant verages, packene nambers of her intrepid fons, her matiners; whe, maving evory danger, have fo liberally contributed to the fane, to the opulence, and to the maritime empire of the country?" Thefe honourable tellimonies of the public regard, however, Captain Cook did not receive, being already emharked on another voyage, from which he never retarned.

The third royage of this celchated navigator was not undertaken by any exprefs command of his Majefty. Captain Cook lad abrady done fo much, that it was thought but reafonable he thould now fpend the remainder of his life in quiet; and in order to enable him to do this in the more comfortable manner, betides his rank of polt-captain in the navy, he was alfo made a captain in Greenwich. Still, however, there were fome points in the feience of geography which had very much engaged the attention of the public, and were indeed of fuch importance as to become a national concern. Thefe were to diforver the connection between A fia and America, and to detemme whether there was not a poflibility of fhortening the pallage to the Eaft Indies by failing round the nurthern parts of the continents of Lurope and Alia. Many attempts, indeed, had already been made hy various mavigators of different nations ; but all of them had failed, and, what was worfe, lad left the point till undetermined. An act of parlia. ment had been palfed in $17+5$, by which a reward of L. 20,000 was held ont to the hips of any of his Majefty's fubjects for accomplifhing this important voyage, but without noentioning any thing of thofe belonging to his Majety; and this reward was further confined to the finding out of the north-welt parfage to the Eaft Indies through Hudfon's Bay. In the year 1776 , however, both the errors jut mentioned were corrected. It was now enacted, "That if any hip belonging to any of his Majefly's fubjects, or to his Majetly, hall find out, and fail through, any palfage by fea between the Athantic and Pacilic Occans, in any direction or paraliel of the northern hemifphere, to the northward of the 52 d degree of northern latitude; the owners of fuch thips, if belonging to any of his Majelty's fubjects, or the commanders, officers, and feamen, of fuch thip belongines to his Majefty, Shall receive, as a reward for fuch difeovery, the lum of L. 20,000.

It vas not, as lias already been binted, now deemcd proper to folicit Captain Cook to undergo frell dangers by undertaking a voyage of this kind; neventhelefs, as he was uaiverfally looked upon to be the litteft perfon in the kingdom for the purpufe, the eyes of every perfon were tacitly fixed upon him: he was confulted on every thing relating to it, and fulicited to name the perion whom he judged mot proper to conduct it. To determine this point, Captain Cook, Sir Hugh Pallifer, and M. Stephens, were invited to the houfe of Lord Sandwich to dinner; where, befides

Cwok. the confideration of the proper officer for condueting the expedition, many things were faid concerning the nature of the defign. They enlarged ulopn its grandeur and dignity, its confecquences to navigation and feinace, and the completeners it would give to the whole fyltem of difooveries; until at lat Captain Cook was fo much inflamed by the reprefentation of the importance of the voyage, that be ftarted up, and declared that he would conduct it himfelf. This was what the parties prefent had defired, and probably expected; his offer was therefore inftantly laid before the king, and Captain Cook appointed commander of the Expedition by the 10th of February 1776. At the fame time it was agreed, that on his return from the voyage he thould be reftored to his place at Greenwich ; and if no vacancy occurred during the interval, the offcer who fucceeded him was to refign in his favour. The influctions he now received were, that he fhould attempt the high latitudes between the continents of Afia and America, and if polible return to England clong the northern coafts of A fia and Europe. This was moll probably the refult of the Captain's own deliberations, and what had been fuggeited by him to Lord Sandwich and other people in pover. He was parrticularly defired to fail firft into the Pacific Ocean thro' the chain of newly difcovered inlands which he had lately vilited. After having croffed the equator, and paffed into the northern parts of the ocean jutt mentioned, he was then to hold fuch a courfe as might tend to fettle many interetting points of geography, and produce fome intermediate difcoveries, bufore be arrived at the main fcene of operation. With regard to this principal object, he was ordered, inmediately on his arrival on the coaft of New Albion, to proceed northward as far as the latitude of 65 degrees, without lofing any time in exploring ereeks or rivers previous to his arrival in that latitude: and for his further encouragement, the act of ' 1745 , offering a preminm for the difcovery of the paffage, was amended in the manner above mentioned. That nothing might be wanting which could promote the fuccefs of the grand expedition, Lieutenant Pickerfgill was fent out, in 1776 , with directions to explore the coafts of Baffin's Bay; and the next year Lieutenant Young was commiffioned not only to examine the we?tern parts of that bay, but to endeavour to find a paffage on that fide from the Atlantic to the Pacife Ocean. Nothing, however, was performed by either of thefe gentlemen which in the leaft could promote Captain Cook's fuccefs. 'Two veffels were provided as in the former voyage, viz. the Refolution and the Difcovery; the command of the former being given to Captain Cook, and of the latter to Captain Charles Clerke. The only thing in which the appointment of the Difcovery differed from that of the Refolution was, that the former had no marine officer on board. Every degree of attention was befowed, as in the former voyage, upon the proper victualling and other neceffaries for the two thips; and that the inhabitants of thole countries which our navigator intended to vifit might derive fome permarent benefit from the intercourfe they had with him, it was detemincd to fend abroad a breed of domeftic animals, and likewife a quantity of ufeful feeds, to be left in proper places. With this view, a bull, two :nws with their calves, and feveral meep, with hay and
corn for their fubfilence, were taken on bas: ; $a+6$ it was likewife purpofed to take in others at the Cape of Crood Hope. A large afforment of inon tools and trinkets was alfo fent out ; and, in thort, every thing that could be judged proper either to cunciliate the grood will of the natives or to prove ferviceable to them, was provided for the voyage, as weh as every convenience for the hips companies. In the fumner voyage Captain Cook had brought along with him a aative of one of the South Sea iflands, named Omai, who retided in England during the interval between the fecond and third voyages, and was now lappy at getting an opportunity of returning to his own couniry. Though he could by no means eomplain of the entertainment he had met with in England, the idea of returning home loaded with treafure, which might enable him to make a figure among his countrymen, foon overcame ail unedfy fenfations which the leavines of his Englith friends might excite. His majelty had taken care to furnith him with every thing that could poflibly be of ufe when he came to his native country: and he had befides received feveral valuable prefents from Lord Sandwich, Sir Jofeph Banks: and leveral ladies and gentlemen of his aequaintance; fo that nothing was omitted which eould poffibly be done to conves, by lis means, to the inlabitants of the South Sea Illands an idea of the Britifh power and greatnefs.

Every thing being prepared for the voyage, our navigator fet fail from the Nure on the 25 th of Jne 1776; but by reafon of fome delay in receiving his inftructions, did not leave Plymouth till the 12 th of July. He had not been lung at fea before he began his operations for preferving the health of his people; which were found equally efficacious in this as in the former voyage. Finding his Itock of provender for the animals on board likely to run thort, he tonched at Tencriffe, in order to procure a fupply, having judged that to be a more proper place than Madeira for the purpofe. On failing from thance he ran a great rikk of running upon fome funk rocks on the iflaud of Bonavifta; but in this, as well as on other occafions of danger, he behaved with the iane judgement, coolnefs, and prefence of mind, that diltinguifhed him throughout the whole courfe of his life. On the 12 th of Auguft he arrived before Port Praya, in one of the Cape de Verde inlands named St Gago ; but not finding it neceffary to go in there, he continued his voyage to the fouthward. The weather now becoming gloomy and rainy, required a continuance of the mothods he had already practifed for preferving the health of his people; and, as formerly, they were attended with the greateft fuccefs. In this voyage, the effect of thefe precautions was the more remarkable, as at this time the feamis of the veffel were opened to fueh a degree as to admit the rain, fo that farce any perfon on board could lie dry in his bed ; and all the officers in the gun-room were driven out of their cabbins by the water which came through the fides. Such was the humanity of the commander, however, that while the fips continued at fea, he would not trult the workmen over their fides to repair the defects, though caulkers were employed in the inffde as foon as fettled weather returned. On the 1 it of September our navigators crolled the equator, and on

Conk.
the $\mathrm{r}^{\text {th }}$ th of Oetober anchored in Table Bay at the Cape of Good Hope. Here they met with a violent tempeft, the effects of which were felt both on fea and land. It lafted three days, and the Refolution was the only hip in the bay that rode out the form without dragging her anchors. On fhore the tents and obfervatory were deltroyed, and the aftronomical quadrant narrowly efeaped irreparable damage. The Difcovery, which had been fome time later in failing from England, was driven off the coall, and did not arrive till the 10 th of November.

While they remained in this place, a difafter happened which threatened the lofs of mont of their live dock. The bull and two cows had been put afhore to graze among other cattle; but Captain Cook had been advifed to keep the feep, 16 in number, near the tents, where they were penned in every might. Some dorgs having got in among them in the night-time, killed four, and difperfed the reft. Six of them were recowered the next day, but the two rams and two of the fineft ewes in the flock were miffing. The eaptain applied 20 Baron Plettenturg the governor; but all his endeawours were unfucceffful, until he employed fome of the meanet and lowet of the people, fellows whofe character was, that for a ducatoun they would cut their mafter's throat, bmon the houle over his head, and bury fim and his whole family inathes. 'This is mentioned as an infance how far the loafted policy of the Dutch government at the Cape of Goud Hope falls fhont of its alleged perfection. After all, two of the fincit ewes in the flack were miffing, and never could be recoverad. The captain, therefore, to repair this lofs, and to make an addation to his original itock, purchafed two young bulls, two fone horfes, two mares, two heifers, two rams, feveral ewe's and grats, with fome rabbits and poultry; when, having tinithed all his bufinefs, he fet fail on the 30 th of November, though. it was not till the 3d of December that he got clear of land. Soon after his putting to fea, he had the miffortune to lofe feveral of the goats, efpecially the males, together with fome fheep; and it was with the utmont difficulty that the reit of the eattle were preferved, by reafon of the thip toffing and tumbling about in a very heavy fea. Having explored fome defolate iffands in the fouthern teas, Captain Cook fet fail for New Zealand. Dusing this part of the voyage, our navigators were moolved in fu thick a fog, that, according to the anthors of Captain Cook's life, "they failed 300 leagues in the dark." 'The firlt land they afterwards reached was New Holland; where, having remained till the 3 oth of January 1777, they fet fail for New Zealand, and on the 12 th of February they anchored in Queen Chalute's Sound. Here the people were fhy and timorous, on account of their having formerly deftroyed ro of Captain Furneaux's people, who had been fent athore to gather vegetables. The caufe of the quarrel could not be known, as none of the party were left alive to tell the news. Lieutenant Burney, who went ahore in queft of them, found only fome fragments of their bo. dies; from which it appeared that they had been killed and eaten by the favages. It was not the intention of Captain Cook, at this diftance of time, to refent the injury; be even refufed to put to death a chief named Kaboora, who, as he was informed by the natives themfelves, had killed Mr Ruwe the cummander of the par-
ty". He was, however, particularly carofal hat no opportunity thould now be ariven the favages of committing fuch an action with impunity and with this view a boat was never fent on thore withejut being well armed, and the inen luder the command of fuch officers as coull be depended upon. 'lhe New Zealanders were no fooner affured of Captain Cook's pacifie difpofition, than they threw afide their fears and fufpicions, and entertd into a commercial intercourfe with the people. It would have been the lefs excufable in Captain Cook to have revenged at this time the maf. facre of M : Rowe's party, as he was affured that the quarrel originated from fome petty thefts of the favages, which were too hatily refented on the part of the Britifh; and had it nut been for this, no mifchief would have happened.

On the 25th of February our navigator left New Zealand, taking with him, at the requelt of Omai, two boys, the eldeit about 18 and the youngeft about 10. Thefe were foon cured of their paftion for trarelling, being both violently fea-lick: but as it was then too late to repent, they exprefled their grief in loud and almor continual lamentation ; and this in a kind uf fong which feemed to confift of the praifes of their native country, whence they were now to be feparated for ever. By degrees, however, the fea-ficknefs abated, their lamentations became kefs frequent, and at laft ccafed entirely; their native country was forgotten, and they appeared to be as firmly attached to their new fileuds the Englifh as if they had been born among them.

So much time was now fpent in failing up and down in the Pacilic Octan, where feveral new itlands ware difcovered, that Captain Cook judged it impoflible to accomplif any thing for this year in the high northern latitudes; for which reafon lie determined to bear away for the Friendly Iflands, in order to fupply himfelt with thofe neceflaries which he had found impof. fible to be got at any of the illands which he had juft difcovered. In his run thither feveral new iflandswere wifited; and in profecuting thefe difcoveries our navi. gator once more narrowly cfeaped being fhipwrecked. The langer at this time arofe from a low fandy ifland, which the Refolution was very near rumning upon. From this fhe was only faved by the circumanace of all the men having been accidentally called upon deck to put the veffel about, and moft of them being at their flations when the danger was difcovered. Suon after this both mips ftruck upon fome funk coral rocks, but happily were got off without damage.

After a itay of between two and three months, Captain Cook took leave of the Friendly Iflands on the $13^{\text {th }}$ of July 1777 ; and on the 12 th of Augult reached Otaheite, where he introduced Omai to his country people, and whofe reception by them is particulaly related under the next article. Here the Captain found the people of Otaheite ready to engage in a war with thefe of Eimeo; but though ftrongly folicired by the former to affift them in an expedition againtt their enemies, he refufed to take any concern in the affair, alleging, by way of excufe, that the people of Eimeo had never offended him. This feemed to fatisfy moft of the chiefs; but one, named Towba, was fo much difpleafed, that Captain Cook could never regain his farour. He even threatened, that as roons

## C O O

Cook. foom as the Caprain flould be gone, be would make war upon Otoo, one of the princes of thefe iflands whom he knew to be in it rict fiiendihip with him; but from this he was deterred by the Captan's threatening to return and chatlife him if he made any fuch attempt. As a mark of Otoo's friendalip, he gave our mavigator a canoe, which he defired him to cary to the king of Britain, having nothing elfe, as he faid, worth his acceptance.

From Otahcite Captain Cook procecded to Eimeo, where, on account of fome thefts committed by the natives, he was obliged to commence hottilities, by burning a number of their war canoes and even fome houfes. Thefe tranfactions gave him much concern; and the more that he had been fo much folicited to make war on thefe people by his friends at Otalueite, to whofe entreaties he had refufed to liften. From Eimeo he procected to Hnaheine, where he faw Omai finally fettled, and lef. with him the two New Zealand youths already mentioned. The youngef of thefe was to much attached to the Englifh, that it was neceflary to carry him out of the hip and put him affore by force. During his tlay on this ifland, the Captain was obliged to punifh a thief with greater feverity than he had ever done hefore, viz. by cauling his head and beard to be fhaved, and his ears cut off. Some other difagreeable tranfactions took place, particulary the defertion of two of his people, who were not recovered without the greatelt diffeulty. In the courfe of his exertions for their recovery, he found it neceflary to detain the fon, daughter, and fon-in-law, of the chief of an illand named Otaha. This had almof produced very ferious confequences, the matives having formed a plot for carrying off Captain Cook himfelf, as well as Captain Clerke and Mr Gore. With regard to the commander, they were difappointed by his own caution and vigilance; but Meflrs Clerke and Core were in particular danger : and it was only owing to the circumftance of one of them having a piftolin his hand, as they walked together on hore, that they were not feized.

Having lift the Society Inands, and difeovered a new group, which, in honour of his patron the Earl of Sandwich, our commander named the Sandrwich Ifes, he fet out on the 2d of January 1778 on his verage northward. In this he was very fuccefoful, afcertaining the vicinity of the continents of Alia and America, which had never been done, or but very imperfectly, before. From thefe defolate regions lee returned to the iland of Oomalafhka; whence hasing refitted and taken in provifions, he returned to the fouthward, and on the 25th of November reached the Sandwich LIands, where he difcovered a new one named $A$ orove, and on the $30 t h$ of the fame month another of much darger extent, named 0 -whew-hece. Seven weeks were fyent in exploring the coalts of this inand; and duriag all this time he continued to have the mot friendly intercourfe with the people, who, however, appeared to be mach more numtiuus and powerful than thofe of any illand our navigators had yet touched at. Se:eral of the chiefs and pincipal prople had attached thendelves greatly to the commander, and in general the people appeared to be mach more honett in their difpofitions than any whom be had ever rifited. But by the time the had rinithed
his circumnavigation of the ifland, and calt anthor in a bay called Karakakoo, matters were greatly altered. An miverfal difpolition to theft and plunder had now taken place; and in this it was evident that the common people were encouraged by their chiefs, who thared the booty with them. Still, however, no hoftilities were commenced: the greateft honours were paid to the commander; and, on his going afhore, he was receised with ceremonies litule fhort of adoration. A valt quantity of hogs and other provifions were procured for the fhips; and on the fth of February 1779, they left the illand, not withour molt magnificent prefents from the chiefs, and fuch as they had never before received in any part of the world. Unluckily they met with a ltorm on the fixth and feventh of the fane month; during which the Refolution fprung the head of her foremat in fuch a manner that they were obliged to return to Karakakoa bay to have it repaired. As they retmrned, Captain Cook had an opportunity of fhowing his humanity to the people by the relief he afforded to fome of their canoes which had fuffered in the itorm. The fame friendly intercourfe which had formerly been held with the natives now commenced, and Captain Cook was treated with the ufual honours; but on the 13 th of this month it was unhappily broken off on the following account. One of the natives being detected in ftealing the tongs from the armourer's forge in the Difcovery, was difmilfed with a pretty fevere flogging; but this example was fo far from being attended with any good effect, that in the afternoon another, having fuatched up the tongs and a chifel, jumped overboard with them and fwam for the thore. 'Ihe mater and midhipman were inftantly difpatched in purfuit of him; but he efcaped on board a canoe, which paddled away fo quickly that the cutter could not come near it. A chief named Pareah, who was at this time on board the Refolution, underflanding what had happened, promilid to go athore and get back the ftolen goods; but before this conld be done the thief had made his cfeape into the conntry: Captain Cook, who was at that time ahore, had endeavoured to intercept the canoe when it landed, but was led eut of the way by fome of the natives who pretended to be his guides. The tongs and chiffel, however, were brought back to the malter as he advanced to the landing place; but he being now joined by fome of the relt of the people in the pinnace, could not be fatisfied with the recovery of the Rolen goods, but indited upon having the thief or the canoe which carried kim by way of reprifal. On his preparing to lamel this late into the water, he was interrupted by Pareah, who infilted. that it was his property, and that he fould not take it away. As the officer paid no regard to his remonttrances, Pareah, who fecms to have been a very throng man, feized him, pinioned his arms tehind, and held him falt by the hair of the head. On this one of the lailors Aruck the chief with an oar, on which, quitting the offeer, he inflantly fuatched the oar out of the man's hand, and broke it in two acrofs his knee. The Indians then attacked the failors with flones, and foon drove them to their boats, to which they were forced to fwim, as they lay at fome diftance from the fhore. The officers who could not fwim retired to a fmall rock, where they were clofely purfued by the Indians;
and here the mafler narrowly efaped with his life, thll Pareah retmoned and ohliged the Indians to give orer their attacks. The gentlemen, fenfible that Pa . reah's prefence alone conld protect them, entreated him to remain with them till they could be brought off in the boats. On his refufal, the matter fet out to the place where the obfervatories had been erected, for farther affifance; but Pareah, who met him, and fufpected his errand, obliged him to return. In the mean time the multitude had begun to break in pieces the pinnace, after having taken every thins out of her that was loufe: on the return of Pareah, however, they were again difperfod, and fome of the ours reftored, after which the grentlemen ware glad to get of in fafety. Before they reached the fhip Pareah overwook them in a canoe, and delivered the midhipman's cap which had been taken from him in the foutle; he alfon foined nofes with them in token of friendhip, and denicd to know whether Captain Cook would kill him on account of what had happened. They affured lim that he would mot, and made figns of reeonciliation on their part. On this lie left them, and padded over to the town of Favaroah; and that was the laft time that he was feen by the Englifh. In the nighttime the fentinels were much ahamed by farilt and melanchely founds from the adjacent viliuges, which they touk to be the lamentations of the women. Next day it was found that the large cutter of the Difeovery had been carritd off in the night-time; on which Captain Cook ordesed the launch and fmall cutter to go mader the command of the fecond lieutenant, and to ly off the eafl point of the bay in order to interecept all the eanoes that might attempt to get out, and if neceflary to fire upon them. 'The third lientenant of the Refolution was difpatched to the weltern part of the bay on the fame fervice; while the mafter was fent in purfuit of a large double canoe already under - fail, and making the belt of her way out of the harbour. He foon came up with her, and by firing a few fhots, obliged her to run on fhore, and the Indians to leave her. 'This was the canoe belonging to a chief named Omea, whole perfon was reekoned equally facred with that of the king, and to the neglect of fecuring him we may attribute the fucceeding difalter. Captain Cook now formed the refolution of going in perfon to feize the king himfelf in his capital of Kavaroah; and as there was reafon to fuppofe that he had fled, it was his defign to fecure the large canoes, which on that account he eaufed to be hauled up on the beach. With this view he left the fhip about feven o'clock in the morning of Sunday the iath of February, being attended by the lieutenant of marines, a ferjeant, corporal, and feven private men. The crew of the pinnace, under the command of Mr Roberts, were alfo armed; and as they rowed towards the floore, the captain ordered the lauch to leave her flation at the oppefite point of the bay, in order to affitt his own boat. Having landed with the marines at the upper end of the town, the Indians flocked round him, and proftrated themfelves before him. No fign of holkility, nor even much alarm, appeared; the king's fons waited on the commander as foon as he fent for them, and by their neans he was introduced to the king, who readily confented to go on board; but in a littie time the Indians began to arm
themfelves with long fyears, clubs, and dargers, and to put on thicla mats which the $y$ ufe ablefonive armonr. 'l"uis bodle appearathe was greatly augmented by an wathy picee of in is whicn wis jull now brought by a cance, are that ore of the fardian chiefs had been killed b; the jeoppte in the I bifeovery's boats. On this the wmon, whis hat nianero fat on the beach converfins familiarl, and taking their breakfatls, remosed, and a confuled muman ran through the crowd. An okd priell now appared with a cocon-nut in his band, which he held wot as a presfent to Captain Cook, linging all the whik, and making a moft troublefome noite as if le meant to divert the attention of the Captain and his puple from doferving the notions of the Indians, who were now every where putting on their armour. Cintan Couk beginuing to think his fituation dangerows, orderel the lieutenant of the marines to mareh towards the fhore, as he himfelf did, having all the whike lold of the king's hand, who very seadily accompanied him, attended by his wife, two fons, and feveral chicts. The Indians made a lane for them to pafs; and as the dillance they had to go was only abont 50 or 60 yards, and the buats lay at no more than five or fix: yards dilkance from land, there was nut the leald apprehention of the eataltrophe which enfuch. The king's younged fon Keowa went on board the pinnace without the lealt helitation, and the king was about to follow, when his wife threw her arms about his nicek, and, with the alfilance of two chiefs, forced him to fit down. The Captain might now lave fafely got abourd, but did not inmediately selinquith the defign of taking the king along with him. Finding at lalt, however, that this coudd not be aceomplified without a great deal of bloodfhed, he was on the point of giving orders for the people to reimbark, when one of the Indians threw a flone at him. 'This infult was returned by the Captain, who had a double barrelled picce, by a difcharge of fmall flot from one of the barrels. This had litile effect, as the man had a thick mat before him; and as he now brandifhed his fpear, the Captain knocked him down with his mufket. The king's fon, Keowa, fill remained in the pinnace, and the detaining him would have been a great cheek upon the Indians; but unluckily Mr Roberts, who commanded the pinnace, fet him ahore at his own requelt foon after the firt fire. In the mean time ano. ther Indian was oblerved in che act of brandilhing his fpert at the commander; who thereupon was obliged to fire "upon him in his own defence. Afiling his aim, however, hekilled one elofe by his fide; upon which the ferjeant obferving that he had miffed the man he aimed at, received orders to fire alfo, which he did, and killed him on the foot. This repreffed the foremofl of the Indians, and made them fall back in a body; but thay were urged on again by thofe behind, and difcharged a volley of ftones among the marines, who immediately returned it by a gencral difo charge of their mufkets; and this was inftantly followed by a fire from the beats. Captain Cook expreffed his aftonifhment at their firing, waved his hand to them to ceafe, and called to the people in the boats to come nearer to receive the marines. 'This order was obeyed by Mr Roberts; but the lieutenant who commanded the launch, inftead of coming nearer, prit

## 亿 $0<1400]$ C O O

cook off to a greater diftance; and by this prepofterous conduet deprived the unfortunate commander of the only chance he had for his life: for now the Indians, esafperated by the fire of the marincs, rufled in upon then and drove them into the water, teaving the Captain alone upon the rock. A fire indeed waskept up by both boats; hut the one was too far off, and the other crowded with the marines, fo that theyscould not dircet their fire with proper effect. Captain Cook was then obierved making for the pinnace, carrying his muket under his arm, and holding his other hand on the back-part of his head to guard it from the fones. An Indian was Seen following hinn, but with marks of fear, as he ftopped once or twice feemingly undetermined to proceed. At laft he flruck the Captain on the back of the head with a club, and then precipitatcly retreated. The latter itaggered a few paces, and then fell on his hand and one knee, and dropped his mufket. Before he could recover himfelf another Indian fabbed him with a dagger in the neck, though ftill without putting an end to his life. He then fell iuto a poot of water knce-deep, where others crowded upon him; but fill he fruggled violently with them, got up his head, and looked towards the ipinnace as if foliciting affitance. The boat was not above five or fix yards diftance; but fuch was the confufed and crowded fate of the crew, that no affiftance could be given him. The Indians then got him under again, but in deeper water, though he fill continued to ftrugglc, and once more got his head up; but being quite frent, he turned towards the rock as if to fupport himfelf by it, when a favage itruck him with a club, which probably put an end to his life, as he was never leen to ftruggle any more. The favages hauled his lifelefs body up on the rocks, and ufed it in the molt barbarous mariner, fnatching the daggers out of one anothers hands, in order to have the pleafure of nuangling it. If any thing could add to the misfortune of this celebrated navigator's death, it was, that even his mangled remains were not faved from the thands of the barbarians. The heutenant already mentioned, who, by his removing to a diftance when the ought to have come on flore, feemed to have been the occafion of his death, returned on board without making any attempt to recover his body; thouzh it appeared from the teftimonies of four or five midhipmen who arived foon after at the fatal foot, that the beach was almott deferted by the Indians, they having ai laft yielded to the continual fire from the boats. The officer alleged in his own excufe fur removing at fritt from the fhore, that he mintook the fignals; but be this as it will, the complaints againt hiin were fo many and fo great, that Captain Clerke was obliged publicly to take notice of them, and to take the depolitions of his accufers in writing. -Thefe papers, however, were not found, and it is fuppofed that the Captain's bad tlate of health had induced him to deftroy them. After all we are informed, that, in the opinion of Captain Philips, who commanded the marines, it is very doubtful whether any effectual relief could have been given to the commander, even if no mirtake had been committe: on the part of the lieutenant. The author of all the mifchief was Pareah, the chicf already mentioned, who had employed peopie to fteal the boa: in the right-time. The
ing was cnireiy imocent both of the thof and the muder of Captain Cook; but the latter was perpetratcd by fome chiefs who were his near relations. The chief who firf ftruck him with a club was named Karinans raba, and he who flabbed him with the dagger was called Noorh. The latter, Mr Samwell, from whofe narrative this account is taken, obferves. wis flout and tall, had a bicree look and demeanour, and united in his perfon the two properties of flength and agility more than he had ever obferved in any ather perfor.- Both of them were held in great eltimation by their countrymea on account of the hand they had in his death.

By reaton of the barbarous difpofition of the Indians, it was found impofible to recover Captain Cook's body after the firlt opportunityalready mentioned was loft. By dint of threats and negociations, however, fome of the principal parts were procured with great difficulty; by which means the navigators were enabled to pelform the laft offices to their much refpected commander. Thefe teing put into a coffic, and the fervice read o. ver them, were commited to the deep with the ufual military honours on the 2 Ift of February 1779. Sonn after his death a letter was iffued by M. de Sartine, fecretary to the marine depaitment of France, and fent to all the commanders of French hips, importing, that Captain Cook flould be treated as the commander of a neutral and allied power; and that all captains of armed veffels who might meet with him, fhould make him acquainted with the king's orders, but at the fame time let him know, that, on his part, he mut refrain from hoftilities. This humane and generous proceeding, with regard to France, originated from M. 'I'urgot; but the thought feems firlt to have Aruck Dr Franklin. Thus much at leaft is certain, that the doctor, while ambaffador from the United States, wrote a circular letter to the American naval commanders fomething to the purport of that already mentioned: but in this he was not fupported by Congrefs; for an edict was inftantly iffued, that fpecial care Gould be taken to feize Captain Cook if an oppertunity of doing it occurred. The Spaniards procecded in the fame manner, and both acted on a principle equally mean and abfurd, that the obtaining a knowledge of the wellern coaft of America, or of a northern paffage into the Pacific Ocean, might be attended with fome bad confequence to their refpective flates.

Captain Cook was a man of plain addrefs and appearance, but well looked, and npwards of fix feet high. His head was frall, and he wore his hair, which was brown, tied behind. His face was full of expreffion; his nofe exceedingly well thaped; his cyes, which were fmall and of a brown caft, were quick and piercing ; his eye-brows prominent, which gave his countenance altogether an air of aulterity. Notwithtanding this, it was impoffible for any one to excel him in humanity, as is evident from the whole tenor of his behaviour both to his own people and the many favage nations with whom he had occation to interfere. This amiable property difcovered itfelf even in the final cataftrophe of his life; his utmott care being directed to the prefervation of his people, and the procuring them a fafe retreat to their boats. And it cannot be enough lamented, that he who took fo much care of others, houkl have perifned in fuch a miferable manner for want of being properly fupported by them. The perfeverance with which he purlied every object which happened to be pointed ont as his daty was anequalled. Nothing ever could divert him from what he had once undertaken; and he perfevered in the midt of dangers and dificulties which would have difheartened perfons of very confiderable ftrength and firmnels of mind. Fur this he was adapted by nature, having a itrong conftitution, inured to labour, and eapabir of undergoing the greatett hardhips. His ftomach hore without difficulty the coarfeft and mort ungrateful food; and he fubmitted to every kind of felf.denial with the greateit indifference. To this frength of eonltitution he joined an invincible fortitude of mind, of which the circumnavigation of New Holland, and his royage towards the South Pole, furnih innumerable intarices. He was mafter of himfelf on every trying oceation; and the greater the emergencr, the greater aloays appeared his calminefo and recollecton; fo that in the molt dangerons fituations, after giviag proper dirtchions to his people, he could fleep foundly the hours that he had allotted to hinfelf. That he poffeffed genius in an eminent degree earnot be queftionad: his invention was ready, and capable not ouly of fuggefting the mott noble objects of purfuit, but the moll proper methods of attaining them. His knowledge of his own profeffion was unequalled; and to this he added a very confaderable proficiency in other feimees. In aftronomy, he became fo eminent, that he was at length enabled to take the lead in making the aflronomical obfervations during the ecurfe of his voyages. In general learning he likewife attained to fuch a proficiency as to be able to exprefs himfelf with clearnefs and propriety; and thus hecane refpectable as the narrator, as well as the performer, of great actions. He was an excellent hufband and father, fincere and fleady in his friendhip, and poffeffed of a general fobriety and virtue of eharacter. In converfation he was unaffected and unaffuming; rather backward in pufhing difeourfe, but obliging and communicative to thole who wifhed for information; and he was diltinguifhed by a fimplicity of manners almolt univerfally the at tendant of truly great men. With all thefe amiable qualities, the Captain was occafionally fubject to an haftinefs of temper, which has been fet forth in its ut molt extent, if not exaggerated by fome, though but few, who are not his friends: but even thefe, as well as others, when taking a general view of his charaeter, are obliged to aeknowledge that he was undoubtedly one of the greateft men of his age.
CaptainCook is diftinguifhed as an author byan account of his fecond voyage written by himfelf. His firft voy. age, as well as that of feveral other navigators, had been recorded by Dr Hawkefworth; but on the prefent oecafion it was not judged neceffary to have recourfe to any other than the pen of the author himfelf; and his journal, with a few occafional alterations, and being divided into ehapters, was fufficient for the purpofe. The flyle is clear, natural, and manly-; and it is not improbable that even a pen of more fudied elegance could not have made it appear to more advantage. When it appeared, which was not till fome time after the author had left England, the book was recommendVol. V. Part II.
ed by the aceuracy and excellency of its charts, and by a numelous collection of tine engravinge done from the original drawings of Mr Hodges.

We cannot conclude this article without taking fome natice of the honours paid to our eelebrated navigator after his death, both by his own countrymen and thofe of other nations. Perhaps indeed it may be faid with juflice, that foreigners hold his memory in an chlimacion untqualied even in this country; a remarkable proof of which oceurs in the enlogy upon him by Michael Angelo Gianetti, rad in the Florentine acade$m y$ on the 9 th of Junc 1785 , and publifhed at Florence the fame year. It is faid alio, that one of the Freneh literary aeddemies propofed a prize for the belt culogium on Captain Cook; and many poetical teflimonies of his merit appeared in our owa language. The Royal Society of London refolved to teltify their refpect to him by a medal, for which purpofe a voluntary fubfeription was opened. A cold medal was given to fuch of the fellows as fubferibed 20 guineas, and a filver one for thofe who fubferibed fmaller fums; and each of the other members received one of bronze. Thofe who fubferibed 20 guineas were, Sir Jofeph Banks prefident, the Prince of Anfpach, the Duke of Montague, Lord Mulgrave, and Meflrs Cavendifh, Peachey, Perrin, Puli, and Shuttleworth. Many defigns were propofed on the occation ; but the following was that which was actually truck. On one fide was the head of Captain Cook in profile, with this infeription round it, Jac. Coor ocrani investigator acerrimus; and on the exerguc, Reg. Suc. Lond. socio suo. On the reverfe is a reprefentation of Britannia holding a globe, with this infeription round hers Nilintentatum nostri liquere; and on the exergue, Auspicus Georgitill. Ore of the gold medals fruck on this oceafion was prefented to the king, another to the queen, and a third to the prince of Wales. Another was fent to the Frinch king on account of the protection he had granted to the fhips; and a fecond to the emprefs of Ruffia, in whofe dominions they had been treated with every expreffion of friendthip and kindnels. Both thefe great perfonages condefcended to accept of the prefent wich marks of fatisfaction. The French king wrote a handfome letter to the Society, figned by himfelf, and underfigned by the Marquis de Vergennes; and the Emprefs of Ruffia commiffioned Count Ofterman to fignify to Mr Fitzherbert the fenfe he had of the value of the prefent, and that fhe had caufed it to be depofited in the mufeum of the Imperial Academy of Sciences. As a further teftimony of the pleafure the derived from it, the emprefs prefented to the Royal Society a latge and beautiful gold medal, containing on one fide the effigies of herfelf, and on the other a reprefentation of the flatue of Peter the Great. After the general affignment of the medals, which took place in 1784 , there bcing a furplus of money ftill remaining, it was refolved by the prefident and council, that an additional number of medals fhould be thrown off, to be difpofed of in prefents to Mrs Cook, the Earl of Sandwieh, Dr Benjamin Franklin, Dr Cooke provoft of King's College Cambridge, and Mr Planta. At the fame time it was agreed that Mr Aubert fhould be allowed to have a gold medal of Captain Cook on his 3 E
paying

 of PolandDuring the two vifits of the Ships at Kamtfliatka, Cohune blum, the commandant of that province, had to towed, is the mot liberal manner, every kind of - ffrtanee which it was in his power to below; and foch was the fuse entertained by the lords of the admisty of the kindness he had hawed, that they depermined to make him a potent of a magnificent piece of plate, with an infoription expreflice of his humane and generous conduct. The iufoription was drawn up by 1), Cone, and afterwards fubmitted to the oppsion and correction of forme gentlemen of the firs aminonce in clantral tate.

Sir Hugh Pallifer, who had all along diSplayed an uncommon $\boldsymbol{r}$ fpect and kindnefs for Captain Cook, like"fife displayed his regard for his memory in a mot amineat manner. On his deflate in Buckinghamflie he contused a foal butdines with a pillar, containing the character of Captain Cook, which is given at the end of the introduction to the late voyage. This was drawn up by the Honourable Admiral Forbes, admiaral of the fleet and general of the marines, to whom Captain Cook was known only by lis merit and extraordinary actions.

A midi all the fe expreffions of unavailing praife, it was not forgotten to how forme effential fervice to the widow and family of our eclehrated navigator. A memorial for a pention of L. 200 per annam was given in to the king from the commiffoners of the admiralty, and figned by the Earl of Sandwich, Mr Butler, the Earl of Lifburne, Mr Penton, Lord Mulgrave, and Mr Mann. His Majelly complied with the request of the memorial, and the grant was paled through the ufual forms with all poffible feed. By this L. 200 for amon were fettle on the widow during life' and L. 25 a-ycar on each of her three Cons. After her death the L. 200 was to be divided between her chicdree; a fourth was allotted to Captain King, and the remaining fourth to Mr Bligh and the reprefentatives of Captain Clarke.

The lat honour paid to the memory of Captain Cook was the granting a coat of arms to the family, which was done by patent on the 3 d of September 1785 ; and of this we have the following defeription. Azure, between the two polar ftars: Or, a flee on the plane of the meridian, north pole elevated, circles of latitude for every ten degrees, and of longitude fur every 15 ; flowing the Pacilic Ocean between $60^{\circ}$ and $240^{\circ}$ weft, bounded on one hide by America and on the other by Afia and New Holland ; in memory of the difcoveries made by him in that ocean, fo very far beyond all former navigators. His track thereon is mated with red lines; and for ereft, in a wrath of the colour is an armimbowed, vefled in the uniform of a captain of the Royal Navy. In the hand is the Union Jack, on a faff proper. The arm is encircled by a wreath of palm and laurel.

Cook's Difcozeries. The number of countries discovered by Captain Cook, and which had never before been vifited by any European, is very confiderable; but it was a remarkable property of our celebrated navigator, that, wherever he touched, every thing relative to the place was determined with fuck accuracy and
precifon, that all former accounts feemed to go for nothing, and the difcovery to belong entirely to Capaa Cook. Thus it was not unusual with him to make difoucries in places already well known; and thus his vogatez have eonvered a wat fund of knowledge perfeatly original. Though the accounts of the different places, therefore, at which lee touched, are particular by given mon er their names in the order of the alphabet, we fall in this article endeavour to join the whole together in foch a manner as to give the reader forme ideal of the benefit which has accrued to faience from voyages attended wot only with much expense and labour, but even with the lufs of the celebrated avigator's life.

When lie fat out in the Endeavour in the year 1768 , Manliera, a the fist place touched at was Madeira. Here Mryolcanic Banks and Dr Solander, betides forme additions to the inland. faience of botany, difcovered undoubted mates of the inland having a volcanic origin. On leaving this place they found it neaffary to touch at Rio de Janeiro for provifions; and during the 1 mint her the commander had an opportunity of determining the cane of the luminous appearance of the lea. On the 2gth of Oe- Luminous tuber they observed that the water frequently emittedapparance father like lightning, though much faller ; but lunch of the dea was their frequency, that eight or ten of then were occalimed bymais. vilible almolt at the fame moment. This appearance they found, both at this time and afterwards, to arife from a fall kind of animal with which the water abounded. While flaying at Rio de Janeiro, a meaneholy wefervation was made of the prodigious wall of human lives with which the working of the Portoguefe gold mines was attended, no fewer than 40,000 Vat nom negroes being annually imported for this purpofe, none her of aeof whom, it feems, furvive the labour of the year; ernes deand our navigator was informed, that in 1766 this the wo .k hey number was fo far hort, that they were obliged to ing the gold draught 20,000 more from the town of Rio itself. Pro- mines. reeding from thence to the fonthern coats of America, he had an opportunity of determining a question of great importance to navigation, viz. whether, in fail-Bert paring to the Pacific Ocean, it is better to pals through faye into the flats of Magellan, or to double Cape Horn and ocean fail through thole of Lee Mare? From Captain Cook's through the voyage it appears, contrary to the opinion of former $\mathrm{s} \cdot \mathrm{rats}$ le navigators, that the latter is the preferable palfage. Mare. Though this he was only 33 days in enening sound the land of Terra del Fuego from the eat entrance of the ftrait of Le Maire till he had advanced about 12 degrees to the weltward, and three and a half to the northward, of Magellan's frats. During all this time the hip fearcely received any damage, though if he had palled the other way he could not have aecomplificd his paffage in lefs than three months, befides immenfe fatigue to his people and damage to the flip. In there 11 army regions, however, he experienced the Excellive fame inconveniences file by other navigators; fuel a therms and fa being met with off Cape Diego, that the Chip fee chliththe quently pitched hes bowfprit under water. Here alfo goons. the excoffive cold and mutability of weather in thee fonthern regions was experienced in fuch a manner as had nearly proved fatal to forme of the gentlemen who failed along with him. Dr Solander, Mr Banks, Mr Monkhoufe the firgeon, and Mr Green the aflronomer, with their attendants and forints, fit out on a botani-

Conk's cal expedition white the lhip lay at anchor in the bay Dikove. $\underbrace{\text { ric. }}$ of Cood Succefs. It was then the midule of fummer, and the morning on which they fet out was as mild and warm as it nfually is in the momth of May in Far. land: lout having afended a monntain for the purgote o! botanzing, they were furprifed by fuch thorms of finow and hat that t's feond not get beck that night. D) Solander, who waned them of their danger, that people when about to perift with cold were feizen with a volent indination to Aeep, was the firft wholeoned likely t , fall a viokim to it; and it was not in the power of his companionn to kesp him from fitting down for that pupoíe. He was awaked in a few minutes: but duriag this hort interval his feet had beome of much diminthed by the cantracion of the vefels, that his thoes fell off from them when he was again mate to rife. Even thefe dreary regins, however, ane nut
ded to be the low at of the human ipecties. Amped, conforing the litale comvenience thy have, it is worA If ful how they can reflt the fevenity of the chinate, for they are admod wibont clothing; they dwell in miferable hovels, which ad nit both the wind and frow or rain; and they have not any hendilfor drefting their food. Neverthelefo, thefe miferable ercatures, as they appeared to our navigators, feemed to have no wioh to poflefs more than they cnjoyed; and they were ablo. lutely indiferent about evely thing that was offered then, except large beads which they wonld tale as ornaments. Hence Dr Huwkeforth, who wrote the aecount of the voyage, concludes, that thefe people may be on a level with ourlelves with refpect to the real hapninefs they enjoy.

On the 26 th of Jumary 1769 our navigators left

Cape Horn ; and from that time to the firt of March, during which ihey ras no lefs than 660 leagnes, met with no current by which the fhip was oncted. Hence it is probable, that during atl this time they had never been near any lani, the carrents of the ocean being ufually met with in the neighbourbood of inands. Scveral iflands, however, were difcovered before they reached Otaneite, on which they bellowed the nam:s of Lagoon Ifland, Thrumb-cap, Bow Ihand, the Groups, Bird IGdnd, and Chain Ifland. All thefe feemed to be inhabited, and were covered with a moll delightful verchure; which appeared to the greater advantage, as our navigators liad for a long time feen no land but the dreary hills and wattes of Terra del Fuego. Having arrived at Oiaheite, they fet about obferving the tranfit of Venus over the fun, which indeed was the main purpofe for which the voyare had been undertaken. The ansiety which they undewent when the time of the expected phenomen anparoached may eadily be imagined, as the whole depended an the circomilance of a clear lky, which though more readily to be expeeted in that climate than one more to the nothward, was fill a inatter of umentainty. In confequence of fome hints which had been given by the Lian of Morton, Captain Cook determined to Send out two partics to difietent places to maketheolaferations; by which means there would be a chance of fuccefs, iven if thome at Otahate Mould fat. Fior this purpofe he fent Mir Gore in the long. buat to Eimen, a meighbourinerilland, along with Mi Monkhoufe, Mr Banks, and Mr Sporing, who whe fumithel with proper indtuments by

Mr Green the aRooncmer. Maflis Hicks, Cierke, Pichererill, and Sandera, were fent in the pinnace to a convenient foot to the ealward of the man obsaroztory, where they were likewife urdeded to make nobervations with luch iattruments as they had. The day on which the tranft happenet was the 3 d of June in60, when they had the farisfaction to fee the fun rife wi.hout a clond; and as the wealow cortinued equally clear throughout the dy, them was the bett opportunity of making the oblerations in a proprer manare. All of them © an atmofolure or dulky chad ionnd the plant, which diturbed then obferv:tiun, and probibly caused them to differ from caca other more co:Aderably than they would otherwite have dune. Aceording to Mr Geen, the times of ingte and egrefs of the planct were as follow:

| Mirning. | li. min. fec. |  |  |
| :---: | :---: | :---: | :---: |
| Firf externad contact, |  | 25 | $4:$ |
| Fint intcrual contact, or total immerfon, Afrifnoun. |  | 4. |  |
| Second internal contact, |  | 14 |  |
| Second external contact, or end of the tranlit, |  | 32 | 10 |

From thefe obfervations the latitude of the oblervatury was found to be $17^{3} 29^{\circ} 15^{\prime \prime} \mathrm{S}$. and the longitude $\mathrm{I} 49^{\circ} 32^{\prime} 30^{\prime \prime} \mathrm{W}$. of Greenwich. Several curious remarks were made both on the comntry itlelf and on the inhabitants. Mr Banks, in an excurion up the otaheate. country, difonered many traces of volcanic fire; the ? volcanic Atones, like thofe of Madeira, had evidently the ap- illand. pearunce of being burnt, and the very clay on the hills had the fane appearance. The natives, though ad-Account of dictud to theving, appeared in general harmetes and the hatreco. fricudly, and very rady to fupply the fhip with necetharics in exchange for fuch things as they wanted. 'The articles on which they fit the groatelt value were Latchets, axes, large nails, fpikes, looking glafes, and beads. 'Iney were allo fond of fine limen, whether white or pritited; but an axe of the value of half a crown would bay more provilions than a piece of cloth of the value of 20 hilhing. They are very fickle and inattentive; to that it was not pofible to engage then to pay any regand to the wor thip of the Deity which they faw performed before the:n ; nor would they attend to any explanation of it that was given them. 'Ihey are not, however, detitute of a religion of thei: own; and are particularly careful of the repohtories of the dead, which they will not allow to be violated on any account. Of this Captain Cook had an intlance, when fome of his people olfered to take dowa an inclufure of one of thele reparitories. They were violenily appofed by the natives, who fent a meflenger to acquaint them that they wouk never fufier any luch thing; and the only infult that ever was offered to an Englifman by the peofle of this intand was on a limilar account. From Otaheite our Bavigators carred with them Tupia, formerly high-priefl of the country and prime minitter to Qucen Obera. Fiom his practive it appeared that the priefls of Otaheite, as well as ellewhote, whe care to place themflews a llep nearer the I eity than the common people, and to whe the deceltionstoo frequenty put in pactice by fach mediaturs. White on board the E'netvour, he fiequently pired to his god Tune for a wind; and acconding to 3 シ
his

Cook's his own account never failed of fuccefs. This, how-bifove- ever, he took care to enfure; for he never began his ries.
prayers till he perceived the breeze already on the water, and fo near that it muft reach the hip before they could well be ended. It was obferved likewife of the people of Otaheite, that they had their bards or minArels, who went about the country with mufical initruments. The band whom they faw at this time confled of two players on flutes and three drummers; the latter accompanying the flates with their voices. Their fongs were made extempore, and the Englifh themfelves were generally the fubject.

From Otaheite our navigators failed towards a neigh-
 low, and without any fettled inhabitants, the Captain chole rather to direct tis courfe towards Huahtine and Ulietea, which he was informed were well inhabited. Thefe had never been vifited by any European hip: but the inhabitants, though peaceable and friendly, were very how and cautious in trading, fo that the Captain was obliged to bring ont his hatchets to manket; a commodity which he had hoped might have been concealed from thofe who had never feen an European fhip before. On his arrivel at Ulietea he found, by the difcuurfe of Tupia, that the inhabitants of a neighoouring ifand named Bolubala ware of fuch a matial difpolition as to be the terror of thofe of Huaheine, Ulictea, and others, infomuch that he apprehended great danger to our navigators fhould they touch at an illand which the Bolabola men had lately conquered. This, however, had fo little effect upon Captain Cook, that he not only landed on the inand already mentioned, but took poffeftion, in his Majefly's name, of Bolabola itfelf, together with Ulictea, Huaheine, and another named Otaha, which were all vifible at once. During their ftay here they paid a vifit to Opoony, the formidable monarch of Bolatola; whom, to their furprife, they fonnd a fecble wretch, withered and deesepid, half blind with age, and fo ftupid that he feemed farce to be poffeffed of a com. mon degree of underitanding. About thele inands they feent fix weeks, befowing upon them the name of the Society Ifles, on account of their being fo near to each other. They are fix in number, Ulietea, Huabeine, Bulabula, Otatia, Tubai, and Maurna. The fmaller ones in their neighbourhood are Tethuroa, Eimeo, 'Tapoamanao, Oatara, Ophuru, Tamou, '「uahoatu, and Whenmuaia.

Leaving the Socicty Inands, which are fituated between Lat. 16.10 . and 36.55 . S. and between 150 . 57. and 152. W. from the merilian of Greenwich, they fell in with the inand of Oheteroa, fintated in S. Lat. 22. 27. and W. Long. 150. 47.; but this was fourd to be dellituie of any harbour or fafe anchorage, and the difpofition of the inhabitants fo hoftile that they could rot by any means be conciliated, So that no attempts were made co land. From Tupia Captain Couk learned that there were feverd inands in the neighbourhood, which our navigator conjectured to be Bofcawen and Keppel's Inands, difcovered by Captain Wallis; but without fpending more time in exploring thefe, he fer fasl to thic fouthward in fearch of a cunticent.

Our voyagers left Oheteroa on the 15 th of Augult 1769 , and on the 30th tad a viev of the comet which
appeared that year ; its tail fubtending on an augle of 42 degrees. This proved a new fource of apprehenfion to Tupia, who inflantly cried out, that as foon as it was feen at Dolabola, the prople of that comery would attack thofe of Ulietea, who would undoubtedly be obliged to fly with precipitation to the mountains to fave their lives. On the 6 th of Ontober they difcovered land, which from its fize, and the enormous mountains oblervable on it, was fuppofed by the gentlemen on board to be part of Tara Shafralis incognita; but on farther examination it was found to be part of They arNew Zealand. Hese the inhabitants were found toriveat New fpeak a dialect of the language of Otaheite, fo that Zealaud. they could undertand Tupia, and he them; yet fo extremely hoflile were their difpofitions, that not the fmalld intercourfe could be held with them; nor could any thing neceffary for the fhips be procurcd excepting wood: fo that the name Captain Cook thought proper to beflow on this part of the country was Paverty-Bay. By the natives it is called Tauneroa, and lies in S. Lat. $3^{8 .} 4^{2}$. and W. Long. 181. 3 G. During the time of his flay in this part of the wonld the Captain circumnavigated almoft the whole country of New Zealand, which he found to contift of two inlands feparated from each other by a narrow ftrait, which, from its difcoverer, las obtained the name of Cook's Strait. In fome places the difpofition of the inhabitants was as favourable as could be wifhed; fo that Dr Solander, Mr Banks, and other gentlemen, had an opporiunity of exploring the country in fume degree, with a view to difcover its natural productions. In Rock of an one of their excurfions, as they paffed through a val- extraordiley, the hills on each fide of which were very fteep, nary fhape. they were fuddenly fruck with the fight of a very extracrdinary natural curiofity. It was a rock perforated throurgh its whole fubtance, fo as io farm a rude but tuperdous arch or cavern, opening dire etly to the fea. This aperture was 75 fett long, 27 broad, and 45 in height, commanding a view of the bay and the hills on the other flue, which were feen through it; and opening at once on the view, produced an effect far fuperior to any of the contrivances of art. On vatural that part of the coalt, which, from having obferved a products of: tranfit of Mercury, they named Aercury bay, oytlers the counwere found in fuch plenty, that they might have load- try. ed not only their boats but even their fhip with them. They were about the fame fize with thofe met with in this country; and on account of their being found in fuch plenty, and likewife thai the adjacent country abounds with conveniencts, Captain Couk was at great pains to point out the fituation of the place. By his obfervations, the latitude of Mercury bay is $36^{\circ} 4^{\circ}$ $28^{\prime \prime} \mathrm{S}$.

Leaving this bay our commander procceded to explore other parts of the country, which by their ascount leems to abound with rivers. Two large ones were met with in Mercury bay; one of which, from the abundance of oyfters found at its mouth, was called Oyfor river; the other they named Mangrove river, fiom the number of mangrove trees growing there. A third, which they called Thames, was met with in that part called the Bay of In lands, up which they failed if miles. Its banks were every where adorned with lofty trees, which they had likewife obferved in other farts of the country. They were tho heavy for-

Conk's Difcoveries.
mafts, but would make the fineft planks imaginable; and as they refembled the pitch pine, the timber of which is lightened by tapping, the carpenter was of opinion that they might thas be rendered more proper for mafts than any European timber. One of thefe trees meafured 19 feet 8 inches in circumference at the height of fix feet from the ground, and was no lefs than Sg, with very little taper, to the branches; fo that the lieutenant fuppofed it mut contain 356 feet of folid timber. In Oneen Clarlotte's Sound, the country was little other than one valt foreft, with plenty of excellent water, and the coaft abounding with bith. As the flip lay at the clillance of only a quarter of a mile from the faore, they were agreeably entertained with the fugring of an infinite number of fmall birds, which formed a melody greatly fuperior to any thing they had crer heard before. The mufic of thefe little chorillers feemed to be like imall bells, mot exquifitely tuned, thourgt probably the diflance and intervention of the water had a confiberable effect in heighteniag it. 'They beran to ding about two in the morning, and continucd their fong till fun-rife, after which they were filent all the day, rembling in this refpect the nightingales of our own countiy.

The time which Capt. Cook fpent in explorisy the coafts of New Zealand was not lefs than fix inonths. - D) his refearches it was flown to confitt of two laye illands, the moft northerly of which is called Eableihomanuce, and the moft foutlerly Tovy, or Tavai Pocnammioo ; though it is not certain whether the whole fouthern ifland or only a part of it is compreliended under this name. 'This iffand feems to be barlen and mountainous, but Eabbecioomanzue lias a much better appearance; and it was univerfally believed by the gentlemen on board, that all kiuds of European yrain, as well as garden plants and fruit, would flourith in the greateit abundance and perfection ; and from the vegetables found here it was concluded that the winters are not more fevere than thofe of Englan!, and it was known by experience, that the fummer was not hotter, though the heat was more equal than in this country. Hee are no quadrupeds except dogs and rats; and the latter are fo fcalce, that they efcaped the notice of many on board. The bids are not numerous, and the gannet is the ouly one of the European kind that was obferved. The infects are equally fcarce; but the fea makes abundant reconyence for this fcarcity of land animals; evely creek fwams with fin, equally deticious with thofe in this country. The foretts are of vaft extent, and filled with excellent timler trees, the largeft, traightelf, and cleancelt that Mr Cook had ever feen. Theie is here one plant which anfwers the purpofes of both hemp and flax, and excels all other of the kind that lias been met with in other parts of the world. If the fettling of New Zealand therefore fhould ever be deemed an object worthy of the attention of Great Britain, Captain Cork was of opinion, that the beft place for eftablithing a colony would be cither on the banks of the Thames or in the Bay of Itlands; each of thefc places having the advantage of an exeellent harbour. Settlements might be extended, and a communication made with the inland parts of the country by means of the river; and veffels eafly conAructed of the excellent timber with which the counary every wherc abounds.

The inhabitants of New Zealand are in a very bar- Crob's barous thate, ar! Lawe a degree of firccity unknown Difuceto the inhabitants of the Sunth. Wea indads, though richa they feem to have the fame origin. During theis refodence there, our havigators hat the nold enbwincing temnt ef cridences of their being eannibals, and accultomed to the in hatidevour the bodies of ther flain enemies. Notwith-la:s. ftanding thele barbarons practices, howeger, they feemed to cujoy a tlate of uninterrupted licalth. In all the vilits made to their towns, none was ever perceived who had the leal bodily comphaint, not even the flightelt eluption on the fkin. This extraosdinary degree of health was likeswife manifelled by the eafe with which their wounds were lealed without the fmalkell application, as well as by the number of old men with which the itland abomded. Many of ehefe, by the lofs of their hair and teeth, feemed to be extremely old, but none of them were decrepid; and though inferior in llrength to the young men, they came not behind then in the leaft with regard to cheerfulne $f_{s}$ and vivacity. The univerfal and only drink of the New Zealanders is water.

Our navigatur had now explored thee-fourths of that part of the globe where the fouthein continent was fuppoted to lie, without being able to fond it; and his voyage lad demonitrated, that the lands feen by former navigators could not have been parts of fuch a continent, though, as he had never procesded farther to the fouhward than 40 degrees, the arguments for it were not as yet entircly overthown. Dir Cook, however, Difiese did not at this time proceed farther in the fearch of ries at Now fuch a continent, but tailed from New Zealand to the L- lland. coails of New Hulland, where he anchored in Botany Bay on the 201 h of April. Here he found a few favage inhabitants more barbarous and degenerate than any that had yet been obforved. Their language was harh and diffonant, totally unintelligible even to Tupia; they appeared to have litale cuintity, and fet no value upon any prefent that could be made them. The not remarkable circumtance in this country feems to be its extieme fearcity of water; not a fingle ftream of any confequence having ever been obferved by any navigator. Some were of opinion inded, that Morton's Bay, in S. Lut. 26. 56. and W. Long. 206. 28. opens into a river; though the only reafoa they had fur this opinion was, that the fea looked paler in that part than ufual, and the land at the bottom part of the bay could not be feen. At this time, however, the matter could not be determined by experimen:, on account of the wind being contrary. The fearcity of water here is the more furprifing, on account of the valt exrent of the country, and likewife its having abundance of tolerable high hills. In this ifland there were founcl many curious plants and animals; and it was found, that in feveral places the marnetical needle Mrarmetic wabs affected to fuch a degree as to vary its. pofition mecdle fureven to 30 derrees. At one time it varied alon prinigly at
 than two points on being removed to the diflance of only 14 fect. Some of the loofe fones being taken up and applied to the needle produced no effect ; but Mr Cook was of opinion that the whole phenomenon was to be afcribed to iron ore in fome of the mountains, and of which traces had been already met with. This irregularity continued in fome degree even at fea; for when the Chip was clofe under Cape Uptart, the vari-

Cook' Litcoveries
36 Ice not al. ways found in the vicinity of land.
had been difcovered, that the iec with winich the polar regions alound has been formed in the vicinity of 13nd. It was found likewife, that the water produced from the melting of iec, even thourth formed in the ocean, was perfectly fweet and well takled. Of this circumftance the Captain took advantare to fupply himfelf with water ; and gave it as his opinion, that it was the molt expeditious method of watering he had ever known. He had likewife an opportunity of detucting another popular error, viz. that penguins, albatroffes, and other birds of that kind, never go far from land. This indeed may be the cafe in open feas, but in fuch as are covered with ice it is wey diferent; for they then inhabit the ice illands, and guat out with them to fea to a great diftance.
When in the latiturle of 49.13. S. fome figns of land were perceived; but as the wind did not admit of ony fearch being made in the direction where it was fuppofed to lie, the Captain proceeded in his voyage t1) the eatward. A very remarkable alteration in the dinection of the needle was now perccived, and which could not be fuppofed owing to the vicinity of any magnetic matter, as it happened while the fhips were far out at fea. The circumfance was, that when the fun was on the flarboard fide of the fhip the variation was leaft, but greatelt when on the oppofite ficle. An aurora auttralis was again obferved, which broke out in fpiral or circular rays, and had a beautiful appearance; but did not feem to have any particular direction, being confpicuous at various times in different pats of the heavens, and diffuling its light over the whole atmofphere.
'The extreme cold and formy weather which now began to take place, determined Captain Cook not to defigned. His olfervations confirmed the accounts of former navigators, that the cold of the fouthern feas is much more intenfe than in equal latitudes in the nor- thern hemifphere; but at the fame time it howed that this cold cannot be owing to the vicinity of a continent, as had formerly been imagined. On the contrary, it was now detemined beyond difpute, that if any fuch continent exilted in the ealtern part of the fouthern ocean, it mult be confined within the latitude of 60 degrees. No farther difcoveries therefore being practicable in higher latitudes, as the winter feafon was approaching, the commander fteered for New Zealind, where he anchored in Dufly Bay on the 25th of March, having been at fea 117 days without once coning in fight of land. Here the time was fpent in procuring proper refrehments for the people, and exploring the fea-coalt and country for the benefit of future navigators. Nor was our commander unmindful of the inhabitants. Here he left the five gecfe which yet remained, choofing for them a place where there were no people at the time to difturb them; and as 'they had there great plenty of food, he had no doubt of their breeding, and in a fhort time fpreading over the comitry. Some days after a piece of ground was cleared by fetting fire to the topwood, after which it was dug up and fowed with garden feeds. Dutky Bay is fituated in the weflernifland of New Zealand, called Tavaipornummoo, which, as has already been faid, is lefs fertike than the wher. The inland part is full of ragged mountains of a valt height : but the feaccoalt

[^15]is coverd with trees, among which is the true fipruce, which was found to be of great ufe. It was remarked, that though a valt quantity of rain fell during the time of reficence here, it was not attended with any bad effects on the health of the people; which furnifhes an additional argument of the healthivefs of the place. Durky Bay is reckoned by Captain Cook to be the mol proper flace in New Zealand for the procuring of refrellments, though it is attended with fome difagreable circumances, particularly being infetted with great numbers of black fand-flies, which were troublefone to an extreme degree. The natives feen at Dufky Bay were apparently of the fame race with thofe feen in other parts of the country, and led a wandering life, without any appearance of being unitcd in the bonds of fociety or friendhip.

From Duky Bay the Captain proceeded to Queen Charlotte's Sound, where he met with the Adventure, which had been feparated from the Refolution for abore 14 wecks. In his paflage thither he had an op- Water ${ }^{13}$ portunity of obferving fix water-fpouts, one of which fpuuts. paffed within 50 yards of the Refolution. It has been a common opinion, that thefe meteors are diflipated by the firing of a gun, arid the Captain was forry he had not made the experiment; but he acknowledges, that though he had a gun ready for the purpofe, and was near enough, his attention was fo much engaged in viewing them, that he forgot to give the neceffary urders.

Having planted another garden in this part of the conntry, and left two goats, two breeding lows and a boar, in as private a fituation as pollible, that they might be for fome time out of the reach of the natives, the Captain fet fail for Otaheite. Durring the long Difoveries abfence of the Adventure, Captain Furneaux had vi- at Captain fited the coaft of New Holland, and difcovered that there was no probability of Van Diemen's land being feparated from it by ftraits: he had likewife found additional proofs that the natives of New Zealind were accuftomed to eat human Aefla. Captain Cook alfo remarked with concern, that the morals of the New Zealanders were by no means mended by the vifit he had formerly paid them. At that time he looked upon the women to be more chate than thofe of moft of the nations he had vilited; but now they were ready to prollitute themfelves for a fpikenail, and the men to force them to fuch an infamons traffic, whether agreeable to the inclinations of the females or not.

In the run from New Zealand to Otaheite, our commander paffed very near the fituation alifiged by Captain Carteret to Pitcairn's ifland, difcovered by him in 1767 , but witloout being able to find it, though a fight of it would have been uffeful for correcting its longitude as well as that of others in the neighbourhood ; but there was not at prefent any time to fpend in fearching for it. Proceeding farther on in his roy-Newifla age, howe ver, he fell in with a clufter of iflands fup-difcovered. pofed to be the fame difcovered by M. Bongainville, and named by him the Dangerous Archipelago. To four of thefe Captain Couk gave the names of Refolution, Doiubful, Fiurneaux, and Adventure Iffcuds. Refolution 1 fland is fituated in S. Lat. 17.2+. W. Long. 141. 39. Doubtful Ifland in S. Lat. 17.20. W. Long. 141.38. Furneaux Ifland in S. Lat. 17.5. W. Lomg.

Cock4 143. 1G. and Adverture Ihand in S. Lat. 17. 4. and Difiove- W. Long. 14t. 30.

No difeovery of any great confequence was made at the ifland of Otaheite or thofe in its neighbourliood, exceptiug that the Captain had an opportunity of correcting the opinion which till now had prevailed, of the exceffive diffolutenefs and immodefty of the women of Otahcite; and which had been enlarged upon by Dr Hawkefworth nore than feemed to be conliftent with decency. The charge, however, accordiag to the accounts of this fecond voyage, is far from being indiferiminately true, even of the unmarried females of the lower claf. Some adlitions were made to the knowledge of the gengraphy of thofe iflands; and from Huaheine Captain Furneaux took on board his fhip one of the natives of Ulietea named Omzi, afterwands fo much fpoke of in England. Captain Cook at firt appeared dillatisticd with his choice of this youth, as being inferior in rank to many others, and having no particular advantage in flape, figure, or complexion; however he had afterwards reafon to be better pleafed. During the Captan's refidence at Otabeite, he ufed his utmoft endeavours to difcover whether the venereal difeafe was endemic among them, or whether it had been imported by Europeans: but in this he could not meet with any perfectly fatisfactory account ; though it was univerfally agreed, that if it had been introduced by Europeans, it mutt have been by the French under M. Bongainville.

Captain Cook having left Ulietea on the 1 th of September 1773 , directed his courfe weftward, with an inclination to the fouth. In this courfe he difeovered land in S. Lat. 19. 8. and W. Long. 158. 54. to thence he proceeded to the illand of Middleburg, where he was treated in the moll hofpitable manner poffile. To fuch an excefs did the people carry their gencrofity, that they feemed to be more fond of giving away their goods than in receiving any thing for them: infomuch that many, who had not an opportunity of coming near the boats, threw over the heads of others whole bales of cloth, and then retired without either waiting or akking for any thing in retura. From Middleburg he proceeded to Amilerdam Ifland, where the beauty and cultivation of the ifland afforded the moft enchanting profpect. There was not an inch of walte ground; the roads were no wider than what was abfolutely neceflary, and the fences not above four inches thick. Even this was not abfolutely lott ; for many of the fe contained ufeful trees or plants.

It is obfervable of the ints of Midlleburer and Amfterdan, as well as of moft others in the South Sea, that they are guarded from the waves by a reef of coral rocks which extend about one hundred fathoms from the flore. Thus they are eflectually fecured from the encroarlments of the ocean; by which they would probably fuon be fwallowert up, is mon of them are mere points in comparifon of the vaft quantity of water which furrounds them. Here he left a quantity of garden vegetable feeds and pulfe, whinh it was not donbted would be taken care of by the indultrious inhabitants. In the latt mentioned iffands our navigators found no animals but liogs and fowls; the former being of the fame kind with thofe ulually feen in the other illands of the Suath Sea; but the latter greuty

Voz, V. FartII.
preferable, equalling thofe of Europe in their inze, and even preferable in refpeet of the goodnefs of their flefh.

On the 7 th of Oeqoher Captain Cook left the ifland of Aniterdam, with a defign to pay another vifit to New Zealand, in order to take in wood and water for his voyage in queft of a fouthern contincent. The day alter be left Amiterdam, he fell in with the inand of Pilftart, formerly difcovered by 'lafman, and fituated in S. Lat. 26', W. Long. $175^{\circ} 59^{\prime}, 32$ leagues ditant from the eatt end of Middleburg. On his arrival at New Zealand, he exerted himfelfas much as ponfible to Anether leave a proper afforturent of veretables and animals for vite to Nove the benefit of the iahabitants. One of the firlt things he did, therefore, was to make a prefent to a chicer, who had come off in a canse, of a quantity of the mot uffful garden feeds, fueh as cabbage, ternips, omions, carrots, parfnips, and yams; tegether with fome whear. French and kidney beans, and peate. With the fame perton he keft alfo two boars, two fuws, four hens, and two cocks. 'This prefent, however valuable in itfelf, feems to have been but indifercritly reccived; for the chief was mueh better fatisfied with a foikenail hate the length of his arm than with all the reft : notwith. ftanding which, he promifed to take care of the feeds. and not to kill any of the amimals. On inquiring about thofe animals left in the country in the former past of his voyage, the Captain was informed, that the boar and one of the lows had been feparated, but not killed. The other he faw in good condition. and very tame. The two goat, he was informed, hal been killed by a native of the name of Ganbiah. The gardens lad met with a better fate; all the articles being in a very flourihing condition, though left entirely to nature, exeepting the potatoes. Captain Cook, however, ftill determined to fupply thefe iflanders with ufeful animals, put on thore a boar, a yotng fow, two cocks and two hens, which he made a prefent of to the adjacent inhabitants. Three other fows and a boar, with two cocks and hens, he ordered to be left in the country without the knowledge of the Indians. They were carricd a little way iato the woods, and there left with as much food as would ferve them for 10 or 12 days, in order to prevent them from coming down to the coaft ia questof it, and thos being difcovered.

A fecond feparation with the Adventure had now taken place; notwithftanding which, Caytain Cook fet out alone with his velfel in quelt of a fouthern con quet of a tilert, and tuch was the condene put in bim by tho them failors, that ahl of them expreffed as much fatisfaction and ahacrity as if not only the Adventure, but aver fo many hips had been in cempany.

On the 26 th of November the Coptain fee fail from New Zealand : and on the 1 2th of 1ucember began to fall in with the ice, but ecnflerably-ferther to the Gunthward han they trad met with it in the former part of his woyage : being now in the latitule of $62^{\circ} 108$. and ${ }_{172} 2^{\circ} \mathrm{W}$. Long. A; they proceded fouthwan? the number of ice iflands inereafed prodigomply and ia Lat. $67^{\circ} 31^{\prime}$ and W. Long. ${ }^{1+22^{2}} 54$, they an at onee got in among fuch a clufter of thicfe illands, that it became a matter of the utnont difficuly and dange: to keep ctear of them. Finding it inpoffithe, thereforce, to get any farther to the fouthward at prefert. 3 F

Cがに
Difcove－ r：e．
the Captain determined to explore a confiderable tract of fia to the morth of his prefent fituation，and then again to fland to the fouth．But in this he was \＆ill mivecefiful；no land being difcovered either in fail－ ing northward，caltward，weltward，or fouthward； though he procecded as far in the laft dirction as $71 . \operatorname{lo.S}$ Lat．and 105.54 ．Wt．It was now impor． fible to proceed；and the opinion of the Captain himelf， as well as of mof of the gentlemen on boad，was，that the ice by which they were now itopped extended as far as the pole．As there was fill room，however，in parts of the ocean entirely unexplored，for very large illands， vur Commander determined not to abandon the pur－ fuit in which he was engaged until there fhould not be any poffbility of doing more；and begdes the potli－ bility of making new difcoveries，he was confcious that many of the iflunds already difcovered were fo obfermely known，that it was of confequence to pay them a fecond vific．With this view he propofed to go in queft of Eafter or Davis＇s Ifland ；the fituation of which was known with folittle certainty，that none of the attempts lately made to difeover it had been fuccefiful．Fie next intended to get within the tro－ pic，and then to proceed to the welt，touching at any inlauds he might meet with，and fettling their fitma－ tions，until he flould arrive at Otaleite，where it was neceffary for him to make fome flay in order to look for the Adventure．It was part of his defign alfo to run to the wiftern as fal as Terra Aulial del Efpi－ ritu Sancio，difeovered by Quiros，and which MI． Buugainville had named The Great Cyclaces．From this land he propofed to fail to the fouthward，and from thence to the ent between the latitude of $50^{\circ}$ and $60^{\circ}$ ．In the execution of this defign，he deter－ nined if poffible to reach Cape Horn during the en－ fuing November，when he wonld have the bett part of the fimmer before him to explore the fouthern part of the Atlantic Ocean．

In purfing liis confe to the northward，it had been part of his delign to find out the land find to have been difeovered by Juan Fernandez in about the latitude of $38^{\circ}$ ；but he was foon convinced，that if any fuch land exilted，it could only be a very fmall illand ：but the profecution of the defign was for fome little time inter－ rupted by a viutent bihous diforder by which the Cap－ tain was attacked．In this，when he began to recover， as there was no fiefhmeat on board，he was obliged to have recourfe to dug＇s fleth；and a favourite animal belonging to Mr Forter was faciliced on the occafon． The Captain was able to eat not only of the broth made of this，but likewife of the flefh，when hisfo－ mach could bear nothing ulfe．On the 1 ith of March they arrived at Ealter Ifland，before which time the

Captain was tolerably recovered．Here tliey made but fow difcoveries farther than detemining the fitua－ tion of it to be in S．Yat． $27^{\circ} 5^{\prime} 30^{\prime}$ ，and Wr．Long． $109^{\circ} 4^{6 \prime} 20^{\prime \prime}$ ．＇The ifland itfelf was found batren and defolate，having every apperance of being lately ruin－ ed hy a volcanic eruption；without either wood，fuel， or frefl water worth taking on board．The inhabi－ sants were few in number；and the women in very ［mall proportion to the men，but remarkable for their lewdnef．A number of gigantic Atatws were obferved， whinch had alfo been taken notice of by Commodore

Roggewein，and the origin of which could not be ac－ counted fur．

On leaving Eafter Ifand，Captain Cook was again attacked by his bilions diforder；but happily recuver－ ad before he reached the Marquefas，wanch they did and the on the Gth and gth of Aprit．One of thefe，being Marquefas．］ a new difeovery，received the name of IImel＇s Ifand， from the young gentleman by whom it was list obler－ ved．＇Thefe are five in number；finated beiween 9 and 10 degrees of fonth latitude，and between $138.47^{\circ}$ and 139．13．of wett longitude．＇They were difcovered by Mendana a Spaniand and their names are，La Magdatena，it Pedro，La Dominica，Santa Cimitina， and Hood＇s Inand．The inhabitanti ate，withont ex－ ception，the finct race of people in the South Sea， furpating all others in that part of the word in the fymenctry of their purdons and regularity of their fa－ tures．Their origin，however，from the afinity of language，was evidently the fame with that of Ota－ heite．It was in Si Chillia that our commander ancho－ red ；and le has left particular directions for finding a particular cove in Refulution Bay in that illand，which is the mol convenient for procuring wood and water．

In the pafage from the Marquefas to Otaheite，our navigators pafid feveral low and fmall inlands commec－ ted together by reefs of coral rocks．Cne of thete， named by the inhabitants Tiackea，was vifited by Liea－ temant Conper．It was difcovered and vilited by Cap－Inand tain Byron；and is tituated in S．Lat．27．30．W．「tockea． Long．144．56．The inhabitants are much darker in their complesions，and feem to be of a fiereer difpuli－ tion than thofe of the neighbouring iflands．They have the figure of a filh marked upon their bodies；a very proper emblem of their profeffion，deriving their fubtittence almolt enticly from the fea．Paffing by Si George＇s Iffunds，which had been alfo difcovered and named by Captain Byron，our Commander now difcuverd four others，which he named Pallifer＇s Iflemeds．One of thete is fituated in S．Lat．15．26．Pallikis＇s and W．Loar． 14 （5．20．another in S．Lat．15．2\％． 1 inands． and V．Loma．146．3．They were inhabited by people refembling thole of Tiookea，and like them were ammed with long pikes．Here our navigator ob－ ferved，thit from W．Long． $138^{\circ}$ to $148^{\circ}$ or $150^{\circ}$ ，the fea is fo full of fmall low iflands，that one camut pro－ cecd with too much caution．

On his arrival in Otaluite，provifions were met with in great plenty；and they were now very acceptable， by reafon of the long time the thip had been at lea without obtaining any confiderable fuoply．Two goats which had been given by Captain Purneaux to a chief named Otoo，appeared to be in a very promiting fituation．＇The female had brought forth two kids， which were almoft large enough to propagate；and as The was again with kid，there was little doubt that the ifland wonld foon be flocked with thefe ufeful animals； though it was otherwife with the fheep，all of which had died except one．On this occafion，alfo，the Cap－ tain furnimed the natives with eats，of which he yave away twenty；fo that there was little danger of the Rock of thefe animals decaring．During his relidence at this time，he had an opportunity of making fome computation of the number of inhabitants on the illand． which he fuppufed to be no lefs than 200,000 ．

Cnok' Difcoverics.

Huaheine and Ulicta Ihands were next vifital, but without any remarkable oceurrence. lrom the latter our Commander fet fail on the 5 th of June 1774; and next day canc in fight of Howe Ihand, difeovered by Captain Wallis, and fituated in S. Lat. if. 46. and W. Long. 154. S. On the 1 6th a new illand, named Palmerfone Jland, was difcovered in S. Lat. 18. 4 . Wr. Long. 163.10.; and, four lays after, another was obferved in S. Lat. 19. 1. W. Long. 169.37 As it was evidently inhabited, the Captain determined to land: but found the people fo extremely holile, that no intercouffe could be had : nay, he himfelf was in danger of lofing his life by a lance thrown by one of the natives, which pafted clofe over his moulder. From the extreme hollility of the people of this inand, it was named by Captain Cook Siavage Jliand. It is of a round hape, pretty high, and has deep water clofe to the lhore, but has no grood harbons.

Pafling by a number of fmall iflands, Captain Cook next anchored at that of Anamocka or Rutterdam, difcovered by Tafman. It is fituated in 20. 15. S. Lat. and 174.3 I . W. Long. Its form is triangular, each fide extending about three and a half or four miles. From the north-welt to the fonth it is encompaffed by a number of fimall inlands, fand banks, and breakers; of which no end can be feen from the illand on the northern fide, and may poflibly be as far extended as Amiterdam or Tongataboo. While the Captain icmained on this illand, he learned the names of more than 20 of the adjacent ifles, fome of which were in fight between the north-welt and north-eaft. Two of thefe, which lie more to the wefward than the others, are named Amatrafua and $O_{g}$ buoo. They are remarkable for their height ; and from a great fmoke vifible about the middle of Amattafoa, it was fuppofed to have a voleanc. The ifand of Rotterdam, Middleburg or Fanowe, with lihtart, form a group cistending about three degrees of longitude and two of latitude. The whole groap was named The Friently IJhis by Captain Cook, on account of the friendthip which feemed to fubfill among the inhabitants, and their courteous behaviour to Itrangers. The people of Rotterdam Mand are fimilar to thofe of Amferdam; but the ifland is not in fuch a llate of high cultivation as Amferdam, nor do its fruits come to tuch perfection. It is alfo inferior in the articles of cloth, matting, \&c. which are accounted the wellh of thefe pats.

From Rotterdam illand our navigator continucd his courfe to the wettward, where he firt difcovered a fmall iffand in S. Lat. 19. $4^{3}$. W.Long. 178. 2. It was uanied Turtle Illand, firm the great number of thefe animals found upon it. Sixteen days atter he foll in with the clutter of iffands named by M. Bongrinville the Great Cychdes. The firit iflant on which he landed was Maliicollo, where, though the people were it fint very holite, they were foon conciliated, and friendfe intecourfe trok place. The langrage of thefe people is comliderathly different from that of the other South-fea iflands; they are diminutive in their perfons, and of ugly fatures; their bair black or brown, thort and ciulting, but lets foft than that of the nesrocs. They had no name for a dog in their languare, and lad never feen the animal ; fo that they were (stremely fond of a dog and bitch of which Cartain Cook nade them a prifent. 'The harbour in
this illand, in which the mip came to an ancion, was named Simdwich harbour, and lies on the northeent fide in S. Lat. 16.25.20. L. Long 167.57 .53 . It is very commodious for the carrying on any operations at land, having agood depth of water, and many other advantages.

The next difcovery was that of the Group named ${ }^{59}$ Slephrit's J/es, in honour of Dr Whepherd, Plumian mes. profefor of attronomy at Oxford. Numbers more were crery day obferved; of which one peaked rock, named the Momment, was uninhabited, being apparently inacculfible to auy other creature but bids. Sandwich ifland is of confiderable extent, and exhibits a molt beautiful profpect. It is furrounded with other fmaller inands, the principal of which were named Montague and Hinchinbrook. At Erromango they found the people hollile and treacherous; and from a Girmifh they had with them near a promontory on the north-eall point of theilland, it was named 'raitor's Head. Its fituation is in S. Lat. 10.43. E. Long. 169. 28.

From Eromango our navigator proceeded to Tan- Tanna na, an illand they had formerly difcovered at a di- Thanad. liance, and which is furrounded by fome others, thrce of which are named Immer, Feotsona or Erronan, and Anctom. At 'Tama they laid for fome time, on account of their wanting fome quantity of wood. A volcano was feen ahout the niddle of this ifand, which burned with great violence, particularly in moill and wht weather : but notwiththanding the friendly terms on which they were wath the natives, the latter would never allow them to approach this mountain. There were fome fpots on the fea-coatt which emitted an hot and fulphureous finoke; and the people alfo caprefed much uneafinefs when thefe were approached or medlled with. The port which the thip entered in this ifland was named Refolution Hurborr, and is fituated in S. Lat. 19. $32,25 \frac{1}{2}$. E. Long. $169.44 \cdot 33$. It is a limall creck three quarters of a mile long, and about half as hroad. It is extremely convenicat, having p!enty of wood and water clofe to the thore. Among the veretable productions of this ifland, there is reafon to fufpect the nutmeg-tree to be one, a pigeon having been hoot, in the craw of which was a wild nutmeg. The inhahitants are two difinct races of people, and fpeak two different languages; one that of the Friendly iflands, the other peculiar to Tana and thofe in the neighbourhood. The people are very expert in the ufe of their weapons; on which Dexterityof Nit Wales makes the fullowing remarks: "I mull the intab in the confels I have often been led to think the feats ande of their which Ifumer reprefents his heroes as performing with lances. their fpears a little too much of the marvellous to be admitted in an beroic poom, I mean when confined within the trait flays of Ariltotle; nay, even fo great an advocate for him as Mr Pope acknowledges then to be furprifing: but fince I have feen what thefe poople can do with their wooden fpears, and them badly puinted, and not of an hard nature, I have not the katt exception to any one paffage in that great poet on this account. But if I fee fewer exceptions, I can find in. finitely more beauties in him, as he has, I think, fearecly an action, circumfance, or defoription of any kind whatcver relating to a fpear, which I have not feen and recognifed among thefe people; as their whinling motion and whifling noile as they by ; their
quivering

(4) quivering motion in the ground when they fall ; their meditating their aim when they are going to throw; and their haking them in their hand as they go along."

T'he Archipelago, in which Captain Cook had now remained a confiderable time, is fituated between 14. 29. and 20.4. S.Lat. and between 166.4 t. and 170.2 \% E. Long. extending 125 leagues in the direction of N. N. W. $\frac{1}{2}$ W. and S.S. E E. The principal illands are the Peak of the Etoile, Tierra del Efpiritu Santo, Mallicollo, St Bartholomew, the Ille of Lepers, Aurora, Whitfuntide Ine, Ambrym, Paom, Apee, Three Mills, Sandwich, Erromango, Tanna, lminer, and Anatom. They were fort difcovered in 1606 by Quiros, who fuppofed them to be part of a fouthern continent; nor were they vilited from that time till the year 1768 , when M. Bungainville bettowad upun them the name of the Great Cyclades, as already mentioned. This gratleman, however, hefides landing in the IIE of Lepers, only difeovered that the conntry was not comnected, but contifted of illands. Captain Conk examined the wonle in fuch an accurate manner, afcertaining the fitwation of many of she illands, and difcovering fuch numbers of new ones, that he thought he had an undonbted right to impofe a new name upon them; and therefore called them the

From the New Hebrides Captain Cook fet fail for New Zealand, in order to profecute his voyage in foarch of a fouthern continent, but in thrce days difcovered a large illand, which he nampd New Caledonid ; and which, next to New Zealand, is the largete in the Iracific Ocem. It lees between 19.37. and 22. 30. S. Lat. and between 163 . 37. and 167 . 14. E. Long. lying N. W. $\frac{1}{2}$ W. and S. E. $\frac{1}{2}$ E. extending about 87 lagges in that direction, though its breadth does mot any where exceed 10 leagues. The natives are Atrong, active, well made, and leem to be a middle race between thole of Tanna and the Friendly Illes; and the women were more chafte than thafe of the illands further to the ealiward. The iffand afforded a condiderabic variety of plants for the botanits, and Come excellent timber of the fpecies of the pitch-pine, for mats and fpars. The wood is clove-grained, white, and tough ; and very fit for the purpofe. One of the fmall illands furrounding the large one was named the I/le of Pimes, from the cquantity of thefe trees found upon it ; and another, from the number and variety of phants it afforded, had the name of Botany $I /$ hand. The coat, however, was fo dangerous, that our navigator, having no more time to fpare, was obliged to leave fome part of it unexplored, though the extent was detemmined, as has been already related. Mr Forter was of opinion, that the language of this people is totally diffrent from that of any of the other South Sea iflands.

Procteding from New Caledonia, our navigator next foll in what an illand abont five lagues in circumfefence, and of a good height, fituated in S. Lat. 29. 2. 30. and E. Long. 163. 16.; on which he betlowed the mane of xorfold yfurm. It was entircly uminhabited. Various trees and plants commonat New Zealand were dberved bere, particularly the flas-plant, which is more loxariant in ihis illand than in any part of New Zealand. 'lhe chaf produce of the flame is a kind of frace pise, many of the thets of winch are 10 or 12
feet in circumference. The palm-cabbage likewife abounds here; and the coals are well flocked with excellent fith. On the 18 th of Oetober they arrived at Queen Charlotte's Sound in New Zealand ; the 1 tuation of which was now afcertained by Mr Wales with the utmoft accuracy, its latitude being found 48. Eealand 5. 56 $\frac{1}{2}$. S. and its longitude r74. 25. $7 \frac{1}{2}$ E. On ex. amining the gardens which had been made, it was found that they were in a thriving condition, thongh they had been entirely neglected by the natives. Some of the cocks and hens were fuppofed to he ftill in exifeence, as a new laid hen's egg was found, though none were feen.

On the roth of November Captain Cook fet fail from New Zealand in fuareh of a fouthern continent; but having traverfed a vaft extent of fea for 17 days, from S. Lat. 43. O. to 55. 48. lee gave up all thoughts of finding any more land in this fratt of dire ocean, and therefore detemined to flecr directly for the well entrance of the Araits of Magellan, with a defign of coafting the fouthern part of Terra del Fucero ouvite round Cape Hon to Le Maire's Straits. As the world had hithertoreceived but very imperfect accounts of this coalt, he thought a furrey of it would be of noore advantage to navigation and geography than any thing he could expect to meet with in a higher latitude. On the 17 th of Dectmber he reached the it Tira coatt of Terra del Fuego, and in three days more an-del Fuego. chored in a place to which he gave the name of Chrifimas Sound. The land appeared defolate beyond any thing he had hitherto experienced. It feems to be
entirely compofed of rocky mountains without the thing he had hitherto experienced. It feems to be
entirely compofed of rocky mountains without the lealt appearance of regetation. Thefe mountains terlealt appearance of vegetation. Thefe mountains ter-
minate in horrid precipices, the craggy fummits of which fpire up to a vaft height; fo that fcarcely any thing in nature can have a more barren and tavage afpect than the whole of the country. In the courfe of his royage along this coatt, he conid not but obferve, that at no time had he ever made one of fuch
lengh where fo little occurred of an interefting naferve, that at no time had he ever made one of fuch
lench where fo little occurred of an interefting nature. Barren and dreary, however, as the coalt was, it was not totally deftitnte of accommodations about
Chrillmas Sound. Frefh water and wood for fuel Chritmas Sound. Freth water and wnod for fuel were found about every harbour ; and the country every where abounds with fowl, particularly geele.
A confedcrable number of plants were alfo found upon A confedcrable number of plants were alfo found upon it, almolt every fpecies of which was new to the botanifts. In paffing by Cape Horn, it was wifhed to determine whether it belonged to the latid of Terra del Fuego or to a fmall ifland fouth from it; but this was found impracticable on account of the foggy weather and dangerous fea. Its latitude was now determined to be 55.58 . S. and its longitude
67.46 . W. The coall appeared lefs dreary here than now determined to be $55 \cdot 58$. S. and its longitude
67.46 . W. The coall appeared lefs dreary here than on the wettern fide of Terra del Fuego; for though the fummits of fome of the hills were rocky, the fides the funmits of fome of the hills were rocky, the fides
and valleys feemed covered with a greenturf and wooded in tufts. In Paing this cape a remark was made Remakson by the Captain, that if he were on a voyage round a voyage by the Captain, that if he were on a royage round a voyage
Cape Horn to the weft, and not in want of wood or roud Cape water, or any other thing which might make it necef- How, lary to put into port, he would fail a confiderable way to the fouthware, fo as to be out of the reach of land to the fouthware,
altogether. By tois method he would avoid the currente, whofe furce, he was of opinion, would be broken
 ries.

Cnok's at 10 or 12 icagues difance from the thore, and far- Cook was undetermined whether it was a group of Difisue. tus. came into the place x here it is fuppofed to lie, neither land nor any certain figrs of it could be net with.
Some iflands, howcyer, were difcovered, particulaly land nor any certain figns of it could be ant with.
Some iflands, however, were difcovered, particulaly Willis's illand, in S. Lat. $5+.0$. W. Long. 382 ; ;
another naned Eird Ifond and South, Gorsia, finated Willis's illand, in S. Lat. 54. ©. W. Long. 382 ; ;
another naned Bird Ifond and South, Gcorsic, fituated between 53.57 . and $54.5 \%$. S. Latt and between 38. 13. and 5. 3. W. Leng. All thefe were co-
vered with mow and ice to a great heith. Nor a tree 38. 13. and 5. 3. W. Leng. All thele were co-
vered with inow andice to a great height. Not a tree was to be feen, not even a flatio, num were there any rivalets or fleams of water; the only vegtablis to be met with were a coarfe ftrong bluded erids, wid burnet, and a kind of mofs. A confiderable quantity of feals and penguins were met with, whofe fleth, thourh, very cuarf, was prefernet ty, the hip's compaty, even by Captain Conk hinder, the the hat provifons,
which were now greatly decaycd. The nuft fouthenly even by Captain Conk hindet, the the falt provifons,
which were now greatly decaycd. The nuft fouthenly land difcovered by our navigater was that on which he beflowed the name of Seuthern Thule, and which is fituated in S. Lat. $59^{\circ} 13^{\prime} 30^{\prime \prime}$, TV. Long. $27^{\circ} 45^{\circ}$. This was flill more dehnate $\ddagger$ an Somth Crorgia, being forfaken even by the feal; and jengnins which abounded on it. Not a aingle hers of any kind was feen upon it, but vall high and harnen momitains, the tops of fome of which redehed above the clouds;
and it may be wemanked, that tins feemo to be the uniyy the tops of fome of which reached above the clouds;
and it may tre wemaked, that tins femo to be the uniyy part of the woild hitherto cifcovend, tatirely unlit for the fupport of animal lie.

Southern Thute was difootred on the gat of January 1795; and from this so the Gth of Februany feveral orther lands were diftovert, and pamed ciafo Brifol, Cape Montarue. 'carater's Jjus, Candlumas fles, and Sandruich's Lazut. Wit!. regatd to this latt, Caŗtaia
iffands or part of a continent lying near the pole, as after all his difappointments he fill weas inclined to think that fuch a continent has an exikence, on ac. count of the vaft quantity of ice met with in the Sonthernfeas; and which from its great leight appears to be formed ia bays and gulphs of the land, and not in the ucen itilf. The greatetl pat of this fouthern continent, homever, if it has any exiflence, mull be within the polar cirele, where the fea is fo incumberere with ice, that the land mult be inaceeflible. So grear is the canger in tavigating thefe fouthern feas, that Captain Cuok afferts on the moof probable grounds in the work, that fuch lauds as lie to the fouthward of his dicecveries could not be explored; and that no man would ever ventare farther than he had dome, 'ihick fogs, fnow-floms, intenfe eold, and every thing that can render navigation dificult or dangerone, mult te cncountered; all which difficulaes anc grtably hightend by the incoprably horrid afpeet of the coantry inflif. It is a pent of the world docmed by nature never once :o fol the warmoth of the fun's rays. $f$ ut to be buicdi in everlafing fuow and ise. Whatever ports theic may be on tlie coalt, they are almolt entirely cusered with frozen fnow of a vaft thicknels. 1f, howeter, any of them thould be for far oren as to incite a mip into $i$, the would run the rifk of ling fixed there for ever, or of coming out in an ice ifland. To this it may be added, that the illands and fluats on the caar. the great falls from the ice-cliffs in the port, or a firdden finow-florm, might be attended with equal. ly facal effects. For thefe reafous our commander determined to alandon the puriuit of a land whofe exittence vas focquivocal, but whofe inutility, if it Nould be difcovered, was certain. One thing only remaned to eromplete what lie wified to arcompling, and that was to determine the exitkence of louten's land. In voyage in this inguity he fpent $: 6$ days; but taving run for 13 voyade of of thele directly in the latitude afigned to that lard, Bouver's and fourd no appearance of it, or of Cape Circumci.! and. fion, he concinded, that reither of thatm had any ex. iftence, but that the navigators had been ceccived by the appea;ance of ice iflands. Two days mone were fpent in quett of fome land which had been olferved more to the fouthwand, but with the like bad fuccefe: after which our commander abandoned all further theughts of fouthen difoveries, and prepared tor returning to Brglard. On his way home, however, he determined to diret his cotrfe in fuch a manner as to fall is with the illes of Denia and ifarfevern. Thele of the ines are laid down in D. Halley's variation chart in the of the ind latitude of $4 \frac{1}{\frac{1}{2}}$. S. and about 4 . O. F. from the me-and $\mathrm{Mas}^{2}$ : ridian of the Cape of Good Hope. None of thefe veca. iflands coukd be found: and nhevefore our commander, having very listie time to fare cither in learching for lint or aitempting to difprove them exillence, nade dice bett of his way to the Cape of Good Hope, and foom thume to England. In his paffage thathe: he vified the ines of st Helena, A feention, and Femando de Noronha. An expriment was made on the ufe of it the ${ }^{2}$ the fill for procuring frell water at fea; the refult of fon the uf:which was, that thongh the invention was uffful upondithiser
the whole, ret it wowil the whole, yet it wowld not by any means be adviadode ofor to :uft entircly to it. Previded indeed that there wei wot a [arcity of foch, and :lat the coppers were geod,

Conk: Difcoveries. rjes. hatd down til maps and charts, and the coal, ill gene , der dangerous than has been utuaty reprete. ed thosigh chis mult madoubtedly have becn onde in a great :1 caftie to the weather, whet hapenct th aemath bly temperate. In one of the imall iflame near staten Land, and which, from their being chico vered on new gear's day, were called Nete Xiar's /fus, m lo of dife harmony was obferce among the angious abound. The fealions necupy the greate!t part of the fea-conft ; the hears occupy the illand ; the fhags are polted in the hightell ciffis; the penguins in fuch places as have the belt acceis to and from the fea; and the other birds choofe inere recturd places. Occafonally, however, all thefe animals were feen to mix together like domeltic cattle and ponltry in a farmyark, whout one attempting to hure the other the the leatt. Even the tagles and vultures were ficcuently obferved futing together on the hills amuag the fhags, whik none of the latter, either old or young, appeared to be dillurbed at their prelence. It is probable, therefore, that thefe birds of prey fubfilty feeding on the carcales of the animals which d'e naturally or by various accidents, and which moft be vely numerous from the immenfe quanty exifing on the illand.

Our navigator now fet out in quel of that extenfive coatt laid down in Mr Dalrymple's chatt, and in which is marked the Gulph of St S.hattian; but when he betlowed the rame of Seathern

Cook's as much might thus be peocured as would fupport Ddiove. life; but that no efforts would be fuffecient to procure $\xrightarrow{\text { sics. }}$ the quantity neceflary for the preferation of health, efpecially in hot elimates. He was likewife convinced that nothing contabutes more to the health of feam"in than having plenty of frefl water. His laft fage in this fecond voyage before his arrival in England was at Fayal, one of the Azores iflands; and his only defign in fopping here was to give Mr Wales an opportunity of finding the rate of the watches going, that fo he might be enabled to fiad the longitude of thele iflands with the greater certainty.

Third ${ }^{73}$ vorage.

In our commander's thid royage he tonched at the itland of Teneriffe inftead of Madeira, looking upon the former to be a better place for procuring refrefiments ; and was convinced of the jultnefs of his con-

74
Vifita the
late of Te neriffe. jecture by the facility with which provifions of all kinds were obtained. The air of the conntry is exceedingly healthy and proper for thofe fulject to pulmonary complaints. This was accounted for by a gentleman of the place from the great height of the infand, by which it was in the power of any perfon to change the temperature of the air as he pleafed; and he expreffed his furprize that phyficians, intlead of fending their pationts to Nice or Libon, did not fend them to T'enerifle.

76
Fmpregnacediemon.

## Prince Ed

 ward'.Iflam;- dif covered.

From the fame gentleman it was learned, that the teafhrub grows in that ifland as a common weed, which is conflantly exterminated in large quantitio. The Spaniards, however. fometimes nfe it as tea, and aferibe to it all the qualities of that brught from the Ear Indies. They give it alfo the name of tea, and lay that it was found in the country when the iflands w were fint difcovered. Another botanical curiofity is the fruit called the imbregnoted lemon, which is a purfect and diltinct Icmon inclofed within another, and difforing from the outer only in being a little more globular.

From Teneriffe Captain Cook proceeded to the Cape of Good Hope, and from thence to the Tounward, where he fell in with two iflands, the larger of which is about 15 leagues in circuit, and the fmaller about nine; their diftance from one another being about five leagues. The one of thefe iflands lues in S. Lat. 46. 53. and E. Long. 37 46; the other in S. Lat. 46. 4. E. Long. 38. 8. As the thips paffed through between them, they could mit difeern tither tree or fhrub upon any of them even with the affillance of theit bett glaffes. The flore feemed to be buld and roeky, their internal parts full of mountains, whofe fides and fummits were covered with flow. The fe two, with four others, which lie from 9 to 12 degrees of longitude more to the eaft, and nearly in the fame larit. dc, had been difcovered in the year 1772 ly Cap. taius Marion du Frefne and Crazet, tro French naw gatros, in their paffage from the Cape of Good Hope to the Philippinces. As no names had been affigned to them in a chart of the S -uthern Ocean commurieated ro Captain Conk in 1775 , the two larger oncs were by him ditinguifhed by the name of Prince Ettward's Jjands, in honour of his Majety's fourth ton; the other four, with a view to commemorate the difcove-

98 ries, were called Marion's and Crozet's Iflonds.

From thefe oun commander feered in the fouthwas? in fearch of Kugulen's land, which he had been inAfructed to touch at, in order to difeover, if poflible,

a good hartour there. In his paffige to it feveral new illands were difcovered; to one whict: Kerguclen had given the name of the I/and of Renderzous, Captain Cook, on account of its thape, changed it to that of Bligher's Colp. It is fituated in 3 . Lat. 48. 29. E. Lonr. 63. 40. and is a high round rock, inaceeffible to ali creatures but birds. $\mathrm{N} \times \mathrm{xt}$ day he fell in with Defrri, tion Kerguelen's land, at firt thought to be a part of the of that
fouthern continent, but afterwards found by Kergue- Mand. len limelf to be an ifland. The extent of it, however, was not determined either by the French navigator or by Captain Cook. The former reckuns it at 200 leagues in circumference, but Captain Cook eftimates it at much leif. Our navigator conld not get any extenfive vicu of it on account of the foggy weather ; but as far as could be difcovered, it was barren and defolate, infomuch that there was neither food nor cowering for cattle of any kind, fo that they would incvitally perif! if any were left. Even the fea-coa'ts were in a great meafure deftitute of fifh; that the there wa, covered with innomerable multitudes of feals. tugether with penguins and other birds; all of which were fo void of fear, that any quantity whatever might be killed without any dificulty. Not a fingle tree nor hitub could he feen, nor a piece of drift wood on the hore; and herbage of every kind was likewife very farce. A prodigious quantity oi the fea-weed, called by Sir Jofeph Banks fucus giganteur, was found in ont of the bays The whole variety of plants tomed in this ifand did not exceed 16 or 18 ipecies. The harbour in which our navigator made his longeft tay on this defolate coait was named Port Pallifir, and is fituated in S. Lat. 49.3. E. Long. t. 9 37. In this royage our navigator undoubtedly duplayed fuperior nantical abilities to rhote of M. Kerguten, whi in two voyages to the place had never ben able to bring his thips to anchor on any part of the coaf.

From Kerguelen's land our navigator proceeded to 80 the coatt of New H.dland, where he now touched at Of Van, the fouthern part called $F^{\prime}$ an Diomen's land, where be land. anchored in Adventure Bay. Here they found plenty of wood and water, with abundance of grals, coarfe indeed, where they went firt athore, but atcerwards mush finer and proper for the cattle. Here, as every where efle. the lationdes and longitudes were fettled with the greatell exactnefs. The bottom of Adventure Bay was found to lie in S. Lat. $+3^{\circ} 21^{\prime} 6^{\prime \prime} ;$ E. Long. $1+7^{\circ} 29$. The inhabitants vifited them in a friendy manne, but teemed as thupid and infentible as triendy manne, for teemed as inupid and intentible as
thufe duy lad formerly feen. They feemed to be totally ignorant of the ufe of iron, and fet no value upon any thing in the ornamental way excepting beads; nor did they feem to be acquainted even with the wfe nor the they feem to be acquanted even with the ule
of fith hooks. Here they found the fories of the ancient fauns and fatyrs living in hollow trees realized. Some huts covereu with birk, and of a muft wretehed contruction, were indeed found near the fhore ; but the moll commodum habitations were :fforded by the molt commoding hatitations were afforded by out by fire to the licight of fix or feven fect; and there was rowm enougl in one of them for three or four peifons to fit nunel a leath made of clay; and it may jully foer hapriting, that notwithtanding the extreme viulence offerd to the vegetative powers of

 Difovethe tree by forming this habitation, it aill continued to flourifh in confegnence of one fide being left entire. The people, notwithtanding their extreme bab urity, were luppofect to proced from the fame flock with the fe of the South S Inmals. As in one of them vilits the natives had feized upon two pirs which hul been brought afhore, apparently with an intentim to kill the $n$, the commonder determined to make them a pert-nt of thefe animals; though from their exceflive fupidity and inattention there was no probability of their allowing then to propagate, if they had been put directly into their hands. To prevent this, Captain Cook ordered the two they had attempted to feize, being a boar and fow, to tecarried about a mile within the head of the bay, and faw them left by the lide of a frefh water rivulet. He was prevented from leaving any other feccies by a conlderation of the barbarity of the inhabitants.

From New Holland ont navigator proceeded to New Zealand, where the arrived on the 12 th of February 1,77 , and anchored in Queen Charlotte's Sound. Here he was defirous of leaving a further fupply of animals; but the infabitants had hitherto fhown fuch careleffrefs about thole which had been left, that he durt not venture to lata my oher than two goats, a male and a female with kil, and two hogs, a boat and fow. He was informed, however, that one chitf had feveral cocks and hens in his polfelion, fo that there was fome probability of thefe animals being allowed to multiply; and as ten on a dozen hues had at different time been left by Captain Cook, befides thofe put on thore by Captain Furneaux, it feems alfo to be likely that this race of creatures will increafe cither in a wild or domettic flate, or both. The gardens had finl been almoit totally neglected, and fome of them deftroyed. Thofe which remained, however, produced cabbages, onions, lecks, putlains, radikes, and a few potatoes. Thefe lat had been bromgt from the Cape of Gool Hope, and were fo greatly meliorated by the change of foil, that with proper cultivation they feemed to bid fair for excelling thofe of mofl other countries.

Our navigator's next courfe was towards the Inand of Otalicite; in the run to which he diforvered the Ihand of Mangeat, fituated its S. Lat. 22. 57. E. Long. 301. 53. From thence he proceeded to Wateoa, where Omai, now on his way home, recongized filuree of his countrymen, natives of the finclety Inands, who had arrived here by the following accident. Abont 12 years before, 20 of the natives of Otaheite had embarked in a cance, in onder to vilit the neighbouring illand of Ulittea. A violent florm arofe, which drove them out of thein courfe, and they fuffened inctedible hardfhips by famine and Catigue, fo that the greatel part of them perifled. Four mea continued haneing by the fide of the veffel for four days afier it Was ovelfet, when they were at laft brought within fight of the people of this ifland. The latter immediarely fent out their canoes, and brought them afhome, treating them afterwards with fo meh kindnefs, tha the three who now furvived exprefled no defire of cturning t: their own country, though they lad now an opportnnity, but chofe rather to remain where they werc. This ifland is fi listed in S. Lat. 20. i. E. Lon 201.45 and is about fix leagues in circumfertace.

The inhabitants are fuid to be equally amiable in their perfons and di pofitions.

Viliting : linall illwd namel Wemnona-ete, or Ota-
Crok's Dinove2ontak, hathated in S. Lat. 19. '5 atad li Long. 201 .
 there were undoubtel markion its hins oces inmally fompented. Havyy's Illad, which in his former voyare hal been delfitute of inhabitmes, was now found to be well peopled; hut the inhabitams thesed fuch an houlile difpolition that no refrefh nentscond be procured; For which reaton it was detemined to lteer for the Fiendly Illands, where there was a certuinty of meeting with an abundant Cupply. In his way cint-pis $9_{3}$ ther he tonched at Patnertun lidum, from a imill ine planian pronear which a hupply of 1 zoo coctanuts wher votained, pet place befides aboudance of fith and bi ds of various kinds. of refrefleHad the iftand been capable of furmithine water, the wher, hut Ciptain woukd have preferred it to any of the intabited water. ones for the parpofe of procuring tefrefomento. as they could be had in any quantity whout moldation from the petulance of the inhabitants. As water at this time happened to be a learce article, our navigator was obligel to fupply hialelf from the thowers which fell, and which affurded as mueh in an hour as he could procrie by dittillation in a month.

Durine the :ime of refldace at the Friendly Inands nur navigutur vifued one minned Hepuee, at which no European thip had ever touched before. Here he was entertained in a friendly manner, fupplied with refrefoments, and left fome uleful animals; great additims were made to the geography of thefe illands, and many curious remarks made on the inhabitants and natural products. It was obferved by Mr Anderfon, that the people lad wery proper notions of the immateriality and immortality of the human foul, and he thought himkif anthorifed to affert, that they did not worhip any part of the vibible ercation.

Piffins by a fmall illand named Toobowai, about five Recestion or dix miles in extent, and lituated in s. Lat. 23.25. Of Omaite. is E. Lun. $210.3 \%^{\circ}$. our navigator now arrived at $\mathrm{Ota}-$ heite. Here Oari met with his rclations, fome of whom received him with apparent indiference; but his meeting with an aunt and a lifer was marked with exprefions of the moll tender regard. It was Hna. heine, however, that was dellined for the place of O mais bral refidene, and thither the Captain repaired on parpote to litale him. The affair wats combuct. ed with rreat folemnity; and Omai brought with hims a fuitable aforment of prefents to the chiefs, went through a greas number of thigious ceremonits, and made a fpeech, the fubject of which had been dicuted to him by Captain Cuok. The re- ss Fult of the negreciation was, that a fpoi of ground was He isfet affigned hima, extending about 200 jards along the todiat $H$ Hze fore of the harbcur, with a proportionahle part of an adjaceni hill. The carpenters of both hips were then employed in conftructing an houfe for him, in which he miklte fecure his European commodities. At the fame time a gaden was made for his ufe, in which wre planted hraddocles, vines, pine-apples, melens, and [everal other garden vergetables. Hese he met with a brother, filler, and fifter-in-law, by whor he was very affectionately received: but it was difeovered with concern, that none of his relations were able to proted himin cafe of any attack on his perfom

## $\mathrm{C} O$ O $\left[\begin{array}{lll}416\end{array}\right] \quad \mathrm{C} O \quad \mathrm{O}$

Cook'; Difoverise. the Society have been for better for the le poor people never to - And.
or property; fo that there was too much reafon to fear that h: would be plundered immediately on the departure of the English. To prevent this, if polfoible, Captain Coots adviSed him to conciliate the fayour and engage the patronage and protection of fore of the mot powerful chiefs by proper prefents; at the fame time that lie himfelf took every opportunity of letting the inhabitants know that it was his intention to return to the Bland again, and if he did not lind Oman in the fame fate of fecurity in which he left him, thole by whom he had been injured would eartangy feel the weight of his refentment. About a fortnight after leaving Huaheine, the Captain had a meltage from Omar ; in which he informed him that every thing went well, only that his goat had died in kidding, for which tie defied another might be font; and accompanied this request with another for two axes, which were rent along with a couple of kids, male and female. On taking histinal leave of the Sohate known the fuperiority of the Europeans in fuck arts as render life comfortable, than after once being acquainted with it to be again abandoned to their origina incapacity of improvement; as, if the intercourle between them and us Should be wholly difentinued, they could not be reftored to that happy fate of mediucrity in which they were found. It hemmed to him that it was become in a manner incumbent on the Europeans to vilit the le iflands once in three or four years, in order to fupply them with thole conveniences of which they have taught them the ale. It is indeed to ie apprehended, that by the tame the iron tools which were then among them are worn ont, they will have forgot the wee of their own; as in this lat t voyage it was obferved that the ute of their former tools was almolt totally abolished.

Having left the Society Islands, Captain Cook now proceeded to the northward, crofting the equator on the 22 d and 23 d of December; and on the $24^{t h}$ dillcovered a low uninhabited inland about 15 or 20 leagues in circumference. Here the longitude and latitude were exactly determined by means of an eclipfe of the fum. 'The welt bide of it where the ecliple was observed, lies in N. Lat. 1. 59. E. Long. 202. 30. From the time of its difcovery it obtained the name of Chrifmas If and. Plenty of turtle were found upon it, and the Captain caufed the feeds of the cocoa-nut, yams, and melons, to be planted.

Proceeding fill to the northward, our navigator next fell in with live illands, to which he gave the ge- neral name of Sauducich fIfes, in honour of his patron. Their names in the language of the country are Wahoo, Atooi, Onecheow, Orechona, and Tehoora. They are fituated in the latitude of 21.30 . and 22.15 . North, and between 190. 20. and 201. 30. E. Long. The longitude was deduced from no fewer than 72 Gets of hama observations. Tie langett of the fe itlan's is Atone, and does not in the heal refemble the other inland of the Synth sea formerly visited by our nawigner, excepting only that it has hills near the centre, which nope grandly towards the Seaside. 'The only domestic animals Jocund upon it were hogs, dogs, and fowls. Captain Cook defigned to have made the inhabitants of this ind all a potent of forme N 91.
others; but being dizen out of it by Pref of wean then, he was obliged to land them upon a faller one named Oneekecoze. They were a he-goat with two females, and a hoar and low of the Liglith breed, which is much fuperior to that of the South-Sea Ifands. He left aldo the reeds of melons, pumpkins, and onions. The foil of this inland feemed in general to be poor: it was obfervable that the ground was covered with Grubs and plants, Come of which had a more delicious fragraney than had been experienced before. The inhabitants of the le intends are much commended, notwithtanding their horrid cut om of eating human fief. In every thing manufactured by them there is an ingenuity and neatnefs in an uncommon degree ; and the elegant form and polish of come of their filhing-hooks could not be exceeded by an European artit, even afiated by all his proper tools. From what was hen of their agriculture aldo, it appeared that they were by no means novices in that art, and that the quantity and goodaef; of their vegetable productions might with propriety be attributed as much to their filiful culture as to the fertility of the foil. The langage of the Sandwich Ines is almond identically the fame with that of Otaheite.

Proceeding farther to the northward, our navigators Ane 9 difcovered the coal of New Albion on the 7 th of March coal dific1779. Its appearance was very different from that of vered.
the countries with which they had hitherto been couverCant. The land was full of mountains, the tops of which were covered with frow; while the valleys between then, and the grounds on the fea-coalt, high as well as low, were covered with trees, which formed a beautiful prospect as of one vat foreft. The place where they landed was fixated in N. Lat. 44. 33. E. Long. 235.20. At firft the natives seemed to prefer iron to every other article of commerce; but at all they flowed fuck a predilection for bills, that fearcely a bit of it was left in the flips except what belonged to the neeffary influments. It was observed alto, that there people were much more tenacious of their property than any of the savage nations that had hitherto been met with, infomuch that they would part neither with wood, water, grails, nor the molt trilling article, without a comperfation, and were fometimes very untrafonable in their demands; with which, however, the Captain always complied as far as was in his poser.

The place where the Refolution was now anchored Nootka ${ }^{90}$ was by our navigator called St George's Som bt, but he Sound. afterwards underftocd that the datives gave it the name of Nootka. Its entrance is lisuated in the eat corner of Hope Bay, in N. Lat: 43.33. E Long. 233. 12. The clanate, as far as they had an opportunity of ob- Mild ref Serving it, was much milder than that on the caftern the climate. coat of the American continent in the fame parallel of latitude; and it was remarkable that the thermometer, even in the niulat, hewer fell bower than $42^{3}$, while in the day-time it frequently role to 60 '. The trees met with here are charily the Canadian pine, white cypuls, and forme ether hinds of pine. There deemed to be a fearcety of birds, which are mach haraffed by the native:, who ornament their clothes with the feathers, and ole the Heth for lied. The people are no flanges to the Natives ac fe of metals, having iron tools in general fe among quainted them; and Mr Gore procured two liver loons of a with the confluction fimiar to what ray be observed in fume tale.

#### Abstract

## C O O [ 417 ] C O O

Coor's Flemiin piaures, from a native who wore them round Difcove- his neck as an ornament. It is morl probable that rics. thefe metals have been conveyed to them by the way of Hudfon's 13ay and Canada; nor is it improbable that fome of them may have been introduced from the north-weftern parts of Mexico.

While Captain Cook failed along this coaft, he kept always at a dittance from land when the wind blew ftrongly upon it; whence feveral large gaps were left unexplored, particularly between the latitudes of $50^{\circ}$ and $55^{\circ}$. The exact fituation of the fuppofed ftraits of Anian was not afeertained, though there is not the leaft donibt, that if he had lived to return by the fame way in 1779 , he would have examined every part with his ufual accuracy. On departing from Nootka Sound, our navigator firft fell in with an indond in N. Lat. 59. 49. E. Long. 216.58 . to which he gave the name of K'ay's Iflud. Several others were difeovered in the neighbourhood; and the flip came to an anchor in an inlet named by the Captain Prince Willian's Sound. Here he had an opportunity of making feveral obfervations on the inhabitants, as well as on the nature of the country. From every thing relative to the former, it was concluded, that the inhabitants were of the fame race with the Efquimaux or Greenlanders. The animals were much the fame with thofe met with at Nootka, and a beautiful fkin of one animal, which feemed to be peculiar to the place, was offered for Cale. Mr Anderfon was inclined to think that it was the fame to which Mr Pemnant has given the name of the cofan marnot. The aleedo, or great king's.fifher, was found here, having very fine and bright colours. The humming-bird alfo canc frequently, and flew about the Ship while at anchor ; though it is fcarce to be fuppofed that it ean lise throughout the winter on account of the extreme cold. The water-fowl were in confiderable plenty; and there is a fpeeies of diver which feemed to be peculiar to the place. Almol the only kinds of fifh met with in the place were tork and halibut. The trees were chiefly the Canadian and fpruee pine, fome of which were of a confiderable height and thicknefs. The Sound is judged by Captain Cook to occupy a degree and a half of latitude and two of longitude, exclufively of its arms and branches, which were not explored. There was every reafon to believe that the inhabitants had never been vifited by any European veffel before; but our navigator found them in poffeffion not only of iron but of beads, which it is probable are conveyed to them acrofs the continent from Hudfon's Bay.

Soon after leaving Prince William's Sound, our navigators fell in with another inlet, which it was expected would lead either to the northern fea or to Hudfon's or Baffin's bay; but upon examination it was found to end in a large river. This was traced for 210 miles from the mouth, as high as N. Lat. 61. 30. and promifes to vie with the mofl confiderable ones already known, as it lies open by means of its various branches to a very confiderable inland communication. As no name was given by our commander to this river, it was ordered by Lord Sandwich to be named Cook's River. The inhabitants feemed to be of the fame race with thofe of Prince William's Sound; and like them had glafs beads and knives, they were alfo clothed in very fine furs,; fo that

Vou.V. Part II.
it feemed probable that a valuable fur-trade might be earried on from that country. Several attempts have accordingly been made from the Britifh fettlements in the Eaft lndics to eftablifh a traffie of that kind; but litule benefit accrued from it except to the proprietors of the firl veffel, her eargo having greatly lowered the price of that commodity in the Chinefe market. It mult be obferved, that on the weflem fide of the American continent, the only valuable fkins met with are thofe of the fea-otter; thofe of the other animals, cfpecially foxes and martins, being of an inferior quality to fuch as are met with in other parts.

Proceeding father to the northward, our navigator They fail now fell in with a race of people who had evidently in with the been vifited by the Ruffians, and feemed to lave adopt- illande difed from then fome improvanents in drefs, sic. In the Rulthe profecution of this part of their voyage, it appeared fans. that they had been providentially conveyed in the dark through a paffage fo dangerous, that our commander would not have ventured upon it in the day time. They were now grot in among thofe iflands which had lately been difcovered by Captain Beering and other Rufian navigators, and came to an anchor in an harbour of Oonalahka, fituated in N. Lat. 53. 55. E. Long. 193.30. Here it was remarked, that the inhabitants had as yet profited very little by their intercourfe with the Ruffans; fo that they did not even drefs the fifh they ufed for their food, but devoured them quite raw.

From Oonalafhka our navigator proceeded agrain towards the continent, which he contimued to trace as far as poffible to the northward. In the latioude of 54.48 . E. Long. $195 \cdot 45$. N. Lat. is a volcano of the fhape of A volcano. a perfect cone, having the crater at the very fummit. On the coalt farther to the north the foil appears very barren, producing ncither tree nor fhrub, though the lower grounds are not deftitute of grafs and fome other plants. To a roeky point of confiderable height, fituated in N. Lat. 58. 42. E. Long. 197. 36. our commander gave the name of Cape Newuban.

Here Mr Anderfon, the furgeon of the Refolation, died of a confumption under which he had laboured for more than twelve months. Soon after he had breathed his laft, land being feen at a diflance, it was named Anderfon's Ifand; and on the gth of Auguit the Mip anchored under a point of the continent, which he named Cape Prince of IV ales. This is remarkable for be- C 97 ing the moft wefterly point of the American continent of Wales. hitherto known. It is fituated in N. Lat. 65.46. E. Long. Igt. 45. It is only 39 miles diftant from the eaftern coalt of Siberia; fo that our commander had vis $9^{8}$ the pleafure of afeertaining the vicinity of the two the cunti continents to each other, which had only been imper-mentes of fectly done by the Ruffian navigators. Setting fail Amand from this point next day, he fteered to the weft and Anierica. north, when he foon fell in with the country of the Tfchutki, which had been exploved by Beering in 1728. Here he had an opportunity of correcting M. Stcchlin's map, who had placed in thefe feas an imaginary ifland, on which he beftowed the name of $A$ lafchka. Being convinced that the land he had now reached was part of the Arratic continent, our commander directed his courfe eaftward, in order to $\mathrm{f}_{\mathrm{a}}$ ll in with that of America; and on the 17 th reached the lacitude of 70. 33. and E. Long. 197.41. Here

thar began to percive the: biekthe"s in the horizom
 thoy has got quite up so it, fo that no farther p:ogrefs could be made. Next diy they made a thitit to fet as far as \%o. 4t; but the ice was now as compart as a wall, and about ten or tweive feet in height. Its Curlice was extremely tugged, and forther to the nouthward appeared much higher. Its fatioce vas covered with pools of srates; and great numbers of fa-iionolaveron it, whefe feht they wele now gial to ufe as food. Our commander continued to traverfe lise Iey Sea till the 20th; bnt the obilmetions leconimas every d.y froater and mreater, it was thomht fromer to rive over all further attemots of fudny a poringe in E.urpe for that year. The did ont, however, omit the iandigntion of the A matic and Anerian coals until te had aile atoctaned the ace curacy of Captain Bueniog's aceumato as fai as he bent, and corrceted the errors if MI. Stehlin. Giant additions were thas made to the reonaphical knowledge of this pant of the globe, and Mr Coxe ohferves, that " it reflecsuo fmall honeur upon the Britifn name, that our great navigator extended his difoveries much father in one experdition, and st fo great a dilance from the point of lis departure, than the Ruffans accomphithed in a long leries of years, and in parts belonging or contigums io their oun empire."

An end of this celebrated ravigats:'s difcorevies, Arrivat at OMOMana howcere, was now at hand. From Beering's ftraits he failed for Oumalainka, where he arrived on the adof Unenber, and thaid for fome time in order to repair his ihips. While the carpenters were employed in this wotk, one :hind of the people had permifion foge on thore by thos, in order to gather berries, with which the intad abounds, and which, though now begiming to decary, wereof gett kervice, in conjunction With the frme-Leer, to preferve the pecple from the feury. Such a quantity of filh was likewife procured, as not ond fuyd to fupfly the thips for the prefent, but Whowife nlowed a great nomber to be carried ont to fea; fo that bence a comiderable faring was made of the provifions of the chigs, which was an atticle of very confiderable confequence. Cin the eighth of the month nur commander received a very timgular prefint fiom fonte perfons unknown, by the hands of an OonalafhLa man named Derromongte. It conimed of a ryeloaf, or rather a falmon pye in the form of a loaf, and highly fealoned with pepper. This man had the like prefont for Cartain Clerke, and each of them was accompanied with a note which none on board could underftand: a few bottles of rum, with fome wine ard port'r, wete fent in exchange; it being fuppoke? that fuch a prefent would be more acceptable than any other thing that could be fared. Corporal Lediard of the marines, an intelligent man, was at the fame time directed to accompany Derramoufhk, for the furpofe of gaining a more fatisfactory account of the country. On the tenth of the montli he returned with three Ruffan feamen or furriers, who, with feveral o. thers, refided at Egroochac, where they had a dwelling houfe, fome flore-houles, and a flop about 30 tons burden. One of thete people was either matter or mate of the veffl, and all of them were vely fober and decent in their betraviour. The erreatelt difficul-
ry arofefrom the want of an interpicter: for which reafoa the converfation was carritd on by tizns. However, the Captain obtained a light of two fea charts, buht of which lie was allowed to copy. One of thein included the fea of Penhaink, part of the coait of Tartary down to the latitude of $41^{\circ}$; the Kurile IClands, atd the peninfula of Kantfehatia. The other comrepehended all the difooveries that had been made from the time of Captain Beering to the year 1777; but thefe were found to be vely trifling. Indeed our navigator was affured by all the Ruffans whom the had occation to fee, that they knew of no other illands than thofe laid down in the chats jut mentioned, and that none of thens had ever fon :ny part of the Ancoican contiant exceoting what lits oppotite to the country of the Trinutiki. With segard to the na-Character tives of Oonalahls, they are to appeaance the mot or be w: in urnative and peaceable peope in the world, tut to hamtats. be in a litate of civilization; thongh perhaps this may be owing in fome meafue to the connestion they have long bad with the Rufians. Frons the affinity chfeused between the laguage of the Eiqumaux, Greenlanders, and thore of Norton's Sound in N. Lat. $54.55^{\circ}$ there is great reafon to beliteve that all thole nations ale of the fame extaction; and if that be the calc, there is liate reafon to donbt that a commanication $A$ commum by fea exifts between the eaftern and wellern lides of nication the American continent; which, however, may vory betwixt probably be finut up by ice in the winter time, or e-the est ven for the mult part throughout the year.
and weft
The return of Captain Cook to the Sandivich IF coancof lands, with the lamentable cataltrophe that enfued, Ameria. have been already related under the former article. We confequenfall now briefly enamerate the confequences of hisces of capdifoveries with refpect to the advancement of fcience. tain Ci ok's Thefe are principally his having overthrown the hy- difcoveries. pothelis of a fouthern continent of immenfe extent, ufually fpoken of under the name of Terra ayfralis incognita ; his demonltration of the impracticability of a northern paffage either by Ana or America to the Eall Indies; and his having eftablifhed a fure method of preferving the health of feamen thronsh the longeft fea-voyages. It is remarked by the bihop of Carlifle, that one great advantage refulting from the late furveys of the globe, is the refutation of fanciful theories too likely to give birth to impracticable undertakings. The ingenious reveries of fpeculative philofophers will now be oblized to fubmit, perhaps with reluctance, to the fober dictates of truth and esperience; nor is it only by difcouraging future unprofitable fearches that the late voyages are likely to be of fervice to mankind, but likewife by leffening the dangers and diftreffes formerly experienced in thofe feas which are within the actual line of commerce and navigration.

The interefts of ficience, as well as of commerce, are highly indebted to the labours of our illuttrious navigator. Before his time almoft half the furface of the globe was involved in oblcurity aad confulion: bus now fuch improvements have been made, that geography has aliumed a new face, and become in a manner a new feience; having attained fuch completenefs as to leave only fome lefs important parts to be explored by future voyagers. Dther feicnces befidez geography nomy, which was in its infancy when the late voyages were undertaken, is now brough to much greater purlestion ; and, during Captain Cook's lalt expedition, many even of the petty olficers could take the diltance of the moon from the fun or from a tar, the moit delicate of all obicrvations, with fofficient accuracy; and the officers of fuperior rank would have been ahamed to lave it thought chat they did not know low to obferve for, and compute, the time at fea; a thing before hardly mentioned among feamen. It mult, however, be rimerrbered, that a great part of the merit in this refpeet is due to the board of longitule. In confequence of the attention of that board to the important object jult mentioned, tiberal rewards have beengiven to mathematicians for perfecting the lunar tables and facilitating calculdions; and artits lave been amply caconrared in the confruction of watches, and other infirments better adzepted to the purpoles of avagation, than any that formcily exiltus.
A valt adilition of knowledge has been gained with rffecest to the chting and flowing of the tides; the direction and fonce of the currens at fea; the nature of the polarity of the needle, and the caufe of its vasiativns. Natural knowledge has been inereafed by experinents on the effects of gravity in different and vey $y$ difitant places; and from Captain Cook's having penctrated fo far into the fouthern regions, it is now afcertained, that the phenomenon whally called the carora borcalis, is not peecular to high northern latitudes, but belonigs equally to all cold clinates, whether north or fouth.

No fcience, bowever, perhaps flands more indebted to thele voyages than that of botany. Ac leatt 1200 nes: fpecies of plants have been adeded to thofe formerly known; and every other department of natural liftory has received large additions. Befides ail this, there have been a vall many oppormaities of obterving human nature in its different lithetions. The innads vilited in the midelle of the Pacific Occan are mhabited by people, who, as fas as could be obferved, have centinued unmised with any difictent tribe dione their firit fettement. Hence a sariety of important fices mady be collected wish refpect to the attaiments and deticiencies of the buman race in an mucultivated fate, and in certain periods of fociety. Even the curiofities brought from the newly difcovered iflande, and which enich the Britilh mufum and the late Sir Athton Lecvei's (now Mr Parkinion's) repolitory, may be conalidered as a valuable acquifition to this country, and affording no frall fund of inltruction and entertamment.

There are few inguiries more generally interething than thofe which relate to the migrationa of the varions colonies by which the diferent parts of the earth have been propled. It was known in general, that the Alatic nation called the Malayns poffefled in former thes much the greatelt trade of the Indies, and that their faips freguented not only all the coatts of Afra, but even thole of A trica likewife, and particularly the large illand of Madagakear: but that fom Matagrafiar to the Marquetas and Eater Hand, that is, neally from the cait hide of Africa till we approach the weit coatt of America, a fpace including almolt half the circumference of the globe, the fame nation of the oriental world fhould have made their lette.
ments, ame soandod colonics thenghome almont cray
 amazing ditamers from the motherecontinent, is an ha forimal fact thu bufone ('aptain Cook', worices eoold not be known, or at beat but very inpmertectly. This is proved, not conly by a foalaty of maners and cuHoms, lut likewite by the athoity of lansugge; and the collections of words which have been miade trom all the widely diffuced illands and commiles vifited by Captain Cook, cannot fail to thesw much light on the origin of nations, and the manner in which the earth was at tiell peopled.

Hetides this, intormation has heea derived concern. ing anohler family of the earth tormenly very mania unknown. This was the tation of the Eiqumank or Gicemlamers, who had formerly been lenown to exit only on the nonth-caltera fatt of the American continont. From Captain Cook's accountr, however, it appears, that the fe people now intabis allo the coall and illends on the wed fide of Amersca appolite to K.mmfehatka. From thele accounts it appears alfo, that the people we fpeak of have extended their migrations $t 0$ Norton Sound, Omalamks, and Prince William's Sound; that is, nearly to the ditlance of 1500 leagnes from their thations in" Geemland and the cuat of Labradore. Nor does thiscurious fat rels merdy on the evidence ariling from the fimilitude of manaers; for it ftands contirmed by a rable of words, cxhibiciug fuch an afinity of lagnage as mutt remove every doubt fion the mind of the morl ferupulous inquier.

From the full confirmation of the vicinity of the two great contincorts of $A$ fia and Anerica, it can :o longer be fuppofed ridiculous to belicue, that the latter received its inhabitants from the foumer ; and by the facts recently difcosered, a degree of further evidence is added to thole which might formenly be denived from nature concerning the authenticity of the Mofaic accrunts. It is not inded to be duubted, that the infpiced witings will fand the tell of the molt rigomens invelligation; nor will it eves be found, that true phinsfophy and Divan Revelation can miltate againd cach ohber: 'The rational friends of religion are to far from dreading the fpirit of inquity, that they whith for nothing more than a candid and insartial examination of the fubject, according to all the lights which the improved realon and entarged feience of man can aiford.

Anothe: good uffect of the voynges of Captain Cook is, that they have excited in other nations a zeal tor funilar undertakings. Dy order of the French government, Medtrs de la Peyroufe and de Langle lailed from Brell in Aurult 1785 , in the frigates Bonflole and Aftroloobe, on an enterprize, the purpofe of which was to improve geography, altronomy, natural hiftory, and philofophy, and to collect an account of the cuiftoms and maneers of different mations. For the more effectual profecution of the defign, feveral gentlemen were appointed to go out upon the voyage, who were known to excel in dificrent kinds of literature. the offiers of the Bouffole were men of the helt informa. tion and fermell refolution; and the crew contained a number of artificers in vatious branches of mechanies. Marine watches, Sic. were provided, and M. Dagetet the aftronomer was particularly directed to make ob. fervations with A.I. Condamine's invariable gendulum,

## 4enern

to detormine the differconces in grarity, and to afertain the true proportion of the equatorial to the polar diameter of the earth. It has likewife been made evideut, that notwithtanding all that has been cone by

Captain Cuol, there is ftill room for a farther inveltigation of the geography of the northern parts of the world. The object accordingly was taken up by the Emprefs of Ruifia, who committed the care of the enterprize to Captain Billings an Erglihman in her majelly's fervice. We thall only make one obfervation more concerning the benefits tikely to accrue from the voyages of Captain Cook, and that is relative to the fettlement in Botany Bay. Whatever may be fuppoled to accrue to the nation itfelf from this fettlement, it muft undaubtedly give the higheft fatisfaction to every friend to humanity to be informed, that thus a number of unhappy wretches will be effectually prevented from returning to their former fcenes of temptation and guilt, which may open to them the means of indultrious fubfiltence and moral reformation. If the fettlement be conducted with wifdom and prudence, indeed it is hard to fay what beneficial confequences may be derived from it, or to what height it may arife. Rome, the greatelt empire the world ever law, proceeded from an origin little, if at all, fuperior to Botany Bay. For an account of this fetlement fee the article Nexu-Holzand.

One other chject remains only farther to be confidered with regard to the fe voyages, and that is the advantages which may refult from them to the difcovered people. Herc, however, it may perhaps be difficult to fottle matters with precifion. From the preceding accounts, it mult be evident that the intentions of Captain Cook were in the higheft degree benevolent; and if at any time the people were the fufferers, it muit have been through their own fault. In one inftance indeed it might be otherwife, and that is with refpect to the venereal difeafe. The evidence in this cafe cannot be altogether fatisfactory. Mr Samwell, who fucceeded Nir Anderfon as furgeen of the Refolution, has endeavoured to fhow, that the natives of the lately explored parts of the world, and efpecially of the Sandwich iflands, were not injured by the Englifh; and it was the conflant care and folicitude of Captain Cook to prevent any infection from being communicated to the people where he came. But whether he was univerfally fuccefsful in this refpect or not, it is evident that the late voyages were undertaken with a view exceed. ingly different from thofe of former times. The horrid cruelties of the Spanifh conquerors of America cannot be remembered without concern for the caufe of religion and human nature; but to undertake expeditions with a defign of civilizing the would, and meliorating its condition, is certainly a noble object. From the long continued intercourfe betwixt this country and the South Sea iflands, there cannot be any doubt that fome degree of knowledge muft already have been communicated to them. Their flock of ideas muft naturally be enlarged by the number of uncommon obfervations which have been prefented to them, and new materials furnifhed for the exercife of their rational faculties. A confiderable addition mult be made to their immediate comfort ane enjogment by the introduction of ufeful animals avid vegetables; and if the only beefit they Mould ever receive from Britain thould be

## 420 ] C 0

the having obtained freth means of fubliferce, this of itfelf mutt be confidered as a valuable acquifition. Greater confequences, however, may fonn be expected. The conntetion formed with thefe people may be confidered as the firft flep towards their improvement; and thus the blefings of civilization may be fpread among the various tribes of Indians in the Pacific Octan, which in time may prepare them for holding an honourable place among the nations of the earth.

As a lupplement to this account of the difcoveries Aecount of made by Captain Cook himfelf, we Mall here fubjoin Captain a nariative of the fubfequent part of the voyage by Clerke's Captains Clerke, \&c. until the return of the Thips to ${ }^{\text {voyage. }}$ England. At the time of Captain Cook's death, the great point of a north-weft paflage remained in fome meafure to be ftill determined: for though, by the event of the former attempt, it had been rendered highly improbable that they fhould fucceed in this, it was ftill refolved to try whether or not, at certain feafons of the year, the ice might not be more open than they had hitherto found it. The firlt object that naturally occurred, however, was the recovery of Cap. tain Cop,taken for Cook's body ; for which Mr King was of opinion the recothat fome vigorous meafure ought inftantly to be pur- very of fued. His motives for this, befides the perfonal re-Caytain gard he had for the Captain, were to abate the con-body. fidence which muft be fuppofed to enfue on the part of the natives, which would probably incline them to dangerous attempts; and this the more particularly, as they had litherto difcovered much lefs fear of the fire-arms than other favage nations were accultomed to do. M : Samwell alfo takes notice of the intrepidity of the natives in this refpect; butafcribes it, in the firt inftance, to ignorance of their effects; and in the next, to anotion, that as the effects of thefe armswere occafioned by fire, they might be counteracted by water. For this purpofe they dipped their war-mats in water; but finding themflves equally vulnerable after this method had been purfued, they became more timid and cautious.

As matters ftood at prefent, there was even reafon to dread the confequences of a general attack upon the Ships; and therefore Mr King was the more confirmed in his opinion of the neceflity of doing fomething to convince then of the prowefo of their adverfaries. In thefe apprehenfions he was feconded by the opinion of the greater part of the officers on board; and nothing feemed more likely to encourage the illanders to make. the attempt than an appearance of being inclined to an accommodation, which they would certainly attribute to weaknefs or fear. Captain Clerke, however, and thofe who were in favour of conciliatory meafures, urged, that the mifchief was already irreparable; that the natives, by reafon of their former fiiend/hip, had a flrong claim to the regard of the Englifh; and that the more particularly, as the late calamitous accident did not appear to have taken its rife from any preme. ditated defign: they urged alfo the ignorance of the king concerning the theft, and the mitake of the iflanders who had armed themfelves on a fuppofition that fome attempt would be made to carry off the king. To all this was added, that the fhips were in want of refreflaments, particularly water; that the Refolution's forematt would require feven or eight days before it conld be properly. repaired; and as the fpring was faft advancing, the fpeedy profecution of the voyage to the northward
ought.

## C. O O $\quad 421]$

ought now to be the only object ; that a vindictive contell with the natives might not only jultify an imputa. tion of needlefs cruelty, but would oceation grat delay in the equipment of the hips.

In confequence of the prevalence of thefe fentiments lenient meafures were adopted, though the behaviour of the natives continued to be very infolent. A great body fill kept pelfefion of the flore; many of whom came off in their canoes within pillol-hot of the flips, and provoking the people by every kind of inlult and defiance. A train of negociations for Captain Cook's body took place; in which the natives thowed the moft hoftile and treacherous difuofition, and, as afterwards appeared, had cut the Hefh from the banes and hurnt it. A piece of about ten pounds weight was brought by two natives at the hazard of their lives, who gave information that the rell had been burnt, and that the bones were in the poffelfion of the king and fome of the principal chiefs. Information was given, at the fame time, that the chiefs were very defirous of war in order to revenge the death of their countrymen.

Thus it appeared that the pacitic plan had anfwered no grood purpofe. No fatisfactory anfiver had been given to the demands made of the bodies of the flain; nor was any progrefs made in the great work intended, viz. a reconciliation with the natives; they till remained on thore in an hottile polture, as if determined to oppole any endeavours that might be made by our people to land; at the fame time that a landing was become abfolutely neceffary, in order to complete the ftock of water. Had this fpiritlefs conduct been perfifled in, there is not the leaft donbt that neither this purpofe nor any other could lave been effected. The infolence of the natives became every day greater and greater ; infomuch that one of them had the audacity to come within muket-hot of the Refolution, and, after throwing leveral fones, waved Captain Cook's hat over his head, while his countrymen on fhore were exnlting and encolraging his audacicy. By this infult the people were fo highly enraged, that, coming on the quarter-deck in a body, they berged that they might no longer be obliged to put up with fuch reitelated provocation, but might be allowed to make ufe of the firlt opportunity of revenging the death of their Captain. The neceffity of more vigorous meafures, therefore, being now apparent, a few difelarges of the great guns, with the burning of a village and fome other acts of Ceverity, at latt produced the mangled remains of Captain Cook. They were wrapped up in a bundle, in which were found both his hands entire, which were eafly known by a far in one of them dividing the fore-finger from the thumb the whole length of the metacarpal bone. Along with thefe was the fkull, but with the fealp feparated from it, and the bones of the face wanting; the fcalp, with the ears adhering to it, and the hair cut Short ; the bones of both the arms, with the Skin of the fore-arms hanging to them; the bones of the thighs and legs joined together, but without the feet. The ligaments of the joints were obferved to beentire; the whole fhowing evident marks of having been in the fire, except the hands, which had the feeh remaining upon them, and were cut in feveral places and crammed with falt, moft probably for the purpofe of preferving them. The ksull was not fractured; but the
fealp had a cut in the back part of it. The lower jaw and fect were wanting, having been [eized by diflirent chiefs.

Having accomplithed the purpofes of thein hay in this place, Captain Clerke fet lail from Karakakooa bay trinicef. in O. why- hee towards Mowee, with a defign to explorefulatemite the eoalts of that ifland more fully than had been donc, ${ }^{\text {t. }}$ make but were unable to accomplith their murpofe: nor in- farther d!deed was it in their power to accomplifh any difcovery cuveris.. of confequence among theie inands. The only inceiligence worth mentioning which they were able toprocure was, that wars had enfued about the property of the goats which were left by Captain Cook on the ifland of Onechow, as has been already mentioned, and that during the contell all thefe pour animals, who had already begun to multiply, were deftroyed; fo that the benevolent attempts of our illuftrious navigator in favour of thefe illanders had proved abortive.

On quitting the ifland of Oneehow our navigators fet fail for another named Modoopapappa, which they were alfured by the natives lay within five hours failing of Tahoora, a lmall ifland in the neighbourhood of Ontchow. In this they proved unfuccelsful; on which it was determined to theer for the coaft of Kamtfchatka. In the paffage thither they arrived at that place where de Gama is faid to have difcovered a great extent of land; but of this they could difcover no appearance. This imaginary continent is faid to have been difcovered by a navigator called Fobn de Gamur. but who feems alfo to have been imaginary, as no perfon can find out either the country where he lived or the time when he made the difiovery. We are informed by Muller, that the firlt account of it was pub. lifhed by Texeira in a chart in $: 649$, who places it between the latitude of $4+$ and 45 degrees, and about $160^{\circ}$ E. Long. and calls it "land teen by John de Gama, in a voyage from China to New Spain." By the French geographers it is removed five degrees farther to the eatl. When they arrived at Kamtichatka 108 they were entertained in the moft Lofpitable manner, vourathe and furnified with every thing that could be procured reception in that defart and barren region. "In this wretched at Famtextremity of the earth (fays the narrator of the voyagre), beyond conception babbarous and inlofpitable, out of the reach of civilization, bound and barricadoed with ice, and covered will fummer fnow, we experienced the tendereft feelings of humanity, joined to a noblenefs of mind and elevation of fentiment which would have done honour to any elime or nation." From Major Behm, in particular, they received fo many and fo great obligations, that an handiome acknowledge. ment was made him by the Royal Society, as has been already obferved. Even the failors were fo ftruck with his gratitude, that they voluntarily requefted that their allowance of grog might be with-held, in order to compliment the garrifon of Bolcheretfk with the $\int$ pirits; faying, that they knew brandy was extremely fcarce in that country, the foldiers on fhore having offered four roubles a bottle for it. The officers, however, would not allow them to fuffer by their generofity in this inclement country and feafon of the year (the month of March not being yet expired) ; but, in room of the [mall quantity of brandy which Major Behm confented to accept, fubflituted an equal quantity of rum,

Coul: 'y Dif we
other piece of ice; and the fivell renderng it unfafe to hie to windward, and finding no profpeat of getting clear, they puthed into a fmall opening, and made the vollel falt to the ice with hooks. Here the Refolution for fome time loft light of her confort, which oceafioned no fmall uneafinefs in both veftels; but at length, on a change of wind, the Difeovery, Cetting all her fails, forced a paflate, though not without lofing a confiderable part of leer theathing, and beconing very leaky by reafon of the bluws the had received.

Thus the two veffels continved to make every efort to penetrate through the immenfe quantities of tce with which thofe feas are filld winter and funmer, but without fuccefs. Captain Clerke therefore finding that it was impoffible either to get to the northward, or even to reach the Aratic continent, the hips being alfo greatly damaged, determined to proceed fouthward to the bay of Awatka, on the Kamtfchadale coaft, to refit, and afterwards take a furvey of the coafs of Japan before the winter fhould fet in.
Duing this navigation, two general conclufions were adopted relative to the extent of the Afiatic coalt, in opporition to the opinion of Mr Muller. One is, that the promontory, called the Eg/t Cape, is in reality the moft eafterly point of Afia; and that no part of that quarter of the globe extends farther than the longitude of $190^{\circ} 22^{\prime} \mathrm{E}$. The other concluion is, that the latitude of the moft north-eaferly point of Afia does not exceed $70^{\circ} \mathrm{N}$. but is rather fomewhat below it. As the prefent difcoveries, however, were terminated on the Afratic fide in the 6yth degree of latitude, the probable direction of the coalt afterwards can only be conjectured. The only fources of knowledge in this cafe are the Ruffian charts and journals; and thefe in general are fo defective and contradictory, that the particulars of their real difcoveries can fearce be colleded. Hence the Ruffian geographers are greatly divided in their opinions concerning the extent and figure of the peninfula of the Tfchutki. Mr Muller, in a map publifined in 1754 , fuppofes it to extend north. eaft as far as the latitude of $75^{\circ}$, and E. Long. $19^{\circ}$, ending in a round cape which he calls TJchukotkoi Nofs. To the fouthward of this cape he fuppofes the coaft to form a bay to the wett, bounded in the latitude of ( $7^{\circ}$ I $8^{\prime}$ by Serdze Kamen, the moll northerly point obferved by Beering in his expedition in 1728. A new form is given to the whole peninfula in a map fublifhed by the academy at PeterBurg in 1776. Here its mont north-eafterly extremity is placed in N. Lat. $73^{\circ}$, E. Long. ${ }^{7} 78^{\circ} 30^{\prime}$; and its molt eatterly point in N. Lat. $65^{\circ}$, E. Long. $189^{\circ} 30^{\prime}$. All the other maps vary between thefe two fituations; and the only thing in which all of them agree is the polition of the eaft cape in N. Lat. $66^{\circ}$. The form of the coatt, however, is very erroneous in the map publifhed by the academy, and may be entirely diiregarded. In Mr Muller's map, the northern part of the coaft has fome refemblance to that laid down in Captain Cook's and Clerke's furvey, as far as the later extends; only that Mr Muller does not make it trend fufficiently to the weft, but fuppofes it to recede only five degrees of longitude between the latitudes of $66^{\circ}$ and $69^{\circ}$; whereas it really recedes almoft ten.

We muft next examinc Mr Muller's authority for
fuppoing the coatt to bend round to the north and north-eaft in fueh a manner as to form a large promontory. - Mr Coxe, whofe accurate refearches into this matter mult give great weight to his opinion, thinks, that the extremity of the promontory was never doubled by any perfon except Defhneff and his party; who failed, in the year 1648 , from the river Kovyma, and are imagined to have got round to the river Anadyr. The account of this voyage, however, gives no geographical delineation of the coaft, fo that its figure mult be deternined by other circumfances; and from thefe it evidently appears, that the Tfetukottioi Nofs of Dethneff is in reality the Eaft Cape of Captain Cook. Speaking of this Nofs, he fays, that a perfon, with a favourable wind, may fail from the illhmus to the Anadyr in three days and three nights. This agrees entirely with the fituation of the Eaft Cape, which is about 120 leagues from the mouth of the river Anadyr; and there being no other ifthmus to the north between that and the latitude of $69^{2}$, it feems exident, that by this defeription he certainly means cither the Eaft Cape or fome other fituated to the fouthward of it. In another place he fays, that oppolite to the ilthmus there are two illands, upon which fome of the ThchutRi nation were obferved, having pieces of the teeth of fea-horfes fixed in their lips; and this exactly coincides with the two iflands that lie to the fouth eaft of the Ealt Cape. Our navigators indeed did not obferve any inhabitants upon thefe iflands; but it is by no means improbable, that fome of thofe from the American coalt, whom the above defeription perfectly fuits, might have accidentally been there at the time, and been miftaken for a tribe of Tfchutki.

Other circumfances, though lefs decifive than thofe juft mentioned, concur in the fame proof. Defhneff fays, that in failing from the Kovyma to the Anadyr, a great promontory, which projects far into the fea, muit be donbled; and that this promontory extends between north and north-eaft. From thefe expreffions, perhaps, Mr Multer was induced to reprefent the comatry of the Tichutki in the form we find in his map ; but if he had been aequainted with the pofition of the Eaft Cape as determined by Captain Cook, and the triking agrcement between that and the promontory or ifthmus in the circumftances above mentioned, it is moll probable that he would not have deemed thefe expreflions of fufficient weight to authorife his extending the north-eaftern extremity of Afia either as far to the north or to the ealt as he has done.

Another authority ufed by Mr Muller feems to have been the depofition of the Coffac Popoff, taken at the Anadirkoi Oftrog in 1711 . Popoff was fent by land, in company with feveral others, to demand tribute of the independent Tichut fki tribes, who :nhabited the comintry about the Nofs. In the account of this journey, the ditance betwist Anadirfk and Tichukotfoi Nois is reprefented as a journey of ten weeks with loaded rein-deer. From fuch a vague account, indeed, we can judge but very little ; but as the diftance between the Eaft Cape and Anadirik does not exceed 200 leagues, and confequently might be accomplifhed in the fpace above mentioned at the rate of 12 or 14 miles a-day, we cannot reekon Popoff's account of its fituation inconfiftent with the fuppofition of its being the Ealt Cape. It may likewife be obferved,

## 

Cook's that Popoff's ront lay along the foot of a rock named Difcoveries.

Matkol, lituated at the bottom of a fpacious gulf, which Muller fuppofes to have been the bay he lays
down between the latitudes of $66^{\circ}$ and $72^{\circ}$; and he ascordingly places the rock Matkol in the centre of it: but it feems more proballe, that it might be a part of the gulf of Anadyr, which they would undoubtedly pals in their journey towards the Eart Cape.

But what feems to put the matter beyond all doubt, and to prove that the cape which Popoff vifited cannot be to the northward of $69^{\circ}$ Lat. is that part of his depofition which relates to an inand lying off the Nofs, from whence the oppofite coalt might be difcerned; for as the oppofite continents, in the latitude of $69^{\circ}$, diverge fo far as to be upwards of too leagues diftant, it is highly improbable that the Afatic coaft fhould again trond eaftward in fuch a manner as to come almoft in fight of that of America. As an additional proof of the pofition in queftion, we may obferve, that the Tfchukot floi Nofs is conftantly laiddown as dividing the fea of Kovyma from that of Anadyr; which could not poffibly be the cafe if any large cape had projected to the north-eaft in the higher latitudes.

The next queftion to be determined is, to what degree of latitude the northern coalf of Afia extends before it inclines directly weftward? Captain Cook was always ftrongly inclined to believe, that the northern coaft of this continent, from the Indigirka eaftward, has hitherto been ufually laid down above two degrees to the northward of its true fituation; for which reafon, and on the authority of a map that was in his poffeffion, as well as from intelligence received at Oonalafhka, he placed the mouth of the Kovyma in the latitude of 68 degrecs. Should he be right in his conjecture, it is probable that the coaft of Afia docs not any where extend beyond the latitude of 70 degrees before it trends to the wett; and confequently our navigators muft have been only one degree from its northern extremity. This feems to be confirmed by the filence of the Ruflian navigators concerming any extent of continent to the northward of Shelatilioi Nofs; nor do they mention any remarkable promontory, except the Eaft Cape, between the Anadyr and the Kovyma. Another particular which Deflneff relates may perhaps be deemed a farther confirmation of this opinion, ziz. that he met with no obftruction from ice in failing round the north-eallern extrenity of Afia; though he adds, that this fea is not at all times fo free of it, which indeed appears evidently to be the cafe. That part of the continent which lies between Cape North and the mouth of the Kovyma is about 125 leagucs in extent. A third part of this fpace, from Koxyma eatward, was explored in the vear 1723 by Yeodot Amoffoff, who infurmed Mr Muller that its direction was eatterly. Since that time it has been furveyed with fome accuracy by Shalauroff, whofe chart makes it trend north-eall-by-大at as far as Shelat floi Nofs, which he places at the dillance of about 43 leagues eat of the Foryma. 'The fpace therefore between the Nufs and Cape North, fomewhat more than 80 leagues, is the only part of the Ruffian dominions now remaining unesplored. But if the Lovgma be erroneoully laid down in puint of longitude as well as latitude, a fupporition far from being improbahle, the extent of the undifcovered coalt will be conVoz. V. Part II.
fiderably diminifhed. The following are the reafons why it may be fuppofed that the mouth of the Kovyma is placed too far to the weftward in the Ruffian charts:

Cook's
Difcove-
rics. 1. Becaufe the accounts that have been given of the navigation of the Frozen Ocean from that river round the north-eaftern extremity of Afia to the Gulf of Anadyr, do not agree with the fuppofed diftance between thofe places. 2. Becaufe the diftance from the Anadyr to the Kovyma over land is by fome Ruffian travellers reprefented as a journey of no very great length, and eafily performed. 3. Becaufe the coalt from the Shelatkoi Nofs of Shalauroff appears to trend directly foutheeaft towards the Eaft Cape. From all whick it may be inferred, with fome degrec of probability, that only 60 miles of the northern Afratic coaft remain to be explored.

With regard to a north-weft paffage from the At-Impracticalantic into the Pacific Ocean, it is highly probable bility "f a that no fuch thing exifts to the fouthward of the 5 Gth or morthdegree of latitude. If, in reality, it exifts any where, can fanfage it mult certainly be either through Baffin's Bay, or into the by the north of Greenland in the weftern hemiphere, Pacific Oor in the eaftern through the frozen fea to the north ${ }^{\text {cean. }}$ of Siberia; fo that in whichever continent it is feated the navigator mult pais through Beering's Straits. All that remains now to be confidered therefore is, the impracticability of penetrating into the Atlantic Ocean through thefe Straits. From the voyages of our navigators it appears, that the fea to the northward of Beering's Straits is more free from ice in Auguit than in July, and perhaps may be ftill more fo in fome part of September. But after the autumnal cquinox, the length of the day diminifhes fo faft that no farther thaw can be expected; and it would be unreafonable to attribute fo great an tfiect to the warmth of the latt fortnight of September as to imagine it eapahle of difperfing the ice from the mof northern parts of the American coaft. Even admitting this to be poffible, it muft at leaft be allowed that it would he highly imprudent to endeavour to avoid the Icy Cape, by running to the known parts of Baffin's Bay, a dillance of about 1260 miles, in fo fhort a eirse as that paffage can be fuppofed to be open. On the fide of Afia there appears dtill lefs probability of fuceefs, as appears from the teftimony of the Ruffian as well as the Englith navigators. The voyage of Defhneff indeed proves the poffibility of circumnavigating the north-eatlem extremity of Afia; but even this affords a very flender foundation to hope for any great benefit, as no perfon belides himfelf appears to have fucceeded in the attempt, though more than a century and an half has now clapfed fince the time of his voyage. 13ut even fuppoling that, in fome very fivourable feafon, this cape might be doubled, ftill the Cape of Taimuara mains, extending as far as the 7 gith degree of latitude, and ruand which none pretend ever to have failed.

Thefe arguments leem conclufive againt any expectation of a north-welt or north-ealt pallage to the Ealt Indies, undefs on the fuppolition of an opent tea very near the polar regions. The probability of get. ting into the polar feas is confidered under the artici: Pole; and inded from what has already been advanced mult appear very little. Wraving this ribject therefore at prefent, we hail return to the remarks made by our navigators during their ficond vovage.

311
1

Conk's

In this they did little more than confirm what had been obferred during the firft; for it never was in their power to approach the continent of Afia in any higher latitude than $6 y^{\circ}$, nor that of America in any part, excepting a few leagues, between $68^{\circ}$ and $63-20^{\circ}$, which they haad not feca before. In both years the ice was met with fonner on the Afrati, than the A. merican coat; but in 1079 they met with it in lower laitudes thaia in $177^{8}$. As they proceted northward, the wee was found univerfally more compact and fold, though they were afoertained at the functime that the greatelt pait of what they inct with was moveable. Its height on a medium was eqtimated at eight or ten feet; thongh fome of the highest might he about 16 or 18 . The curtents were generally at the rate of one wile in the bour, and more generally fet from the fouth-wef than from any other quarter. Thair force, howerer, was fo ineonflerable, whatever their dinection aight be, that ao conctution could pofflly be drawn from them conecring the exiftence or nonexitence of a northeru paffige. With regard to the temperature of the we.ther, July was found much colder than Augut. In the former, the thermometer was once at $28^{\circ}$, and very frequently at 30 : whereas during the lafy year it was very uncommon in Auguft to have it as low as the freezing point. High winds were experienced in hoth feafons, all of which blew from the fouth-weft. The air was foggy whenever the weather became calm; but the fogs were obferved to accompany foutherly winds much more than others.

The flraits, in the neareft approach of the contisents to each other, in the latitude of $66^{\circ}$, are abont 13 leagues over; beyond which they diverge to N . E. by E. and W. N. W.; fo that in the latitude of $69^{\circ}$, their ditance from each other is about 300 miles. A great refemblance is obferved betwixt the contincuts on both fids of the ftraits. Both are dentitute of wood; the fhores are low, with mountains further inland, rifing to argreat height. The foundings in the mid way between them were from 29 to 30 fathoms, gradually decreaing as either continert was approach$\varepsilon \mathrm{d}$; with this difference, however, that the water was fomewhat fhallower on the coaft of America than that of Afia, at an equal diftance from land. The bottom, towards the middle, was a foft fimy mud; and near citleer fhore was a brownifh fand intermised with a few thells and fmall fragments of bones. There was but little tide or current, and what there was came from the welt.

Before the fhips could reach the peninfula of Kam:fchatka, Captain Clerke expired; in confequence of which the command devolved upon Mr King, Captain Gore being now the fuperiur officer. On the seturn to Kamklatka, Captain Clerke was buried in the fpot on which a church was to be ereated; it having been his own defire to be interred in the chureh.

By the tine they arrived at this peninfula, the face of the country was greatly inproved; the fields being eovered with the mofl lively verdure, and every plant is the moft flourining flate. The eruption of the wheano which they had ubferved on their lat departure from Kamtfehatka, had done little or no damage no:withtanding its viclence. Several fones had fallen about the fize of a goofe's egg, but none larger. At this vifit it was obfersed by our mavigators, that the
complexions of the Ruffians feemed to be much more unhealthy and fallow than when they faw them fornetly; and the Ruffians made the fame obfervation upon the complexions of their gufts. As no certain caufe for this alteration could be perceived, the blame was by both partics laid on the voraure of the country; which, by contrafting itfelf with the colour of the penple, made the letter appear to difacivantaze.

Having repaired as well as they conld the damages fullained by the flips among the ice, our navigators now began to proced on their voyage fouthward; but the flatterd condition of their velkls, with the little time they had now to fpare on vuyages of difcovery, after having been fo long at fea, now rendered them much lefs fucceffoul than formetly. Bcfore leaving the peninfula, however, they took care to give fuch a deffription of the hay of Awatka as mutt be of great fervice to future navigators. ': his bay lies in 52 . 51 . N. Lat. and 158.48 . E. long. in the bight of another bay formed Ey Cape Garartea to the fuuth, and (hecponfioi Nofs to the rorth. The latter of the fe bears from the former N. E. by N. and is 32 leagues ditant. From Cape Gavarea to the entranee of Awatka hay the coall takes a northenly direction, and uxtends about in leagues. It confits of a chain of ragged cliffs and rocks, and in many parts prefents an appearance of bays or indets; but on a nearer viciv, low grounds were perceived by which the headlards were connected. Frors the entrance of Awatka bay, Checponkoi Nofs bears E. N. E. diftant 17 leagués. 'The fhore on this fide is flat and low, with hills belind gradually rifing to a conliderable lieight. The latitude of Cape Gavareca is 52. 2 I . By this remarkable difference of the land on both fides the Cape, navigators may be directed in their courfe towards it from the foutliward. When they approach it from the northvard, Cheeponfleci Nofs becomes very confoicuous; it being a bigh projecting licedland, and urited to the continent by a large extent of levei ground lower than the Nols; and prefents the fame appearance whether viewed from the north or fouth. Should the weather happen to be fufficiently elear to admit a view of the mountains both on the fea coaft and in the neighbourhood, the fituation of Awatfia bay may be known by the two high ones to the fouth of it. That nearef the bay is in the form of a fugar loaf, the other flat at top and not quite fo high. Three very confpictous momitains appear on the north fide of the bay; of which that to the wet appears to be the ligheft; the next, biing a voleano, is readily known by the fmoke which it emits; the third is the nof northerly, and might properly be called a cluther of mountains, as it prefents feveral Hat tops to view. When got within the capes, the entrance of the bay of Awatha to the north is pointed out by a liglithoufe on a perpendicular bead land. Many fumken recks lie to the caturard of this head-land, Aretcling two or three miles into the fea; and which with a moderate fea or fwoll will always frow themfelves. A fmall round illand lies four miles to the fouth of the entrance, principally compofed of high pointed rocks, one of which is very remarkable. The entrance into the bay is at firll about three mile: wide, and one and an half in the narrowet part ; the length is four miles in a north-weft dirction. Winun the mouth is a nuble

## C O O

Cook's nothe bafon about 25 miles in circumference; in which Difcove- are the harbours of Rakowecra to the eaft, 'Tarcintla rics.

## 123

 to the weft, and St Peter and St P'ulul to the north.On leaving Kamtehaka, it was unanimoully judged Account of improper to make any attempt to navigate the feas Acceryge between the continent of Aifa and Japan. Inflead of from the time of teuving Km fchaika. this, it was propofed to fleer to the eaftward of that ifland, and in the way thither to fail along the Knrikes; examining particularly thofe that are fituated
nearef to the nowthern coalt of Japan, which are faid to he confideralle, and neither fubject to the Ruflians nor Japanefe. In cafe they flould have the good fortune to meet with fonc fecure and commodions harbours in any of thefe iflands, it was fuppofed that they might prove of coniderable importance, as convenient places of thelter for fublequent navig.ters, who might be emphoyed in exploring the fas as the means of producing a commercial intercourfe among the adjacent dominions of the two above mentioned empires. The next object was to take a furvey of the coalts of the iflands of Japan; after which they deligned to fail for the coait of China as far north as poffible, and then fail along it fouthward to Macan.

In purfuance of this plan, they failed along the coaft of Kamtfchatka, till they came to the fouthern point called Cape Lopruki, whofe fituation they determineri to be in Lat. 51.0. E. Long. 156.45. To the north-welt they ohferved a very lofty mountain whofe fummit was lof in the clonds; and the fame intant the firt of the Kurile inlaads, named Shomm/a, made its appearance in the direction of weff, half fouth. The paflage betwist the fouthern extremity of Cape Lopatka and the illand of Shoomka, though only one leagne in breadth, is extremely dangerous, both on account of the rapidity of the tides, and of the funk rocks which lic of the Cape. In the courfe of this voyage, they had occaion to obferve, that a violent fwell from the north-eaft frequently took place, though the wind had been for fome time in the weftern quartes; a circumftance fer which they feem to have been altogether unalle to account.

The tempefluous weather which now occurred, prevented any difcoveries from being made among the Kurile Intes; however, they again failed over the fpace affigned to the land of De Gana, without being able to find it ; and from comparing feveral accounts of the Rufian mavigators with one another, it was judged extremely probable, that the lend of Jefo, fo frequentby lad down in former maps, is no other than the mot foutherly of the Kurile Ihes. On coming in view of the coall of Japan, they had the montination to find that they could not approach the land by reafon of the tempethons weather and bad thate of the hips; the roats of thefe illands being extemely diagerous. Paffing from thence in quell of the Bathee illands, they found amazing quantitics of pumice-flone foating in the fea ; fo that they fecmed inclined to believe, with Mr Mull. 2, that if there had formerly been any part of the continent, or large illand, called the Land of $7_{6 j}$, it mut have difappeared in a volcanic convalion; which alfo mur have been the cafe with that callde the womfuny's Land and Saten fhom. Though they had not the good fortune to fird the Baflee Illands, they difcovered one in $24.4^{8}$. N. Lat. 14. 20 E. Long. which from its appearance, and the fulphureous imell
$427] \quad \mathrm{C} O \quad \mathrm{O}$
conitted by it, they named Sulpur IRend. After this nothing remarkalle oecurred till their arnival at Canton in China, where hat ing Aaid for fome time in order to put their flips in repair, they at hat fet fail for Britain; but through ftrefs of wether were driven as far morth as Stromnels in Orkney. Fron thence Cap. tain Gore font a difpatch to the Lords of the Admiralty to inform them of his arrival; and on the ath of October 1780 the thips reached the Nore, after an abo fence of 4 years 2 months and 22 days.

COOKERY, the art of preparing and itsefling vietiuals for the table: An art, in its fimpletl and ordinary modes, fufficiently familiar to every limufekeeper; and, in its luxurions refinemems, ton copionfy detailed in manuals and directories publihed for the purpofe th require any enlargement here, were it even a topic that at all deferved confideration in a work of this nature.

COOLERS, in medicine, thofe remedies which produce an immediate fenfe of cold, being fuch as have their parts in lefs motion than thofe of the organs of fecling; as fruits and all acid liquors. Or they are fuch as, hy a particular vifcidity or grotheifs of parts, give the animal fluids a greater confifency than they had before, and confequently retard their motion, having lefs of that inteftine force on which their heat depends: of this fort are cucumbers and all fubftances producing vifidity.

COOM, a term applied to the foot that gathers over an oven's mouth; alfo for that black, greafy fubfance, which works out of the wheels of carriages.

COOMB, or Comb, of Corn, a dry meafure con. taining 4 bufhels, or half a quarter.

COOP, iu hufandry, a tumbrel or cart inclofed with buards, and ufed to carry dung, grains, \&c.

Coop is alfo the name of a pen, or enclofed place. where lambs, poultry, \&c. are fhut up in order to be fed.
COOPER, a tradefman who makes cafks, tubs, and barrels, for holding liquors or other commolities, Every cuftom-houfe and excife office lias an officer called King's-copary; and curry flip of burden has à couper on board.

Coopir (Anthony-Athley), fint earl of Slaftefhury, a mofl able flatefman, was the fon of Sir John Cooper, Bart. of Rockborn in Hamphire, and was born in: 621. He was elected member for Tewkefbury at 19 years of age, in the fhort parliament that met April 13. 16to. He feems to have been well afferted to the king's fervice at the beginning of the civil wars; for he repaired to the king at Oxford with offers of affilance : but prince Maurice breaking article, to a town in Dorfethire that he had got to reccive him, funifhed him with a pretence for going over to the purliament, from which be accepted a commition. When Richard Crumwell was depofed, and the Rump come again int: power, they nominated Sir Anthony one of the ir conach of Rate, and a commiffoner for managins the army. At that vety time he laternaged in a fecret core eppondence for reftoring Charks in. and, upon the king's coming over, was fuorn of hiz privy conacil. He was one of tle commifloners for the trial of the repicides; was foon afier made chancellor of the exchequer, then a cormmifioner of the treafury; in 1672 was created earl of Shafternery; and focn after was railed to the poof of lord chancel-

Conksry 11 Cosper.

Cooper. lor. He filled this office with great ability and intcgrity; and thongh the fhort time he was at the helm was in à tempeftuous feafon, it is doing him juftice to fay, nothing could either diftract or affright him. The great feal was taken from him in 1673,12 months after his receiving it ; but, though out of office, he litl made a diftinguilhed figure in parliament, for it was not in his nature to remain inactive. He drew upon himfelf the implacable hatred of the duke of York, by Iteadily promoting, if not originally inventing, the famons project of an exclufien-bill. When his enemies came into power, he found it neceffary to confult his fafety by retining into Holland, where he died fix weeks after his arrival, in 6683 . While his great abilities are confeffed by all, it has been his misfortune to have his hiflory recorded by his enemies, who ltudied to render him odious. Butier has given a very fevere character of him in his Hudibras.

Cooprer (Authony Afhley), eall of Shaftelhury, was fon of Anthony earl of Shaftefbury, and graudfon of Anthony fint earl of Shaftefbury, lord high chancellor of England. He was born in 1671 , at Exeterhoufe in London, where his grandfather lived, who from the time of his birth conceived fo great an affection for him, that he undertook the care of his education; and he made fo good a progreis in learning, that he could read with eale both the Latin and Greek languages when only 11 years old. In 1683 , his father carried him to the fehool at Winchetter, where he was often infulted on his grandfather's account, whofe memory was odious to the zealots for defpotic power: he therefore prevailed with his father to confent to his defire of going abroad. After three years flay abroad, he returnted to England in 1689, and was offered a feat in parliament in fome of thole boroughs where his family had an interell. But this offer he did not now accept, that he might not be interrupted in the courfe of his Audies, which he profecuted five years more with great vigour and fuecefs; till, on Sir Johu 'Trenchard's death, he was elected burgefs for Pool. Soon after his coming into parliament, he had an opportunity given him of expreffing that finit of liberty by which he uniformly directed his conduct on all occafions. It was the bringing in and promoting " the act for regulating trials in cafes of high treafon." But the fatieuts of attending the houfe of commons, in a few years fo impaired his health, that he was obliged to declint coming again into parliament after the diffolution in $169 \%$. He then went to Holland, wherc the converfation of Mr Bayle; Mr le Clerc, and feveral other learned and ingenious men, induced him to relide a twelvemonth. During this time, there was printed at London, in Svo. an imperfect edition of ford Alhley's Inquity concerning Viriue. It had been fureeptitivuly taken from a rough draught, iketched when he was no more than 20 years of age. His lordDip. "ho was greatly chagrined at this event, immediately bought up the impreffon before many books were fold, and fet about corpleting the treatife, as it afierwards appeared in the fecond volume of the Characteritics. soon after lord Athky's return to England, he became, by the deceale of his father, earl of Shaftibury. But his owa private affairs hindered him from attending the houfe of lords till the fecond year of his peerage, when he was vesy earneft
to fupport king William's meafures, who was at :Coopes. that time projecting the grand alliance. So much was he in favour with king William, that he had the offer of fecretary of ftate; but his dcelining conflitution would not allow him to accept it. Though he was difabled from engaging in bufinefs, the king confulted him on matters of very high importance; and it is pretty well known that he had the greateft thare in compofing that celcbrated laft fpeech of king William, December 31. 1701. On Queen Anne's ac. ceffion to the throne, he returned to his retired manner of life, being no longer advifed with concerning the public; and was then removed from the vice-admiralty of Dorfet, which had been in the family for three generations. In 1703 , he made a fecond journey to Holland, and returned to England the year fotlowing. The French prophets, foon after this, having by their enthufialtic extravagancies made a great noife throughout the nation, and, among different opinions, fome advifing a profecution, the lord Shaftebury apprehended that fuch meafures tended rather to inflame than to cure the difeale. This was the origin of his Letter concerning Enthufiain, which he feat to lord Somers, then prefident of the council; and which, being approved of by that nobleman and other gentlemen to whom it was fhown, was publifhed in 1708 , tho' without the name of the author, or that of the perfon to whom it was addreffed. His Moralift, a philofophical Rhapfody, being a recital of certain converfations on natural and moral fubjects, appeared in Jan. 1709; and in the May following his Senfus Communis, an Effay upon the Freedons of Wit and Humour, in a Letter to a Friend. It was in the fame year that he entered into the marriage flate with Mrs Jane Ewer, the youngelt danghter of Thomas Ewer, Efq; of Lee in Hertfordhire. By this lady, to whom his lordhip was related, he had an only fon, Anthony the late Earl of Stafteßury. In 17 IC , his Soliloquy, or Advice to an Author, was publithed at London in 8 vo. While he was thus employing himfelf in literary compofition, his health declined fo falt, that it was recommended to him to feek affitance from a warmer climate. Accordingly, in July 1711, he fet out for Naples, and purfuing his journey by way of France, was obliged to pafs through the Duke of Berwick's army, which at that time lay eneamped near the borders of Piedmont. Here he was entertained by that fanous gencral in the molt friendly manner, and every affiltauce was given him to conduct him in fafety to the Duke of Savoy's dominions. Our noble author's removal to Italy was of no fervice to the reeftablifhment of his health; for after having refided at Naples about a year and a half, he departed this life on the $4^{\text {th }}$ of February, O. S. 1712.13 , in the 42 d year of his age. The only pieces which he finifhed after he came to this city, were the Judgment of Hercules, and the Letter concerning Defign, which laf was added to that impreffion of the Characteriftics which appeared in 1732. It was in 1711 that the firft edition was publifhed of all the Characteritties together, and in the order in which they now ftand. But this publication not being entirely to his lordhip's fatisfaction, be chiefly employed the latter part of his life in preparing his writings for a more elegant edition; which was given to the woold in 1713 , foon after his diceafe. The feveral prints that were then firf

## 

Cooper. interfperfed through the volumes were all invented by himfelf, and defoned under his immediate infection; and for this purpole the was at the pains of crawing up a moft accurate let of inftructions, the manufcript of which is thill preferved in the family. That no miftakes might be committed, the Eall did not leave to any other hands fo much as the drudgery of correcting the prefs. In the three volumes of the Characteriftics of Men, Manners, Opiniont, and 'Times, he completed the whole of his works which he intended for the public eyc. Not long before his death he had furmed a fcleme of writing a difcourle on painting, foulpture, and the other arts of delign, which, if he had lived to have fmifhed it, might have proved a very pleafing and uiefill work, as he had a line tafte in fubjects of that kind: but his premature deceafe prevented his making any great progrefs in the undertaking. The Earl of Slaftefbury had an efteem for the works of the bett Englifh divines; one remarkable inflance of which was difplayed in his writing a Preface to a volume of Dr Whictrot's Sermons, publithed in 1698. Copies of thele fermons had been taken in thort-hand, as they were delivered from the pulpit ; and the Earl had fo high an opinion of them, that he not only introduced them to the world by his Preface, but had them printed under his own particular infpection. In his Letters to a Young Man at the Univerlity, he fpeaks of Buhop Burnet and Dr Hoadly in terms of great applanfe, and has done juttice to the merits of Tillotfon, Barrow, Chillingworth, and Hammond, as the chisf pillars of the church againd fanaticifm. But whatever regard his lordhip might have for fome of our divines, it was to the writings of antiquity that his admiration was principally directed. Ithele were the conftant objects of his itudy, and from them he formed his fyftem of philolophy, which was of the civil, focial, and theittic kind.

Of Lord Shaftefbury's charaker as a writer, different reprefentations have been given. As one of his greatelt admirers, may be mentioned Lord Monboddo; who, \{peaking of his Rhaplodil in particular, does nut befirate to pronounce it not only the beft dialogue in Englifh, out of all degree of compariton, but the fublimeft philolophy; and, if we will join with it the Inquiry, the completelt fyltem both of morality and theology that we have in cur language, and, at the fame time, of the greateß beauty and clegance for the tlyle and comporition.

Even feveral of the authors who bave diringuifned themlelves by their direct oppofition to many of the fentiments which occur in the Characterifties, have neverthelets mixed no fmall degree of applaule with their cenfures. "I have again peruled, with frefh pleafure and frefh concern (fays Mr Balguy, in tuis Letter to a Deift), the volumes of Characteritics-I heartily wifh the nutle author had been as unprejudiced in writing as I was in reading. If he hat, I am perfuaded his readers would have found double pleafure and double inftruction. It feems to me, that his lordfip had little or no temptation to purfue any fingularities of opinion by way of diftincuon. His fune geres would fuffiently have dillin. guifhed him from vulgar authors in the high road of truth and good fenfe; on which account his deviations feem the more to be lamented. The purity and polite. sefs of his feyle, and the dulicacy of his fentiments,
are and mult be acknowledged by all readers of tafte Cooper. and fincerity. But neverthelefs, as his beauties are not eafy to be overlooked, fo neither are his blemifhes. His works appear to be ttained with fo many grofs errors, and his tine thoughts are fo often mingled with abfurdities, that however we may he charmed with the one, we are forced to condemn the other." Mr Bal. guy hath farther obferved, with regard to the Inquiry concerning Virtue, which is the immediate object of his animadverfion, that though he cannot agree in every particular contained in it, he finds little more to do than to tell how much he admires it ; and that he thinks it indect, in the main, a performance fo juft and exact as to deferve higher praifes than he is able to give it.

Dr Brown, in his Effay on the CharaEteriftics, obferves, that the Earl of Shaftefoury hath in that performance mingled beauties and blots, faults and excellencies, with a liberal and unfparing hand. At the fame time, the Doctor applauds that generous firit of freedom which mines throughout the whole. Another direct antagonith of the Earl of Shafteßury, Dr Leland, has obferved, that no impartial man will deny him the praife of a fine genius. "The quality of the writer (continues the Doctor), his lively and beautiful imagination, the delicacy of tafte he hath fhown in many inflances, and the graces and embellifhments of: his ityle, though perhaps fometimes too affected, have procured him many admirers. To which may be add. ed his refined fentiments on the beauty and exeellency of virtue, and that he hath often fpoken honourably of a juft and good Providence, which minitters and governs the whole in the bett manner; and hath flrongly afferted, in oppofition to Mr Hobbes, the natural difference between good and evil; and that man was origitally formed for fociety, and the exercife of mutual kindnefs and benevolence; and not only fo, but fur religion and piety too. Thefe things have very much prejudiced many perfons in his favour, and prepared them for receiving, almoft implicitly, whatever he hath advanced." Dr Juhnfon, as we are informed by Si Juhn Hawkins, bore no good-will to Lord Shaftelbury; "neitner did he feem at all to relifh the cant of the Shaftefburian fehool, nor inclined to admit the pretenfons of thofe who profeffed it, to taltes and perceptions which are not common to all men; a tathe in morals, in poetry, and profe writing, in painting, in fculpture, in mufic, in architecture, and in government! A tafle that cenfured every production, and induced them to reprobate every eftort of genius that fell thort of their own capricious ftandasd."

The grand point in which our noble author has ren- biog, Eris, dered himielf jufly obnoxious to the friends of reli-vol.iv. gion, is his having interfperfed through the Characterillics a number of infinuations that appear to be unfavourible to the caufe of revelation. There have not, howewar, been wanting many among his admirers, who have the ught that he ought not to te reckoned among the deilical writers. The author of Animadverfions upon Dr Brown's three Effays on the Characterillic: obferves, that it is "imprudent, to fas no worfe, i! fome lincere advocates for Chrilkianity, to reject the friendly advice and affiltance of fo malterly a writer as the Lord Shafcebury, and to give him up to the deills as a patron of infidelity." But it is matter of fact, and not confiderations of prudence o: imprudence, that.

## C O O [ 430$]$ C O O

conper mund determine the queftion. In fupport of his Lordthip's having been a believer in our holy religion, may be alleged, his Preface to Whiche .t's Sermons, and his Letters to a Student at the Univerfity: in both which works he contlantly exprefes hinifult in fuch language es feems to indicate that he was really a Chrithian. And with regard to the Letters it may be remarked, that they were writen in 1707, 1708, and 1709, not many years before his lordfipis's death. Neverthokfs, there are in the Characterillics fo many focptical paffages, that he mull be confidered as having been a doubter at leaf, if not an abfolute diffecticver, with refpeet to revelation. But if he mult be ranked amongl the deils, we agrce with the obfervation of one of his biographers, that he is a very different deit from numbers who have appeared in that charaiter; his general principles being much lefs exceptionable.

The Ityle of Lord Shaftelbury's compolitions is alfo a point upon which various and contradictory fentiments have beer entertained. But for the fullefland mon judicious criticifm that has appeared upon that fubject, we may refer the reader to Dr Blair's Leectures on Rhetoric and Delles Lattres, Vol. 1. p. 192, 193, 207, 208, 234, 263, and 396-398.

Cooprer (Samul), a very eminent Englifh miniasure painter, born in 1609 , and bred under the care of lis uncle John Holkins. He derived, however, his principal excellence from a tudy of the works of Van Dyek, in whofe time he lived; infonuch that he was commonly fyled "Van Djeck in little." His pencil was chiefly confinced to the head, in which, with all its dependences, efpecially the hair, he was inimitable; but if he defended lower, his incorrectusfs was notorious. He died in 1672 ; and his pieces are univerfally admired all over Europe, felling for incredible prices. -He had a brother, Alexander, likewife a good miniature painter, who became limuer to Chriltina queen of Sweden.

Cooper (Thomas), a pious and learned prelate ir the reign of queen Elizabeth, was born at Oxford about the year 1517. He was educated in the fchool adjoining to Magdalene college, of which he was a choitiltar; where allo, in 1539, he was clected probationer, and fellow in the following yar. About the yenr ${ }^{5} 5+6$, quiting his fellowhip, he applied hinfelf to the ftudy of phyfic, in 1556 took the degree of bachelor in that fuculty, and practifed as phytician at Oxford. Eeing inclined to the Proteflant religion, probably this was only a pudent fufpention of his limal intentions during the lopith reign of queen Mary: for, on the acceltion of Elizabeth, te refumed the itudy of divinity; becane a celebrated preacher, was made dean of Chrittchurch and vice chancellor of the univertity, having secumalatad the degrees of bachelor and doetir in divinity. In 506 he was made dean of Cloucelter ; and, the vear following, bilhop of Lincoln: whence, in $158+$, fic was tranflated to the fee of Winchefter; in which eity he diced on the 29th of April 1592, and was buried in the cathedral there, on the fouth tide of the choir. The feveral writers who have mentioned Dr Cooper, manimonty give him the character of an cloquent preacher, a lean ned divine, and a good man. Fic had the misfortune while at Oxford to manry a lady whofe gallantries became notorions: neverthelefs fo would not be divoreed from licr ; bnowing that he
could not live without a wife, he did not choofe "to charge his confcicuce with the feancial of a fecond marriage." He wrote, 1. The Epitome © Chronicles from the $17^{\text {th }}$ year after Chrilt to 1540, and thence after to 1560. 2. The faurus lingux Romane et Britannice. This dictionary, which is an improvement upon Elyot's, was musha amired by queen Elizabcth, who thence forward determined to promote the author. 3. A brief expolition of fuch chapters of the Old Teltament as ufually are read in the church, at common prayer, on Sundays throurhout the year. 4. An admonition to the people of England. 5. Sermons.

Cooper (John-Giltert), a polite writer of the prefent age, was born in 1723; and was defeended from an aucient family in the county of Nottingham, whote fortune was injured in the lif century by their attadment to the principles of monarchy. He relided at Thurgarion priory in Nottinghamhire, which was granted by King Henry VIII. to William Cooper, one of his ancectors. This manfion Mr Cooper inherited from his father, who in 1739 was high-heriff of the county ; and tranfmitted it to his fon, who filled the fame refpectaole office in 1783 . After palling through Wellminiter fchool under Dr John Nicoll, along with the late Lord Albemarle, Lord Buckinchamfhire, Man jor Juhnton, Mr George Ahby, and many other emin nent and ingenious men, he became in 1743 a FellowCommoner of Trinity-college, Cambridge, and relided there two or three years; but quitted the univerity on his maniage with Sufanna the daughter of William Wrighte, Efq; fon to the Lord Keeper of that name, and Recorder of Leicetter $1729-1763$. In the year $17+5$ he commenced author by the publieation of The Puwer of Harmony, a poem in fto; and in 7,6 and 1747 he produced feveral Effays and Puems uater the fignature of Philalethes, in a periodical woak called The Nufeum, publifhed by Mr Dodlly. In the Fame year be came forward as an author, witin his name, by a work which reeeived much afillance from his frieud the Reverend John Jackion of Leiceiler, who communicated feveral learned notes, in which he contived to manifett his diflike to his tormidable antagonitt Mr Warburton. It was intited The Life of Socrates, coll cted from the Memorabilia of Xenophon and the Dialogues of Plato, and illultrated farther by Ariftule, Diodorus Siculas, Cicero, Prochs, Apuleius, Maximus Tyrias, Bucthins, Dingents Latertins, fuo lus Geflius, and others, $17+9,880$. In this work Mr Coojer gave evident marks of fuperior genies; warm, impetuous, and impatient of reftraint. In 1754 Hr Cooper publifhed his Letters on Tafte, 8 ro ; an elegant little volume, on which no fmall have of his teputation is fourded; and in 1.55 , The Tomb of shakefpeare, a Vifion, 4 to ; a decent perfornance, but in which there is more of wit and application than of nature or genius. In 1756 he affitted Mr Moore, by writing fome numbers of The World; and attempted to rouie the indignation of his countrymen againft the Heffians, at that joncture brought over to defend the nation, in a pocin called The Genius of Britain, addreffed to Mr Pitt. In 1758, he pubbithed Epitles to the Great, from Arifippus in Retirement, 4 to ; and The Call of Arillippus, Epittle IV. to Mark Akenfide, M.D. Alro, A Father's Advice to hio Son, in $\ddagger$ tu.

## C O P $\quad[431] \quad$ C O P

Inthe Annual Regiter of the fame yenr is his Trannation of An Epitle from the King of Pruffa to Monfieur Voltaire. In 1759, he publified Ver Vort ; or, the Nunnery Parrot; an Heroic Poen, in four cantos; inferibed to the Abbels of $1^{* * *}$; tranilated from the Fiench of Monfieur Greflet, for ; reginted in the fird volume of Dilly's Repotitory, 1777; and, in 1764 , Poems on Ceveral Subjects, by the Author of the Lite of Socrates; with a prefatory Advertifement by Mr Dodfley. In this little vohme were included th the feparate poetical pieces which have been airendy mentioned, excepting Ver Vert, which is a lprightly conspofition. Mr. Conper died at his father's huffe in MayFair, after a long and excuciating illnefs arifing from the thone, April 14. 1769

CO-ORIMLNATE, fomething of equal order, rank, or degree, with another.

COOT, ir ornithology. See Furica.
COOTWICH (John), doctur of laws, was born at Utrecht, and foent great pare of his life in travelling. He publithed in Latin, in $\mathbf{1 6 1 9}$, an account of his journey from Jerululemand from Syria; which is very farce and in high elteem. Time of his death uncertain.

COPABBA, or Dalfam of Cofztex, a liquid refinous juice, fowing from incifions made in the trunk of the eopaifera ballamun. Sce the following article. This juice is clear and tranfparent, of a whitih or pale ycllowith coluur, an agreable fmell, and a bitterilh pungent tafte. It is ufually about the confifence of vil, or a little thicker: when long kept, it becomes nearly as thick as honey, retaining its clearnefs; but has not been obferved to grow dry or Culid, as moft of the other refmous juices do. We fometimes meet with a thick fort of baifam of copaiba, which is not at all tranfparent, or much lefs fo than the foregoing, and generally has a portion of turbid watery liquor at the bottom. This fort is probably either adulterated by the mixture of other fubfances, or has been extracted by coction from the bark and branches of the tree: its fmell and tate are much lets pleafant than thofe of the genuine baliam. Pure balfam of copaiba difolves entircly in rectified fpirit, efpeeially if the menitrum be proviouly alkalized: the folution las a very fragrant fmell. Difilled with water, it yiclds a large quantity of a limpid effential oil; and in a Itrong leat, without addition, a blue oil.

The balfam of copaiba is an ufeful comohorating detergent medicine, accompanied with a degiee of irritation. It frengthens the nervous lydem, tends to loofen the belly, in large dofes proves purgative, promotes urine, and cleanfes and heals exulcerations in the urinary paflages, which it is fuppoled to pertorm more effectually than any of the other balfans. Fuller obferves, that it gives the urine an intenfly bitter talte, but rot a violet fmell as the turpentines do.

This ballam has been principally celebrated in grkets and the fuor intus, and externally as a valnerary. The author above mentioned recommends it likewife in dyfenteries, in fcorbutic eachexies, in diferes of the breaft and lungs, and in an acrimonious or gutefeent flate of the juices: he fays, he has known very daagerous coughs, which manifetly threatened a eoufumption, cured by the ufe of this balfan aluse ; and that, notwithanding its being lot and bitter, it has goud
effeets even in hectic eafes. Moll phyfieians feem Copaifera now, however, to confterer hallans and relins too fimulant to be ventured on in phehifical affections.

The dofe of this medicine rately exceeds 20 or $30 \underbrace{\text { norrs. }}$ drops, though fome dinset 60 or more. It may be conveniontly taken in the fom of an clandaccharmm, or in that of an emultion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilarge of gum-arabic, till they are well incomporated, and then gradually adding a proper quantity of water.

COI'AFFERA, in botany: i gems of the monogyuia order, belonging to the decondria chats of plames; and in the natural method ranking under thufe of which the order is doubtful. 'Fhere is no calyx; there are four petals; the legumen ovate; ore feed with an arillus or coat refembling a berry. We know but of one feries, the balfamum, being that which yields the copariba halfam mentioned in the preceding artick. This tree grows near a village called Ayoph, in the porince of Antiodi, in the spanih Welt Indies, abunt ten days journey from Casthagna. Thete are great numbers of thefe trees in the woods about this ifllage, which grow to the height of 50 or 60 feet. Some of thefe trees do not yield any of the balfam; thufe which do, are dittinguifhed by a ridge which runs along their trunks. 'Thefe trees are wounded in the centre, and they place calabafh fhells, or fome other veffels, to the wounded part to receive the balfam, which will all fiow out in a floort time. One of thefe trees will yield hive or tix gallons of bulfam: but tho they will thrive well after being tapped, yet they never afford any more balfam.
$\operatorname{COD}^{2} A L$, improperly ealled sum coral, is a sum of the refinous kind brought from New Spain, being the concrete juice of a tree ${ }^{\text {w }}$ which grows in the Se parts. "Rizus Cow It eomes to us in irregular mafles, fome of whteh pallinum. are tranfparent, and of different fhades as to eolour, from a light yellow to a deep brown. Some pieees are whitifh and femitranfparent. To the fmell it is more agrecable than frankincenfe; but lath neither the Solubility in water eommon to gums, nor in Spirit of wine common to refins, at leaft in any confiderable degrec. By thefe properties it refembles amber; which las induced forme to think it a mineral bituren relembling that fublanee. In dillilation it yields an oil, which like mineral petrolea is indiffoluble in pirit of winc. Copal it felf is foluble in the effential cils, particularly in that of lavender, but not eafily in the exprefled ons. It may, however, be diffolved in linfeed oil by digeftion, with a beat very little lefs than is fufficient to boil or decompofe the oil. Thas folution, diluted with frivit of torpentine, forms a beatiful tranfarent varnifl, which when properly applicd, and flowly dicd, is very hard and durable. This varsifh is applicd to fuutfobses, tea-boards, and other utenlils. It preferses and gives luftre to paintinge, and grently rettores the decayed colours of old pifures, bs filing up the eracks mid rendering the furfaces capable of reflecting light more uniformby.

COMARCENAKY , the liare or quata of a co. parcener.
(CO1'ARCENERS, (from con and particips, "par:ner ; '), of Parceners ; fuch as have equal portions in the inseritance of theis ancefter.

## C O P $\left[\begin{array}{lll}432\end{array}\right] \quad$ C O P

Cope Coparceners are fo either by law or cuftom. Coparceners by law, are the iffue female; which, in default of a male heir, come equally to the lands of their anceftor. Coparceners by cullom, are thofe who, by fome peculiar cuttom of the country, challenge equal parts in fuch lands; as in Kent, by the cuftom of gavelkind. The crown of England is not fubject to coparcenary.

COPE, an ecelefiaftical ornament, ufually worn ly chanters and fubchanters, when they officiate in folemnity. It reaches from the fhoulders to the feet. The ancients called it pluviale.- The word is allo ufed for the roof or covering of a houfe, \&c.

Cope is alfo the name of an ancient cuftom or tribute due to the king or lord of the foil, out of the lead-mines in fome part of Derbyfhire; of which Manlove faith thus:

Eyrefs an ? regrefs to the king's highway,
The miners bave; and lot and cope they pay:
The thirteenth difh of ore within their mine,
To the lord, for lot, they pay at meafurisg time, sixpence a lead for ope the lord demands, And that is paid to the b:rrghom jpler's hand.
This word by doomfday-book, as Mr Hagar hath inserpreted it, fignifies a hill: and cope is taken for the fupreme cover, as the cope of keaven.
COPEL. See Cupel.
COPENHAGEN, the capital of the kingdom of Demmark, fituated on the eattern fhore of the ifland of Zealand, upon a fine bay of the Baltic fea, not far from the itrait called the Sound. E. Long. 13.0. N. Lat. 55. 30.

The precife date of the foundation of this city is difputed ; but the moft probable account is, that it took its rife from a caftle built on the fpot in the year $1 \times 68$, as a protection againft the pirates which at that time fivarmed in the Baltic. The conveniency of the fituation, and the fecurity afforded by the cafte, foon induced a number of the inhabitants of Zealand to refort thither: but it was not ditinguifled by the royal refi dence until ${ }^{443}$, during the reign of Chrillopher of Ba varia; fince which period it has been gradually enlarged and beantified, and is become the capital of Demmark.

Copenhagen is the beft built city of the north; for although Peterfburgh excels it in fuperh edifices, yet, as it contains no wooden houfes, it does not difplay that friking contraft of meannefs and magnificence, but in general exhibits a more equable and uniform appearance. The town is furrounded towards the land with regular ramparts and baftions, a broad ditch full of water, and a few outworks: its circmuference meafurcs hetween four and five miles. The itreets are well pared, with a foot-way on each fide, but too rarrow and inconvenient for general ufe. The greater part of the builhings are of brick; and a few are of free-itone brought from Germany. The houles of the nobility are in teneral fulendid, and contructed in the Italian Ayle of architecture : the palace, which was ereted by Chrittian VI. is a large pile of building ; the front is of tone, and the wings. of brick fluccoed; the fuite of apartionents is princely; but the external appearance is more grand than elegant.
The bufy finit of commerce is vifible in this city, which cortains about 80,000 inhabitants. The havea is always crowded with nerchant fhips: and the ftreets $\Leftrightarrow$ anterteced by broad cands, which bring the mer-边 62
chandize clofe to the warehoufes that line the quars. This city owes its principal beanty to a dreadful fire in 1728 , that deftroyed tive churches and 67 Itreets, which have been fince rebuilt in the modern Atyle. The new part of the town, railed by the late Fing Frederic V. is extremely beautiful, fearcely inferior to Bath. It coufits of an octagon, containing four uniform and elegant buildings of hewn ftone, and of four broad ftreets leading to it in oppofite directions. In the middle of the area fands an equefrian itatue of Frederic V. in bronze, as big as life, which coll $80,000 \mathrm{I}$. The Royal Mufeum, or Cabinet of Rarities, merits the attention of travellers. This collection, which was begun by Frederic III. is depofited in eight apartments, and ranged in the following order: animals, flells, nimerals, paintings, antiquities, medals, dreffes, arms and implements of the Laplanders.

Part of Copenhagen, which is called Chrifianfoafen, is built upon the Ine of Amak, which generally attracts the curiofity of foreigners; (fee Amak). From this place, to which the main city is joined by a bridge, the markets are fupplied with fowl, beef, mutton, venifon, corn, and culinary vegetables, which are produced here in the greateft abundance.
COPERNICAN, in general, fomething belonging to Copernicus. Hence,

Copernican Syfem or Hypothefis, that fyttem of the world, wherein the fun is fuppofed to ref in the centre, and the planets, with the earth, to move in ellipfes round him. See Copernicus.

COPERNICUS (Nicolaus), an eminent aftronomer, was born at Thorn ins? Pruffia, Jan. 10. 1472. He was taught the Latin and Greek languages at home; and afterwards fent to Cracovia, where he ftudied philofophy and phyfic. His genius in the mean time was naturally turned to mathematics, which he purfued through all its various branches. He fet out for Italy when he was 23 years of age; but ftaid at Bononia fome time, for the fake of being with the celebrated aftronomer of that place, Dominicus Maria; whofe converfation, however, and company, he affected, not fo mucla as a learner, as an affiltant to him in making his ubfervations. From thence he paffed to Rome, where he was no fooner arrived than he was confidered as not inferior to the famous Regiomontanus; and acquired in fhort fo great a reputation, that he was chofen profeflor of mathenatics, which he taught for a loug time with great applaufe. He alfo made fome aftronomical obfervations there ahout the year 1500 . Returning to his own country fome years after, he becan to apply his rall knowledge in mathematics to correct the fyitem of altronomy which then prevailed. He fet himfelf to collect all the books which had been written by philofophers and aitronomers, and to cxamine all the rarious hypothefes they had invented for the folution of the celeftial phenomena; to try if a nome fymmetrical order and contitution of the parts of the world could not be difco. vercd, and a more jurt and exquifite harmony ia its motionse eftablifhed, than what the attronomers of thofe times io eally admistect. But of all their hypothefes nome pleafed hin fo wall as the Pythagorean, which made the fun to be the centre of the dyitem, and fuppofed the earth to move not only round the fun, but round its ow: axis alio. Ho thought he difeerned mench beautiful ${ }^{\text {can }}$ Coperai cus.

## 00 p

pernices, beautiful order and proportion in this; and that all
 that embarrafment and perplexity from epicyeles and cscentrics, which attenid the P'olemace hypothefes, would here be entirely removed.

This fyllem, then, he began to confider, and to write upon, when the was about 35 yeary of age. He cmployed himelf in contemplating the phenomena carefully; in making mathematical calculations; in examining the obfervations of the ancients, and in making new ones of his own; and after more than 20 years chiefly fpent in this manner, he brought his feheme to perfection, and eftablithed that fyytem of the world which goes by his name, and is now nniverfally received, (fee Astronomy, no 22.) His fyltem, howcerer, was then looked upon as a molt dangerous herefy: for which he was thrown into prifon by Pope Urban V1II, and not fuffered to come out till he had recanted his opinion ; that is, till he had renounced the teftimony of lis fenfes. He died the afth of May $15+3$, in the 7 oth year of his age.

This extraordinary man had been made canon of Wormsty his mother's brother, Leacas Wazdrodins, who vas bithop of that place. He was not only the greateit of aftronomers, but a perfeet maller of the Greek and Latin tungues; to all which he joined the greatef piety and innocence of manners.

Copernicus, the name of an attronomical inftrument, invented ly Mr Whiflon, to exlibit the motion and phenomena of the planets, both primary and ficundary. It is buite upon the Copernican fyitem, and for that reafon ealled by his name.

COPHTI, Cophts, or Copti, a name given to the Chrillians of Egypt, who are of the fect of Jacotites.

The crities are extremely divided about the origin and orthorraphy of the word; fome write it Cophti, others Cuphtites, Cophtitx, Copts, \&c. Scaliger derives the name from Cortos, an anciently celcbated town of Egypt, the metropulis of the Thebaid. Kircher icfutes chis opinion, and maintains, that the word originally lignifies "cut" and "circuraferibed;" and was given thede people by the Mahomet ms, by way of reproach, becaufe of their pratice of circumeifing: but P. Sullier, another Jefuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the wod from ary, -ros the ancient name of Egpyt, by retrenching the firll fyllable: but this opinion, too, P'. Sonlier difputes. J han de Leo and others fay, that the Egyptians ancichely edled their country Elchibth, or Cillh, from Cibih their firt king, whence Cophtite, Ec. (thers fay from Cobtim decond king of Egypt. Vanleb derives the word Copht from Copt fon of Mifraim, grandfon of Nowh. All thefe etymolugies I'. Solfer rejects, on this principhe, that were they truc, the Egypting ought all equally to be called Coqiti ; whered, in eficet, none but the Cluitians, and anong thofe none but the Jaccbites, bear the name, the Machiwa not being comprcheraded under it. Hence he choofes to derive the word from the name Jacobite, retrenching the firit fyllabt: whence, Cubite, Colveat, Corta, and Cophta.
'Ihe Cophts thave a patriarch who refides at Cairo, * Wut he takes lis tite from Ale:andria: he has no arcthifhop umt." lim, but 11 or 12 bifhops. The teft of the clem, whether fecula: or regular, is comSuz. F. Patid.
pofed of the orders of ist Antomy, St Paul, and St
C. P hat. Macarius, who have each their monaterics. Betrides the orders of prielts, deacons, and lubdeacons, the Cophts have likewifo archimandrites, the dignity whereof they confer with all the payers and ceremonies of a trict ordination. J'his makes a condiderable differnce among the priells; and belides the rank and authority it gives then with regard to the religi-
ous, it comprehends the degrec and functions of arel. ous, it comprehends the degrec and functions of arechpriche. By a cuilom of 600 years ilanding, if a prient clected bilhop be not already archinandrite, that dignity muft be conferred on him befure epifopal ordination. 'The fecond perion among the clergy, after the patriarch, is the titular patriacch of Jervilem, who alio iclides at Cairo, bccaute of the few Cophts at Jerufalem ; he is, in effect, listle more than the bifhop of Cairo: only he goes to Jerufalem every Ealler, and vilits fome other places in Palectine near Egypt, which own his juridition. ' I'o him belongs the goverument of the Cophtic church, during the vacancy of the patriathal fee.

To be elected patriarch, it is neceffary the perfon have lived all his life in continence: it is he confers the bilhoprics. To be tlected bifhop, the perfion mull be in the celibate; or, if he have been maried, it mult not be abuve once. The pricels and inferior minillers ase allowed to be marriced before ordination; but are not obliged to it, as Ladulphus erroncuafly obferves. They lave a great manber of deacons, and aren confer the dignity frequently on children. None but the loweth rank among the people commence ecclenalics; whence artes that excelive ignorance found among them: yet the refpect of the laity towards the clergy is very extraodinary. Their offict is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occationally.
The monaltic life is in great efteem among the Cophts: to be admitted into it, there is always requined the confont of the bilhop. The religious Cophts make a vow of perpetual challity; renounce the world, and live with great aulterity in deferts: they are obliged to fleep in their cluthes and their girdle, on a mat Atretched on the ground; and to prollate themfelves every evening 150 times, with therr face and breatt on the ground. They are all, both men and women, of the lowet clafs of the people; and live on athis. The numeries are properly hefpitals; and few enter but widows reduced to begrary.
1 . Roderic reduces the errors and opinions of the Cophts to the following heads: 1. 'hat they put away their wives, and cfpouce others while the firt are liang. 2. That thes have feven facraments; viz. baptifm, the encharill, combmation, ordination, frith, fattiag, and prayer. 3 . Ihat they theny the Holy stpinit to proced frem the Son. 4. That they ouly allow of theree cecunenical councils; that of Nice, Confantinople, and Ephctins. 5. That they only allow of one nature, will, and operation, in Jefus Chriit, after the union of the humanity with the divinity. For their errors in difcipline, they may be reduced, 1. To the practice of circumcifing their clildren before baptifm, which hist obtained among them from the 12 th century. 2. To their ordaining deacons at five years of seo. 3 I
3. 10

# C O B [43t] C O P 

conki.
3. To their allowing of mamiage in the fecond degree. 4. Wo their furbearns to eat blood: to which tone add eneir belief of a haptim oy fire, which they confer by applying a hat non to th ir forehead or cheets. - Others paliait thefe errors, ind fow that many of them are rather abufes of paticnlat perions in un doctrines of the fect. This feeto to be the cafe with regand to their polygamy, eating of blond, marayin? in the fecond degres, and the baption of lire : for circoncifion, it is not practifed as a ceremony of relifon, hor as of any divine appointment, i, at metely as a cultom wixh they oulve from tise Immalites; asd which, porisps, may lave hal its oririn fom a view to haith and decency in thot hot cuntrice.

The Cophst, at wincont thea, have mate feveral remiuns with the Lomins; bit arwys in apeamence suly, and und fome neectity of the iratiais. In the time of pore ínul IV. a Syrien was difatehod to Eome from the patriare of Alexandin, with leiter to that pap: whe rein he acknowlodged his authority, and pumided ubedince; cotirnos a perfon might he Ahfpatcted to Aleenadria, to toct about a reanion of his chace' to that of Rome: Forliant to which, Pias IV. fucceflor io Pant, choisk. Recicic a je uit,

 Qophts deputed fut that mupole loy the putiarch, was make to hou, chat the tides of father of futirers, bator of putors, and matley of ald churenes, which
 sere in ande thon trese marters of civility and comfhiment; and that it was in this manare the patrarth wited to write on his frionds: they added, that time
 wera patriarch, indencmbent of one another, tach was thidfand mancio of his own church. 'Ilio was the antwer the putrarcl gave the pope, after he had recelved a fum of money remitted in him from Rome, by the hande of the Veatian contio.

COPrilic, or Cuptic, the language of the Cophos, the anotet lenguare of the Egyptians, mixed with a grat deal of Gicet, the chataeters it is writon in beims all Greek. It $l_{2}$ as a fom and cunAtruction peculiar to itfere: it has mo inflections of the bouns or verbs; but exprefles number, cafe, gender, Iufon, mood, tenfe, and poffefive pronouns, by letters and particles welixed.
F. Kircher is the firt who publifined a grammar and mand abty of the Cophtic. There is not known any Lonuk extant in the Cophtie, excepi tramfations of the Hot Seriptures, or of ecoldattical othecs; ur others that bave remion therets, as dicionames, \& e.

The ancinat Coplatic is now no longer found but in bouks f the language now wed thonghont the coumtry is A: abic. The vid Cophtic, wioh Wisciser manamins to be a mother-tonruc, and independent of a 11 ot bes, had beca much altered by the G+cek: for welaes that it hao burowed all its charachers from the Gretk, with a wy litile barianon, a mat moner of the words aic pume Goct. Tufis, indeed, afferts, that the was no Cophtic Iangage till after Legrpt lecame fubject to the Arabs. 'Ghe langname, accordlug to hem; is a mixture of Greek and Arabie: the very name there of noi being in the work inllutur the arabs
were matters of the country. But this, M. Simon obferves, proved nothing ; except that what was anciently callud Egytian, has fince by the Aales bean called Cofliti, by a corruption of fpeech. 'There are, it is true, Arabic words in the Cophatic; yet this by no moans proves but that there was a language before that time, either Cophtic or Egyptian. Pietro de la Valle oblerves, that the Cophts have enticly lolt thio ancient tongue; that it is now mo longer underflood ameng them; that they have nothing extant therein but lome facred buots; and that they litil fy mals in it.

Ail their other hooks have been tranflated into Babic, which is their valsar tongue ; and this has o:c.anoned the originats to be lote : it is added, that they rheare the eptithes and appels in the maf twice; onve in Arabic and once in Copheic. Intect, if we beheveri, Vanico the Cophotay de mals an Arabic, all but the enntics and gofpeli, whach they reheare buth in that and Cophtic.

Conhtic Eidie. Sce Bare.
Counte Litarge are ibree; one atributct io Dabl, aronher to St Glegory, and the thind on Cyil: they ate tranhated iato Arabic for the wie of the prietts am! people.

COPLATA, mader the wefern empire, a grave-disger. In the firit ages of the church there were cherks antined for this employment. In the year $35-$, Coniantine mace a law in ferour of the fiefts copiatop? i. e. of thofe whs had the care of interams; whereby lue exempa them fiom tle luftal contribution which idl other traders frail. It was under him alfo dhat they intt tegan to be called cojeate, q. d. clerks
 cuth, jerio. "I cut, beat," ixe. Before that time they were callud decani and lectiariz; perhaps becnufe they were divided by decads or tens, each whereof had a bier or litter far the carriage of the deal budies. 'Pheir flace among the derks was the next in urder betore the chantors.

COi'TNS of a wisll, the top or cover of a wall, made floping to carry off the water.

Cofine ovid, in carpenty, a fort of hanging over, net fquare to its upright, but bevelling on its under frue thll it end in an edge.

COPIST, in diplomatic fotence, fignifies a tranferber or copier of deeds, bouks, \&e.

COPPA, in law, a cop or cock of grafs, hay, or cort, divided into titheable portions: as the tenth cock, \&e. 'This wond in frituefs denutes the gathering or laying up the com in cops or heaps, as the method is for barley or oats, \&ce. not bound up, that it may be the more fainy and jufty tithod: and in Kent they itill retain the word, a cop or cosp of lay, Itraw, \&

## COPPEL. See Cupel.

COPPER, the finct of the imperfect metali, called by he alchemits b'ents, on account of its facility ut: uniting with a great number of diferent netallic fubo Atences. Its colour, when pure, is pale red, and its feccific grarity from 8.7 to 9.3 , which depends not only on its degres of purity, but allo on its condeniation by hammering. The fpecitic gravity of Japar copper is tol water is g000 to 1000; but that of the Swalifn kinds oniy as $828+$ or $88+3$ - The colour,

## C O P [ 43.5$] \quad$ O O P

when clean, is very brilliant, but it is extreancly diahle to tarnith. It has a difagreable imell, very pereceptible on friction or on being heated : it s tafe is deyptic and naufeons, but lefsperceptible than that of irm. lis temacity, dmility, ant hardnefs, are very confiderable, and its daflicity fuperime to that of any other metal except deel. From this lath quality mafics of the metal emit a loud and latting found when throck; and this more efpecially when catl into a proper form, viz. fuch an one as may make tle metal , ibrate in the mot fimple manner pofible. Thus, if caft into the hollow form of a bell, whont any cracks or imperfectons, an uniform tone will be produced by it; or at latt the tones produccel by the ftroke will confitt of a fingle prodominant one, and of whers hat have an agrement with it. When hroken by often hemding backward and forwad, it appears intermally of a Cull red colour, without any bighturfs, and of a fine frambated texture ; not ill refombling, as Cramer oblerves, fome kinds of eathen ware. It continaes malleable in a red heat, and in this fatrextemds mach more eaftly thas when cold ; but has not that valuats guality of irwa, by which two pieces colace together when heated to a great decree. In a heat fer below isuition, the furface of a piese of polined copper becomes covered with varions ranges of prifinatic colours; the red of each order beine nedrett the the end whel has been mod heated. Keduced to a fine powder, or even of flinges, and thown acrofe a flame, it pioduees blue or green colours, whence its ufe in lirewoks. It requires a firce beat to O elt it ; lefs, accurding to M. Wedgewoud, than goh or lileer, but more according to fone other metallargitts. - It is remarkably impatient of moilture $x$ hen in a trate of fufion; and the contact even of a very fmall quantity of water will caule a valt mafs of melted metal to be theow ahont with incredible violence, to the imminent danger not only of the berlanders butcen of the thonectl furnaces and buildings. Effects of this kind are faid to have becn wroducel by fo hight a a anfe as the wadment fuisting in a furnace fall of meltec cupuer.

Corper is found in the bowels of the earth in the folloming Rates.

1. Natice cupper, laving the red comur, the mas. leabiity, and all the other propertins of the metal. It is dillinguithed, fays Mr Fomeroy, iuta two kinds; copper of the firll furmation ani comper of the focond formation or cementation. 'lhe aroper of the tirl formation is oifperfed ia lamine or fobes, in gangue ahnot always quatzofe ; fome of its crythats refemble a kind of vegetation, but wher focimens are in maffes or grains. Copper of eementation is commonly in gratins or fuperforial laminx, on thones or on irca: this laft appears to have becs depolited in waters comtaining vitriol of copper which has been precipitated by irom. Native copfer is fomal in manyphaces of fourope: particularly in various parts of Wcotland, Implimd, and Wales; at St Pell in Lyons; at Nombers in Swaten, and Nentl in I- ungary. It is alfo to be nat with in feveral parts of America.Mr Kirwan fays, it is mut with cither of its own peculiar colom or hackith or grey; and that either in grains or in large flapelefs folid lunops ; in a foliated. eapillay, or arturefoent form, or ery thallized in quadrangular pyramids, in or on clay, chitus, yuart 2 , huors,
 it to have hean orisimbly prexipitatad by inon from waters which lode it in flation, whith is the parel
 daced in that matuar ; ami then thas lint is reeme
 whith fuldur; which latt conmizatios is called blact comper.

Native eopper is fomd in wore conflerable gunn. tities at Cape Limand in Comball : it is fomed ino thread or branches, and he; in wins of fome thectsnefi, contamed i:s blackith Repontine mised with hownith bal, and covered externally with a grecoith nephetes, patly adharent to it and partly lone. Native cunper, in large lumps, has alfo been fomed in
 found at fucl Virgin in the fame conaty, Ifere it Gout, into sations bramhes andion varions directenn: the pieces feen to be fommed of fatl thomboidat crvflals iaterfperied with yuate, the impreflime of whith are to be feen in the o operit fulf fom whence we might conclucle that the quartz esiled before the metal. Some of the? lamps of native roprer have been found in this finnt that we ighed fonm 20 to 30 pounds: and in the month of Manch 1,3 ; thore were Ho lefs than 28 millicas of pounds of rich copper ore extracted fiom this mine. At a phace called Catarrab, contigrous to lluwl yosin, fome crytallzed native copper has heen found, with the iramparent vitee ot: copper ore, to be afterwards montimed, crydalliged in octanedrons of a ruby coluar: thouerin tho luttor
 compact native copper is fornd in lamps of a fpherical forn ; the copper either lait in its metallic fom, or Legining to be tomsformel ban wat conper-gtafos imbedded an decayer granite. Native copper of a tunder and mofs-hike fura, baiten? wherens mby

 the is inatterel a pontie with sutive copper.

 per. This i, known has iod dufy colom. hanior ratized with to that of the cales but riff from cupner by hammerisg. It i, feldom met with, and then is gencrally

 and is caltect funcors of cofor. Dir Lirwan fays, that it is fometimes met with in alowfotom, and gencrally
 nef, thoweh beittle; fomethers erylallized and tranfe parent, tither ia a capillary form, or in cubes, primene pyamils: it effacties with acids, and is found in scotland. Enghtand, amd Gomany. According to Mr Funtana, 100 parts of it comtaii 7 7. of cupper, 26 of fixed air, and one of water. Mr lirwan diftinguiftes the hepatic ore as being of a bown colour. It "contains a variable poportion of iron or pyritce, and fometimes fulphurated copper: and hence affords from 20 to 50 fer cent. of conper. It is oftensividifahe" (we fippofe flowing the colours of the raition ). 2. Earthy copper, mountain-gren. green chay forolla w. malachite. The lat, according to Mr Kirwan, Wobslike

## C $\mathrm{O} \quad \mathrm{P}$

Coifer

4 Murtain green.
green jafper, but lifs hard, and does not frike fire wihl feel, is of a radiated or equable texture, generally of an owl form, and the dize of an eres, but forntimes forming capllay filaments. Nufohenbrook fixes its ipcific gravity from 3.5 to 3.99 t . It is fometimes mised with calcareous earth and g.pfum. According to Mr Fontana, 100 parts of the puret fort contain 75 of copper and 25 of aerial acid and water. Mountain green is generally found in a loofe and friable tate, rarcly crytallizel tand indurated, of ten mixcd with calcareous eath, iron, and fome arfenic. An hundred parts of the purell kind contain 72 of copper, 22 of acrial acil, and 6 of water.

A compact green copper ore, like malachite, mixtd with grey copper ore, and likewife green velver-like copper in the form of bunches, are found at Huel Virgin in Cornwall. At Carrarach, in the fame comty, is found alfo an amorphons green cupper ore, on a decayed granitc; and at of Mlenan, the fave is found ifratifid beiwist quartz, and covered with a Eruwnith iron. Cronfedt inforns us, that buth the green and blue colours of copper ores depend on a mentuum, and therfore may be often edulcorated or waned dway. In Salfield they find alfo a fort of greet, fomewht indurated, calcarcous fublanes, containing conper: this, when broken, looks fat, and femewhat iniany; bit, upar the whok, it refembles a jatper. It is there very impropety called a grich coper shaljore. Cood copper is made of it ; and, with a phlogitic fubtance, without bing uftulated, it forms a kind of bell-metal fit for being emploged for that purpefe.

The maluchite, according to Mr Fourcroy, is frequently found in siberia, compaing beds, fome of which reprefent nippics of var:ous magnitudes. Some fpecimons are compofed of needles, eonverging towards a common centre. The grain of malachite is fufifient. ly Lard to take a fine polih, and is therefore furaud into tojs of different kinds; fut as it is frequenty porous and full of unequal cavities, the fulid pitcecs of a certain fize are rectsoned valuaile. The ?tata in which it is found are often of diferent flates of green. The moxntain greta is a true ochere of copper, of a more or lefs deep, green, not heary, and uncqually distributed on its gangex: it appears to be combinad with the cretaceuns adid. There are two varieties befides the malachite, riz. the fimple mountain green, and that which is cyyitalizud, or the filky copper ore of China. It is cummon in the Hartz, and likewife in China. It is wery pure, and cryallized in long Gilky kundes of confiderable folidity: To theie three flates, fays Mr Fonrcroy, we may ada a beautiful green fand, brought by M. Dombey fron Peru, which appears to be a cals of this metal mixed with fand, and containing a fmall quantity of muriatic acel.
3. The third variety of this fpecies is the mountainblue, or blue chryfucolla. This, according to M. Fourcroy, is a calk uf capper of a deep blue colour, fometimes regularly furmed in rhomboidal prifmatic crytals of a bue blue, in which cafe it is chlid azure of copper. "All allete calces of cupper (iays he) appear to have been precifitated frum vitriclic foluticns of copper, by the intermedium of catearcons earth through which the waters have tranfaded. Mí. Sarge confiders thefe blue copper ores as combinations

## C O P

of copper with the volatile alkali ; from which he affirms inat they differ only in their degree of folubility; he likewife thines that the malachites is produced from this tlue, which be calls tranfpaent azare copper ore; but mout mineralogits are of a differet oumion." Mr Kirwan tells us, that 100 parts of this ore contuin about 69 of copper, 29 of aerial acid, and 2 of water. Nin Morveau, in the Dfemoirs of the Academy of Dijon for $178_{2}$, has fhown, that the calees of copper ote determined to a blue rather than a green colutr, by a greater proportion of phlogition.
III. Cupreons fones. Thefe are the turzusife and he Turquaife pis armenus. The former of thefe is inaproperly called and lay is $\frac{\text { armenus. }}{}$ a ltone, being the tooth of an animai peuctrated by the bluc cals of copper. It toles its colvir when heated; is opaque, of a lamillar texture, and fufceptible of a fine polith; its Specific gravity from 2.5 to 2.908 ; fome are of a decp bine, fome more white, and become deeper when heated. They are found in Perfia and in Languedoc in France; the copper may be extracted from them by ditilled vinegar. Reamme informs us, MTem. Par. 1715 , that nitrous acid will not diffolve the Pertianturquoife, though it will thate of France. The lapis amenus has calcareous earth or gypfum for its baie ; whence it lometimes effervefecs with acids and fometimes not. It is ufd in painting, sion wround to a fine powder, under the manc if Bice. TH thefe Mr Foureroy adds "opper mincralized by the muriatic acid and minted to chay." This ore has been confounded with tale; and it was expoied to fale at Paris, in the year 178 , under the rame of green mica. It $c$ onfits of fmall beautifully green cryals, or fmall brilliant fcales. It was difcorered by Mr Forter in the mines of John Georgonlaidt ; the green cupreous fand of Peru already mentioned, perhaps belungs to the fame clafs.
IV. Cupper mincralized by folphur, with fcarce any Copper m: iron, improperly called vitreons copper ore. This is n radized of a deep vialte grey, grecnith brown, or liver colour; by fulphur. melting with a very semle heat, ponderous, fometimes Alsible, and always yielaing to the knife. When broken it appears of a bright golden culour. It is iumetomes found in mapelfof maffes, fometines regularly eryitalized ; is much more fufble than pure copper, and has a feecific gravity from $4 . S$ to 5.3 .33 . It is found in mines of other copper ores, ia linetitone, fpar, quartz, mica, and clay : it is the richeft of all the copper ores; afurding from So to go per cent. of copper, 10 or 12 of fulphur, and a fmall proportion of iron.
$v$. Copper mineralized by fulphur with a large pro- wilha portion of iron, azure copper ore; does not difter from large pro. the preceding but in the quantity of iron it contains, prion of which fometmes anounts to 50 per cer:. It yields 50 or 60 pomnds of copper per hundred, the relt being fulphur. The lefs iron this ore contains, the nicher it is in copper; and it has by many becn confounded. with indurated monntain the.
VI. Copper mineralized ty fulphar, with much iron, Yellowco the yellow copper ore, or chiluw pyrits. The coluar per ore, of thes is ycllow, or yellow mixed with red or green, ries. or variegated like a pigeon's ruck; it is inferior in hardnefs to the other pyrites, not readily giving five with ited as they do. It is fumetimes fumb cryifallized, and fonstimss in thapelefs maffes; its fpecinic

## C O P

gravity is about 4.16. It occurs both in feparate maffes and embodicd in fones, being the mont common of all the copper ores. The crytallized kind ationts leall metal, contuining only from + to 8 per cent. the remainder beiag chictly iron. It is generaily redulith, and is in fact only a martial pyrites with a inall portion of copper; the grecmith yllow contains moli fulphur, and from $1 ;$ to 20 pericnt. of copper; the pure yellow contains molt copper, viz. lrun 20 to 30 par rent. "The cupreous pyrites (fàs MI. Fourcruy) often prefent very biliant blue or viokt colours at their furlace, which are produced by the decompofition of their principles: they are then called chatesant ores of copper, or ores refmblug the peacock's tail: they commonly contain a large quantity of Sulphar, a mall quantity of iron, and are nut rich in copper ; fuch are the ores of Derbythire in England, fome of thofe of St 13 ell in Lyons, and many ores of Alfatia, fuch as thole of Caulenbachand Fildens."
VII. Copper united to Culphur, arfenic, iron, and a fmall quantity of filver. This is called arlenical or grey copper ore, and is of a white, grey, or brown colour ; of moderate larduefs, very brittle, fometimes crytallized, and often of an indeterninte figure. is is very difficult of fution, and more ponderous than the former. It contains from 35 to 60 fer cent, of copper ; the brown is the riched in copper; the white or grey contains moll arenic; and if the filver it contains exceed 1 or 3 for cent. it is called grey filver ore. It is found embodied in all lorts of fones, and mixed with uther copper ores, as well as with the ores of other metals.

A great variety of fulphurated copper ores is to be met with in the mines of Comwall, vik a whitih.grey ore crytallized in frath tiangular and quadrangular pyramids, with truncated points, is fonnd alons with the folid copper ore at Poldice and Dolcoth : but the richeft are the folid grey ones found in various places; Gome of which may be cut with a knife like the foft vitreous fllver ore. The moll remarkable of the yelluw ores is the Ralactitical ore, of an hemipherical form, called run velloweopper, often variegated with difierent c- luurs. A compact red gluffy copper ore, covered with mountain green, or green copper, and with calciform copper of a vemmilion red colour, is found in cry ta lized quartz, mixed with tender green mica. We allo meet with an olive-grenercuicured copper ore which is arfenical, and cryttalized into tender fpicula of about three lines long, flariling up Araight, either fingle or fafciculated, or radiated, found on the granitical mountain at Carrarach. Thefe cryttals melt before the blow-pipe with an arfenleal fnoke, and afterwards melt, forming a button of a grey colour, which, on being melted again with buras, fon proluces a very pure copper. Anotber kind of arfenical cupreous cryflats anc likuwif met with in the form of green cubes run torecther, with fmooth and fhining furfaces, upen grey copper-ore, in a mafs of crytallized compact quartz, with various crytals in iffetf; and guatly refembling finall cubes of fluor.
VIII. Copper mineralized by fulphur andarfenic with zinc and iron; brown or blemdefe copper ore. Mir Monnet found this ore only at Catherineberg in Bohcmia; it is brown, granulated, and very hard, and contains from 13 to 30 for cens, of conper.

This kind of ore may be antytul in the iiquid way by folution in nitrons acil, and procipitation of the

Corper. craper by iron. 'The ireman! zine are preciphated

 porated to dryweis. 'llee iron beiner thens dophlogifLeated, becomes. infoluthe in the nitrous acid, but the call: of zinc in rediffion, and akain precipitated by the Padian alkati. An hundred gains of this precipitate are eqpivaluncto 20 of zine in its metalic it tut ; and 100 grains of dephlugiticated iron are equivalent to 73': of irma in its metallic fate.
IX. Arrilliceous fchitofe, or faty copper ore feemsid $\mathbf{I}_{3}$ tw curifl of the vitrous copper copper ore, feems claty cop-
 it in whuas, and not barcly differsed through it in vilibk partictes: it is of a brown or black colour, lamillar texture, and very heevy; afording from 6 to 10 for calt. of cupper, and is of ditticult fution, unlefo limeflone be adad. It contains a little bitumen, calcarenus earth, and iron.

र. Bitmminous copper ore is a kind of pitcoal beuninon: found in sweden. It burns with !ittle or no flame, cre. but leaves athes from which copper is extrated.
X1. Black copper ore, of the colour of pitch. Mr Back cop. Gefletit denominatus it copper ore in feoriz: it is a per ote. rchidum of the decompofition of the yellow and grey copper ures which contain neither fulpaur nor arlenic, and angroaches to the thate of malachite; it has a black laining appearance like pitch.
All. Copper united to fulphur and arfenic contain. Antimonial ing antimony, of antimonial copper ore, is mentionadore. by Mr Sage in his Elements of Mineralogy. It is grey, and bright in its fracture like antimony, and contains from it to 20 per cent. of metal.

X1II. Copper diffolved by the vitriolic acid. In the year 1673, oll countryman Dr Brown vifited a famous coppermine at LIera-grundt, about feven Enghill miles hom Newfol in the Upper Hungary; and he mfinms us, that there he faw two 「prings, called the Ohidnd Aew zement, which turned iron to copper, as it is vulsarly faid. Bat the cafe is, that the iron is difulved by the vitriofic acid of this fring-water, and the copp ar is precipitated in its motallic form in the place of the iron. It has been the cultomin Eemany for fome centuries to colluct the copper contained in there wateis, by filling with them fune pits made purporaly for this operation. Old iron is thrown in, and being diflolved by the acid, is fupended in the water, whing the copper is precipitated: the mud being raked out, is milted afterwards in a furnace, and a very fine copper is produced: from 100 tons of iron, $8+$ and fimetimes go tons of line copper is thus produced.

But althorgh this method of obtaining copper has beco hay practifed in (Jermany, yet it is but of late years, fay Bithop Watfon (p. 238 . of the frlt volume of his Lisays), that any lucceffell attempts of this kind have beco made cither in England or leland. In this laft, at leall, it sas quite owing to an accilent. There are the very cteldrated copper-mines at Arklow, in the conaty of Wicklow in Ireland; and from thefe mines ifues a seat quaticy of water, Aronely impregnated with vitrish of copper. One of the workmen havin accidentaly lift an iron thowl in this water, he fowad it lo:en wetes after fo incrutted with a coat

Coper. of copper, that it was tivught to be changect into

The proprictors of the mines, in purfuance of this hint, made proper pits and receptacles for the water ; and have chtamed, by means of feft in bars pat into them, fuch quantities of copper, that thefe ftreans ate now of as much confequence as the mines themfelved. One ton of iron produces near two tons of conger mand and eath ton of mad produces, when an itect 16 handred weight of copper, which fells for T. 10 Sterling a tom mote than the copper which is fouch from the cre.

There is is the iffe of Anglefey, on the coalt of Worth Wales, a mountzin called Paziz, which abounds in cupperere, the bed of ure being abowe to feet in thicknets. The lefiees of this mine ammally raife from is to lecen thoufand tons of metchatable cre, and daly empory above to furnaces in fmelting it. This on contans a great quantiey of fupphur, which muth he fopmated iy wating lefore it can be fluxed into copper. The phiogiton, with part of the vitrotic acid, is chfperied into the air by the fo:ce of the fres ; another part of the acid attacks and diffulves fach a quantity of the copper, that the water in which the wathed ore is wathed (by means of old won immeried in it according to the German method) produces great quantities of fine copper, fo that the proprictors have thene obtained in one year near roo tons of the eopher presipitated from this water.
If this water was afterwards evaporated, it would yield green vitrim or vitriolated iron, at nealy the rate of 200 tons of vituioi for each hundred ton of iren at leatl; which, at the rate of La 3 Stelliag for ton, might perhaps produce vary good proft to the undertabers, if any thould fettle luch a manufuture there.

Belides the colebrated copor-mines at Arkluw in the countr of Widklow in Ieland, there are no lefs than fernoteen difietent places in Britain in which copper-mines are found, as mentioned by Dr Campbell in the ad vel. p. 44. of his I'litiod Surevg of Britain. Theic are Cardigathire, Chehire, Comwall, Cumbertand, Derbyhire, Devonflure, lancaftive, Ithe of Man, Nurthumberland, Shophaire, Somericthice, Stafordhire, Yorkhine, Wales, Warwickihire, Wellraordand, and North Pritain: fome that are worked at this time give fuch large products of thic motal, that the opening more copper-mines in this ifland would frobably affect the copper-trede of Europe in a very conliderable manner. The Eton mine, in the ellate of the louke of Devonitire, on the frontiers of 1 Br by?hire, but properiy lituated in the county of Staffordhire, produces at lealt 300 tons of copper per intnum. 'I'hat of the mountain colled $F$ aris, in the illand of Angletey, whofe bed of ore is about to feet in thicknets, prodnces about 1500 tons of copper in the yeat ; and the copper-mines of Cornwall produce no lefs than 4000 tons in the fame period. Mr Jars, who wifted thefe mines in the year i770, found, apon cal. culation, that the anmal produce of thete mines amounted to L. 140,000 Sterling; and M. H. Klaproth, in his Obferrations on the liofils of Cornwail, juik publihed (in 1787 ), afferts that this accomat is not an exaggerated one.

Copper is purined with lefo diffenty than iron: and

1ts, groodnest is judged of by the bright rednefz of its cuint.
The inpurity of eorper proceeds from the mixture of heterogencons fandences that are alloyed with it, callizes on accelat of teing naturally contained in the copper- wher tools ores. Iron and arlenic are the chicf of theic matural ingo mixtures. 'rlw copper.ores of variegated eothurs the white copper-ures, and generally thule mineralized by fuhhur, contsin a greater propertion of iron; whifit the blae and green copprores commony parauce a puer metyl, buing frec, ior the mol pat, if any confincoabic ferruginons monture. The great aim, therefore, of the metallurgit mal le direeted to teparate thefe mistures from the eopper, beginning by the proper examination of the cre, and by atcentaning the proportion of fulphur that may be required to ferrify the quantizy of imn there comained. 'The ore fhonld atwers be falled ly a flow fie, in a clofe firnace, which contribnes the bell towards lcorifing the ferrugin, nis and heterogentons mixtures; and the fame operati in mitt be iepeatedafter the fecond and hide fufion of the metal, thll its grain becomes of an lonoge:tems fine texture. The misture of fulpharen' $y$ yrites in the fufiom of the metal contribures towards obtaining this obje Ct : if their quality be cto fen aco cordmy to the quatity of fuphlur wanting. Fut ia the fecond, third, and following operations, only pure fulphur thoull be added, to feorify the remander of the iron that is Atill intermised with the copper. This flould be done when the metal is already well futed; covering it immediately with a proper gquartity of eharconk, and feparating the foria of drofs formed on the finface of the fufed metal.

The erpper extraEted from thofe mines rear New[ol, in Upper Hungary, is Caid to be ulually melted 14 times before it i, lit for iff. Thefe are the greatch copper-mines inall Hungary. 'lhate are, however, other mines, whole copper requineò far lefs fufions to be well purified. The atove was the procels of Mr Delins, divecter of the mines of Bennat near Temefware in Hungary, propofed by him to the inferial boad of the Autrian mines.

Pure cupper allowed to con hawly will form itfeif into regular cr: Ethlizations, which the Able Mongaz defribes as quadrangular peramids, fometmes fold, and fometimes compofed of other fimilat fmall pyramids lut rady a thaing. When heated it hecomes colenocd on its funface, near!y in the fame manare as Hetl: the colunrs are blue, yellow, and latly violet; it docs not melt tut by a viluent white heat, though much inferior to that which nelts iron. When in a ruriswin flate of fotion it app:ars covered with a green flame, a gricen which the filings of the necal likevife produce when fime when profected throush flame ; and hence are ufed in fire- meted. works, as has been already temanked. The eryitallizatim of the metal above mentios:ed is belt perceived by faffering the mital to cond if why ; and after the furface is tecome congraled, the fluid fortion being pour- Particular ed off, the remaining folid patt is found to be cryilal- defription lized in pyrmids, whichare more regular and large of the cryin proportion as the fution has been imose complete talls.
and cooling more gradual. The pyramids, accoating to Fourcrur, are quadrangular, and appear to be formed of a oreat number of ofthedrons minerted into one

## C $O \quad \mathrm{P}$

Copper.
another. When heated with excefo of air, this metal burns at its firfacs, and is converted into a calx of a dark red colour, in proportion as it ablotbs the bafe of the deplilngificated part of the atmofphere. The calx may be eafily obtainced by heating a ball of copper red-hot, the form of which canfes the calx to loals off; and the fame effer takes place when red-hot copper is quenchal in cold wata; the feparation of the cals bing promoted by the futden contraction of the mesal. This calx is catled the foales of copper, and may be further calcined till it becomes of a decp boown; after which, by violent heat, it may be melted into a blackifin or deep reddin trown mals. ' Phe foorix may patly be reducud withont any additional phlogiton; : for tha fiunders, who buy chen of the copperimiths, take un wher trostle with them than that of thowins them into large erucibles on the motted conper, with which they incorporate by lifton; and the fane mothod is made afe of to melt the filings. 'lhe calk of copper appears io poffef fome taine propertics, but its natore has mot yet bien afcertained.

Cunp. 1 catcines when expoled to the ait, and is convertul into a green whe or calx, which is in fome deyere Cumble in watu, and communicates a tafle as whe as femicious q:alities to it. It is remarlable, however, that this rult does not corrode the intral patts like that of iron, but is contineld to the furface; and thus, intead of detroying, contributes, for a long time at lea!l, bo the prefervation of the metal. This is pertionaly oblervable in the antique medals and tathes, which are very will preferved mader a covering of roft. 'The antiquasians call this crull patime', and $p$ it a figh volse apon the pieces of ancicaity covered with it ; bet the falims and others have got a methot of imiratmig this ctut, atd thas there is great danger of being riteeived.

Cupper, when taken into the human body, afts as a. violent emetic, and has heen genarilly accomed :aifonous, though bately reccived whith fome aptlaule into the materia medica as a tronic. The pernicious Cultite, howser, and very difurgeable talle which it certainly communicates on fome necations, render it higlly neceffary to oblerve fone caution in the ufe of this mutal, of which formany kitclen utnils are made. Beldes an exact aiterition to cleantined, it is ahtoexther imperper to let any fund remain in a copper velfel till it be colt; for copper is much motecalcinable in the cold than whan heated. Mr Foncoy cxplains this by fuppoling the calcination to te produced by wuter in a fate of extitme divifion: is lung., 1h.urefore, asthe fand is benling and the veff. I hot, the aquecos vapour does net adhere to ins fariace: but when the veflel is cold, the drops of water which adtecte to its fides calcine it, and reduce it to a gre a alx. The air and the eretacems acid (bxed air), te faya, ato contribute greatly to this calcinatoon for by dililling the rutt $1 f$ copper hised air has heen obsaned.
 the vefiels mode of it are ufrily covered with tan in the intick. Tut tin copper-veffels, they are fint feraped clean and bright; after which they are rubbed with fal ammniniac to lean them more perlectily. They are then heated and forinkled with powdered retin, which prevents the furface of the copper frombeing cakined; afier which the melted tin is puomed on abo fored a-
bout. It is, lowewer, juthe enmplained, that the tinning of copper-w ffels is not fisacient to detemt them

Cowns. from the action of the air, muiture, and falme fohe fances; becaufe thafe weffe, even when well thats, are oblerved to be fulject to cuit. Phis might pofis. bly be renedied by a thicker enowing of tim ; and a n anutacture of this kind was lome time ago ctlalliffed at Edinburgh, though it dues not diperar eo ha:e much attacted the notice of the public; vlive fowever, is no objection to the mefulners of the invervine. The method employed was to make the futho of the copper very rough, with a mactritue contrived for cian purpole, and the tin put upen it in this titnation; atter which the copper wata hameneed imouth as talore. Mr Fomocoly objects to this thicker conomer of tino that there " is reaton to fear that a degree of heas fuperior to that of briling water, io which thefe velfels are often evpefed, wond melt the tin and lave the lafdee of the copper uncorered." This ohjection is furdy voil of fonndation: for as long as there remains any hquid in the veffel, the tin will not melt thon, d the heat were applied so it directly without any intervention of copper ; and if a dry heat we-c applied, a thin coveriag of tin wond be ftill lefs able to retit it than a ihick one. Our author, however, onferses, that to prevert this accident the tio may le diluyed with iron, ilver, or platima, to dimianh its furbulity, and render it capable of beimer applied in thiccier itrata on the copper. Alloys of this kind, he tells us, are alnealy uledin feveral inanafactures.

The vory linall quatity of tin required to cover the fay frall
 inches in didmeter and 37 inches in depth, beingentequred found to gatn no mare than 2 I grains by this opera- fur this tion. Thas farll quantity is meverthelels fuficient of of so. prevent ele dengers which might arife from the ufe of cupper-veilds, provided care be taken not to allow fub. flances capable of diffolving the tin to remain too loner in them; but more efpecially that the tin be frequently renewed, as the fricurn, iteat, and a ation of tpoons, with which the included fubllanees are Atirred, very foon dellroy it. There is likewife another catle of Eefe sinde ${ }^{27}$ apprehenfon, acer ring to our anthor, viz. that the tinnongten tin is ofter alloyed with leal, evera to the quantity of tee cmplu-one-funth of its weight: in which cafe the later may ${ }^{\text {ed. }}$ exent its mifchic vous influence, elpeciatiy as it is known that lead is eafly folable in fitty lublances. To peevent this fophattication, he is of minion that cuvernment thund take fufficient care that the braziters be nut doceived in the tion they purchafe, aad that they may not employ ary but the Malace or Banea tin, ia the itate it is received from the Eatt Indies, without hawing been akoyed or melied by the pewterems. A better methond, bowewer, feema to be that propoled by M. Fulte of Kumen, tu whe veflets of forgrediron cu-zitsice vered over on the infide with zinc, which, he fays, cript and have ahwaty been wicd with achantage by certain per- cii inters fons; and it were to be whiles that its whe might be. ${ }^{\prime}$ em. comb mote aencrul.

Copfer is allo ufed in mizture with other matals, yarne ${ }^{20}$ pasiculary tin and zinc, in enamel-painting, dycing, minture of \&c. Nived with in in comferable quantity, it gro- offermina
 with zinc is forms Brass, Pincurbect, of Smatiok, Maxhemir sold, AC. according to the propustion; it

Crapens being ainays obfervable, that the comprunds mat nearly refembling erold in colom lave the leati ductility and are moft brithe. Sec thefe articles, and Cuemstry Ina', x.

With requard to the poifonons qualities of copper when taken into the body, much lefs danger feemo to arife than from thofe of arienic, on account of its caly folubility; nor indeed have we met with any well anthenticated intlance of a perton who has died in confeguence of frallowing even wedtereafe itfelf. In one cafe, where an whucky boy had fwallowed fome bits of this fubfance thrown one of a chemilt's laboratory, the fymptoms were only violent ficknefs and vomiting, from which he recovered $1, y$ drinking warm water largely; and frobably nothing alfe would be requitite in any cafe, though Mr Fourcroy advifes ometics, abundance of water, liver of culphr, alkalis, dic. The ufe of cmetics in fuch a caft, however, feems altugether fuperfinous; fince verdigreafe, in the quantity of a grain or a grain and a half, has been ordered by fome medical writers in the eafe of poifon fwallowed o:herwife, as the emetic mont guick in its operation that could be thought of.

COPlERAS, a name given to the factitious gieen vitiol. See Chemistry-Igitex.

COPPERPLATE. See Engravixg.
COPPICE, or Copse, a little wood, confiting of under-woods, or fuch as may be raifed either by fowing or planting.

COPTOS (anc. geng.), a famous trating town of the Thebais, inhabited by Eeyptians and Arabs, fume diftance from the Nile; cthers place it in a fmall in and in the Nile, on which, however, it had a port. Heve Ins, on hearing of the death of Ofiris, cur one of her locks and put on mourning; and hence the name Cop. tos, fignifying privation. A proof this of the antiquity of the place. And for this reafon the Ifiaci, or priefts of Iflo, were bald, according to Juvenal:

COPULATION, the act of genceation, or the congrets of the male and female, otherwife called caiton. See Generation.

COPY, in a law fenfe, a tranfeript of a writing or inftument, made for the ufe and fatisfaction of fome of the parties concerned, or in order to preferve the memory thereof.

Copy is alfo ufed for an imitation of any orisinal work; particularly a painting, draurht, fignre, \&ic.

Cepr, among printers, denotes the manulcript or oniginal of a book given to print from.

Cafr-hodd, a tenule fo which a tenant has no. thing to fhow but the expy of the rulls made by the Atward of the lord's court.

It is called a bafe tenure; hccaufe the tenant holds the land at the will of the lord. However, it is not fimply at the will of the lord, but acoordins to the cuftom of the manor by which fuch elate is delicendible, and the tenant's heirs may inherit it; and a copy. holler, fo long as he does his firvices, and dues a $t$ ado the cutom, cannot be ciected ly the lord ; and it he be, he hall have trefafs againt him. See the articles 'Tevure and Villenage.

COPr-Holder, one who is admitied tanat of han. or tenements within a manor, which tims out ot mind, by ufe and cultom of the manor. have been demifable, and cemifed to fuch as will take them in fec-rimpe

N gi.
or lee-tail, for life, years, or at will, accordiars to the
Copt. cuitom of the manor by copy of court-roll ; but is ge. merally where the tenant has fuch eftate either in fee or for three lives.

Cont-Risher, the right which an author may be fuppofed to have in his own original literary compofitions; fo that no other perfon, whout his leave, may publith or make profit of the copies. When a man by the exertion of his rational powers has produced an original work, he has clearly a right to difpofe of that identical work as he pleafes: and any attempt to take it from him, or vary the difpofition he has made of it, is an invalion of his right of proporiy. Nuw the identity of a literary compefition confifis entirely in the fentiment and the language; the fame conceptions, clothed in the fame worde, mult neceffarily be the fame compolition: and whatever method be taken of conveying that compofition to the ear, or to the eye of another, by recital, by writing, or by printing, in any number of copics, or at any period of time, it is always the identical work of the author which is for conveyed; and no other man (it hath been thought) can have a right to convey or transfer it without his conlent, either tacitly or cxprefsly given. This confent may perlaps be tacitly given when an author femits his work to be publethed without any referve of right, and without itamping on it any narks of ownerhip; it is then a prefent to the public, like the building of a church, or the laying cut a new highway: but in cale of a bargain for a fingle impreffen, or at tutal fale or gift of the copyjight; in the one cafe the reverfion hath been thought to continue in the original proprictor ; in the other the whole proverty, with its exclufive rights, to be perpetully transferred to the grantee. On the other hant, it is urged, that though the exclufive right of the mandesipt, and all which it contains, belones undoubtcolly to the owner before it is printed or publibhed; yet fiom the inftant of publication, the exclufive right of an author or his affigns to the fole comsmunication of his ideas immediately vanithes and evapurates: as being a right of too fubale and unfubtantial a nature to become the fubject of property at the common law, and only capable of heing guad. adby pofitive fatute and fpecial provilions of the ma. gittrate.

The Foman law adiudged, that if one man wote any thing, theny evcr fo elesantly, on the paper or parchment of ancher, the writing hould hetong to the orifinsl owner of the materials on which it was writen: meaning celtainly nothing more thoreby that the mere mechanical opesation of witiare, fur which it directed the foribe to receive a fatisfaction; crpecially as, in works of genius and invention, fuch as a plenter patated on another man"s canrar, the fame law gave the canvas to the painter. We find wo other menation in the lew of any property in the works of the uncertanainge though the faie of limay copice, for the purpofes of a ccical or muliplication, is certainly as anciemt as the times of Terence, Martial, and Statins. Neitiber wita us in Britain hath there been (till ron lately) any final determation upon the iight of authors at the common law. It was determined in the alde of Millor $a$. Talae in $B . R$. Pech. 2 Geo.III. I-09, that an cxchufie copy-right

## C O R [ 441$] \quad \mathrm{C} 0 \mathrm{R}$

Coques in authors fubfitted by the common law. But afterwards, in the cafe of Donaldfon v. Becket, before the houfe of lords, which was finally determined 22 d February 1774, it was held that no copy-right fulbfifts in authors, after the expiration of the feveral terms ereated by the llatute 8 Amm c. 19. This Itatute dectares, that the author and his affigns thall have the whole liberty of printing and repriating his works fur the term of 14 years, and no longer; and alfo protects that property by additional penaltics and forfeitures; directing farther, that if at the end of that term the author laimelf be living, the right hatl then return to him for another term of the lame duration.

COQUES (Gonzalo), an efteemed painter of portraits and converfations, was born at Antwerp in 5618 , and was a difcople of the old David Ryckaert; under whofe direction he applied himfelf diligently to cultivate thofe promifing talents which he pollefled; not only by practing the beft rules adminitered to him by his inflructor, but alfo by lludying nature with fingular attention.-He was a great adinirer of Vandyck; and fixing on the manner of that great artift as his model, had the happinefs of fo far fucceeding, that next to him he was efteemed equal to any other painter of his time. - In the fchool of Ryckaert he had been accultomed to paint converfations, and he frequently compoied fubjects of fancy like Teniers, O flade, and his mafter; and by that habit, he introduced a very agreeable ftyle of portrait painting, in a kind of hillorical converfations, which feemed much more acceptable to perfons of tafte than the general manner of painting fortraits, and procured him great reputation and riches. In that way he compufed feveral fine pictures for king Charles I. and likewife feveral fur the archatuke Leopold, and the prince of Orange; which latter prince, as a mark of refpect, prefented Coques with a rich gold chain, and a gold medal on which the bult of that prinee was impreffed. He died in 1084 .-He had an exeellent pencil; his portraits were well defigned, with eafy natural attitudes; he difpofed the digures in his compoftion fo as to aroid confufion or embarraffment; he gave an extraordinary clearnefs of colour to his heads and hands; and his touch was frec, frrm, and broad, a circumfance very uncommon in works of a fmall fize.

COQUIMBO, a port-town of Chili, in South America, fituated at the mouth of a river of the fame name, which difcharges itfelf into the Pacific ocean. W. Long. 75. IC. N. Lat. 30.O.

COR caroli, in athronmy, an extraconflllated flar in the northem hemidphere, fituated between the coma Berenices, and urfa najor; fo called by Dr Halley in honour of King Chartes.

Cok Hydre, a fixed far of the firt magnitude, ia the conflellation of hy dra.

Cor heonis, in aftronomy, a fixed flar of the firt magnitude, in the conflellation Leo.
Cos-meille, a noted plant, common in the Highlands of Scotland. Its roots dried are the lupport of the highlanders in long journeys, annidft the barren hills deftitute of fupports of life; and a fuall quantity, like the alimentary puowders, will for a long time repel the attacks of hunger. Insufd in liquor it is an Vol. V. Eart II.
agreeable beverage, and like the Nepenthe of the Corsciss. Grecks, cxhilarates the mind. From the fimilitude of found in the name, it feems to be the fame with chara, the root difcovered by the foldiers of Cerar at Dyrrhachium, which foeped in milk was fuch a relicf to the famithed army. Or we may reafonably believe it to have been the Caledomian food defcribed by Dio, of which the quantity of a bean would prevent both hunger and thirst: and this, fays the hitorian, they have ready for all occations.

CORACIAS, the Roller, in ornitholgy a a ge. mus of birds of the order of pica, the characters of which are: 'llac bill is 1haight, bending towardo the tip, with the edges cultrated : the notrils are namow and nakel; the legs for the mott part hort; the toes placed three before and one behind, and divided in their urigin. 'lhis genus is not contined to one tipni. of the glube, as one or other of the dificrent feceies may be met witi in all the fum quarters of it.

1. 'The garrula, or garrulous roller, is about the fize of a jdy; the bill black, and at the bate befet with britles, but do not cover the noftrils: the head, neck, brealt, and belly, are of a light bluifh green; back and feapulars, reddith brown ; coverts on the ridge of the wing rich hhe, beneath them pale green; upper part and tips of the quills dunky ; the lower parts of a fine deep blue; rump, of this lalt colour: tail forked, of a light blue; the outer featber tipped with black above, and bencath with deep blue, as is the cafe with fuch part of the quill feathers as is black above; the other tail feathers are dull green: the legs are hort, and of a dirty yellow. Mr Pennant obferves that thefe birds are frequent in feveral parts of Europe, in molt parts of which it is a bird of paffage. Mention is made of them in Sweden and Denmark on the one hand, and as far as Africa on the other; not that they are found in all the parts between, nor in the fame plenty. Willoughby tells us, that in Germany, Sicily, and Malta, they are fo common as to be fold in the markets, and in poulterers fhops. Adanfon fays, that it "comes to retide for fome montlis of the fummer in the fouthern parts of Europe, and groes back to Spend the remainder of the year in Seneggal," having thot one on board the hip, on its paffage, in A. pril. Frifch obferves, that it makes its neft in woods, where there is binch; that it does not come to its colour till the fecond year; flies in thoups in autumn; often feen in tilled grounds, with rooks and other birds, farching for uorms, finall freds, and roots. Its deth tattes like that of a turtle. It is fatich alfo fometimes to make the neit in holes in the ground, in one of which nefts wo egrs were found. The nelt is gencially fitthy, from the youm evacuatiog their exerements therein; whence by fome it was faid to make the nett of exerements. W'e are tuld in the liritifh Koologry, that it has licen twire thot in Finsland, and is remarkable for making a chatering noife, whence its name.
2. The blue-faiped roller is in lengelt fight inches; the bill theee quarters of an inch long, bent at the tip, and of a black colour: the irides are wed : the general cobour of the plunare deep bhe-blats, dathed with ftraks of greenith blue: tic tull and legs are black. It iahabits New Cakdonia.

Caraeo H11:
3. The Chinefe roller is of the fize of a jay: The bill and irides are red: the head, hind part of the neck, back, rump, and upper tail coverts, are green: throwgh the eycs on each lide is a black Itripe : the under farts of the body, from chin to vent, are yellowih white, tinged with green; but the thighs are grey: the wing coverts are olive bown; quills the fame, with a mixture of chefnut in fome: and others, nearef the body, tipped with whitc: the tail is live iaches in length, and wedge-haped, the outer feathers fhorteniar by degrees like that of a mapie; all of them are more or lefa green, verging to black near the ends; the tips of all are white: the lerg and claws are of a pale red, and toger than in other rollers. It inhahits China, and is called at Conton Sc:it-ta-honar. It is nut very common.

There are 13 other ifocies enumerated by crnithoIngitls; themorl mony of them duabiful, and fuppofed to be only varietics.

CORACO-bracurals, in anatomy, the name of a mufcle in the arm, ferving to raife it upwards.

CORACOIDES, in anatomy, a fmall tharp procefs of the feapula. Sce Anatomy, $\mathrm{n}^{2} 47$.

CORACOMANTES, in antiquity, perfons who foretold events from their obfervations on crows.

CORALLINA, oi Coral, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The fpecics are cight, diftinguithed by the form of their branches, and are found in the occan adhering to tones, bones, fiells, \&c. The corals were formerly believed to be vegetable fubllances hardened by the air; but are now known to be compofed of congeries of animals, which are even endued with the faculty of moving fipontaneoully.

The iflands in the Sonth-fea are mofly coral rocks covered over with earth. The hittle creatures, which have fearce fenfation enough to dilliagnifh them from plants, build up a rocky flructure from the bottom of that fea, too deep to be meafured by human art, till it reaches the furface. Some of thefe coralline iflands appear to be of a much older date than others; particularly the Fricondy ifliuds: and it is probable that as thefe fubmarine wooks are continually going on, new iflands may by that means frequently be produced.
M. de Pyffonnel of Marfeilles, in confequence of a feries of experiments and obfervations from about the year 1720 to 1750 , fecms to have been the firit who threw a proper liglt upon the nature and production of coral and fimilar marine fublances. Thofe bodies, which the count de Marligli imagined to be flowers, this ingenious naturalifl difcovered to be infects inhabitiag the coral ; for upon taking brunches of it out of the water, the flowers, which proceeded from a number of white points anfivering to the holes that piereed the bark, and the radiation of which refembled the flower of the olive-tree, entered into the bark and difappeared; but upon being agaia reflored to the water, they were fome hours after perceptible. 'Tluefe flowers fpread on white paper loft their tranfparency, and became red as they dried. The holes in the bark corvefpond to frall cavities upon the fubftance of the coral; and when the bark is removed, there may be feen an iufnite quantity of little tubes connecting the batk with the imer fabltance, befids a great number
of fmall glands adhering to them; and from thefe tubes Corallina. and glands the milky juice of coral iflucs forth: the boles in the bark are the openings throagh which the infects that form thefe fubtlances for their labitation cone forth; and theie cavitise which are partly in the bark and partly in the fublance, are the cells which they inhabit. The organs of the animal are containal in the tubes, and the ghondules are the extrenitics of its feit, and the millyy liquor is the blood and juice of the animal, which are more or lefs abondan in proportion to its health and vigone. When the infecto are dead, they corrupt, and commonicate to the water the fonll of putrid fifh. This juice or kquor runa along the furrows perceived upon the proper funtance or body of coma, and fopping by little and little becomes, fixed and hard, and is changed into thone; and being fopper in the bark, caufes the coral to increake proportionably and in evcry dirction. In formiars coral, and other marine productions of this clafy, the animal labours like thofe of the tellaceous kind, each according to his fpeces; and thi ir productions vary according to their feccral forms, magnitudes, an $\rfloor$ colours.

The coral infect, or polype, M. Peyfonnel obferves, expands ititif in water, and contracts itelf in air, or when it is toached with the hand in water, or acid liquors are poured upon it : and he actually faw thefe infects more their claws or legs, and expand thenf.lves, when the fea-water containing coral was placed near the fire, and keep them in their expanded fate when feparated from the coral in boiling water. Broken branches of coral have been obferved to faften themfelves to other branches, and have continued to grow ; and this is the cafe when they are conncted with detached pieces of rock and other fubitances, from which no nourifhment could be derived. The coral infects in their cells, not having been injured, contime their operations; and as they draw no nonrithment from the foone of the coral, they are able to increafe in a detached and feparate fate. Coral was fomd to be equally red in the fea as out of it ; and it was more thining when jut taken out of the water than even when it is polifhed; and the bark by being dricd becomes fomewhat pale. M. Peyflonnel found that it grows in different directions, fonetimes perpendiculaly downwards, fometimes horizontally, and fonetimes upwards; and in the caveins of the fea, open to every expofure.

This fyltem was little regarded, though firft communicated to the Acadeny of Scierces at Paris in 1727, till Mr Trembley's difcovery of the frefh-water polype; but fince that time, it has ocen confirmed by the obfervations of M. Bernard de Juffieu on the feacoats of Nurmandy, and thofe of M. de Reaumur near Rochelle. M. Donati of Turin has alfo adopted the fame hypothefis, viz. that coral is a mafs of animals of the polype kind; and inflead of reprefenting the polype beds and cells which they contain as the work of polypes, he thinks it more jult to fay, that coral and other coralline budies have the fame relation to the polypes united to them, that there is between the fhell of a finail and the fnail it fclf, or the bones of an animal and the animal itfelf.

The fame fyttem has alfo been excellently illuftrated and efubliflod by Mr Lllis, in anfwer to the objee-

Corallina, tions of Dr Batter of Zealand, and Dr Pallas of Ber-
Coral. lin, who dill refer corallines to the vegetable kingdom.

There are properly hut three kinds of coral; red, white, and black: the black is the rarct, and molt effeemed; but the red was formenly ufed in medicine. It metl be chofen thick, fimooth, and fhining, and of a beantiful red, not covered with any tartareous matter. However, this fubllance is now farce ever preferibed by any intelligent practitioner.

When coral is newly taken up ont of the fea, the finall protuberances on its furface are foft, and yicld, on being preffed, a nilky juice which effervefocs with acids. The cortical part with which the coral is all over covered is not near in compact as the internat, and may eatily be taken of whill frefly; and from this part it is ufurdy freed before it comes to the market. The greatef coral trade is in Genoa and Leghorn. The fmall $f_{p}$ migs unfit for ornamental ufes are in the flops !ewigated into a fubtile powder; which, however, has no medicinal virtues fuperior to the common tellacca. Coral is not unfrequently imitated by artificial compofitions, fome of which are made to refemble it exactly; but the abufe may be difcovered by fire, the counterfeit not affording the alkaline carth which is afforded loy the genuine coral. 'The colouring ingredients in the artificial coral are cinnabar and minien, both of which are eafily difcovered. The natural coral feems to receive its colotr from iron; for $f_{P}$ irit of vitrinl acquires from it a ferruginous tafte; and on calcining the coral, fome particles are found among the athes that are attiacted by the magnet. Sixteen ounces of coral, according to Neumann, when ditilled in an open fire, yield about fix feruples and an half of volatile alkaline fpirit, with two or three grains of an empyreumatic oil: from the caput morthum calcined, tive fermples and a half of fised faht may be extraced. In former times, many extraord:nary virtues were expected from this fubitance, on account of its fine red colour ; and therefore a great number of methots were tried to extract this colour by means of fpirit of wine. None of thefe, however, fucceeded. A red collour was indeed fometimes obtained, but it turned out the fame whether any coral was ufed in the operation or not. In fome of thefe proceffes, howevcr, the coral lofis its colour. One methool of making the tincture is by diffolving a pound of fugar in a little water, and then adding half a pound of wax. A pound of coral toiled in this mixture lofes its redacfs, but is found to be malleend in other refuects. In order to prepare the tincture, the wax and fugar mult be dill lued in firit of wiac.

CORAL Fishery. Red coral is fomed in the Mediterranean, on the thores of Piovence, from Cape de la Couronne to that of is 'Tropez; abont the ifles of Majerea and Minorea; on the toulla of Sicily ; on the conits of Africa; amb, lafly, in the Ethiopic ocean, about cape Negro. The divers fay, that the little branches are found only in the caverns whefe tituation is paralkl to the earth's finface, and open to the fouth. The mamer of fithing being nearly the fame where ever coral is foumb, it will foffice to inllance the method ufed at the hattion of France, under the direction of the company ettablimed at Marliciles for that fithery. Seven or vight meri io in a beat commanded by the
patron or propricion; and when the net is chrown by comat, the caller, the ret wank the veffel, and holp to dane Cornimes the net in. 'The nut is empofed of two rafters of wood tied crofs-wife, withlads fised th them: the the they faften a quantity of heme twited loofly remm, and intermiagled witi fone limgenctiors "boins in. Hrument is let down where thay thals there is comal, and pulled up agan when the cord is thangely intanglal in the homp and wettins. For this papare, fis boats are fometimes re piece! ; and if in hating in, the rope happens to break, the fithemen ran the bazard of being lolt. Before the lifloers ger to lea, they agree for the price of the cond, which is fonseimes more, fometimes lefs, a pound; and they (ngage, wis pain of corporal punifhnent, that nuthar the mar their coew thall cmbezale any, but dehere the whole to the proprietors. When the fithery is ented, which amounts one ycar with another to twenty-dive quintals for each buat, it is divided into thiteen parts; of which the proprictor hath four, the callers two, and the other his men one each, the thirteenth belongs to the company for payment of the boat furnifleal them.

Coris-Stome, a name for a lind of red and white argate which breaks in veins, and is found in Italy and fome parts of Sixony. That of Rochlit\% in Suxony is the molt celebrated, and is found in globules which have a kind of cruit about them.
CORALLINES, in natural hillory, were formerly reckoned a gents of plants, and Mr Tournefort enumerates 36 fpecies of them; but in the Linnean fyftem they belong to the clafs of zoophytes, and are defined by modera naturalifts to be fubnarine plantlike bodies, that confift of many flender finely divided and juinted branches, refembling fome fpecies of mofs: or animals growing in the form of plants, having the ir flems fixed to other bodies: thefe ftems are compofed of capillary tulbes, whofe extremities pafs through a calcareous cruit, and open into pores on the furface. The branches are often jointed, and always fubdivided into finaller branches, which are either loofe and unconneted, or juined as if they were glued togethor. They are dillinguifhed from plants by their texture and handuefs: they alfo yield in diftillation a contiderable quantity of volatile falt ; and their fnell, in buruing, refembles that of burnt horns and other animal fuhftances. Many of the corallines feem to conlit of a lingle tube, containing a fingle parent animal. Every branch emitted contains an offspring of this parent dopendent upon it, and yet capable of producing its like in the emition of a new brancli. Otbers confit of many fuch tubes united, rifing up together, and encircling the deferted tubes of their progenitors, whofe cxuvia lecome the fubflratum of a rifing generation. Mir Ellis diatributes corallines intor the offichluted, ta budw, celifforous, and articuluted kinds.
${ }^{6}$ fefondated corculiner are dithinguifled by their horny hollow ranifications: molt of them are firnificd with litte denticles on their branches, like teaves on mofles; and at certain feafoms of the year they are furninhed with furall bodics like blalders, proceeding from their flems and branches, and differing in form according to the different fpecies. Their colour, when dry, is of a ycllowith or pale brown, and their nature is claHic. They are found adheriag to rocks, hy lls, and

## C O R [44 ] C O R

Eoralines. fucufes, by fmall root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they caufe no effervefcence. See Plate CXLVII. fig. \&. where a reprefents the fea-tamarifs in its natural tize, and $A$ in which the denticles are magnified. Fig. 2. b, B, is the fea-cyprefs; fig. 3. $c d, C D$, the farll climbing coralline with well fhaped cups.

Tubular coralimes are compofed of a number of fimple tubes, growing up nearly together; or of fuch branched ones as have neither denticles nor veficles. Thefe are horny" and clatic like the former, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the inteftines of fimall animals. See lig. 4, E.

Cellifirous corthlines are thofe which appear, when magnified, to be fine thin cells, the habitations of fmall animals connected together, and difpofed in a variety of elegant furms like branches. Thefe effervefce with acids. Sec fig. 5, Ff, witl part ( GH ) magnified.

Articulated corollines confitt of fhort pieces of a Aony or cretaceous brittle matter, whofe furface is covered with pores or cells, which are joined by a tough, mem. branous, fexile fubtance, compofed of many fmall tubes of the like nature compacted together. The
Place fony part is foluble in vinegar, and the other part remains entire. $a, A$, (fig. 6.) is the coralline of the mops. It is fixed to rocks and thells by tony joints, which, as they rife, are united to others by extremely fine and flender tubes: Thefe may be difcovered by a good eye, or a common magnifier. As the flems extend themflves, they become pennated by fide-branclies which come out oppolite to each other, and are jointed in the fame manner; the joints of this fpecies are like the upper part of an inverted cone, but a little compreffed: The whole furface is covered over with very minute circular-fhaped cells like pores; fee 13 , and $\mathrm{B}_{1}$, where they are ligher magnitied. B 2, thows a crofs fection highly magnified. If a branch of this coralline is put into vinegar, thefe cells are diffolved with the whole cretaceous furface; inttead of which there appear rows of minute ramifications, which feem to have communicated with each of thefe cells. Up. on fome fpecimens of this coralline, we may obferve little fmall figures like feed-veffels, with which the branches frequently terminate : They are alfo found on the fides, as may be feen at $A$, where they are magni-ged.- When a branch is rendered foft by being iteeped in vinegar, there may be fquezzed out from the little knobs at the ends and fides, fmall twifted fiofures, like tnofe at A 1 , which are magnified higher at A 2.-We frequently find this coralline of dif. ferent colours, as red, green, afh, and white; but all of it, by being expofed to the fun and air on the fhore, becomes white.

The ancients have fuid great things of the virtues of the common curalline. Diofeorides prefcribes it for mitigating the pain of the gout, and for preventing Aagnations of the lumours in any part; he fays nothing of its virtues againf worms, which are what we alone eftecm it for. We give it in powder from so grains to a feruple or half a dram twice a day in thefe cafes, and that with a contiderable good effect.

Befides the above, Mr Eillis enumerates other gene-Corallodenra of marine productions; as the keratophyta, efchara, fponges, and alcyonium; all which are the nefts or matrices of fea-animals. Sec Polype. The laft clafs of marine bodies is formed like fungufes of vaious figures, and with different forts of covering : fome having a gritty, and fome a callous $\mathrm{K}_{\mathrm{k}} \mathrm{in}$, with a fpougy fubfance in the infide : other fpecies are of a flethy fubfance.

CORALLODENDRON, in botany. See Erythrina.

CORALLoides (frutices.) See Eschara and Keratophyta.

CORAM (Captain Thomas), a genteman remark. ably diftinguifhed by his l-umanity, was born about the year 1668, and pent the early part of his life in the ftation of mafter of a veffel trading to our colonies. Afterwards refiding in the eaftern pant of the metro. polis, among feafearing people, where bufinefs often obliged him to come early into the city and return late, he frequently faw young cluldren expofed in the Itreets through the indigence or cruclty of their parents. This excited his compaffion, and induced him to project the foundation of an hofpital for foundlings. In this humane delign he laboured with indefatigable diligence for feventeen years; and by his application procured a number of the nobility and gentry to patronize and carry the fcheme into execution, and at length obtained the royal charter for it. He was alfo highly inftrumental in promoting the trade of America, by procuring a bounty upon naval ftores imported from our colonies. He was likewife eminently concerned in fetting on foot the colonies of Georgia and Nova Scotia. His laft charitable defign, in which he lived to make fome progrefs, was a fcheme for uniting the North American Indians more clofely to the Britifh intereft, by an eftablifhment for the education of Indian girts. In thort, he fpent the greatelt part of life in labouring for the public, and experienced a fate too common in thofe who devote their talents to fuch laudable purpofes; being at laft indebted for fubfitence to the voluntary fubfcriptions of fome public-fpirited perfons, at the head of whom was the late Frederic Prince of Wales. Captain Coram died in 1751 : and was interred, at his own defire, in a vault under the chapel of the Foundling Hofpital.

CORAN, or Alcoran. See Alcoran.
CORAX, in ornithology, the trivial name of a fpecies of Corves.

CORANICH, among the Scotch and Irih, the culfom of finging at funerals, anciently prevalent in thofe countries, and ftill practifed in feveral parts. Of this cuftom Mr Pennant gives the following account. "I had not the fortune to be prefent at any in North Britain ; but formerly affifted at one in the fouth of Ireland, where it was performed in the fulnefs of horror. The cries are called by the Irith the alorolone and bullulu; two words very expreflive of the found uttered. on thefe ocealions; and being of Celtic flock, etymologits would fwear to be the origin of the oxoanyar of the Greeks and ululutus of the Latins. Virgil is very fond of wing the latt whenever any of his females are diltrefled; as are others of the Roman poets, and gemerally ou occafious fimiar to this. It was my fortune

P

-

## C O IR

Sranich to arrive at a certain town in Kerry at the time that a perfon of fome diftinction departed this life: my curiofity led me to the houfe, where the funeral feemed conducted in the pureft clallical form.

```
Quodiungiue afpicenal lu`%us, gemntufyme fonabunt,
Formaque non tucili funeris intus croth.
```

In fhort, the conclamatio was fet up by the friends in the fame manner as Virgil deferibes that confequential of Dido's deatli;

```
I_gmentiq, gemituque, ज' femineo wluhatu
TER: f) cmam:.
```

Immediately after this followed another ceremony, fully deferibed by Cambden in his account of the manners of the ancient Irith; the earneft expoftulations and reproaches given to the deceafed for quitting this world, where the enjoyed fo many bleffings, fo grood a huband, and fuch fine children. This cuftom is alfo of :breat antiquity, for Euryahs's mother makes the fame addrefs to her dead fon.

```
------ Tume illa finetioc
```

```
Crudlis?
```

But when the time approached for carrying out the corps, the cry was redoubled,

> Trennhis whutubus atheriu comphent;
a numerous band of females waiting in the outer court to attend the hearfe, and to pay in chorus the laft tribute of their vorees. The habit of this forrowing train, and the neglect of their perfons, were admirably fuited to the occalion; their robes were black and flowing, refembling the ancient Palla; their feet naked, their hair long and dithevelled: I might truly lay,

```
It gui conducti plorant in funern, dicunt
Et fuciunt prope plura colintibus exanimo.
```

The corple was carried flowly along the verge of a moft beautiful lake, the ululatus was continued, and the whole proceflion ended among the venerable ruins of an old abbey:"

CORBAN, in Jewifh antiquity, were thofe offerings which had life, in oppoition to the minchal, or thoie which had not. It is derived from the word karab, which fignifies " to approach;" beeaufe the victins were brought to the door of the tabernacle. The corban were always looked upon as the moft facred offerings. The Jews are reproached with defeating, by means of the corban, the precept of the fifth commandment, which enjoins the refpect due to parents. For when a child had no mind to relieve the wants of his father or mother, he would fay to them, "It is a gift (corbar:) by what foever thou mightell be prolited by me;" i.c. "I have devoted that to God which you afk of me, and it is no longer mine to give."

Corban is allo a ceremony which the Mahometans perform at the foot of mount Arrarat in Arabia, near Mecca. It confilts in killing a great number of fheep, and diflributing them among the poor.

CORBEILS', in fortification, little bankets, about a foot and a half high, eight inches wide at the bottom and twelve at the top; which being filled with earth, are frequently fet one againft anothor upon the parapet or elfewhere; leaving certain port-holes, from whence to fire upon the enemy under covert without being feen by them.

CORBEL, in architecture, the reprefentation of a
baket, fometimes feen on the heads of caryatides. The word is allo ufed for the valfe, or tambour, of the Corinthian column; fo called from its refemhlance of a bafket, or becaufe it was fnlt formed on the model of a balket.

Corbel, or Corbil, is alfo ufed, in building, for a Short piece of timber placed in a wall, with its cnd ficking out fix or eight inches, as occafon ferves, in manner of a fhouldering-piecc. The under part of the end thus flicl ing out is fometimes cut inte the form of a boultin; fometimes of an ogee, and fometimes of a face, Sce. according to the workman's fancy; the upper fide beiner plain and flat.

Corber is alfo uled by fome arehitects for a niche or hollow left in walls for images, ligures, or flatues to ftand in.

CORBEI (Richard), bifhop of Norwich, and an eminent poet, was born at Ewell in Surry, toward the fatter end of the IGth century ; and educated at Oxford, where he was efteemed one of the moft celebrated wits of the univerity. Entering into holy orders, he became a popular preacher, and was made chaplain to King James I.: when, after "feveral preferments in the church, he was, in 1629 , made bithop of Oxford; and, in 1632 , was tranflated to the fee of Norwich. He was very hofpitable, and always a generous encourager of public defigns. He died in 1635. There have been Ceytral editions of his poems publifhed under the title of Poemata Stromata.

CORPEY, a town of Picardy in France, with a famous abbey of Benedictine monks. It is feated on the river Somme, 10 miles eaft of Amiens, and 75 north of Paris. E. Long. 2. 35. N. Lat. 49. 55 .

CORCELET, in natural hiftory, that part of the Aly-clafs which is analogous in its fituation to the breaft in other animals. Many have called it the breaft in thefe allo, but improperly; becaufe the brealt of other animals is the place of the lungs and trachea, but thefe organs are in the fly-clafs diltributed through the whole body. The wings are affixed to this part of the fly-clafs; and there are fome difinctions of great confequence in regard to the arrangement and diftribution of thofe animals into genera. Some flies have a duuble corcelet, or one divided into two parts; and this is the cale of the fly produced from the furmica leo, which therefore does not carry its only difinction in the figure of its antennae. One pair of the legs ot this tiy are attached to the firit or anterior corcelet, which is alfo eapable of moving on the other.

The corctets of fome flies are alio much more cicvated than thofe of others; and in fome this elevation is carried fo far, that the head is forced by it to be bent downward, and the creature is plainly made hump-backed by it. The great kind, and the tipuls, furnifh inlances of this elevated and homp-hacked carcelet.

A feries of flies of two wings are known by a very particular armament which they carry on the corcelet, ufually called their bragls. This conlifts of two long, flender, fharp-pointed priekles, which are imnoveable in their infertions, and feem meant as offenfive or defenfive weapons; but in what manner they are uled it is not eafly to be determined.

All thefe hits are produced from long water-worms

## $\mathrm{COR} \quad[44.6] \quad \mathrm{C} O R$

Cracies whil open and funnel-fahioned talt, or furnihed with their aperture for refpiration at the binder extremity.

There are thre linown fpecies of this fort of me,
with armed corcelets, which differ much in lize, but are all produced of worms of this kind. The larett of thele thics are produced from the largett and longet worm, and are fomething longer than the bee. 'The fmallell are produced of wems very imall and flender, and are themfelves extromely minute: and the third hind is of a middle fize betwon thefe, and produced from a proportionably firaller wom than that of the firit, and proportionably larger than that of the fecoms feecies.

All thefe fpecies have their wings but little diftinguiflable at their firf production from the thell; they appear indeed only like two !nemer filaments laidacrofs their bodies: but they quichly how, that in this thate they were only very nicely folded together; and foon expand, and thow their full estent and proportion.

When firt produced from the thell, the the the are of a pale green colour. The mider part of their belly in many continues green, but in the greater number it becomes of a pale dead brown. Some of them have the ontide of their bodies of a deep brown, approaching to hlack, with limes of a dead brown between the commiffures of the rings. The back of fome others has only a blackith brown hand, which runs traight down fiom the corcelet to the end of the body, the whole budy befade being of a dad brown. The corcelet in thele llies is brown, and the prickles are yellowith near their infertions, but nearly black at their points. They lave thee of the fmall gloffy eycs difpored in the lhape of a triangle on the back part of their head; and their reticular eyes are brown, and at fome ditance from one another.

CORCHORLS, in botany: A genus of the momogynia order, belonging to the polyandria clafs of plants: and in the natural mthod ranking under the 3-th order, Culumace. The corolla is pentapetalous; the calyx pentaphyllous and decidnous; and the capfule many-ralved and many-cellect.

There are eight fpecies; of which the moft remarkahle is the olitorins, an annual, and a native of Alia, Africa, and America. It riics with a round, friated, upright, branched falk, to near two feet, which is furnithed with leaves differing in hape; fome being oval, fome cut off ftraight at their hafe, and others almof heart-haped. They are of a deep green colom, and have a few tocth on the margins if their late, that end in brithy, retlesed, purplith flaments. 'The fowers come out at the fides of the branches oppolite to the leares. They fand fingly on very fort peduncles; are compofed of five fmall yellow petals, and a great number of thamina furronding an ublong germen, which becomes a long, rough, tharp-poined capfule, opening in four parts, each tilled with greenith angular feeds - This plant is fown by the jews absut Aleppo, and is therefore called. Fious moll ze'. 'The leaves are a favourite fallad anong thele pecple, and they boil and wat them with their meat.

CORCULlM, a diminutive from cor, " the heart," little lieart ; the eflence of a leed, and principle of life of the future jlant, attached to aiol containcd within the lobes. It connite of two parts, termed by limmers Plumula and Rostellum. The former is the roulinete of Grew and other maturalits. 'The
corculum is in fact the embryo of the futare vegctable; and is attached by two trunks of wifels to the lobes at their union. 'The tirit of its two parts mounts upward, and becomes the trank. The other frikes into the ground, and is the rudiment of the root. The lohes ans: heart of the feed are diftinctly vibible in the bean, and other feeds of that clafs, efpecially after icmaining fome time in water or earth.

The principle of life is leated cither at the fummit or thafe of the feed. From this circmatlance are conAtructed the two tirlt claffes in Ciefalpinus's method, containing trees and hrubs only.

CORCYRA (ance geog.), an inland in the Ionian Sen, oppolite to Thefrotia, a diftriet of Epirns, called Sibura and Pbeacia by Homer. In Callimachus it is called Drepane; its molt ancient name, according to the Scholiatt, from the currity of its figure. Famous for the fhipwreck of Ulyties and the gardens of Alcinous. Now Corfu.

Corcrest, a cognominal town of the inland; former! foucrful, and capable of coping with mighty fates; fitnated about the middle of the eall fide of the ifland, called The Town of the Ploraciats by Homer. Now Corfi, from the $k \xi^{2} \neq w$ of the middle age, the nane of the citadel. It was a colony of Corinthians; Coroyrai, the people. E. Long. 19. 4\%. Lat. 39: 50 .

Coreva Nigra, an illand in the Ahiatic, on the coalt of Dalmatia (Pliny) ; called Melema by the Creeks, to diflinguish it from the mand in the lomian Sua. The cpithet Nigra was added, from its woods of tall trees with which it is amolt covered. Now Cimesta.

CORD, or CenRd, an aftemblage of feremal threads of liemp, cabled or twited together by means of a wheel. Sce Cornage. The word comes from the Greek $x^{n g} g^{2 n}$, which properly lignifies an intuline or gut, of which cords may be made. See Cnord.

Niagiral Cord, an inftrument in gieat wfe among the Laplandur, and by them fuppoled to be endued with a number of virtues. It is a cord or rope with three knots tied in it. They wie many magrical rites and ceremonies in the tyinr of this cord; and, when the:s prepared, it is fuppofed to have power over the winds; and they will fell, by means of it, a good wind, or at lealt the promile of one, to a hip. If they untie only one of thele knots, a moderate gale fucceeds; if two, it is much tronger; and if three, a liorm is fure to fullow.

Cord of I'mond, a cortain quantity of wood for burning, fo called becaule formerly meafured with a cord. The dimeniions of allatue cond of noud are eigh feet long, four fiet high, and four feet broad.
 by water, comes on board a velld, in oppofition to that which is Hoated.

CORDAGE, a term ufed in general for all forts of cord, whether fmal, middling, or ireat. See Rope.

The naval corduge of the carlier ages was in all probability only danges of leather. Thefe primitive rones were retaned by the Caledonians in the thind century. 'llee nations io tire north of the Baltic had them in the uinth or tenth centuries: and the inhabitants of the weitorn intes of seotland make ufe of them at prefent; cutting the fin of a Ceal, or the raw and falted hide of a cow, into long pieces, and fattening the plough to their horfes with them, or even twiting them into drong ropes of 20 or 30 fathoms lensth.

## C O R [ $4+7$ ] C O R

But thice, in the fouth of our ifland, and on the continent, were early fuperfeded by the ufe of iron chains. The very masitime and commecicial nation of the Veneti, that were fo intimately conneeted with the Delgax of Britain, ufed iron chans for their cables in the days of Cefar. Bat in the mare difterat and refinced comtries of the fouth, both thongs and thefe had long given place to the ufe of vergetable threads; and the aits of combining them into itrength. In this mamer the Grecks appear to have ufed thic common rubes of their comitry, and the Carthaginians the fpartum or broom of Spain. And as all the cordage of the Romaus was made of thefe materials at their lath defeent on our ifland, fo the art of manufacturing them would nceefarily be introdaced with the Roman fettenents among the Eritons. Under the dirceion of Ruman artits their thongs of leather would naturally be laid ahile, and the junci, or rufles of the plains, worked up into cordage. And what ramarably coincides with this opinion is, that the remains of old cables and ropes are itill ditinguithed among the Britifa failors by the name of ol! jum $h$.
The nations of Roman Elitain, and the tribes of Caledonia and Ireland, had inherited, from their earlieft anceftors, many of the reder arts of navigation. Their hips were large open buats, framed of light timbers ribbed with hurdes and lined with hides. Thefe were furnithed with matts and fails. The latter were formed of hides, as the tackle was of thongs. They were actually of hides anong the Veneti as late as the days of Cxfar; and they were never furkd, but only bound to the mafl. But thefe flight fea-hoats, and their rude furniture, would foon be difmiffed by the provincials for the more fubftantial veffels and more artificial fails of the Romans. The Roman fails, which were compofed of fax in the days of Agricola, were afterwards made of hemp; and our own are therefore denominated cannabis or cancas by our mariners at prefent. And about the fame period affuredly did the junk of the Britih cordage give way to the fame materials; the ufe of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the firf century.
CORDATEI, an appellation frequently given by naturalift to things fomerylat refembling a licart.
CORDED, in heraldry. A crofs corded, fome authers take for a crofs wound or wencled about with cords: others, with more pubability, take it for a crufs made of two pieces of cord.
CORDELERAS, monntains of South America, otherwife catted Avdes.-

CORDELIER, a Francifian, or scligions of the oder of St Francis. , The Cordeliers are eluthed in thick gey cloth, with a little cowl, a chaperon, and cloak, of the fanse; having a girdle of rope or cord tied with three knots: whence the name.- They are otherwife called Mimon Friars, their original name. The denomination Cordelier is faid to have been fint given them in the war of St Lonis againat the infidels; wherein the Triars Minor having repulfed the barborians, and that king having inquired their name, it was anfwered, they weae people corcldiez, "ticd with ropes." The Cozdliers are th a wan ploterad Scotils.

CORDEMOI (Geral de), a learned phiofopher and Cordemok hiturian, burn at Paris, male hinfolf known to M. Boffict, who phaced lim about the dauphin in the gnaLity of reader. He indructed that young priace with great alfaduity ; and in 1675 wats receised into the French academy. He wrete a gremal hiltory of France during the fotl races of the lionch kings, in 2 vols; and fix difcourfes on the Dittintion betweon Body and Soul, which were printed torether in 1702 in quaros. He died in 168 f . M. Cordenoifollowad the principles of Defcartes.

CORDIA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking unter the folt order, Ajperifoliu. The corolla is funnel-haped; the Ityle dichotomons or divided into two threads, and exch of thefe divided into other two.

There are five fpecies, of which the prineipal are the myxa and febeftena. 1. The myxa, or Alfyrian plum, grows wild in Affyria and Cagypt, and alfo on the coatt of Malabar. It rifes to the lieight of a middling plum-tree; and its branches are furnifhed with oval, woolly leaves, llanding without order. The flowers are produced in bunches; are white, and confitt of one tubular petal, and a like calyx, nearly of an equal length, and both are cut into five parts at their brims. In their centre are five very fmall thamina, and one flender ityle crowned with an obtufe 1 lig ma. The gemen is roundifh, and fwells to a plum of the fame form, and about the fize of a danfon, of a dank brown culour, a fweet talle, and very glatinous. Thefe plums were formenly kept in the ihops; and were accounted good for obtunding acrimony, and thereby ilopping defluxions of rheum upon the lungs: bwt at prefent they are lictle ufed for thefe purpofes. In fome parts of Curky they cultivate this tree in great abundance, not only for the fake of the fruit to cat, but to make birdlime of, which is a vatt article of trade in a town called Scill.-2. The febettena, or rough-ledved febeften, grows naturally in both the Indies, and fends foth feveral fhrubby ftalks eight or ten feet high. The young leaves are furrated, but the full grown ones are not. They are of an oblong-oval form, rough, of a decp green on the upper fide, and Hand alternately on fhort foottalks. The flowers terminate the branches in large chatlers, are nearly of the Chape and colour of thofe of the marsel of Peru, and matee a molt beatiful appearance. Eatch has five ftamina and one !ifid ltyle. The plums are much of the flape of thofe of the myxa, and are eaten in the fame manmer. The fruit of this tree is lefs valuable than the wood, a fmall piece of which thrown upon a clear fire will peafume a room with a mof argreatle odenir.

CORDIAI, in medicine, whatever railes the firits, and gives them a fudden ilremsth and cheerfidnets; as wine, fpirits, the ellowia of flowers, fruit, and many other fubitances.

CORION, in fortification, a row of fones, made round on the outfice, and fet betweea the wall of the fortrefs which lies anope, and the paraper which ttands perpendicular, after theh at maner, that his difference nate: bit be offenhice to the eye ; whence the cordons fore only. as an urnament, barimes romad about the

## C O R

cordeba, place, being only ufed in fortifications of ftone-work: Cnvinut. for in thofe made with earth the void fpace is filled up with pointed trakes.

CORDUDA (anc. geog.), an illuftrons city of Betica, on the right or north fide of the Betis. Built by Marcellus, according to Strabo ; hut which Marcellus, is not fo clear. It was the firft eolony fent into thofe parts by the Romans; and furnamed Patricia, beeaufe at firt inhahited by principal men, buth of the Romans and natives. It is mentioned by Sit. Italicus in the fecond Punic war; and hence it is probable the fatt Marctllus was the founder, and not the Marcellus engaged in the civil war between Cxfar and Pompey. It was fameus for the birth of the two Senecas and of Lucan (Martial), and for its rich produce in oii (Statius, Martial). Still retaining its name a litte altered. W. Lomr. 5. Lat. 37.45 .
(ORIDOUA, or Cordora, a city of Andalulia in Spain, fituated on the river Guadelquiver, in a very extenfive plain. The circumference is large: but it is not peopled in proportion to its extent, for there are a great many orchards and gardens within the walls. There are many fuperb flructures, palaces, churehes, and religious houfes; particularly the cathedral, which is very magnificent: it was formerly a mofque when the Moors poffelted the town; for which reafon it till retains the name of Meqquita, which has the fame meaning. This eathedral is very rich in plate; four of the filver candlefticks coit L .850 a-piece. The revenue of the fee amounts to L . 3500 per annium; but as the bifhops cannot devife by will, all they die poffefed of eicheats to the crowa. The fquare called the Plaza Major is furrounded with very fine houfes, under which are piazzas. The trade is flowrifhing on account of the river; and confits of wine, filk, and Cordowian leather. In the neighbourhood of this place are a valt number of orange and lemon trees, which renders their fruits exceeding cheap. The belt horfes in Spain come from hence.

Cordova was the ancient Corduba mentioned in the preceding article. After the fall of the Roman empire, it was fubjected to the dominion of the Goths; but in the eighth eentury it was raifed by the Moorifh princes to a itate of fplendor unequalled in any other part of the world. In the year 755, Abdoulrahman, only heir-male of the Ommiad line, laving paffed over from A frica at the head of a few defperate followers, found means to raife a rebellion in Spain; when, after a battle fought on the banks of the Guadelquiver, in which he overthrew the heutemant of the Abaffe Caliph of Damafeus, he became king of all the Moorin poffeflions in the fouth of Spain, and in 759 tixed his royal refidence at Cordowa. Then began thofe Hourihing ages of Arabian gallantsy and maguificence which rendered the Moors of Spain fuperior to all their cotemporaries in arts and sarms, and made Cordora one of the mod fplendid citie's of the world. Agricolture and connmeree profpered under the happy fway of this heru; and the face of the entutry a as changed from a feene of defolation, which the long wars and harth governmeat of the viceruys had bromegh on, into a molt pophlous flourifing itate, exceeding in richeo, number of inhabitants, attivity, and induftro, any prion or iublequent era of the Spanifa tiatory. He aded new furticications to the cown, built himetf a

[^19]magnificent palace with dclicious gardens, laid caufe- Cordoua. ways through the marfhes, made excellent roads to open ready communication between the great tuwns, and in 786 began the great mofque, which he did not live to finith.

During the courfe of two centuries, this court continued to be the refort of all profeffors of the polite arts, and of fuel as valued themfelves upon their military and knighty accomplifhments; while the reft of Europe was buried in ignorance, debafed by brutahty of manne:s, or diftracted by fupeaftitions difputes. Eugland, weakened hy its heptarchy, was too ineonfiderable even to be mentioned in the political hiftory of the times: France, though it had a gleam of reputation under Charlemagne, was ftill a barbarous unpolifined nation: and Italy was in utter confufion ; the frequent revolutions and change of mafters rendering it impolifile for learning, or any thing grood, to acquire a permanent footirg in fo unitable a foil: Greece, though fill in poffeffion of the arts and luxury of ancient Rome, had loft all vigour, and feemed abforbed in the mot futile of ail purfuits; viz. that of fchola. ftic argument and religious fubtilties.

The refidence of the Ommiad Caliphs was long eonfpicuous for its fupreme magnificence, and the crowds of learned men who were allured to it by the protection offered by its fovereigns, the beauty of the country, the wholefomenefs of the climate, and the varicty of pleafures that returned inceffantly in one enchanting round.

Cordova became the centre of politenefs, indultry, and genius. Tilts and tournaments, with other contly fhows, were long the darling pattimes of a wealthy happy people; and this was the only kingdom in the welt where geometry, aftronomy, and phyfic, were regularly fudied and practifed. Mufic was no leís honoured; for we find, that in 844 a famous mufician called Ali Zeriab came to fettle at Cordora, and formed feveral pupils, who were fuppofed to equal the mott ectebrated performers that were ever known even in the Eaft. That architeEture was greatly encouraged, we need no other proof than the great and expenfive fabrics undertaken and completed by many of thefe Spanifh monarchs. Whatever faults may be julty condemied in their manner by the connoifleur, accuftomed to the chatte notle graces of the Grecian proportions, certainly nobody can behold what remains of thefe Moorith edifices, without being ftrongly imprefed with a high idea of the genius of the artilts, as we.t as the grandear of the prince who carried their plans into excention.

Thefe fultans not only gave the moft ditinguihed protecion to arts and fiences, and to the perfons larned in any of them, bit were themfelves eminently verfed in various branches of knowledge. Alkehem II. collected fo immenfe a quantity of manuforipts, that before lie end of his reign the royal library contained no kefs than 600,000 volumes, of which the very catalogue filled to huge folios. The univerity of Cordova was fonded by him, and ueder fuch favourable aufices rofe to the highelt pitch of eclebrity.

Abdoulrahman was fucceeded by his fon Hiffem, whofe pallion for glory and architecture was not in the lealt inferion to that of his father. He put the finilhiug hand to the molque, which the plunder of the fouthern

## $C O R$

Cordoua fouthern prowiness of Fronce enabled him to complete

## Cordwain

 ers. in the courfe of a ferv jears. The bridge over the Guadelquiver was a work of Hillem's after his own plan.
## Alkahens fucceeded Hiftem.

Abdoulrahman II. was alfo pafionately fond of building. He was the firt that brought the fupplies of water to Cordova by neans of leaden pipes laid unon aqueduets of itone. The quantity was fo confiderable, that every part of the pulace, the mufques, batha, fquares, and public edifices, had all of them their fountains confantly playing. A great many of thefe works fill fubfitt. He paved the whoke city, and erected feveral mofques.
After him reigned Mahomet Almondar, Abdallah, and Abdouhahman III. who furpaffed all his predeceffors in fplendor, richcs, and expence. His fubjects vied with each other in profufion and magnificence. This monarch was fucceeded by his fon Alkahem II. who left a minor to fucceed him, and the kingdom to be governed by the famous vifir Mahomet Abenamir, firnamed Almanzor or "the defender," from his great victories and wife conduet. His defcendent sinherited from hin the vifirfhip, and a power as abfolute as if they had been caliphs, until the weaknefs of the fovereigus encouraged, and the infolence of the minifters provoked, the grandees to difurb the llate with their jealoufies and diffenfions. Thefe broils occafioned fuch a feries of civil wars and anarchy, as oretherew the throne of Cordora, and deflroyed the whole race of Abdoulrah. man. Thus the glorious edifice, founded by the valour and prudence of that conqucror, and cemented by fimilar virtues in many of his fucceffors, funk into nothing as foon as the fecptre devolved upon weak enervated princes, whofe indolence and incapacity tranfferred the management of cvery thing to a vifir. Many petty kingdoms fprang up ont of the ruins of this mighty empire ; and the Chriftians foon found op portunities of defloring, by feparate attacks, that tremendous power, which when united had proved an overmatch for their utnoft furce.

Nicu Cokdus, a confiderable town of South America, in the province of Tucuman, with a bilhop's fee, 175 miles from St Jago. W. Long. 62.5. S. Lat. 32. 10.

CORDUAN, a famons pharos or light-houfe of France, in Guienne, at the mouth of the river Girond. The architecture is extremely fine ; and is placed there to hinder vefiels from runing on the fand-banks at the mouth of the river. W. Long. I. 9. N. 1,at. 45.36.

CORDUS (Valerias), a learned botanit, was the fon of Ericius Cordus, a phyfician and poet of Germany. Having learnt the languages, he applied himfelf to the fuly of botany; in the prodecution of which, he examined the momntains of Gommany, and travelied into It:ly; but being wounded in the leg by the kic's of a horfe, died at Rome in $154+$. He wrcte Remarks on Dieforides, and other works.

C' $/$ RDW AINERES, orCorDinIRs, the tum whereby the fatutes denominate boomoless. The word is formed from the French cordonier, which ITEnage derives from corcluan, a kind of leather brought from Cordona, wherenf they formonly made the unper-
Von. V. Part II.

## C O R

leathers of their floes. Others derive it from corte, Cones. "rope," becaufe anciently floges were made of cords; ——rm as they flill are in fome parts of Spain, under the name of alpargites. But the former etymulogy is better warranted: for, in cffect, the French workmen who prepare the corduas are atill called cordoumaiers.

In Paris they have two pious focietics uader the tithes of fieres cordonners, "brothers froemakera," eftablithed by authority towards the midate of the izth "see C.if. ceritury; the one under the protection of St Crifpin*, fir. the other of St Crifpianus, two faints who had formerly honoured the profffion. They live in community, and under fixed thatutes and officers; by which they are directed both in their firitual and fecular conccrus. The produce of their fhoes goes into a common ltock, to furnifh neecfarics for their fupport; the reft to be diftributed among the poor.

COREA, a peninfula lying to the north-ealt of Clina, betwcen 99 amd 109 degrees of F.. Long. and between 32 and 46 of N. L.at. It is divided into 8 provinces, which contain 40 cities of the attank, 5 I of the 2 d , and 70 of the 3 d . The capital of the whole is Hanching, where the king refides. The Jefuits fay, the people are well made, of a fweet and trac. table difpolition, and fond of learning, mufic, and dancing, and in general refemble the Chinefe. Their loufes are mean, bcing covered with thatch; and they have no beds, but lie on the floor. They have little filk, and therefore make ufe of linen-cloth in ins room. Their trade confilts in white paper, pencils, gingfent. gold, filucr, iron, gellow varnith, fouls whofe taile are three feet long, hotfis no more than three fect in height, fable-flins, caftor, and mineral falt. In general it is a fertile country, tho' abounding in mountains. It is tributary to Clhina.

Mr Grofier relates in ohfervation conce:ning the natural hittory of Corca, which, in his opinion, furnithes a new proof of the revolutions which the furface of our glebe has endergone. An ancent Chinef, book aflerts, that the city where Kipé, the king of Corea, eftablinned his court, was built in a place which forms at prefent a part of the territories of rong-ping-fou, a city of the firft clafs in the province on Petchchi. "If this (fays he) be admitted as a fact, we may from thence conclude that thefe territorics formerly belonged to Corea; and that the grolf of Lax-tong, which at prefent deprates this kingdom from the province of Pctcheli, did not then exilt, and that it has been formed fince; for it is not probable that a fovereign would have fized his refidence without the boundaries of his kingdom, or in a place where he was feparated from it by a wide and extenfive fea. 'Ihis conjecture is confirmed by certain facts admitted by the Chinde. Thus when $\gamma_{i r}$, furnamed the Great, undertook to drain and carry of the waters which had imundated the low grounds of feveral provinces, he began by the river Ifoang-ho, the overflowing of which caufed the greatult devaltation. He went in fearch of its fource to the bofom of Tartary, from Whence he directed its coufe acrofs the provinces of Chan-ft, Chen fi, Fonan, and Petcheli. 'Towards its mouth, in order to weaken the rapidicy of its waters, he divided them into nine channels, through which be caufed this river difcharge itfelf into the eatern fea

## C O R [ 450 ] C O R

near the mountain of Kir-che-chan, which then furmed a promontory. Since that tine to the prefent, that is about 3950 years, the river Hoang ho has departed fo much from its ancient courfe, that its mouth at prefent is about fix degrees farther fouth. We mult alfo remark, that the mountain Kie-che-chan, which was formorly uniked to the main land of Yong-fongfou, ftands at prefent in the fea at the diltance of about 50 leagues to the fouth of that city. If the fea has been able to cover with its waters that extent of territory which at prefent forms part of the gulph of Leatong, may we not be allowed to fuppole that like inundations may have formed fuccelfively the whole of that gulph, the ancient exillence of which feems fo ill to agree with the refidence of the kings of Corea in the territories of Yong-ping-fou? It is true, the Clienefe hit?ory makes no mention of fo confiderable a phyfical revolution; but it is equally filent with regard to the 500 lys ( 50 leagues) extent of gromb shich is at prefent covered by the fea beyond the mountains of lieeche-chan. Befides, of all the changes which the furface of our globe experiences, thofe only are mentioned in hiftory which happen fuddenly, and which confequently make more imprefion on the minds of men.

Corea chicfy produces wheat, rice, and ginfeng, with a kind of palm-tree which yields a gum capable of producing a yeilow varmift little inferior to gilding. Hence alfo are exported caftor and fable fkins; alfo gold, filver, iron, and follil falt ; a kind of fmall bruthes for paintinge, made of the hair of a wolf's tail, are likewife manufactured here, which are exported to China and highly efteemed there. The fea-coafts abound in fifh, and great numbers of whales are found there every year towards the north-eaft. Several of thefe, it is faid, have in their budies the harpoons of the French and Dutch, fiom whom they have efcaped in the northern extremitics of Europe; which feems to indicate a paffage from the European into the Afratic feas round the continents of Europe and Afa.

A confiderable quantity of the paper of Corea is annually imported into China: indeed the tribute due to the emperor is partly paid with it every year. It is made of cotton, and is as ftrong as cloth, being written upon with a fmall hair-brufl or pencil; but muit be done over with alum-water before it can be written upon in the Enropean manner. It is not purchafed by the Chincfe for writing, but for filling up the fquares of their fath-windows; becaufe, when oiled, it refifts the wind and rain- better than that of China. It is ufed likewife as wranping paper; and is ferviceable to the taylors, who rub it between their hands until it becomes as foft and flexible as the finelt cotton cloth, inftead of which it is often employed in lining clothes. It has alfo this fingular property, that if it be too thick for the purpofe intended, it may be eafily fplit into two or three leaves, each of which are even flronger than the bsit paper of China.

The Coreans are well made, ingenious, brave, and tractable; are fond of dancing, and flow great docility in acquiring the fciences, to which they apply with great ardour, and honour in a particular manmer. the northern Coreans are larger fized and more robuf than thofe of the fouth? have a tafte for arm,
and become excellent foldiers. Their arms are crolsbows and long fabres. Men of learning are diftinguithed from other claffes of people by two plumes of feathers in their caps; and when merchants prefent the Coreans with any books for fale, they drefs themfelves in their richef attire, and burn perfumes before they treat concerning the price.

The Coreans mourn three years, as in China, for a father or mother: but the time of mourning for a brother is conlined to three months. 'lheir dead are not interred until three years after their deceafe; and when the ceremony of interment is performed, they place around the tomb the clothes, chariot, and horfes of the deceafed, with whatever elfe he howed the greatef fondnefs for while alive; all which they leave to be carried off by the affiltants. Their houfes, as in China, contift only of one fory, and are very ill built; in the country being compofed of earth, and in cities generally of brick, but all thatched with ftraw: the walls of their cities are conllructed after the Chinefe manner, with fquare turrets, battlements, and arched gates. Their writing, drefs, religions ceremonies, and creed, as well as the greater part of their cultoms, are borrowed from the Chinefe. 'Their women, however, are lefs confined, and have the liberty of appearing in public with the other fex, for which they are often ridiculed by their neighbours. They differ from the Chint fe alfo in their ceremonies of marriage, and in the manner of contracting it; the parties in this country taking the lioerty to choofe for themfelves, without confulting the inclinations of their parents, or fuffering them to throw any obitacles in their way.

COREIA, in antiquity, a fetival in honour of Proferpine, named Core, kopn, which in the Moloffian dialect fignifies a beautiful woman.

CORELLI (Arcangelo), the fanous Italian mufician and compofer, a native of Fulignano, in the territory of Bologna, was born in 1653 . He entertained an early propenfity to the violin; and as he advanced in years, laboured inceffantly in the practice of that inftrument. About the year 1672 , his curiofity led him to vilit Paris, probably with a view to attend the improvements which were making in mulic under the influence of cardinal Mazarine, and in confequence of the eftablifhment of a royal academy; but, notwithftanding the character which he brought with him, he was driven back to Rome by Lully, whofe jualous temper could not brook fo formidable a rival as this illullrious Italian. In the year 1680 he vifited Germany, and met with a reception fuitable to his merit from moft of the German priaces, particularly the elector of Bavaria; in whofe fervice he was retained. and continued for fome time. After about five years ftay abroad, he returned again to Rome, and there purfued his ltudies with great affiduity.

The proficiency of Corelli on his favourite inftrument the violin was fo great, that the fame of it reached throughout Eutope. The ftyle of his performance was learned, elegant, and pathetic; and his tone firm and even. Mr Geminiani, who was well acquainted with, and had ftudied it, was ufed to refembie it to a fiveet trumpet. A perfon who had heard him perform fays, that, whilft he was playing on the violin, it was ufual for his countenance to be diftorted, his
eves to become as red as fire, and his eye-balls to roll as in an agony.

Corelli was highly favoured by that great patron of poetry and mufic, cardinal Ottoboni. Crefecmbini fays, that lie regulated the mufical academy held at the palace of his eminence every Monday aftumon. Here it was that Mr. Handel became acquainted with him ; and in this acadeny a ferenata of Mr Handel, entitled, Il Trionfo del Tempo, was performed, the overture to which was in a ityle fo new and fingular, that Corelli was confounded iu his firtt attenupe to flay it.

Uning the refiduce of Corelli at Rome, befides thore of his own country, many perfons werc ambitious of becoming his difciples, and leaming the practice on the violin from the greatent mafter of that infrument the world had then heard of. Of thefe it is faid the late lord Edecombe was one; and that the fine mozzutinto priat of Corelli hy Smith was feraped from a picture painted by Mr Hingh Howard at Rome for that nobleman.

Cordli died at Rome in 1713 ; and was buried in the church of the Rotunda, otherwife called the Dantheon, in the firt chapel, on the left lrand of the entrance. Over the place of his interment is a fepulchral monument to his honour, with a marble butt thereon, erected at the expence of Philip-William, count palatine of the Rhine, under the care and direction of cardinal Ottoboni.

For many years after his deceafe, this excellent mufician was commemorated by a folemn mulical performance in the Pantheon, on the amiverfary of his death. In the ycar 1730 an eminent mafter, now living, was prefent at that folemnity, who relates that at it the third and eighth of his concertos were performed by a numerous band, among whom were many who had been the pupils of the author. He adds, that ${ }^{-}$ thefe two pieces were performed in a flow, diftinct, and firm manner, without graces, and juf as they are wrote; and from hence concludes, that this was the manner in which they were played by the author him. felf.

He dicd poffeffed of about 60001 . Aterling. He was a paffionate admirer of pictures, and lived in an uninterrupted friend 11 p with Carlo Cignani and Carlo Marat : thefe two eminent painters were rivals for his favour ; and for a feries of years prefented him at times with pictures, as well of other mafters as of their own painting. The confequence was, that Corelli became poftefled of a large and valuable collection of original paintings; all which, together with the fum above mentioned, he bequeathed to his dear friend and patron eardinal Ottoboni, who, referving the pietures to himfelf, generounly diftributed the reft of the effects among the relations of the teftator.

Corelli is faid to have been remarkable for the mildnefs of his temper and the modefty of his deportment : neverthelefs, he was not infenfible of the refpect due to his kill and exquifite performance. Cihber, in the Apology for his Life, p. $3+0$. relates, that when he was playing a folo at cardinal Ottoboni's, he difcovered the cardinal and another perfon engaged in difcourfe, upon which he laid down his indtrument; and being afked the reafon, gave for anfwer, that he feared the mufic interrupted their converfation.

The compofitions of Corelli are celcbrated for the hamony relulting from the mion of all the parts; but the finenels of the airs is another diftinguifhing characturitic of then : the allemand in the noth folo

Carelis Corfu. is as remarkable for fpirit and foree, as that in the IIth is for its cnchanting delicacy: his jigs are in a ftyle peculianly his own ; and that in the 5 th folu was never equalled. In the gavot-movements in the ad and th $^{\text {th }}$ operas, the melody is dillibuted with great judgmen: among the feveral parts. In his minnets alone he feems to fail ; Dononcini, Mr Handel, and Giufeppe Martini, lave excelled him in this kind of airs.

It is faid there is in every nation a ftyle both is fpeaking and writing, which never becones obfolete; a certain mode of phrafeology, fo confonant and congenial to the analogy and principles of its refpective languagc, as to remain fettled and unaltered. This, but with much greater latitude, may be faid of mufic; and accordingly it may be obferved of the compolitions of Corelli, not only that they are equally intelligible to the learned and wnearned, but that the inprellions made by then have been found to be as durable in general. His mutic is the language of nature ; and, for a feries of ycars, all that heard it became fertible of its eflects: of this there cannot be a ftronger proof than that, amidll all the innovations which the love of changre liad introduced, it continued to be perfurmed, and wats heard with delight in churches, in thedtres, at public folemnities and fellivities, in all the citics of Europe for near 40 years. Men remembered, and would refer to paffages in it as to a claffic author; and even at this day, the mafters of the feience do not henitate to pronounce of the compolitions of Corelli, that, of fue harmony and clegant modulation, they are the moll perfect examplars.

COREOPSIS, tickseeded sunflower: A genus of the polygamia frultanea order, belonging to the fyngenefia clalis of plants; and in the natural method ranking under the 49 th order, Compofta. The receptacle is paleaceus; the pappus two-horned; the calyx ercet and polyphyllous, furrounded with patent radiated leaflets at the bafe. There are in fpecies, moft of them herbaccous perennials. They are very flowery, and rife from three to cight fect thature; terminated by clufters of compound radiated flowers of a yellow colour. They have all perennial fibrous roots, and annual ftalks, which rife in the fpring, Hower from July to October, and deeay to the rout in November. The flowers are all thaped like fun-flowers, but fmaller, and are very ornamental. They are eafily propagated by lipping or dividing the roots in autumn, when the Italks decay; planting the lips at onee where they are to remain; after which they will require no farther trouble than to be kept free from weeds, and have the decayed falks cut amually in autunm.

CORFE-castle, a borough-town in Dorfethaire in England. It takes its name from a lhong calte, belonging to the crown, that Hood there, but is now ruined. It fonds two members to parliament. W. Long. 2. 8. N. Lat. 50. 33 .

CORFU, an illand in the Ionian fea, at the mouth of the gulph of Venice, formerly cafled Corcyra and Phacia, famous for the gardens of Alcinous. It be312
longs

## C OR $\mathrm{R} 4 ; 2] \quad \mathrm{C} O \mathrm{R}$

6mf. longs at prefent to the Venctians: and foms the but. the inand of Cyprus uprords of 700 years aro; and wark of Chritendom agant the 'lurks, who have often attempted to reduce it, hut without fiecels. It is uell fortified, and has 50 eaftles; and the number of the inhabitants is laid to be about 50,000. The intrebstants are of the Greek church; and the Vemetims fiend them arovernorand magiftrates, whicharechangedevery two years. 'The foil is very fruitful, and produces a great deal of wine, olives, and feveral other fruits, particularly figs, which are exceedingly good. The chief city is likewife called Corfu; fee the following article.

Corfu, a city of the ifland of that name, bulunging to the Ventians. It is a large place, flrongly fortified and defended by a garrifon of about $10,000 \mathrm{men}$; which, however, in the upinion of a late traveller, do nut appear adequate to the extent of the fortifications. A number of vely excullent brais and iron cannon are mounted on the different forts, which, he obferves, are fo divided, that it would take treble the number of their sarrifon to dafond them. However, the republic of Fenice is generally at peace with the different European nations, and the ancient power of the Turks being inuch decared, they have lithe to apprehend; tho' to prevent any fudden lurprife, the Venetians keep a formidable fyuadron in the harbour of Corfu, and the worke have been much improved by Major General Paterion. - In the late war they had with the 'Iurks, this town was attacked by an anny of 80,000 men, and attempted to be ftormed fereral times ly the ene$m y$; but the garrifon, which confitled of $12,000 \mathrm{inen}$ under the command of Count Schuknburg, made fo brave and gallant a defence, that they always repulfed them, and obliged them to raife the liege, and abandon the place with confiderable lofs. For this piece of fervice the republic has caufed a magnificent datue to be erected in memory of the Count, with an elegant Latin infeription, fetting forth the many emihent fervices of his military atchierements. The circumference of the city is about four mil.s; the numtor of inhabitants on the whole ifland are computed at about 50,000 , the greatet part of whom are Greeks.

This inand is the refidence of the governor-general, whufe juriddiction extends over all the inands lubject to the republic of Venice, in the Levant feas, and is conlidered as one of the greatelt homours they can confer on a lubject. He is alwass a nobleman of the firit rank, and has his appointment for three years only, in which time he makes a tolerable additiou to his fortime, and on his return to Venice is generally advanced to the honours of the fenate. In the city are many landfome Greek churches, the principal of which is that of St Speridione, or the cathedral: It is embellithed with fome excellent paintings, and molt fuperbly ornamented. The body of the faint from whom it was named, is preferved entire in a rich fhrine within the church. The Grecks are molt of them fuch fanatics as to be cominually offering their devotions at this fhrine, believing that through the intercefion of the faint they will obtain all their wants; and that by offerings of money their lins will be forgiven them; by which means the church has amaffed an immenfe treafure. The relic of the faint is depolited in a filver coffin, richly decorated with precious itones. It is in an amazing thate of preferation; he having died in atu: remanins +20 years there, was twnported to this piace. Betrile the grand lleet, the Vemetians have ancother of galleys, that are manned by convi各s whole crinces are mot of fuch a nature as to manit death. The chief divertions of this place in the winter are operas; they have always a company of comedians for the feafon from Naples. In the fummer they pafs their time in walking upon the ramparts: few except the governor and great oficers of ftate are permitted to kecp carriages. The Corfu people perfectly refemble the Zanteots in their manners (fee Zanre) ; though it mult be obferved in praife of the former, that aftafInations are uncommon among them, their laws being too fevere to permit fuch practices with impunity. L. Long. 19. 48. N. Lat. 30. 50.

CORIA, a town of Spain, in the kingdom of Leon and province of Eltremadura, towards the confines of Fortugal, with a bifhop's fec. It is feated on a little river called Alugon, in a very fertile plain. There is nothing remarkable but the cathedral chuch, except at a little diftance a river without a bridge, and a bridge without a river. This was caufed by an earthquake, which turned the river another wisy. IV. Long. 6. q/ N. Lat. 39.59

CORIANDRUM, CORIANDER: A genus of the degnie order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Umbillotic. The corolla is radiated; the petals inflextd-emarginated ; the involueram univerfal and monophyllous; the partial involucra halved; the frut Pherical. There are only two fpecies, both of them herbaceors annuals, the leaves of which are ufful for the kitchen, and the feeds for medicine. Buth fpecies have divided fmall leaves, fomewhat refemhling partley: but there is but one fpecies generally cultivated; namely, the futivum. This hath a fmall fibrous white root, erowned by many parted leaves, having broadifh fegments; and in the centre an upright, round, branehy dtalk, two feet high, having all the branches terminated by umbels of Howers, which are fueceeded by globular fruit. It is propagated by feed, which when a good crop is wanted, ourght to be fown in Marcl, either in drills a foot alunder, or by broadcalt, and then raked $i n$. When the plants are an inch or two high, they hould be hoed to fix or eightinches diftance. The feeds when frefh have a flrong difagreeable frinell, which improves by drying, and becomes fufficiently grateful: they are recommended as carminative and ftomacbic. They are alfo much ufed by the brewers both in England and Holland, to give a flavour to their trongeft beer. The ancients had a notion, that the juice of coriander would deprise people of their fenfes, and even of life. The leaves are fome. times ufed for culinary purpofes in foups, and as an. ingredient in falads; but as they are of a fetid fnell, they are held in no great efteem in this country.

CORIARIA, the Taner's or myrtle-leafol Sumach : A genus of the decandria order, belonging to the diœcia clafs of plants: and in the natural methoid ravking under the 5tth order, Mifeellanes. The male calyx is pentaphyllous; the corolla pentapetalous, very like the calys, and united with it; the antheræ bipartite. The female calyx is pentaphyllous; the corolla. like that of the male; the $\mathrm{Ht}_{3}$ les five, feeds five, cover- whe a like number of fucturnt petals, forming alus gether the refemblance of a berty'. 'I'here are two $i_{1}$ pecies, the myrtifela and the fomina. They are both natives of the fouth of France, but the former is mut commonly cultisated in thas country. It is a pretiy ormanental plont, with a haruby pilhy brown llem, clofely branching from the bottom, and forms a bufly head three or four fect over, thickly garnithed with obbung, puinted, bight green leaves, having fmall fidis of whtith flowers at the erds of the branches. It is calily propacated by fuckers from the root, which it antore's plentifnly, and may be taken off with fibies every autumn or winter. It nater be alfo propagated by layers in autumn, which will take root in a year. It is much weded in the fouth of France, where it naturally prows, for taming of leather, whence its name of tomer's fomazo. It alfo dyes a beautiful black cohur. The beiries are dangerous, and whea eaten generally occation virtigues and eplepfies. The old leaves have the fame ciEct upon cattle that cat them, but the young leaves are imocent.

CURIDOR, or Cokridor, in fortification, a rus 1 or way aloug the edge of the ditch, withont-fide; encompathing the whole fortification. The word comes frome the Italian coridore, or the Spmifh curidor.

It is alfor called the coverteatay; bucaufe covered with a mlacis, or efflanade, ferving it as a parapet. The corider is ahout 20 yards broad.

Coridos is alfo ufed in architecture, for a gal. lery or long ifle around a building, leading to feveral chankers at a diliance from each other, fometimes wholly inclofed, and fometimes upen on one fide.

CORINNA, a Grecian lady, eelebrated for her beauty and poctic taleuts, was born at Theflu a city of Beoutia, and was the difciple of Myrtis another Grecian lady. Her verfes werc fo ttteemed by the Greeks, that they gave her the name of the lyric mufe. She lived in the time of Pindar, about 405 years before Clirilt; and is faid to have gained the prize of lyric poetry from that poet : but Paufanias oblerves that her beanty made the judges parial.

CORINTH, a celebrated city of antiquity, for fome time the mofl illuftrious of all the Greck cities. It is faid to have been fuunded 1514 years before Chrit, by Sifyphus the fon of Eolus, and grandfather of Ulyfles. Varions reafons are given for its name, but moll anthors derive it from Corinthus the fon of le. lops. It was fituated in the fouth part of the Ifthmus which joins the Peloponnelus, now the Morea, to the continent. It confiled of a citadel built upon an eminence, and thence named Acrocorintius; befides which it had two maritime turns fubject io it, named $L_{\text {c }}$ theum and Cinclusa. The whole ftate extendsed farce half a degree in length or breadth; but fo adwartarroully were the above-montioued ports fituated, that they might have gaince the Corinthians a fuperiority, if not a command, over all Grece, had not their advantageons lituation inclined them to commence rather than war. For their citadel was almont impregnable; and, commanding both the Ionian and AEgcan fas, they could eably cut off all communication from oue half of Grece with the other ; for which raton this city was called one of the foters of Silcec.

But as the guids of the Corinthians led them to Corinth. commerce rather than martial exploits, their city became the finell in all Getece. It was adorned with the moll fumptwous buildings, as temples, palaces, theatres, porticoses, $\hat{c}$ c. all of them enriched with a beautiful kind of columns, which from the city were caikd Corimbian. lint though the Corinthians feldom or never engaged in a war with a view of enlarging, but ather of Jufencing, their little atate, they did not forget to cultinate a good difeipline both in time of peace and of war. Hence many brave and expericneed generals lave been fumihed by Corinth to the "ther Grecian cities, and it was not uncommon for the later to prefer a Corinthian general to any of tiocir uwh.
'Mas city coninaed to preferve its liberty till the year before Clain $t^{\prime}$, when it was pillaged and bume by the Ramans. It was at that time the drongeft phace in the whin, but the inhabitants were fo dimeartencd ly a peeceding defeat, and the death of their generah, that they had not prefence of mind enough exin to that their gates. The Roman conful, Munmius, was fo much furprifed at this, that at firl he could fearce believe it ; but afterwards fearing an ambufeade, he advanced with all poffible caution. As he met with no rehitance, his foldiers had nothing to do but de. ftroy the few inhabitants who had not hed, and plander the city. Such of the men as had flaid, were all put to the fword, and the women were fold for flates. After this the city was ranlacked by the greedy foldiers, and the fooils of it are faid to have best immenfe. There were more veffels of all forts of metal, more fine pictures, and fatues done by the greateit matters, in Corinth, than in any other city in the wurld. All the princes of Europe and A fia, who had any talke in painting and foulpture, furnifhed themfelves hare with their richeft moveables: here wore caft the fineft flatues for temples and palaces, and all the liberal arts brought to their greated perfection. Many inellimable picees of the mott famons painters and itatuaries fell into the hands of the ignorant foldiers, who either dehroyed them or parted with them for a trifle. Polybiusthe hiftorian was an eye-witners to this harbarifm of the Romans. Le had the mortification to fee two of them playing at dice on a fanous picture of Arillides, which was accounted one of the wonders of the world. The piece was a Bacchus, fo expuiftely done, that it was proverbilly faid of any extraordinary performance, "It is as well done as the Backbus of Ariflides.". This mattenty piece of painting, however, the joldiers willingly exchanged for a more convenient table to play upon: but when the [poils of Corinth were put up to fule, Attalus king of Purganus offered for it 602,000 fefterces, near 5000 l. of our monty. Mummius yas furprited at fuch a hish price of wod lor a picance, and imagined there muk be fome nagical virtue in it. He therefore interpofil his ambority, and carrid it to Rume, notwithltading the complants of Attalus. Flere this fumons. picture was lodined in the tomple of Ceres, where it was it latt deftroyed by fire, together with the temple. Another extraudinary inlance of the Atupidity of Mummius is, lhat when the pictures were put on board the tranfports, he told the mafters of the vethle very ferion?", that if any of the things were citho:

## C O R

Comer.
cither lon or fpoilded, he would oblige them to find others at their own colt; as if any other picees cou!d have fupplied the lofs of thofe ineftimable originals, done by the greatett maters in Greece. When the city was thoroughly pillaged, fire was fet to all the corners of it at the faine time. The flames grew more violent as they drew near the centre, and at laft unitling there made one prodigious conflagration. At this time the famous metalline mixture is faid to have been made, which could never afterwards be imitated by art. The gold, filver, and brafs, which the Corinthiars had concealed, were metted, and ran down the freets in fleams, and when the flarres were extin. grifhed, a new metal was fourd, compofed of feveral different ones, and greatly etteemed in after ages.

The town lay defolate until Julius Cexar fettled there a Roman colony; when, in moving the rubbilh and digging, many vales were found of brafs or earth finely embofled. The price given for thefe curiofities excited induftry in the new inhabitants. They left no burying-place mexamined: and Rome, it is faid, was filled with the furniture of the fepulchres of Corinth.

Strabo was at Corinth foon after its reftoration by the Romans. He deferibes the fite as follows. "A lofty mounta:n, in perpendicular height as much as three ftadia and a half (near half a mike), the afcent 30 thadia ( $3 \frac{3}{4}$ miles), ends in a pointed fummit called Acrocorinthus. Of this the portion to the north is the moft fteep; beneath which lies the city on a level area, at the foot of the Acrocorinthus. The circuit of the city alone has been 40 ftadia ( 5 miles), and as mueh of it as was unfleltered by the mountain has been walled about. Within the inclofure was comprehended alfo the Acrocorinthus, where the mountain was capable of receiving a wall; and as we afcended, the veftiges were plain; fo that the whole circumference exceeded 85 itadia (near 11 miles). On the other fides, the mountain is lefs fteep, but rifes very high, and is sifible all around. Upon the fummit is a fmall temple of Venus; and below it the fpring Pirene, which does not overflow, but is ahways full of pellucid and potable water. They fay it unites with fome other hidden veins, and forms the fpring at the mountain foor, nunning into the city, and affording a fufficient fupply for the ufe of the inhabitants. In the city is plentry of wells, and in the Acrocorinthus, as they fay, for we did not fee any. There they relate the winged horfe Pegafus was taken as he was drinking, by Bellerophon. Below Pirene is the Sifyphéum, fome temple or palace of white fone, the remains not inconfiderable. From the fummit is beheld to the north Parnafurs and Helicon, lofty mountains covered with frow; and below both, to the welt, the Criffean gulph bounded by Phocis, by Beotia and the Megaris, and by Corinthia and Sicyonia oppofite to Phocis. Beyond all thefe are the mountains called the Oncian, ftretching as far as Bootia and Citheron from the Scironian rocks on the road to Attica." Strabo faw likewife Cleonz from thence. Cenchrere was then a village. Lechxum had fome inhabitants.

New Corinth had flourifted 217 years when it was vifited by Paufanias. It had then a few antiquities, many temples and ftatues, efpecially about the Agora or inarket-place, and feveral baths. The Emperor Hadrian introduced water from a famous fring at

Stymphalus in Areadia; and it had various fountains Cerinth, alike copious and ornamental. The ftream of one iffued from a dolphin, on which was a brazen Neptune; of another, from the hoof of Pegafus, on whom Bellerophon was mounted. On the right hand, coming along the road leading from the marketplace toward Sicyon, was the Odéum and the theatre, by which was a temple of Minerva. The old Gymnafium was at a ditance. Going from the market-place toward Lechevm was a gate, on which were flaced Phaton and the Sun in gilded chariots. Pirene entered a forntain of white marble, from which the current paffed in an open channel. They fuppofed the metal called Corintbian brafs to have been immerred while red hot in this water. On the way up to the Acrucorinthus were temples, flatues, and altars; and the gate next Tenea, a village with a temple of Apollo lixty ftadia, or feven miles and a half ditant, on the rond to Mycen.e. At Lechæum was a temple and a brazen innage of Ntptune. At Cenchree were temples; and by the way from the city a grove of cyprefs trees, Cepulchres, and monuments. Oppofite was the Buth of Hicien, water tepid and falt, fluwing ulentifully from a rock into the fea. Mummius had rained the theatre of Corinth, and the munincence of the great Athenian Atticus Herodes was difplayed in an edifice with a roof inferior to few of the mult celebrated ftructures in Greece.

The Roman colony was referved to fuffer the fame calanity as the Greck cit $\gamma$, and from a conqueror more terrible than Mummius, Alaric the favage deftroyer of Athens and miverfal Greece. In a country haraffed with frequent wars, as the Peloponnefus has fince been, the Acrocorinthus was a palt too confequential to be neglected. It was befieged and taken in 1459 by Mahomet II.; the defpots or lords of the Morea, brothers of the Greek emperor who was killed in defending Conftantinople, refufing payment of the arrears of the tribute, which had been impofed by Sultan Morat in 1447. The country became fubject to the Turks, except fuch maritime places as were in the polfelfion of the Venctians; and many of the principal inhabitants were carried away to Contantinoplc. Corinth, with the Morea, was yielded to the republic at the conclufion of the war in 1698 , and again by it to the Turks in 1715.

Corinth retains its old name, and is of confiderable extent, flanding on high ground, beneath the Acrocorimhus, with an eafy defeent toward the gulph of Lepanto ; the houfes fcattered or in parcels, except in the Bazar or market-place. Cypreffes, among which tower the domes of mofques, with corn-fields, and gardens of lemon and orange-trees, are interfperfed. The air is reputed bad in fummer, and in autumn exceedingly unhealthy: Wheler relates, that from the tof of the Acrocorintluns or Citadel, he enjuyed one of the moft agreeable profpects which this world can afford. He gueffed the walls to be about two miles in compafs, inclofing mofques, with houfes and churches moftly in ruins. An hour was confumed in going up on horfeback. It was a mile to the foot of the lill; and from thence the way was very fleep, with many traverfes. The families living below were much infelted by corfairs, and on cvery alarm Hocked up to the cafle.

According

## C O R

Corinth According to Dr Chandler, Corimth has preferved Coris.
but fuw monuments of its Greek or Roman citizens The chicf remains, he informs us, are at the foutlo
weft corner of the town, and clove the bazat or market; 11 columns fupporting their architraves, of the Doric order, Aluted, and wantiner in height near half the common proportion to the diancter. Within them, toward the weftern end, is one taller, though not entire, which it is likely contributed to fultain the roof. They have been found to be tone, not marble; and appear brown, perhaps from a crult formed on the outlide. The ruin he judges io be of very remote nutiqnity, and a portion of a fabric erected not only before the Grcek eity was deftroyed, but before the Doric order had attained to maturity. He fufpects it to have been the Sifyphemm mentioned by Strabo. North of the Bazar ftands a large mais of brick-work, a remnant, it may be conjectured, of a bath or of the Gymnafium.
The inhabitants are mon of them Chrifians of the Greek church, who are allowed liberty of confcience by the Turks. E. Long. 28. 13. N. Lat. 38. If.

Corinth, (the illhmus of), in the Murea, is a neek of land which joins the Morea to Grecee, and reaches from the gulph of Lepanto to that of Egina. Julins Cefar, Caligula, and Nero, attempted to cut a chaunel through it, but in vain; and they therefore afterwards built a wall acrofs it, which they called Hexamilium, becaufe it was fix miles in length. This was demolifhed by Amurat II, and afterwards rebuilt by the Venetians, but was levtlled a fecond time by Ma. homet II.

CORINTHIAN, in general, denotes fomething belonging to Corinth : thus we fay, Corinthian brafs, Corinthian order, \&c.

Corinthian Brafs. See Brass and Corinthe
Corinthian Order, in architecture, the fourth order of architedure, according to Scamozzi ; but Mr Le Clerc makes it the fifth, being the moft noble and delicate of all the other fisc. Sce ArcuitecTURE, $n^{\circ} 47$.

CORIO (lernardine), an hiftorian, born of an itluftrious family at Milan, in the year a 6 Go. He was fecretary of tate to that duchy; and the Duke of La: vis Storza appointed him to write the hiftory of $\mathrm{Mr}_{\text {- }}$ lan. He died in 1500 . The bell edition of his hiftory is that of 1503 , in folio. It is primed in Italian, and is very farce.

CORIOLANUS (C. Marcius), a famous Roman eaptain, took Corioli a town of the Volfci, whence he had his furname : at laft, difgulting the people, he was banifhed Nome by the tribune Decins. He went to the Volfci, and, perfuading them to take up arms againft the Romans, they encamped within four miles of the eity. He wonld not liften to propofals of peace till he was prevailed upon by his wile Veturia, and his mother Volumnia, who were followed by all the Roman ladies in tears. He was put to death by the Volfci as a traitor that had made them quit their conqueft: upon which the Roman ladies went into mourning; and in the fame place where lis blood was fpilled there was a temple confecrated to Feminine Virtue.

CORIS, in botany: Agenus of the monogynia order, belonging to the pentandria clafs of plants; and in the

## 455 ] C O R

natural method ranking with thofe of which the order is doubtful. The corrolld is monopetaluss and itrecsular ; the caly x prickly; the eapfule quinquevalved fuperior. Thare is ouly one fpecies, aia. the moafpelientis, or blue maritime coris. Tlare are two varieties of this plant, one with a red, and the olloer with a white fower; but thefe are ordy accideutal, and arife from the fane feeds. They grow wild atout Montpelier, and in molt places in the fouth of France: they feldom frow above fix inches high, did 「pread near the furface of the ground like heath; and in Junc, when they are full of flowers, make a very pretty appearance. They may be propagated by fowing their fecds in a bed of fieth earth, and afterwands removing the youns plants, fome into pots, and others into a warm bosder. They generally bear our winter colls well enough, but fevere frofts will fometimes deflroy them: for which reafon it is proper to keep fome of them in pots, which thould be put under a hot-bed frame in winter. As they feldon produce good feeds in this country, thiey may, in want of thefe, be propagated by lips and cuttings, which will take root if planted on a very gentle hot-bed, maded from the fun, and duly watered.

Coris is alfo ufed in the Eaft-Indies for a kiud of mells which pafs for money.

CORISPERMUM, TICKSEED: A genus of the digyuia order, belonging to the monandria clais of plants; and in the natural method ranking under the azth order, Holoracas. There is nocalyx ; two petals, and one oval naked feed. There are two fpecies; but none of them are remarkable for their beauty or any other quality.
CORITANI, (anc. geog.) a people of Britain, oceupying widely the inland parts, as Northampton, Leicelter, Rutland, Lincoln, Notlingham, and Derby
fhires, (Camden).

CORK, the bark of a tree of the fame name, a fpecies of Quereus. See Quercus.

To take off the bark they make an incition from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the firt. When Ilripped from the tuee, which does not therefore die, the baik is piled up in a pond or ditch, and loaded with heary fones to flatten it, and reduce it into tables: hence it is taken to be dried; and when fufficiently dry, put in bales for carriage. If care be not taken to frip the bark, it fplits and peels of itfelf: being puthed up by another bark formed underneath.

The bark of cork, as well as the acorn, are of fome ufe in nedicine; being both reputed aftringents, after being burnt and powdered when ufed externally; but the chief employ of the former is, to put in hoes, nippers, \&c. and to ftop bottles. The Spaniards burn it to make that kind of light black we call Spanifs black, ufed by painters. Cups made of cork, are faid by fome to be good for hectical perfons to drink out of. The Egyptains made coffins of cork; which being lined with a refinous compofition, prefer ved dead bodies uncorrupted. The Spaniards line ftone-walls with it, which not only renders them very warm, but corrects the moifture of the air.

Fofll-Gorx, a name given to a kind of Atone. It feems to be a fpecies of amianthus, confifting of Hexi-

Cor is
Corts.

## $\mathrm{COR} \quad[4: 6] \quad \mathrm{COR}$

Cuis. bie fibes lonfely interwoven, an! fomewhat refembling vegetable cork. It is the dighteft of ali lanes; by fire it is fafible, and form a black ghafs. It prifeftes the general qualities of amianthus. See that article.

Cors, in Latin comitatus Corcagialis, a connty of the province of munlter in Ireland. It is the man populous and confiderable county of the kingdom nest to that of Dublin ; containing near a million of acres, and being divided into 15 baronics. It is bounded on the north-eat by the county of Waterford ; on the welt by Kerry ; by Limeric on the north; and by the fea on the fouth and fouth-eaft. Including Defmond it is 85 miles in length and 50 in breadth; bue is vety uncqual both way's. 'I'hough a confiderable part of the country is borgy, mountainous, and barren : yet by the induitry of the inhabitants it is pretty well cultivated and improved, and contains feveral good towns and harbours.

Cors, a city of Ireland, and capital of the county of that name. It is an epifcopal fee; and is the largett and moft populous of any in the kingdom, Dublin alone excepted. It is fituated on the river Leee, 15 miles from its mouth. It is a place of great trade, the harbour here being one of the linelt in the world. Though fmaller veffels can come up to the key. yet the larger generally ride at a place called Paflage. 'This city, together with its liberties, makes a county. It was built, or rather fortified, by the Danes, in the ninth century. The greate: part of it llands on a marky ifland furrounded by the river Lee, which ation runs through the city, and divides it into feveral canals. On this account fome have thought the air very moif and unwholefome. Complaints have alfo been made againft the water as impure; but, from comparing the bills of mortality with thole of cther cities, it appears that the city of Conk is far from being uahealthy: This hath been acconnted for from the influx of the tide, by which a itagnation of air is prevented. The fartt charter of Cork was beftowed by Henry III. and afterwards ratified by Edward I. Edward II, and Edward III. Edward IV. granted a new charter ; and the city received many favours from the fucceeding monarchs. King James I. gave the citizens a new and ample charter; and king Charles $l$. what is called the Great Charter, by which, among others, a claufe in king Janes's charter was enforced, making this city a county of itfelf. The fee of Cork is reputed worth L. 2 ;00 a-year. The chapter confits of a dean, chanter, chancellor, treafurer, archdeacon, and twelve paebendaries. The church is dedicated to St Barr or Finbarr ; and the diocele is diviled into five deanerics. There is very little to be found in ancient writers concerning the foundation of the Cathedral of Cork; jet it is generally aferibed to St Barr in the feventh century. Many of its bifheps have been great benefactors to it. Throngh length of time, the chuch became quite ruinous; but it hath lately been completely rebuilt, and is now an elegant modern ftrmeture. To defray the expence, the pailiament laid a tax on all coals confumed in the city of Cork. The deanery is reputed to be worth 1.400 a-yen.

Cork is much improved and enlarged, feveral hroad ftreets have been lately added, by filling up the canals that formeny an through them, and are now built up with elegant houfes; the parade is very fpacious, $\mathrm{N}^{\circ} \mathrm{g}_{2}$.
and is adorned with an equeftrian flatue of king George II. It hath the lareef exoret in the king. dom, particulally of betf, hidez, tallow, butter, tifh, and other provilions. It is partly fituated on fevera? ifands, formed by the river Lee, which are hanked and puayed in, fomewhat like the towns in Ifolland: and partly on rifing grounds, on the north and fouth dides of the river. The earl of Marlborongt belieged and took it from king James's army in $16 g \circ$; when the duke of Grafton, who terved as a volanteer, was flain in an actack. It contains about 8600 houfes, and upwards of 70,000 inhabitints. It hath twelve companies of foot quartered in the barracks. Befides a ftately cathedral, built from the foundation, between 1725 and 1735, by the produce of a duty upon coals, as above noticed, it is adorned with feveral handfome parifh churches. It has alfo an elegant exchange for the merchants, a new and beautiful cultom-houfe, a town hall, feveral fine hofpitals, and various other public Aructures. The city poffeftes an annual revenue of about 13001 . out of which the mayor enjoys for his falary and the fupport of his dignity 5001 . The wealth and grandeur of Cork arife fium its capacious and commodious haven, where almoft any nurber of Thips may lie with eafe and fafety. According to rome accounts, when there has been no war, 1200 veffels have reforted hither in a year. Ships from England, bound to all parts of the Welt Indies, take in here a great part of their provilions; and on the fame acconnt the haven of Cork is vifited by thofe alfo of mott other nations. The nlaughtering feafon continues from the month of Auguft to the latter end of January; in which fpace it has been computed, that they kill and cure feldom fewer than 100,000 head of black cattle. The reft of their exports comlift of butter, candles, hides raw and tanned, linen cloth, pork, calves, lambs, and rabbit-Akins, tallow, wool for England, linen and woollen yarn, and woitted. The merchants of Cork carry on a very extenfive trade to almoft all parts of the known world; fo that their commerce is annually increafing. The produce of the cuftoms fome years lince exceeded 60,0001. and the number of thips that they employ is double to what it was forty years ago. The only thing that feemed to be wanting to the fecurity of the port of Cork was fupplied in the earl of Chotertield's memorable adminittration, by building a fort on the great ifland, to command the entrance of the haven. The outlets of Cork are cheenful and pleafint. The conntry around the city, on both fices of the river, is hilly and picturefque; and the harbour called the Cone, is one of the belt in the world; the entrance is fafe, and the whole navy of England might ride in it, fecure from every wind that blows. Ships of burden, howerer, are cobliged to unload at Puffage, live miles and a half from Cork, the chantl not dimitting velfels of above 150 tone.

CORK Fack', or IWajacoat, is an invention of one Mr Duboung, a gentleman very fond of fwimming, but fubject to the cramp, which led him to confider of fome method by which he might enjoy hio favourite divertion with fafety. The wailcoat is sompofed of four picces of cork, two for the breatts and two for the back; each pretty near in length and breadth to the gur ters of a waincoat without Anps; the

C O R [
the whole is covered with coarfe canvas, with two holes to put the arms throngh: there is a fpace left between the two back-pieces, and the fame betwixt ead back and brealt-piece, that they may fit the catier to the body. Thes the waincoat is only open before, and may be faltened on the weater with Ruinga, or, if it hould be thourht more lecure, with buckles and leather ftraps. This waillcoat does not weigh aloove 12 ounces, and may be made up for about 5 or 6 thillings expence. Mr Duburg tried his wailtcoat in the Thancs, and found that it not only fupported him on the water, but that two men could not fink him, tho' they nfed their utmoft efforts for that purpofe. If thofe who ufe the fea occafionally, and efpecially thofe who are obliged to be almof conitantly there, were to have thofe wailtcoats, it would be next to imporfible that they frould be drowned. It would allo be of valt fervice to thole that, for the fake of health, bathe in the fea; and even the moll delicate and timorous young lady might by the help of one of there jackets venturc into a rough fea. See Atk-Yuahet, and B.sмдоо-Hal't.

Cormandel.. See Coromandel.
COR-MASS, the name of a grand procerion, faid to bave heen eftablifhed at Dunkirk during the dominion of Charles $V$. and renewed on St John's day, the twenty-fourtly of Jure. After the celebration of high mafs, the proceffion, confitting of the feveral tradefmen of the town, begins. Exch perfon has a burning taper of wax in his hant; ; and after each company comes a pageant, followed by the patromfaint, ufually of folid filver, richly wrought and adorned. The companies are followed by mufie; and after the mulicians, the friars in the habits of their order, the fecular priefts, and then the abbot magnificently adorned, and preceded by the hoft. Machines likewife of various fantaltical forms and devices, and as variouly accoutred, form a pat of the flow on this occifion; which is deferibed as one of the molt fuperb and magnificent in the world, by an eye-witnefs, in 1755 .

CORMORANT, a corruption of corvorant, in or. nithology. See Pelicanus.

CORN, in country affairs, the grain or feeds of planes feparated from the fica or ear, and ufed for making bread.
There are feveral fpecies of com, fuch as wheat, rye, and barely, willet and rice, oats, maize and lentils, peale, and a number of other kinds; each of which has its ufefulnets and propricty.

Europe, in every part of it; Egypt, and fome other cantous of Africa, particularly the coatts of Barbary; and fome parts of America cultivated by the Europeans, paticularly New England, New France, and Acadia; are the places which produce corn. O ther commies have maize and rice in lien of it ; and fome parts of America, both in the iflands and continents, limple ronts, fuch as potatoes and manioc.Egypt was anciently the molt fertile of all other countrics in corn; as appears both from facred and profane hillory. It furmithed a good part of the people fubject to the Roman empire, and was called the dyy nurfe of Rome cand Holy. Britain, France, and Poland, feem now in the place of Egypt, and with their fuperfluities fupport a good part of Europe.

For the firt difcovery and culture of corn, authors Vol V. Part 11.
are much divided: the common opinion is, that in the firlt ages men lived on the fpontancous furits of the earth; as acorns, and the nut or malt produced by the beech; which, they fay, took its rame fagus, from the Greck $f * y^{3}, I$ art. It is added, that they had not either the ufe of corn, nor the art of prepa. ring or making it eatable.

Cures has the credit of being the firt that howed the ufe of corn, on which account the was placed among the gody; others give the honour to 'rimote. mus; others hare it between the two, making Ceres the firlt difooverer, and Triptolemns the firf planter and cultivator of corn. Diodorus Siculus afcibes the whole to Ifis; on which Polydore Virgil ohferves, he dots not differ from the reft; Tis and Ceres being in reality, the fame. The Athenians pretend it nas among them the art began; and the Cretans or Candiots, Sichians, and Egyptians, lay clain to the fame. Some think the title of the Sicilians bett \{upported, that being the ccuntry of Ceres: and authors add, f:e did not teach the fecret to the Athenians, till the had fint inftructed ber own comerymen. Ohhers fay, Ceres pafled firlt into Atrica, thence into Cirte, and, lat of all, into Sicily: many of the learned, however, maintain it was in Esypt the ant of cultivating corn finf began; and it is certain there was corn in Egypt and the Eaft long before the time of Ceres.

Conn is very different from fiuits, with refpect to the manner of its prefervation ; and is capable of be. ins preferved in public granarits, for prefing occafoons, and of being kept for fiveral centuries. - A litthe time after the fiege of Mutz, mater IIenry II. of France, in the year 1578 , the due d'Eppernon laid up valt ftores of corn in the citadel; which was preferved in good plight to the year 1707, when the French king and his retinue, paffing that way, eat bread baked thereof.

The chief thing that contributes to the prefervation of corn is, a cruat which forms on its furface, Ey the germination of the grain next underncath, to the thicknefs of an inch and a half. On that at Meiz people walked, without it giving the leall way. At Sedan was a granary cut in a rock, whercin a heap of corn was preferved a hundred and ten years: it was covered with a crult a foot thick.

For the prefervation of corn, the firft method is to Jet it remain in the fpike; the enly expedient for conveying it to the iflands and provinces of America. The inhabitants of thofe countries fave it in the ear, and raife it to maturity by that precaution : but this method of preferving it is attended with feveral inconveniences among as; corn is apt to rot or fpront, if any the leat moilture is in the heap; the rats likewife infell it, and our want of haw atfo obliges us to feparate the grain from the ear. The fecond is to turn ont and winnow it frequenty; or to pour it through a trough or mill-hopper, from one lloor to anotner; being thus moved and aired every 15 days, for the firft 6 inonths, it will require lefs labour for the future, if lodged in a diy place: but if, throurh neglect, mites thonld be allowed to 月ide into the heap, they will foom reduce the corn to a lieap of duft: this mult be avoid. cu by moving the corn anew, and rabbing the places adjacent with oils and herbs, whofe ftrong od mar may chace thern away; for which garlic and dorarf-elder 3M
are

## C O R [ 458$] \quad \mathrm{C} O \quad \mathrm{R}$

are very effectual : they may likewife be expofed to the open fun, which immediately kills them. When the corn has been preferved from all impurities for the fpace of two years, and bas exhaled all its fires, it may be kept for 50 or even 100 years, by lodging it in pits coered with ftrong planks, clofely joined together: but the bafer way is to cover the heap with quicklime, which fould be diffolved by fprinkling it over with a fmall quantity of water; this caufes the grains to hoot to the depth of two or three fingers; and inclufes them with an ineruftation, as above mentioned, threugh which neither uir nor infeets can pesetrate.

Imbian Cok. or maize. See Zfa.
Cor:-Butcerit, method of dettroying it. See Agricilture, ho 80
Cokw-Crake. Sce Pallus.
Corn-Mill, a waterengine for grinding of corn. See Mechanics.
CORNS, in furgery, hard excrefeences, confiting of indurations of the $\mathbb{k}$ in arifing on the toes, and fometimes on the fides of the feet, where they are much expofed to the preflure of the fhoes. By degrees they prefs themfelves farther down between the mufenlar fibres on thefe parts, and by their irritation oceafion extreme pain. Many eures have been prefcribed, hut the total removal of them is always found to be attended with great difficulty. It has been reeommended to foften them with platters, and then to pull them up by the roots, to apply cauftic, \&ic. A piece of raw beef laid on by way of plafter, and frequently hifted, is alfo faid to be effectual; but the beft cure is to bathe them frequently in warm warer, and pare away as much as poffible of the indurated flin without drawing blood.

Corn, in farriery. See Farriery.
CORNAGE, an anciene tenure, the fervice whereIf was to blow a horn when any invafion of the Scots was perceived. This tenure was very frequent in the northern countics near the Picts wall; but by flat. 12 . Car. II. all tenures are converted into free and common focage. - An oid rental calls cornage, mertgeldt, q. d. neat-gred. Lord Coke fays, in old books it is called borvgeld.

CORNARISTS, in ecclefiattical hiftory, the difciples of Theodore Connhert, an enthuliaftic fecretary of the flates of Holland. He wrote at the fame time againft the Catholics, Lutherane, and Calvinifts. He maintained that every religious communion needea reformation; but he added, that no perfon had a right to engage in accomplifhing it, without a miffion fupported by miracles. He was alfo of opinion, that a perfon might be a good Chriftian without being a member of any vifible ehurch.

CORNARIUE, or Haguenent, (John), a celebraled German phyfician, born at Zwickow in Saxony, His preeeptor made him change his name of Haguenhot to that of Conarius, under which lee is moft known. At 20 yars of age he taught granmar, and explained the Greek and Latin poets and orators to his feholars; and at 23 was licentiate in medicine. He found fault with mont of the remedies provided by the apotheearics; and obferving, that the greatelt part of the phyficians taught their pupils only what is so be foud in Avicenua, Rafis, and the other Arabian
phyficians, he carefully fought for the writings of the belt phyficians of Greece, and employed about 15 years in tranflating them into Latin, efpecially the works of Hippocrates, Aetius, Eginetes, and a part of thole of Galen. Meanwhile he practifed phyfic with reputation at Zwickow, Francfort, Marpurg, Nordhaufen, and Gena, where he died of an apoplexy in 1559, aged 58. He alfo wrote fome medicinal treatiles; publifhed editions of fome poems of the ancients on medicine and botany; and tranflated fome of the works of the fathers, particularly thofe of Bafil, and a part of thofe of Epiphanius.
CORNARO (Lewis), a Venetian of noble extrac. tion, memorable for having lived healthful and aetive to above 100 years of age by a rigid courfe of temperance. By the ill conduct of fome of his relations lie was deprived of the dignity of a noble Venetian; and feeing himfelf excluded from all employments under the republic, he fetiled at Padua. In his youth, he was of a weak conllitution; and by irregular indulgence reduced himfelf, at about 40 years of age, to the brink of the grave, under a complication of diforders; at which extremity he was told that he had no other chance for his life, but by becoming fober and temperate. Being wife enough to adopt this wholefome counfel, he reduced himielf to a regimen of which there are very few examples. He allowed himfelf no more than 12 ounces of food and 14 ounces of liquor each day; which became fo habitual to him, that when he was above 70 years of age, the experiment of adding two ounces to eacll by the advice of his friends, had like to have proved fatal to him. At 83, he wrote a treatife which has been tranflated into Englifh, and often printed, intitled, Sure and certain Methools of attaining a Long and Healtbful Life; in which he relates his own flory, and extols temperance to a degree of enthufialm. At length, the yolk of an egg became fufficient for a meal, and fometimes for two, until he died with much eafe and compofure in 1566 . The writer of the Spectator, $\mathrm{n}^{\circ} 195$. confirms the fact from the authority of the Venetian ambaffador at that time, who was a defcendant of the Cornaro family.
C.ORNAVII (Ptolemy), a people of Britain, be. ginning in the very heart of the ifland, and extending, to Cheller. Now Waraick, IVoreflir, Saiop, Staffort Ghires, and Chefh:re (Camden).
CORNEA TUNICA, in anatony, the fecond coat of the eye; fo called from its fubitance ref-mbling the horn of a lantern, in Latin cornu. See Anatomy, $n^{\text {¹ }} 142$.
CORNEILLE (Peter), a celebrated French poct, was born at Rouen in the year 1606 . He was brought up to the bar, whiel lie attended for fome little time; but formed with a genius too elevated for fuch a profefion, and having no turn for bufuefs, he foon deferted it. An affair of gallartry oceafioned his writing his firft piece, intitled Melite; which had prodigious fuccefs. Encouraged by the applanife of the public, he wrote the Cid, and the other tragedies that have immortalized his name. In his dramatic works he difcorers a majefty, a ftrength and elevation of genius, farce to he found in any other of the French poets; and, like urr immortal Shakefpeare, feems berter acquainted with nature than with the rules of critics. Corneille was received into the French aca-

## $\mathrm{C} \circ \mathrm{R} \quad[459] \quad \mathrm{C} O R$

corneille demy in 1647 , and died dean of that academy in 1684 , tranflation, in Trench verfe, of the "Imitation of Jefus Chit," \&cc. The bet edition of his works is that of 1682 , in 4 vols 12 mo .
Cornellie (Thomas), brother of the former, was a member of the French academy and of that of inferiptons. He difcovered in his youth a great inclination to poetry; and at length publifhed Several dramatic pieces in 5 vols 12 mo , forme of which were applauded by the public, and acted with fuccefs. He alto wrote, I. Atranflation of Ovid's Metamorphofes, and of fore of Ovid's Epittes ; 2. Remarks on Vauglas ; 3. A Dictionary of Arts, 2 vols folio; and, 4. An univerfal, geographical, and historical Dictionary, in 3 vols folio.
Cornell (Michael), a celebrated painter, was born at Paris in the year $16+2$; and was infracted by his father, who was himfelf a painter of great merit. Having gained a prize at the academy, young Corneille obtained a penfion from Louis XIV.; and was font to Rome, where that prince had founded a fchool for young artists of genius. Having Audied there forme time, he gave up his pention, and applied to the antuque with great cate. He is faid to have equalled Carache in drawing, but in colouring he was deficient. Upon his return from Rome, he was chofen profeffor in the academy of Paris; and was employed by the above prince in all the great works he was carrying on at Verfeilles and Tiianon, where are fill to be feed forme noble efforts of lis genius.

Cornel tree, in botany. See Cornus.
CORNELIA, daughter of Scipio Africanus, was the mother of Tiberius and Caius Gracchus. She was courted by a king, but he preferred being the wife of a Roman citizen to that of a monarch. Her virtues have been defervedly commended, as well as the wholefome principles the inculcated in her two dons. When a Campanian lady made once a flow of her jewels at Cornelia's house, and entreated her to favour her with a fight of her own, Cornelia produced her two fond, [aping, "There are the only jewels of which I can boat."

Cornelia Lex, de civitate, was enacted, in the year of Rome 670 , by L. Corn. Sylla. It confirmed the Sulpieian law, and required that the citizens of the eight newly elected tribes Gould be divided among the 35 ancient tribes. -Another, de judiuiis, in 673, by the fame. It ordained, that the prater Mould always obfere the fame invariable method in judicial proceeding, and that the process could not depend upon his will.-A Another, de funptilus, by the fame. It limited the expenses which generally attended funerals.-Anothen, de eeligione, by the fame, in 677 . It cettored to the college of priefts the privilege of chooling the priefts, which by the Domitian law had been lodged in the hands of the people.--A mother, de municipizs, by the fame; which revoked all the privileges which had been forme time before granted to the Several towns that had affifted Marius and Dina in the civil wars.Another, de nusififratious, by the fane; which gave the power of beating honours, and being promoted before the legal age, to thole who lad followed the irterell of Scylla; while the fogs and partizans of his
enemies, who had been proferibed, were deprived of Cornelia the privilege of ilanding for any office in the flare.Another, te magillratibus, by the fame, in 673 . It ordained, that no perron thould exucife the fame office within ten years diffance, of be invelled with two ditGerent magitracies in one year--A another, de magiffatitus, by the fane, in 673. It diverted the tribunes of the privilege of making laws, interfering, holding affemblics, and receiving appeals. All foch as had been tribunes were incapable of holding any other office in the late by that law.- Another, de myjeflete, by the fane, in 670 . It made it treafon to lend an army out of a province, or engage in a war without orders, $t$, influcuce the Folders to fare or random a captive general of the enemy, to pardon the leaders of robbers or pirates, or for the absence of a Roman citizen to a foreign court without previous leave. The punifment was aqua ${ }^{\circ}$ ignis interditio. - Another by the fame. It gave the power io a man accufed of murder, cither by poifon, weapssis, of falfe acculations, and the feting fire to buildings, to choose whether the jury that cried him should give their verdict clam or palm, viva, vogue or by ballot. Another by the fame; which made it aqua $\mathcal{G}$ ignis interdiaio to finch as were guilty of forgery, concealing and altering of wills, corruption, false accufations, and the debating or counterfeiting of the public coin. All fuch as were accellary to this offence were deemed as guilty as the offender.-Another, de pocuniis repetumdis; by which a man convicted of pecsration or extortion in the provinces was condemned to fifer the aqua ennis inierdizio.- Another by the fame; which gave the power to fuch as were feet into the provinces with any government, of retaining their command and appointment without a renewal of it by the fenate, as was before obferved.-Another by the fame; which ordained, that the lands of proferibed perfons thould be common, efpecially thole about Volaterix and Fefulx in Etruria, which Sylla divided among his fuldiers.-Another by C. Cometius tribune of the people, in 686. It ordained, that no person gould be exempted from any law according to the general cuttom, unlefs 200 fenators were prefent in the fenate; and no perfon thus exempted could hinder the bill of his exemption from being carried to the people for their concurtence.-Another by Naffica, in 582 , to make war against Periens, for of Philip king of Macedonia, if he did not give proper fatisfaction to the Roman people.
cornelian. See Cafrelian.
CORNER, in a general fend, the fane with Angle.

CORNET, in the military art of the ancients, an inftrament mach in the nature of a tramper; which when it only founded, the emigns were to inarch alone without the foldiers; whereas, when the trumpet only founded, the oldies were to move without the enlifno. The cornets and buccinx founded the charge and :etreat; and the cornets and trumpet. founded during the comte of the bate. See Plate Cl. .

Cornet, in modern military aconomy, denotes an officer in the cavalry who bears the ensign or colours of a troop.

The comet is the third offer in the company, and commands in the abduce of the captain and liententut. 3M2

## $\mathrm{C} O \mathrm{R}$

Cerceris He takes his tithe from his enfign, which is fquare; and is fuppofed to be called by that name from cornu, becaufe placed on the wings, which form a kind of
points or horns of the army.- Others derive the name from coronet; allering, that it was the ancient cullom for thefe uffecrs to wear coronets or galands on their heads.

CORNEUS, the name by which Limnus calls a kind of tin-ore, fourul in black columns, with irregular fides, and terminating in prifms.

CORNICHE, Cornash. or Cornicf, in architcetare, the nepermolt member of the cntathature of a column as that which crowns the order. See Architectere, Chap. I. and the Plates.

Corviche, is alio ufod, in genemal, for ail lite projectures in nafomy or joinery, twen where there are no columns, as the cormiche of a chimney, beatufit, Ec .

Corntche. Find a piece of ordnarce, is that next from the mazsle-ing, backward.

CORNICULiARIUS, in antiquity, an officer in the Roman armer, whofe bufinefs was to aid and afint the military tibume in quality of a lientenant.

The cormiduriil went the rouncs in lien of the trihune, vified the watch, and were nearly what the aids major are in the French almy.

The denomination cornialurits was given them from a litile hurn, calied cornicoun, which they nied in giving orders to the foldiers: though Salmatus derives it from cormialum, the crelt of an head-piece; it heing an obfavation of Pliny, that they wore iron or Erafs horas on their helnets; and that thefe were called cornitula.

In the $\mathrm{N}^{\top}$ ditin Interit we find a kind of fecetary or regiter of the fame name. His buinefs was to attend the judge, and enter down his fentences and decitions. The eritics dative the word, in this fenfe, from corniculun, a litele horn to put ink in.

CORNICULUM (anc. geog.), a mown of the Sabincs, to the calt of Crutumerium, towards the Anio. It was burnt down by Tarcuin; but reftored again, after the - pthion of the kags, "Florus). Now in ruins, called il ilonse Ge:nars, (Helftenius).

CORNISH mamosn, a mome given by many people to the crytals found in diging the mines of tin in Cornwall. Sec Corxwal, p. 4 Gz. col. 2.

CORNIX, in ornithology, the trivial rame of a spacies of Corves.

CORNU. See Horr.
Cokve Ammonis, in natural hidory, foffie falls, called alfo Jerpent-ftenes, or jume-fores.
They are found of all fizes, from the breadth of a fixpence, to more than two fect in diameter; fome of thom rounded, others greatly compreffed, and lodged in different frata of thones and clays; forme again are fnuoth, and others sidged in different manners, their ftrix and ridges heing cither ftaight, irregularly crooked, or undulated. See $S_{\text {vaske }}$ Stone.

Corm Ceteri. Sce Hartshoris.
CORNUCOPIA, among the ancient poets, a horm out of which proceced plenty of all things; by a pa:ticular privilege which Jupiter granted his nufe, fuppofed to be the groat Ama'thea. 'The fable is thus interpreted: That in Lubi. there is a little tervitory Shaped not unlike a bullick's hoon, crecediug fertile,
given by king Ammon to hia daughter Amalthea, Cornuco. whom the poets leign to heve been Jupiter's nurde.

In architecture and fculptuse, the cornucopia, or horm of plenty", is reprefonted under the figure of a large horn, out of which iliue fruits, flowers, \&c. On medals, $F$. Junbert oblerves, the cornucopia is given to all deities.

CORNLCOPI EE, in botany: A genus of the digynia order, beloncing to the triandria clafs of plants; and in the natural method ranking under the $f$ th order, Graminu. The iavolucrum is monophyllons, fun-nel-fhaped, crenatecl, and multiflorous; the calyx bivalved; corolla one valved.

CORNUS, Cornel-tree, Cornelian cherry, or Dog-wood: A genus of the monogyaia order, belonging to the tetrandria clafs of plants; and in the natural method raming under the frth order, Sethate. The invalucrum is moft frequently trataphy llous; the petals above the receptacle of the firuit four; the iruit itfeif a bilocular kemel.

Species. Of this genus there are five fpecies; the molt remarkable tue the folluwing. 1. The mas, or cornelian cherry-tree, hath an upright tree-tlem, rihing 20 feet high, branching, and forming a large head, garnifhed with oblong leaves, and fmall umbels of yelluwith-green flowers at the fides and ends of the branches, appeating carly in the fpring, and fucceeded by fmall, red, cherry-like, eatable, acid, fruit. 2. The fanguinea, bloody-twig, or common dogwood: hath an upright tee-ftem, branching io or 12 feet high, having blood-red thoots, garnithed with oblong pointed nervous leaves two inches long; and all the branches terminated by umbellate white fowers fucceeded by black berries: of this there is a kind with variegated leaves. 3. The forida, o: Virginian dogwood, hath a tree-ftem branching 12 or 15 feet high, and fine red thoots garnifhed with large heart-fhaped leaves; and the branches terminated by umbellate ulite flowers, having a large involucrum fucceeded by dark red berries. Of this fpecies there are feveral varieties, chiety diftinguifhed by the colour of their berries, which are red, white, or bluc.

Culure. All the fpecies may be propagated by foeds, which ought to be fown in autumn, otherwife they will lie a year in the ground. When the plants come up, they fhould be duly watered in dry weather, and kept clean from weeds. The following autumn they may be tranfplanted into the nurfery; and having remained there two or three years, they may then be removed to the places where they are to remain. They may alfo be propayated by fuckers, of which they produce great plenty, or by laying down the young branches.

CORNUTIA, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 40 th order, Perfonutic. The calys is quinquedentated; the ftamina larger than the corolla; the ftyle very long; the berry monofpermons. Thare is bat one fpecies, viz. the pyramidata, with a blue pyramidal Hower, and hoary leaves. It grows plentifully in feveral of the illands of the Weft Indies, alfo at Campeachy, and at La Vera Cruz. It rifes to the height of $10=$ or 12 feet, with rude branches, the leaves being placed: oppolite. The fowers are produced in fpikes at the

Cornwal end of the branches, and are of a fine bine colour. They ufually appear in autumn, and will fometimes remain ia beauty for two months or more. It is proparated either by feeds of cuttings, and makes a fine appeararice in the fiove; but is too tender to bear the rpen air in this comstry.

CORNWAL, the molt wellerly county of England, bounded by the Englih channcl on the fouth, St George's channel on the welt, the Briftol channel on the north, and on the ealt by the river Tamar, which feparates it from Devonthire. Its name is fuppofed hy fome to the compounded of carn, figuifying "a rock" in the Bricifh Janguage, and Gauls, or $W$ atalcs, the name the Saxons gave to the Britons. Others, howewre, think it is duived from the Latin cornu, or the Britifo kern, "a horn;" on account of its ruming out into the fea fomewhat in the form of a horn. Hither the amcient Fritons (as well as in Wales) retired on the intrufon of the Saxons, where they oppofud their further conquets. In this part of the illame they formed a kinglom hat cxited for many years after, under different prinecs, amonght whom were Ambrodius Aurelias, and the jufly celthrated Arthur; nor were they fubdued till the middle of the 7 th century, from which time Cornwal was confiderer as fubject to the Weft Saxon kings, who begun their fovereignty in 519 , and continued it till 828 , under 18 fovereigns, the lat of whom was the great Egbert, who fubdued all the others; and by uniting them, formed the kingdom of England, when this county was included in the county of Deron, then the ght divifon; and that accounts for Alfred's not mentioning Cornwal, which on forming the circuits after the Normart conquelt, is included in the weftern circuit. In 1337, Edward 1ll. erected it into a dukcdom, and invefted with it Eiluard the Black Prince. Ibut this, according to the expreis words of the grant, is limited to the firlt-born fon and heir, on which account Richard II. was created duke of Cornwal ber charter. So was Henry V. by his father Henry IV. Henry V1. delivered the duchy to his fon prince Edward, and Edward IV. created his fon Edward V. duke of Cornwal, as did Henry VII. his fon, afterwards Henry VIII. upon the death of his cider brother Arthur. James I. created his fon Henry duke of Cornwal, which title on his deceafe came to his brother Clathes. The eldelt fons of fucceeding kings have enjoyed this title by inheritance. Thefe not only appoint the fheriff, but all writs, deeds, \&ic. are in their mame, and not in the king's; and they have alfo peculiar royalties and prerogative diftinet from the crown, for which they appoint the officers. This county is 80 miles long, to broad, and 250 in circumference; containing 960,000 acres, and 126,000 inhabitants. It is divided into 9 hundreds; has 2.7 market towns, viz. Launcelton, Truro, Falmouth, Helfon, Saltafh, Bodmyn, St lves, Tregony, Camelford, Fowey, St Germains, Peuryn, Callimgton, St Aufte, Ealt Looe, Paditur, St Colomb, Pentance, Gmanıpond, Lefkard, Leftwithicl, St Mawes, St Michacl, Nurport, Market Jew, Stratton, and Redruth; 1230 villages, 16 i parithes, 89 vicarages, provides 640 men to the militia, and pays 8 parts of the land-tax. Its chief rivers are the Tamer, Fale, Cober, Loor, Camel, Fuwe, Haile, Lemara, Kenfe,
and Aire. Its principal capes or head-lanls are thic Curame. Land's-end, the Lizard, Cape Connwal, I)cadnan'shead, Kame-head, Sce. and a clafter of ilanci., $1+5 \mathrm{in}$ number, called the Sril'y h/ks, fuppoled formerly to have been joined to the mam inde, thotorh now 30 miles diflant ; abounding widh aniquitics, particulaly druidical.

As Cornwal is furrounded ly the fua on all foldes except the ealt, its climate is matern from that of the other parts of Biarin. 'Phe remions of this difference will be eatily undertoni from what is obferved conceming the clowate of hmericis. The fummers in Cornwal ant lefs hot, aml the winters lof: cold, than in other parts of Enghad, and the foring and harvelt are obferved to be more bachwant. iligh and fad len winds ane alfo more common in this than in other counties of England. The comenty is rocky and motutainous; but the mountains atre lich in anetals, efpecially tin and copper. 'The valleys are very' pleafint and fertile, yielding gieat planty buth of corn and patture. The lands near the fea-conf are manured and fertilized with fea-weed, and akind of fand formed by the particles of broken thells as they are dafhed againft ench other hy the fea. Cattle of all forts are fomaller heve than in the other countios of England; and the wool of the theep, which are molly* withont horns, is very fine, and the flefh, both of them and of the black cattle, extremcly' delicate. 'I he count$t y$ is well fupplied with fifh from the fea and the mang nivers with which it is watered. The molt noted of the fea-figh is the pilchard; of which prodigious quantities are caught from July to November, and export cd to different parts, efpecially to Spain. It is faid that a million have been fometimes taken at a fingle draught. The natives are remarkable for their ftrength and activity, as well as their dexterity in wrettling, in which exercife the Cornifh hug is highty cxtolled.

This county abounds in mines of difietent metals and femimetals; but the principal produce is tin. The Plenicians early vifited thefe conts for this article, fome think 400 or 450 years before Chrift; and the mines continued to be wrought with various fuccefs at different periods. In the time of king John they appear to have yielded no great emolument ; the right of working them being wholly in the king as earl of Cormwal, and the mines farmed by the Jews for 100 marks; and according to this prupo.tion the roth of it, L.5. 13 s .4 d . is at this day paid by the crown to the bifhop of Exeter. In the time of Xichard king of the Romans and earl of Cornwal, the tinmines were immenfely rich, the Jews being farmed out to him hy his brother Henry IIT, what interet the? had was at his difpofal. The Spanifh tin-mine beind; floped by the Moors, and none difoovend in Geamany, the Malabar coait, or the Spanin Wcit Endies, Cornwal and its earls had all the trade of Europe foi it. 'The Jews being banithed the kingdom, it EAw, i. they were again mestected tillthe gentlenow of Black more, lords of feren iithings bett flored at that ifat: with tin, obtained of Edmund earl of Comwert, fon cr Richard king of the Romans, a charter undor his own feal, whith more explicit grats of priviless, coute, pleas, parliaments, and the text-tin or $\mathrm{r}^{2}$ th of all the tin raifed. At this time too the right of bouncinger
dividis $E$

Sonnwal. dividing tingrounds into feparate partitions for the encouragement of fearching for it feems to have been firft appuinted, or at leaft adjufed. This charter was confirmed 33 Edward I. and the Cornith feparated from the Devouthire tinners. Their laws, particular1y recited in Plowden's Conmentaries, p. 237 , were further explained 50 Edw. III. contirmed and enlarged by parliament, \& Rich. II. 3 Ed. IV. I Ed. VI. 1 and 2 P. and M. and 2 Eliz. and the whole fociety divided into four parts under one general warden, to do juntice in law and equity, from whofe fentence lies an appeal to the duke of Cornwal in council, or for want of a duke of Cornwal to the crown. The lord-wardsa appoints a vice-warden to determine all Eannary difputes every month : he alfo conifitutes four Atewards, one for cach of the precincts before mentioned, who hold their courts cyery three weeks, and decide by jurits of dix perfons, with an appeal referved to the sice-warden, lord-warden, and lord of the prince's council. In dificult cafes the lord-warden, by commifion, ifues his precept to the four principal towns of the ftamary diftricts, who each choofe in members, and thefe twenty-four ittanators comftitute the parliament of tinners. Each flannator choofes an affifant, making a kind of flanding council in a different apartment to give information to the prince. Whatever is enacted by the hody of tinners mult be figned by the itamators, the lord-warden, or his deputy, and by the duke or the king, and thenceforward las with regard to tin affairs all the authority of an act of the whole legilature. Five towns are appointed in the mof convenient parts of the comity for the timers to bring their tin to every quarter of a year. Thefe are Leflard, Leltwithiel, Truro, EIellon, and Penfance, the lat added by Charles II. for the conveniency of the weftern tinners. In the time of Henry VIII. there were but two coinages, at Midfumer and Michaelmas: two more at Chriltmas and Lady-day were added, for which the timers pay an acknowledgment called Paf grouts, or 4 d. for every hundred of white tin then coined. The officers appointed $\mathrm{l}_{\mathrm{y}}$ the dake affay it ; and if well puified ftamp it by a hammer with the duchy feal, the arms of Richard carl of Cornwal, a lion rampant $G$. crowned $O$. within a bordure of bezants $S$; and this is a primifion to the comer to foll, and is called coining the tin. Every hurdred of white tin fo comed pays to the duke 4 s . The tin of the whole county, which, in Carew's time, in the laft centuy, amounted to 30 or 40,000 l. yearly, has for 24 years haft paft amonnted one year with another to L. iso,0co or 100,000 therling. Of this the duke of Coraval receives for his 4 s. duty on evers hundred of whit - tin above L. 10,000 yearly : the bounders or proprieturs of the foil about $\frac{t}{6}$ th at a medium clear, or about L. 30.000 gealy; the remainder goes to the adventurers in the mine, who are at all the charge of working. Tin is found colleeted and tixed in lodes a.d 0 ons, or in grains and bunches in the matural roel, ir lonte and cearached in fingle feparate ftones culie "oles or Mratans, or in a continued courfe of fuch Atom co tod the loulyt un liveng freane, or in an art... nacoly palverized flate. It is molt cafily diforeted by ita Mo the ludes by he fattered frac...ents of hem called fades, by leave of the lord of the fuil or the pouncer. The tin being dividadanong the hords and
adventurers, is flamped and worked at the mill ; and Cornwal. being thus dreffed is carried under the name of black tin to the melting-houfe, where it is melted by Welih pit-coal, and poured into blocks of 3201 b . weight, and carried to the coinage town. Mundic, a fearce metal or mineral ore, of a white, braffy, or brown colour, is found in large quantities, intermixed with till, copper. and lead, and fometimes by itfelf. Iron ore is found in Cornwal, but the working it does not aufwer. There is no richer copper, nor a greater variety any where than in this county. Silver, if really found here in the reigns of Edward I. and II. has been rarely found fince, nor do the lead-mines anfwer. Very late difeoreries have proved that Cornwal has more gold than was formerly imagined. What is called the Corni/h damome is a figured cryftal generally hexagonal and pyramidical, or columnar, or both, of a tine clear water, and of all our baltard diamonds in this nation eftecmed the bell, and fome of different colours, black, yellow, \&cc. The clearer thefe are, the better they will bear cngraving for feals.

In privileges and language Cornwal feems to be another kingdom. By 21 Elizabeth it was ordered that all duty on Cornifl cloth exported thould be remitted to every Englifhma within the duchy of Cornwal. This was firtt granted by the black priace, in confideration of their paying $4^{s}$. for the coinage of every hundred of tin; whereas Desonihire pays no more than 8d. They lave alfo by grant from Richard earl of Cornwal, confirned 45 Henry III. freedom to take fand out of the fa and carry it through the country for manure; whereupon in the following reign, on an inquifition made, we find a complaint that Saltalh had lately taken 12 s . yearly for each barge that carried fand up the Tamar; whereas nothing ought to be demanded. They fill continue this ancient method of improving their land, carrying it ten miles up into the country, and great part of the way on horles backs. Mr Ray fuppofes the wirtue of this fand depends chicfly on the falt mixed with it, which is fo copious that in many places falt is boiled up ont of a lixivium made of the fa fa:d; and the reafon why fand when it has lain long in the fun and wiad proses iffos enriching and wfeful is, that the dews and rain exaporate great part of its falt. They had likewife a privilege of trading to all parts of the world, granted them by Chales I. in recompence of thicir loyalty.

The number of lowoughs in this fmall county was furprifingly incercafed by Edward VI. who added feven to the original fis, Mary two, Elizabeth liz, making in all 21 , iending 40 members beldes the county two. Eight of thefe boroughs had an immediate or remote connection with the demefne lands of the dnchy; the eff betonged to viligions hoafes, or powerful families, or were old boroughs, which had legal immuninies granted to them by their princes or luad.

The Cornifh language is a dialect of that which till the Suxurs cane ia was common to all Britain, and more ancienty to Ircland and Gaul ; but the inlabitants of this illand being difperfed before thofe conquefts, and driven into Wales and Comwal, and thence into Brotagne, the fame language, for want of frequent intereonife, became diferently pronomeed and waten, and in differm degrees mixed with different

## $\mathrm{C} O \mathrm{R}$

$\mathrm{C} O \quad \mathrm{~B}$
ans for many reafons. It was feparated by inaccef- Coromaniible mountains from Malabar, where thefe bold ad- del. venturers cndeavoured to fettle themfelves Spices and aromatic3, which were the principal objects of their attention, were not to be found there. In thort, civil diffentions lad banifhed from it tranquillity, fecurity, and indurtry. At that feriod the emphe of bifangar, to which this wait comaty was fubject, was falling to ruin. The gosemments of Vilapour, the Carnatic, Golconda, and O. ixa, throw ofl their dependence, and affumed the tite of kings. Thofe of Madara, Tanjore, Myfore, Giagi, and fone others, likewife uinped the forcreign athority, though they retained their ancient title of Nitick. This rewolution had juft happened when the Earopeans appared on the coalt of Coromandel. The forcign trade was at that time inconliderable; it confitted only of diamonds from Gokenda, which were carnied to Calicut and Surat, and from thence to Ounus or Sasz, wlace they were circolated through all Europe and Alia. Maffulipation, the richef and motl populons city of thefe comutrice, wis the ouly market that was known for linens; they were purchafed at a great fair annually holden ihere by the Ambian and Malayan veifels that frequented that bay, and by caravans arrived from diftant parts. The hens were exported to the fame places with the diamonds. The fondnefi, for the manufactures of Coromandel which began to prevai? here, infpired all the Enropean nations trading to the Indian feas with the refolution of forming fetilements there. They were not difeonraged cither by the difficulty of conveying goods from the inland parts of the country, where there was no navigable river; by the total want of harbours, where the fea at one feafon of the year is not navigable; by the barrennets ot the coalts, for the moft part uncultivated and unimbabited; aor by the tyranmy and lluctuating late of the government. They thought that filver would be induftrionly fought after; that Pegu would furnifh tinber for building, and Bengal corn for fubliftence: that a profperous royage of nine months would be more than fufficient to complete their ladings; and that by fortifying themfleses they thould be fecure againt the attacks of the weak tyrants that oppreted the fe countries.

The firt European colonics were eftablifhed near the fhore. Some of them oltained a fettement by forec; molt of them were furmed with the conkent of the fovereigns; and all were confined to a very narrow tract of land. The boundarics of ach were marked ouc by a hedge of thorny plants, which was their only defence. In procefs of time fortifications were raifed; and the ficurity deried from them, added to the lenity of the government, foon increafed the number of colonits. The fiplendor and independence of thefe fettements fereral times raifed the jealonfy of the princes in whofe dominions they wre fermed; but their attempts to demolifh then proved abortive. Each colony increafed in profperity ia prosportion to the riches and the wifdom of the nation that fonded it. Nane of the companics that ixercifed an excl five privilege beyond the Lape of Cioort Hope had any concern in the trade of diamonts. This was always left to private merclants, and by derrees foll entircly into the hands of the Euglith, or the Jew?

Coroman- and Armenians that lived under their protedion. At del. prefent this grand objece of huxury and indutitry is much reduced. The revolutions that heve happened in Indothan have prevented prople from reforting to thefe rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whote of the commercial operations on the coar of Coromandel is confined to the purchafe of cottons. The manufacturing of the white cottons bought there, differs folittle from ours, that it would be neither intereting nor inftructive to enter iuto a minute defeription of it. The procefs ufid in making their printed cottons, which was at firlt fervitcly followed in Europe, has fince been rendercd more fimple, and brouglt to greater perfection by our manufacturers. The painted cottons which are bought there, we have not get attempted to imitate. Thofe who imagine we have been prevented from undertaking this branch merely by the high price of labour anong us, are miltaken. Nature has not given us the wild froits and drugs neceffary for the compofition of thofe bright and ind lible colours which conflitute the principal merit of the In dian manufacturcs; nor has fhe furnilled us with the waters that ferve to fix them. The Indians do not univerfally obferve the fame method in painting their cottons; either becaule there are fome niceties pecaliar to certain provinces, or becaufe different foils produce different drugs for the fame ufes. We thould tire the patience of our readers were we to trace the flow and painful progrefs of the Indians in, the art of painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What feems to authorife this conjecture is, that they have ftopped in their imporements, and lave not advanced a lingle flep in the arts for many ages; whereas we have proceeded with amazing rapidity. Indced, were we to confider only the want of invention in the Indians, we fhould be tempted to believe, that, from time inmemorial, they have received the arts they cultivate from fome more induftrious nation; but when it is remembered that thefearts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be conrinceid that they are natives of that country. It may appear fomewhat furpriing that cottons painted with all forts of colours thould be fold at fo moderate a price, that they are almoft as cheap as thofe that have only two or three. But it mult be obferved, that the merchants of the country' fell to all the companies a large quantity of cottons at a time ; and that the demand for cottons painted with various coloms makes but a finall article in their affortments, as they are not much ctteemed in Europe.

Though cottons of all forts are in fome degree manufacturid through the whole country of Indoltan, which estends from Cape Comorin to the banks of the Ganves; it is offervable, that the fine forts are made in the cantern part, the conmon oues in the centre, and the coarle ones in the moft wettern parts. Mamufactures are thablilhed in the European colouies, and upon the eoalt: they are more frequent at the diftance of five or tix leagnes from the fea, where cotton is more cultivated, and provifions are cheaper. The puchais made there are carried 30 or fo leagues
farther into the country. The Indian merchants fet- C thed in the Luropean factories have always the mawagement of this bufinefs. The quantity and quality of the goods wanted are fettled with thefe people: the price is fixed according to the patterns: and at the time a contract is made, a third or a fourth part of the money agreed on is advanced. This arrangement is owing to the noceflity thefe merchants themfelve are under of advancing money to the workmen by the partners or agents who are difperfed through the whote country: of keeping a watehful eye upon thein, for fear of lofing what they have advanced; and of gradualiy leffening the fum, by calling for the cottons as falt as they are worked off. Without thefe precautions, nothing could be depended on in an oppreflive government, where the weaver cannot work on his own account, either becaufe his circumftances will not permit, or beeaufe he dares not venture to difcoser them for fear of exactions. The companies that have either fuccefs or good management, conftantly keep the flock of one year in advance in their fittlements. By this method they aic fure of having the quantity of goods they lave occation for, and of the quality they choofe, at the molt convenient time: not to mention that their worknen, and their merchants, who are kept in conitant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their thips. They have only five or fix months at moft to execute the orders fent from Europe. The goods are manufactured and examined in hafte; and they are even obliged to take fuch as are known to be bad, and would be rejected at any other time. The neceflity they are under of completing their cargoes, and fitting out their veffels before hurricanes come on, leaves no room for nicety of infpection. It would be a muttake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of fetling them with a reafonable advantage to the company with whom they are engaged. For, befides that the generality of them are not rich enough to embark in fo large an madertaking, they would not be cettain of finding their accome in it. If the company that employ them fhould be hindered by anforefeen accidents from fending the ufful number of hips, thefe merehauts wonld have no vent for their commodities. The ludians, the form of whofe drefs itquires different breadths and lengths from thofe of the cottons fabricated for our ufe, whold not purchafe them ; and the other European companies would be provided, or certain of teing provided, with whatever the extent of their trade required, and their money enabled them to purchafe. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be ufeful. It has been a cullom, time immemorial, in Indoftan, for every citizen who borrows money, to give a writters inftrument to his creditor. This deed is of no force in a court of judicature, unlefs it is tigned by three witnefes, and bears the day of the month and the year when it was made, with the rate of intereft agreed upon by the parties. If the borrower fails to fulfil his engagenents, he may be arrefted by the lender himfelf. He is never imprifoned, becaufe there is no foar of his maling his efcape. He would

Coronan- not even eat, without obtaining leave of his creditor.
del, The Indians make a three-fifld divifion of interelt: Corosia. one kind they call wice: another neither wiae nor vir-
tise; and a third, they fay, is wirtuc. The firft is four fer cent a month; the fecond two; and the third one. The lat is, in their opinion, an act of beneficence that only belongs to the mofl licroie minds. Yet, though the Furopeans, who are forced to borrow, meet with this treatant, it is plain they cannot avail themflves of the indulgence without being involved in min.

The foreign trade of Coromandel is not in the lands of the natives. In the wellern part, indect, there are Nolammedans knowa by the name of Cholics, who, at Naour and Porto-Nuso, fend out hips to Acken, Aergny, Siam, and the catlen coall. Betides vefids of confiderable burden comployed in thefe voyages, they have fmaller embarkations for the coatting trade for Ceglon and the pearl fifnery. 'The Indiuns of Maffilipatan turn their attention another way. They import from Bengal white callicocs, which they dye or print, and fell then again at the places from whence they had them, at 35 or 40 per cent. advantage. Excepting thefe trautactions, which are of very little confequence, the whole trade is vilted in the Europeans, who have no partners but a few Bamans and Armenians fetted in their colonies. The quantity of callicoes exportud from Coromandel to the different ports of lndia, may be computed at 3500 bales. Of thefe the Fench carry 800 to Malabar, Mocha, and the ifle of France; the Englih, 1200 to Bombary, Matabar, Sumatra, and the Philippine Ifauds; and the Dutch 1500 to their different fettements. Except 500 bales deftined for Manila, each of the value of 100 guintas, the others are of fuch an ordindry kind that they do not exceed 30 guineas at prime coft ; fo that the whole number of bales do not amount to more than about L. 150,000 .

Cormandd firminhes Europe with 9500 Dales; 800 of which ate brought by the Danes, 2500 by the French, 3000 by the Enylith, and 3200 by the Dutch. A confiderable past of thefe callicoes are dyed blue, or triped blue and red for the African trade. The others are fine nowhins, printed callicoes, and liandkerchiefs from Maffulipatan, or Paliacate. It is proved by experience llat eadr of thefe bades colls only about L. 42 Sterling: confequently they ought to bring in to the manfactory where they are wronght near L. 360,000 . Thes pasmenta are not entirely male in fpecie, ether in Earope or Afid; we give in exchange, cloths, irom, lad, copper, comal, and fome other articles of lefs value. On the other hand, Alia pays with fpices, pepper, rice, fugar, corn, and dates. All thefe artickes taken tegether may amount to about L. $210,0 \mathrm{cco}$; and from this calculation it follows, that Coromandel seceives annually from Europe about L. $\hat{5} 00,000$ in money. The Britih, who have acquirad the fame fuperiority on this coall that ducy have effewhere, have formed on it feveral futhements.

CORONA, among abitumits, denotes that edge of the glans peris where the preputium begins.

Cornna, or Halo, in opties, a luminous circle, furrounding the fun, the moon, the planets, or fixed flars. Sometimes thefe circles are white, and fometines cokeured, like the rainbow. Sometimes one only is vi-

Vol. V. Part II.
fible, and fumetimes feveral concentric ceronas make their appearance at the fame time. Thole whed have been feen about Sirins an! Jupiter were nover more than three, four, or bice degrees in diameter ; thofe Whish furoumb the moon ane, alfor, fomatimes no more than three or live degrees; but thefe, as well as thore which huround the fun, are of vay differnt magnitudes, viz ul $12^{\circ} 0^{\prime}, 22^{\circ} 35^{\prime}, 30^{\circ} 0,38^{\circ} 0^{\prime}, 41^{\circ}$ $2,45^{\circ} 0^{\prime}, 4^{60} 24^{\prime}, 47^{\circ} 0$, and yo, or coen laram than this. 'lisir diameters atho fometmes vary daring the time of oblervation, and the beadths both of the coloured and white circles are very different, viz. of 2,4 , or 7 degrecs.

The eolours of the fe coronas ate more dilate than thofe of the ranhow; and they are in a different order, according to their fize. In thofe which Ivewton ubferved in 1602 , they were in the following order, reckoning from the infide. In the innermont were Llue, white, and red; in the middle were purple, blue, green, yollow, and pale red; in the ontermon, pale blue and pale red. Mr Huygens obferved rednext the fun, and a pale blue outwards. Sometimes they are red on the infide and whice on the outdide. Ni. Weidler obferved one that was yellow on the iafide and white on the outfide. In lirance, one was obfervod in 1683 , the middle of which was whate; atter which followed a burder of rex: next to it was blue, then green, and the outermols cricle was a brieht red. In 1728 , one was $1=4$ of a pale $10 d$ sutwardly, then folluwed gchlow, and then gren, temimatad by a white.
Thefe coronas are very frequent. In Holland. M. Mufthembrock fays, 50 may be feen in the duytime, ahnoil every year ; but they are diffocult to be olferved, except the eye be lo fituated, that not the body of the fun, but only the neighbouring pasts of the hearens can be deen. Mr Middleton lays, that this Whnomenon is very frequent in North America; for that there is generally one or two about the fun wery weck, and as many about the moon esery month. IFalos round the fun are very freguent in Ruffa. M. Epinus fars, that from the 23 d of April 1758 , to the 2oth of Suptember, he himful had obferved no lefo than 26 , and that lie has fometimes feen twice as many in the fame fipace of time.

Cormas mary be produced by placing a lighted candle in the midit of feam in cold weather. Alfo, if glafs windows be breathed upon, and the flame of a candle be placed fome feet from it, while the feectator is alfo at the diftance of fome foct from anuther part of a window, the flame will he furvunded with a colvured halo. And if a candle be plaved belind a glafs receiver, when air is admited intu the vacuam withinit, at a certain degree of denlity, the vapour with which it is loaded will make a colloured halo round the flame. This was obferved by Otto Guericke. In December 1756 , M. Muitherbrouck ohferced, that when the glats windows of his room were covered with a thin plate of ice on the infide, the moon appearing throngh it was furrounded with a large and varioully coloured halo; and, opening the window, he found that it arofe intirely from that thim plate of ice, for none was feon except through it.

Similar, in fome tefpects, to the halo, was the re 3 N markabse

## C O R <br> [ 466 ] <br> C O R

Carona. markable appearance which M. Bouguer deferibes, as obferved by himfeli and his companions on the top of Mount Pichinca, in the Cordilleras. When the fun was jult rifing behind them, fo as to appear white, each of them faw his own fladow projected upon it, and no other. The difance was fuch, that all the parts of the fhadow were eafily ditinguifhable, as the arms, the leg, and the head; Eut what furprifed them mult was, that the head was adorned with a kind of glory, confiting of three or four fimall concentric crowns, of a very lively colour, each exhibiting all the varicties of the primary rambow, and having the circle of red on the outhde. The intervals between thefe circles continued equal, though the diameters of them all were conltantly changing. The latt of them was very faint, and at a confiderable diflance was another great white circle, which furrounded the whole. As near as M. Buguer could compuite, the diameter of the firlt of thefe circles was about $5 \frac{5}{5}$ degrees, that of the fecond 11, that of the third 17 , and foon; but the diameter of the white circle was about 76 degrees. This phenomenon never appeared but in a cloud confiting of frozen particles, and never in drops of rain like the rainbow. When the fun was not in the horizon, only part of the white circle was vilible, as M. Bouguer frequently obferved afterwards.

Similar aifo to this curious appearance was one that was obferved by Dr MrFait in Scotland. This gentheman obferved a rainhow round his fhadow in the mift, when be was upon an eminence above it. In this fituation the whole comntry round feemed, as it were, buried under a wald delage, and nothing but the tops of diftant hills appeared here and there above the flood; fo that a man would think of diving down into it with a kind of horror. In thofe upper regions the air, he fays, is at that time very pure and agree. able to breathe in. At another time he obferved a double range of colours round his thadow in thefecircumfances. The colours of the outermoft range were broad and very diftinct, and every where abont two feet diftant from the thadow. Then there was a darkih interval, and after that another narrower range of colours, clofely furrounding the fhadow, which was very much contracted. This perfon feens to think that thefe sanges of colours are canfed by the intlection of the rass of light, the fune that occarioncl the ring of light which furrounds the fhadows of all bodies, obferved by M. Maraldi, and this anthor*. But

- Edin. Ef the prodigious variety with which the fe appearances fuyd 1 f. 1 y 8.
they fall to the ground, he thought they mult be protuberant in the middle, before their defecent ; and according to this protuberancy he imagined that the diameter of the halo would vary. - In treating of meteors, Gaflendi fuppofed that a halo is the fame thing with the rainbow, the rays of light being in both cafes twice refracted and once reffected within each drop of rain or vapour, and that all the difference there is between them arifes from their different fituation with refpect to the obferver. For, whereas, when the fun is behind the fpectator, and confequently the rainbow before him, his cye is in the centre of the circle; when he views the halo, with his face towards the fun, his eye is in the circumference of the circle; fo that according to the known principles of geometry, the angle under which the object appears in this cafe, mult be juit half of what it is in the other. Though this writer fays a great deal upon the fubject, and endeavours to give reafons why the colours of the halo are in a different order to thofe of the rainbow, he does not deferibe the progrefs of the rays of light from the fun to the eye of the fpectator when a halo is formed by them, and he gives no figures to explain his ideas.

Dechales, alfo, endeavours to fhow that the generation of the hato is limilar to that of ther ainbow. If, fays he, a fullere of glafs or cryftal, $\mathrm{AB},\left(\mathrm{n}^{\circ} \mathrm{I}\right.$.) full of Pare CL, water: be placed in the beams of the fun flining from C, there will not only be two circles of coloured hight on the fide next the fion, and which contlitute the two rainbows; but there will alfo be another on the part oppofite to the fum, the rays belonging to which meeting at $E$, afterwards divarge, and form the coloured circle $G$, as will be vifible, if the light that is tranfmitted through the glabe be received on a piece of white paper. The colours allo will appear to an cye placed in any part of the furface of the cone FEG. Meafuring the angle FEF, he found it to be 23 degrees. They were only the extreme rays of this cone that were coloured like thofe of the rainbow.

This experiment he thought fufficiently illuitrated the generation of the halo; fo that whenever the texthice of the clouds is fuch, as not entirely to intercept the rays of the fun or moon, and yet have fome degree of denlity, there will always be an halo round them, the colours of the rainhow appcaring in thofe drops which are 23 degrees difant from the fun ar moon. If the fun be at $A$, and the fpectator in $B$, the halo will be the circle DFE, DBE being $4 \sigma$ degrees, or twice 23.

The reafon why the colours of the halo are more dilute than thofe of the rainbow, he fays, is owing principally to their being formed not in large drops of rain, but in very fmall vapour ; for if the drops of water were large, the cloud would be fo thick, that the rays of the fun could not be regularly tranfinitted through them; and, on the other hand, he had obferved, that when the rainbow is formed by very thin vapours, the colours hardly appear. As for thofe circles of colours which are fometimes feen round candles, it was his opinion that they are owing to nothing. but moifture on the eye of the obferver; for that he could never produce this appearance by means of vapour only, if he wiped his eyes carefully; and he had obferved that fuch circles are vilible to fome perfons.

Corona. and not to others, and to the fame perfons at one time $\underbrace{\text { Corona }}$ and not another.

The molt confulerable of all the theories refpecting halos, and that which has met with molt favourable and the longef reception, is that of Mr Huysens. Sir Iface Newton mentions it with refpect, and Dr. Smith, in his Complete Syltem of Optics, does not fo much as hint at any other. The occalion of M. Huygens publithing his thoughts on this fubject, was the appearance of a halo at Paris, on the izth of May 16637, of which he gave an account in a paper read at the Royal Academy in that city, which was afterwards thanfated, and publithed in the Enclifh Philotophical Tranfuctions, and which may be feen in Lowthorp's Abridgment, Tol.1. p. 189. Put this article contains nothing more than the heads of a difcourfe, which he afterwards compoied, but never quite finithed, on this fubject: and which has been tranilated, with fome additions, by Dr Smith, from whom the following account is chielly extracted.

Ow philoforher had been firlt engaged to think particulaty upon this fubject, by the appearance of five funs at Wrarfaw, in 1058 ; prefenty after which, he fays, he hit upon the true caufe of hatos, and not long after of that of mock funs alfo.
'To prepare the way for the following obfervations, it mull be remarked, that if we can conceive any kind of bodies in the atmolphere, which, according to the known laws of optics, will, cither by means of reflection or refraction, produce the appearance in quetlion, when nothing elfe can be found that will do it, we nuft acquiefce in the hypothefis, and fuppofe fuch bodies to exif, even thongh we cannot give a fatisfactory account of their generation. Now, two fuch budies are affumed by Mr Huygens ; one of them a round ball, opaque in the centre, but covered with a tranfparent fhell; and the other is a cylinder, of a fimila. compofition. Sy the help of the former he endeavours to account for halos, and by the latter for thofe appearances which are called mock funs. Thofe bodies which Mr Muygens requires, in order to explain thefe phenomena, are not, however, a mere affumption; for fome fuch, though of a larger fize than his purpofe requires, have been actually founc, comfiling of fnow within and ice without. They are particularly mentioned by Defcartes.

The balls with the opaque kernel, which he fuppofed to have been the caufe of them, he imagines not to exceed the fize of a turnip-feed; but, in order to illultrate this hypothelis, he gives a figure of one, of a larger fize, in ABCDEF, ( $n^{0}$ 3.) reprefenting the kernel of fnow in the middle of it. If the rays of light, coming from GH, fall upon the fide AD, it is manifeft they will be fo refracted at $A$ and $D$, as to bend inwards; and many of them will ftrike upon the kernel EF. Others, however, as G.A and HD, will only touch the fides of the kernel; and being again refracted at $B$ and $C$, will emerge in the lines $\mathrm{BK}, \mathrm{CK}$, croffing each other in the point K , whofe neareft diltance from the globule is fomewhat lefs than its apparent diameter. If, therefore, BK and CK be produced towards $M$ and $L$, $\left(n^{2} 4.\right)$ it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone reprefented by it.

For the fame reafon, erery other of the fe grlobules Comons. will have a fladow behind it, in which the light of the $\longrightarrow$ ( fun will not be perccived. If the eye be at $N$, and that be conceived to be the vertex of a cone, the lides of which NR, NQ, are parallel to the lides of the furmer cone KL, MM, it is evident that none of the globules within the cone QNR can fend any rays of the fun to the eye at N . But any other globule out of this cone, as X, may fend thofe rays, which are more refratied than $X Z$, to the eye; fo that this will appear enlightened, while thofe within the cone will appear obicure. It is evident from this, that a certain area, or $f_{p}$ ace, quite round the fim, mult appear dark: and that the face next to this area will appear luminous, and more lo in thofe parts that are nearell to the obteure area; becaufe, he fays, it may calily be demonltrated, that thofe globules which are nearelt to the conc QNR exhihit the largelt image of the fun. It is plain, alfo, that a corona ought to be produced in the fame manacr whatever be the fun's altitude, becaufe of the fpherical ligure of the glubules.

To verify this hypothefis, our philofopher advifes us to expufe to the fun a thin glufs bubble, tilled with water, and having fome opague fubtance in the centre of it ; and lee fays we thall find, that we fhall not be able to fee the fun through it, unlefs at a certain dillance from a place oppofite to the eentre of it ; but as foon as we do perceive the light, the image of the fun will inmediately appear the brightert, and culoured red, fur the fame reaton as in the rambow.

Thefe corunas, he fays, often appear ahout the moon; but the colutrs are fo weak as to appear only white. Such white coronas he had allo feen about the fum, when the fpace within them appeared fearee darker than that without. This he fuppofes to happen when there are but few of thofe globules in the atmofphere; for the more plentiful they are, the more lively the colours of the halo appear; at the fame time alfo the area within the corona will be the darker. The apparent diameter of the corona, which is generally about +5 degrees, depends upen the lize of the dark kernel; for the larger it is with refpect to the whole globule, the larger will be the dark cone behind it.

The globules that form thefe halos, Mr Inygens fuppofes to have confifted of foft fnow, and to have been rounded by continual agitation in the air, and thawed on their ontlides by the heat of the fun.

To make the diameter of the halo 45 degrees, he demonftrates that the femidiameter of the globule mut be to the femidiameter of the kemel of fnow very nearly as 1000 to 480 ; and that to make a corona of 100 degrees, it mult be as 1000 to 680 .

Mr Weidler, in his Commentary on parhelia, publifhed at Wirtemburgh in 1733, obferves that it is very improbable that fuch globules as Mr Huygens's hypothefis requires, with nuckei of fuch a precile proportion, flould exilt ; and if there were fuch bodies, he thinks they would be too finall to produce the effects afcribed to them. Belides, he obferves that appearances exactly fimilar to halos are not uncommon, where fluid vapour alone are concorned; as whin a candle is placed behind the feam of beiling water in frolly weather, or in the midat of the vapour iffuing

## C. $O \quad \mathrm{R}$

comon. copiounly from a bath, or behind a receiver when the air is fo much rarefied as to be incapable of fupporting the water it contains. The rays of the fun twice regeted and twice refracted within fmall drops of water are fufficient, he fays, without any opaque kernel, to produce all the appearaces of the halos that have the red light towards the fon, as may be proved by experiment. That the diameter of the halos is generally hald of that of the rainbow, he accounts for as Gafiendid did b.fore him.
M. Narriotte accounts for the formation of the fmall cois as by the tranimiflion of fight through aqueous rapous, where it fuffers two refractions, without any intermediate reflection. Ho flows that light which romes to the eye, after bring refracted in this manner, will be chichy tiat which fallo upon the drop anaty perpondicular; becaule more ays fall upon any given quantity of fuyface in that fituation, fower whem ars retheted with fmall degrees of obliquity, and they are not fo much featcored after refraction. The red will always be outermon in thele cormas, as confiting of rays which fuficr the leaft refraction. And whercas he had feen, when the clunds were driven brikly by the "ind, halos round the moon, waning frequently in their diameter, being fometmes of two, fometimes of three, and fometimes of four degrees; fometimes alfo being coloured, fometimes only white, and fometimes diappearing entirely; he concluded that all thefe variations arofe from the different thicknefs of the clouds, through which fometimes more and fometimes lefs light was tranfmitted. He fuppofed, alfo, that the light which formed them might fometimes be reffected, and at other times refracted. As to thofe coronas which confif of two orders of colours, he imagined that they were produced by fimall pieces of fnow, which when they begin to diffolve, form figures which are a little convex towards their extremities. Sometines, alio, the frow will be melted in different flapes; and in this caft, the colours of feveral halos will be intermised and confufed; and fuch, he fays, he had fometimes obferved round the fun.
M. Mariotte then proceeds to explain the larger coronas, nanely thofe that are about 45 degrees in diameter, and for this purpofe he has recourfe to equiangular prifms of ice, in a certain pofition with refpect to the fun; and he takes pains to trace the progrefs of the rays of light for this purpofe: but this hypothe lis is very improbable. In fome cafes he thought that thefe large coronas were caufed by hail-ftones, of a pyramidal figure ; becaufe after two or three of them fiad been feen about the fion, there fell the farme day feveral fuch pyramidal hail-ilones. M. Mariotte explains parthclia by the help of the fame fuppolitions. Sce Parhelia.

Sir Ifaac Newton does not appear to have given any particular attention to the fubject of halos, but he has hinted at his fentiments concerming them occafionally ; by which we perceive that he confidered the larger and lefs variable appearances of this kind as produced according to the common laws of refraction, but that the lefs and more variable appearances depand upon the fame caufe with the colours of thin plates.

He concludes his explication of the rainbow with
the following obfervation on halos and parhelias. "The light which come through drops of rain by two refractions, without any reflexion, ought to appear the fronget at the diftance of abont 26 desiece from the fun, and to decay gradually both ways as the diflance from him increafes. And the fame is to be underfood of light tramimitted thrumph Cpherical hailftones: and if the hail be a lithle Plitted, as it often is, the tranfmitted light may be fo Rrong, at a lithe lefs cittunce than that of 26 degrees, as to form a halo abont t'e fun or moon; which hato, as often as the latil-thones are duly figured, may be colnared, and then it mut be red within by the katl refremible rays, and the without by the inue refratasibe ones; specially if the hail-fories have opazgee ghthles of frow in their centres to intercept the light within the balo, as Mr Hurgens las nberved, and make the infide of it mone dittinctly deined than it wond othervife be. For iuch haildones, though foberical, by tewninating the lifit ly the fuow, may make a halo red within, and columilefs withon, ard darker within the red than without, as halos wet to be. For of thofe rays which pals clufe by the frow, the red-making ones will be the kalt rofrauted, and fo come the the cye in the Atraighteft lincs."
Some tarther thoaches of Sir Ifane Nowton's on thes fuljecio of halos we find febjoine! to the account of his experiments on the colours of thick plates of glafs, which he conccived to be fimilar to thofe which ate exhibited by thin ones. "As light refected by a lens quick-filuered on the back fide makes the rings of the colours above defribed, fo (he fays) it ought to make the like rings in pafing through a drop of water. At the firt reflexion of the rays within the drop, fome colours ought to be tranfmitted, as in the cafe of a lens, and others to be reflected back to the eye. For inftance, if the dancter of a fmall drop or globule of water be abour the 500 dtl part of an inch, fo that a red-making raty, in pafling through the middle of this globule, has 250 fits of eafy trantinifion within the globule, and all the red-making rays which are at a certain diftance from this midde ray round about it have 249 fits within the globule, and all the like rays at a certain farther difance round about it have $24^{8}$ fits, and all thofe at a certain farther dittance ${ }^{2}+7$ fits and fo on, thefe concentric circles of rajs, afier their tranfmillion, falling on a white paper, will make concentric rings of red upon the paper; fuppofing the light which paffes through one fingle globule ftrong enough to le fenfible, and in like natner the rays of other colours will make rings of other colours. Suppofe now that in a fair day the fun thould fhinc through a thin cloud of fuch glubules of water or hail, and that the globules are all of the fame fize, the fun feen through this cloud ought to appear furrounded with the like concentric rings of colours, and the diameter of the firft ring of red hould be $7 \frac{1}{4}$ degeees, that of the fecond $10 \frac{1}{4}$, that of the third $12^{\circ} 33^{\prime \prime}$, and accordingas the globules of water are bigger or lefs, the ring flould be lefs or ligger."

This curions theory our author informs us was confirmed by anebfervation which he made in 1692 . He faw by refesion, in a veffel of itagnating water, three halos, crowns, or rings of colours about the fun, like threc little rainbows concentric to his body. The co-

## C O R

Corons, amung botanita, the name given by fome to the circumference or margin of a radiated compound flower. It correfperds to the radius of Linnaus; and is exampliticd in the flat, tongue-fhaped petals which occupy the margin of the daify or funflower.

Gorona Aybulis, or Merilionalis, Southern Crown, a conllation of the fouthern hemifphere, whofe tare in Proleny's catalogue ane 13 , in the Bitilh catilogrte I2.

Corom Boralis, the Northern Crown, or Garlund, in athonomy, a contellation of the hethern he:nifplere, whole flars in Ptolemy's eatalugue are cight, in 'Tychu's as many, and in Mr Flamllead's 21.

Cukovs Imferialis, in conehyology, a name given by fome authors to a kind of voluta, difering from the other thells of that iamily, by having its liead onnamented with a number of pinis, forming a furt of crown. Su Voluta.

CORONAL, in anatomy, the firle future of the fiull. See Anatomy, $\mathrm{H}^{\prime}: 3$.

CORONALE os, the lame with the os frontis. See Avatomy, n? 12.

CORONARY vessels, in anatomy, certain ver. fels which funnih the fubdance of the heart with blood.

Corovarr Artaries, are two arteries rpringing out of the aorta, befort it leaves the pericardium. See Anatomy, $\mathrm{n}^{3} 122$, and 123 .

Co:onalkr Fitin, a vein diffufed over the exterior furface of the heart. See Anatomy, $\mathrm{n}^{\circ} 122$.

Stumachic Cokonstr, a vein inferted into the trunk of the fplenic vein, which, by uriting with the mefenteric, forms the vena porta. See Anatomy, $\mathrm{n}^{\circ} 123$.

CORONARLE, in botany, the roth order of plants in Linneus's Fratments of a natural methed. Under this name, inttead of the more obvious one $l i$ lacce, Linnxus collects a great number of genera, molt of which furnih very beautiful garden-flowers, viz. al. buca, cyanella,' fitillaria, helonias, hyacinthus, hypoxis, lilium, melanthium, ornithogalum, fcilla, tulipa, agave, aletris, aloe, anthericum, atphodelus, bromelia, burmannia, hemerocallis, polianthes, tillandfia, veratrum, yucea.

CORONATION, the ceremony of invefling with a crown, particularly applied to the crowning of kings, upon their fuceceding to the fovereignty. See hing.

CORONA (anc. geog.), a town of Bectia, near mount Helicon, and the lake Copais, fituated on an eminence; famons for the defcas of the Athenians. and Boeotians by Agelilans.-Another Coronx of Thenaly; having Narthacium to the eatt, and Lamia near the Sperchius, to the north, (I'iolemy).

CORONE (auc. geog.), a town of Meflenia, fituated on the fea, giving name to the Sians Coronwns, (Piny) : now Golfo di Coron. Paufanias takes it to be the Aepea of Homer; but Strabo Thuria, and Pliny Pedafus, wuw Coron, in the territory of Belvidac, in the Morea. E. Long. 22, Lat. 36. 3 3.

CORONELLI (Vincent), a famous geographer, born at Venice. His fill in the mathematies havins brought him to the knowledge of the comst d'Elrers, liis eminence employed him in makiog globes for Louis ilV. With this view Corondili ipent finne
time at Paris; and left a great number of globes there, which are cftecmed. In 168 , he was made cofmographer to the republic of Venice: and four years after, public profeffor of geography. He founded an academy of cofmography at Venice; and died in that city in 1718 . He publilhed above 400 geographical charts, an abridgement of cofmography, feveral books on geography, and other works.

CORONER (coronator), an ancient officerin England, fo ealled becaufe he hath principally to do with pleas of the crown, or fuch wherin the king is more imnediately concerned. Aad in this light, the lord chief juttice of the king's bench is the principal eoroner in the kinglom; and may, if he pleafes, exereife the jurifdiction of a coroner in any part of the realm. But there ate alfo particular coroners for every county of England ; wfoally four, but fometimes fix, and fometimes fewer. This officer is of equal authority with the fheriff; and was ordained, together with him, to keep the peace when the eals gave up the wardhip of the county.
He is choten by all the freeholders of the county conit ; and hy the flatute of Wefminfter 1. it was e.. nacted, that none but lawful and difereet knights fhould be cholen: but it feens now fufficient if a man have lands enough to be made a knight, whether he bereally knighted or not: for the coroner ought to have an eftate fufficient to maintain the dignity of his office, and anfwer any fines that may be made upon him for his mifbehaviour; and, if he hath not enough to anfwer, his fine thall be levied on the comaty, as a puniflment for electing an infufficient officer. Nuw, indeed, through the culpable neglect of gentlemen of property, this office has been fuffered to fall into difrepute, and get into low and indigent hands; fo that although formerly no coroners would be paid for ferving their country, and they were by the aforefaid fatute of Wefminter i. exprefly forbidden to take a reward under pain of great forfeiture to the king; yet for many years palt they have only defired to be clofen for the fake of their perquilites; being allow. ed fees for their attendance by the Itatute 3 Hen. VII. r. I. which Sir Edward Coke complains of heavily, though fince his time thofe fees bave been much enlarged.
The coroner is chofen for life; but may be remored, either by being made fheriff or clofen verdenor, which are offices incompatible with the other; and by the fratute 25 Geo. II.e. 29. extortion, negleft, or mifbehaviour, are alfo made caufes of removal.

The office and power of a coroner are alfo, like thofe of the therif, either judieial or miniterial ; but principally judicial. This is in great meafure afcertained by flatute 4 Edw. I. De offrio coronatoris; and confifts, firft, in inquiring, when any perfon is lain, or dies fuddenly, or in prifon, concerning the manner of his death. And this mutt be juper vifumn corporis; for if the body is not found, the coroner cannot fit. He muft alfo fit at the veiy place where the death hap. pened. And his inquiry is made by a jury from four, five, or fix of the neighbouning towns, over whom he is to prefide. If any be found guilty by this inqueft of murder, he is to commit to prifon for farther trial, and is alfo to inquire concerning their lands, goods, and chattels, which are forfeited thereby : but whe-
ther it be murder or not, he mult inquire whether any deodand has acerued to the king, or the lord of the franehife, by this death; and mult certify the whele of this inquifition to the court of king's.bench, or the next affizes. Another branch of his office is to inquire concerning fhipwrecks; and certify whether wreck or not, and who is in poffeflion of the goods. Concerning treafure-trove, he is alfo to inquire coneerning the finders, and where it is, and whether any one be fufpected of having found and concealed a treafure; " and that may well be perceived (faith the old tatute of Ediw. I.), where one liveth riotoully, haunting taverns, and hath done fo of long time ;" whereupon he might be attached and keld to bail upon this fufpicion only.

The minitterial office of the coroner is only as the therifts fubititute. For when jult exception can be taken to the fleriff, for fulpicion of partiality (as that he is interefted in the fuit, or of kindred to either plaintiff or defendant), the procefs null then be awarded to the coroner, inftead of the fheriff, for execution of the king's writs.

CORONET. See Crown.
Coronet, or cornet, of a horfe, the lowel part of the pattern, which runs round the coffin, and is diftinguifhed by the hair joining and covering the upper part of the houf.

CORONILLA, jointed podted Corvtea: A genus of the decandria order, belunging to the diadelphia clafs of plants; and in the natural method ranking under the 32 d order, Pupilionacea. The calyx is bilabiated, with two fegnents above coalited; the vexillum fearee any longer than the alx; the legumen much contracted between the feeds. To this genus Linneus alio joins the emerus, or foorpion fena; though Mr Miller makes it a difinct fpecies. There are 11 fpecies, all of them plants of confiderable beauty, with very bright yellow flowers. All of them, however, are rather too tender for this climate, except the emerus. This fpecies rifes with a thrubby flem, branching numeroufly fix or eight feet high, clofely garnifhed with winged leaves of three pair of lobes, terminated by an odd one; and, at the fides of the branches, numerous long flowerftalks, each fupporing two or three large yellow flowers of the papilionaceous kind, fucceeded by longinh pods; it is eafily propagated by feeds, and likewife by layers or cuttings. The leaves of this plant are efteemed laxative, and ufed as a fubltitute for common fena in fome parts of Europe. A dye is procured by fermentation from the leaves, like that of indigo.

CORONOID, and Condrloid, proceffes. Sce Anatomy, $\mathrm{n}^{\circ} 26$.

CORPORA cavernosa, in anatomy, two fpongious bodies, called alfo corpora neviofa and corpus Spongiofum. See Anatomy, p. 738, col. 2.

Cokrok.t Pyramidahia, are two protuberances of the under part of the cerebellum, about an inch long; fo called from their refemblance to a pyramid. See Anatomy, по $13+$

Corfora Striata. See Anatomy, p.758, col. i.
CORPORAL, an inferior officer under a fergeant, in a company of fuot, who has charge over one of the divifions, places and relieves centinels, and keeps good order in the corps de garde: he alfo receives the word from the inferior rounds, which pafiea by his

## C O R

Corporal, corps de garde. This offecer carries a fufee, and is Corpora- commonly an old foldier: there are geacrally three corporals in cach company.

Corporst of a Shis of War, an officer under the mafter at arms, employed to teach the officers the exercife of fimall arms, or of muketry; to attend at the gang-way, on enterime ports, and obferve that no fpirituous liquors are brought into the fhip, urites by exprefs teave from the oflicers. He is allo to extinguin the fire and candles at eight o'clock in winter and nine in fummer, when the evening gou is thed; and to walk frequently down in the lower decks in his watch, to fec that there are no lighes but fuch as are under the charge of proper centinels.

Corforal (Corporali), is alfo an ancient charch. term, fignify ing the facred linen fpread under the chalice in the cuchanitl and mafs, to receive the fragments of the bread, if any chance to fall. Sume fay, it was pope Eufbius who fint enjoined the whe of the corporal ; others aferibe it to St Silvefter. It was the cuftom to carry corporals, with fome folemity, to fires, and to heave them againt the flames, in order to extingnith aleen. Plilip de Comines fays, the pope made Louis XI. a picfent of the corporale, whereon my lord St Piter fung mafs.

CORPORA'IION, a body politic or incorporate. fo called, becanfe the perfons or members are juined into one body, and are qualified to take, grant, ※e.

Of corporations the e is a great variety fublilling, for the advancement of retigion, of learuing, and of commerce; in order to preferve entire and for ever thofe rights and immunities, which, if they were granted only to thofe individuals of which the body corporate is compofed, would upon their death be uttenly lott and extinct. 'T'o flow the advantages of thefe incorporations, let us constider the cafe of a college in either of our uniserlitics, founded al / ludendum et orandum, for the encouragement and fupport of religion and learning. If this was a mere voluntary af. feinbly, the incividuals which conpofe it might indeed reat, pray, fudy, and perform feholatio exercifes together, fo long as they coull agree to do fo: but they could neither frame, nor rective, any laws or rules of cheir conduct; none at leafl which would lave any binding force, for want of a cocrcive power to create a Enffient obligation. Neither could they be eapable of retaining any privileges or immunities: for, if fuch privileges be attacked, which of all this uneonnected affembly has the right or ability to defend them? And, when they are difiperfed by death or otherwife, how thall they transfer thefe adrantaFes to another fet of Atudents, equally unconnetted as themfelves? So alfo, with regard to holding ellates or other property, if land be granted for the purpoles of religion or learning to 20 individuals not incorporated, there is no legal way of continuing the property to any other perfons for the fame purpofes, but by endtefs conveyances from one to the other, as ofren as the lands are changed. But when they are confolidated and united into a corporation, they and their fuceeflors are then confidered as one perfon in law: as one perfon, they have one will, which is collected from the fenfe of the majority of the individuals: this one will may eftablifh rules and otders for the regulation of the whole, which are a fort of mu-
nicipal laws of this little republic; or rules and Aa-
Curporatutes inay be preferibed to it at its creation, which are then in the place of natural laws: the privileges and immunities, the cllates and polfeffons, of the corpo$\overbrace{B 1}$ Blavi/b. ration, when once velled in them, will be for ever velled, withour any new converance to new fuccerfions; for all the individual metibers that have exill. ed from the foumation to the prefent time, or that fladlever hereafter exit, are but one perton in liw, a perfon that never dies: in like naner as the river Thanaes is till the fane , iver, though the parto which compofe it are changing every inllant.
The honour of originally inventing thefe political conlitutions entircly belongs to the Romans. They were inrroduced, as Plutach fays, by Numa; who finding, upon his acculfion, the city torn to pieces by the two rival factions of Sabines and Rmmans, thought it a prudent and politic meafuse to fubdivide the fe two into many fmaller ones, by indituting feparate fucietics of every manual trade and profeflion. They were afterwards much confidered by the civillaw, in which thicy were called univerforatis, as forming one whole out of many individuals; or collers $a$, from being gathered together: they were adopted alfo by the canou law, for the maintenance of ecelefialtical diteipline; and from them our firitual corporations are derived. But our laws have confiderably sefined and improved upon the invention, aconding to the ufual genius of the Englith nation: particulatly with regard to fole corporations, contilitig of one petion only, of which the Ruman lawyers had no notion; their maxim being that "tres faciunt collegium:" though they beld, that if a corporation, origimaly' confiting of three perfons, be reduced to one, "it univerfitas ad unum redit," it may ftill fubift as a corporation, "et ftet nomen univerfitatis."
As to the feveral forts of corporations, the firt divifion of them is into argrequede and folco. Corporations aggreate confint of many perfons umted together into one fociety, and are kept up by a perpetual fuceeffion of membets, fo as to contiane for ever: of which kind are the mayor and commonalty of a city, the head and fellows of a college, the dean and clapter of a cathedral churcl. Corporations fole confilt of one perfon only and his fucceforz, in fome particula tlation, who are incorporated by law, in order to give them fome leral capacities and adrantyges, particularly that of perpetuity, which in their natural perfons they could not have had. In this fenfe the king is a fule corporation: fo is a bilhop: fo ale fome deans and prebendaries, dittinet foom their feveral chapters: and fo is every parfon and viear. And the neceffity, or at leaft ufe, of this inftitution wall be very apparent, if we confider the cafe of a parfon of a church. At the original endowment of paith-cluarches, the freehold of the church, the clurch-yard, the parfonage-houfe, the glebe, and the tithes of the parifh, were vefted in the then parfon by the baunty of the doaor, as a temporal recompence to him for his fpiritual cate of the inhabitants, and with intent that the fame emoluments flould ever afterwards continue as a recompence for the farne care. But how was this to be effected? The freehold was vefted in the parfon; and, if we fuppofe it velted in his natural capacity, on lis death it might defeend to his heir, and would be liable to bis debis and incum-
brances:

Cigporz brances：or at bet the heir might be compellable，at いい月．

E1．2．6．
Comaint． fome trouble and experce，to convey thefe rights to the fucceediag incumbent．The law therefore has wife－ ly ordained，that the parfon，cutatemus parfon，hall ne－ ver die，any more than the king；by making him and his fucceflors a corporation．13y which means all the original riglats of the parfonage are preferved entive to the fucceffor：for the profent incu nbent，and his pre－ deceffor who lived feren centurics ago，are in law one and the fame perfon；and what was given to the one was given to the other alfo．
A nother divifion of corporations，either fole or ag． gregate，is into ccilefingital and lay．Eceletiaflical cor－ perations are where the members that compofe it are ertirely fpiritual perfons：fuch as bihops；certain deans and prebendaries；all archdeacons，parfons，and vicars； which are fute corporations：deans and chapters at prefent，and formerly pior and convent，abbot and monks，and the like，bodies agereyate．Thele are ereeted for the furtherance of retigion，and perpetn－ ating the rights of the church．－LLay corporations are of two forts，cind and elemofnary．The civit are fuch as are erected for a variety of temporal purpofes．The king，for inftance，is made a corporation to prevent in general the potfibility of an intercumm or＂acancy of the throne，and to priferve the pofleflions of the crown entire ；for，immediately npon the demife of one king， his fucceftor is in full poffefion of the regal rights and diguity．Other lay corporations are ereeted fur the grod goverment of a tow or particular diftriet，as a mayor an！commonalty，ballife and burgeffes，or the like ：fome for the advancement and rerulation of ma－ nufactures and commerce；as the thading companies of London and other towns：and fome for the better earryieg on of divers fectial purpofes；as church war－ dens，for conforvation of the goods of the parth：the college of phyticians and company of furgeons in Ion－ don，for the improvenent of the medical cience；the royal focity for the advancement of natural know－ ledge；and the fociety of antiquarians for promoting the Itudy of antiquities．The elecmofynary fort are fuch as are conituted for the perpetial diaribution of the free aims，or boanty，of the founder of them to fuch perions as he has direeted．Of this kind are all hofpitals fir the maintenance of the poor，lick，and impotent；and all eollegrs，both in our univerlities and out of them：which colleges are founded for two pur－ pofes：1．Fer the promotion of piety and learning by proper regulations and ordinances．2．For inparting affitarce to the members of thofe bedies，in order to enable them to profecnte thair dovotion and thudies wita greater eafe and affuduity．And all thefe elee－ mofynary corporations are，thictly fpeaking，lay，and not ecclefialical，even though compoicu of coclenati－ cal pafons，and although they in fome things partake of the nat lre，privileges，and retitictions of coclefi－ allical hadies．

IIwin thus marhalled the feveral fpecies of cor－ porations，hit us next procced to confider，I．How corporations in general may be created．2．What are their powers，capacities，and incapacities．And，3．How they may be diflutved．
i．Corporations，by the civil law，feem to have been created by the mere att aud voluntary affocia－ Nog．
tion of their members；provided fuch convention was Corpors－ not contrary to law，for then it was intifun collcgium． It does not appear that the prince＇s confent was ne－ ceflary to be actually given to the forndation of them； but mercly that the original founders of thele volun－ tary and friendly focicties（for they were little more than fuch）fluyud not ehabhith any meetings in oppo－ friton to the laws of the tate．

But in England the Ling＇s confent is abfolutely ne． ceffary to the erection of any corporation，either im－ pliedly or exprefsly given．The king＇s implied con－ fent is to be found ia corporations which exill by force of the common law，to which our former kings are fuppofed to have given their concurrence；commun law heing nothing elif but cullom，arifing from the univerfal agreeneat of the whole community．Of this fort are the kiag himelf，all bimops，parfuns，vi－ cars，church－wardens，and fome cthers；who by com－ mon law have ever been held（as far as our books can fhow us）to have been corporations，wirtute oficii：and this incorporation is fo infeparably annexed to their offies，that we cannot frame a complete legal idea of any of the fe perions，but we nuth alio have an ictea of a corporation，capable to tranfmit his rights to his fuc－ ceffors，at the fane time．Another meihod of impli－ cation，whereby the king＇s confent is prefumed，is as to all corporations ty prefeription，fuch as the city of London，and many others，which have esited as cor－ porations，time whereof the memory of man runueth out to the contrary；and theref．re are looked upon in law to be well created．For though the members thereof can flow no legal chatter of incorporation， yet in cafes of fuch high antiquity the law prefumes there once was one；and that by the varicty of acei－ dents，which a length of time may produce，the char－ ter is loft or deflroyed．The methods by which the Ling＇s conient is exprefsly given，are cither by act of parliament or chartcr．By act of parliament，of which the royal affent is a neceffary ingredient，corporations may undeubtediy be created：but it is obfervable，that moll of thofe flatutes，which are ufually cited as ha－ ving created corporations，do cither conlirm luch as have been befure created by the king；as in the cafe of the college of phyficians，ereeted by charter to Hen．VIII，which chater was afterwards confirm ed in parliament；or，they permit the king to erect a corporation in futuro with fuch and fuch powers；as is the cafe of the bank of England，and the focicty of the Britifh fifhery．So that the immediate creative aft is wifually performed by the king alone，in virtue of his royal prerogative．

AHl the other methods therefore whereby corpora－ tions exill，by common law，by preleription，and by act of parliament，are for the inolt part reducible to this of the king＇s letters patent，or charter of incor－ poration．The king＇s creation my be performed by the words crazurs，crigimius，fandamas，incorporamus，or the like．Nay it is held，that if the king grants to a fet of men to have gillam merateriam，＂a mercantile mecting or aftembly，this is alone fufficient to incor－ porate and ellablith them for ever．

The king（it is faid）may grant to a fubject the power of erceting corporations，though the contrary was formerly held ：that is，he may permit the fub－

Corpanta tion
ject to name the perfons and powers of the enporation at his pleafue; but it is really the king that erects, and the fubject is but the inftument ; for though none but the king can make a corporation, yet quidiait per aliam, facit per fe. In this manner the chancellor of the univerfity of Oxford las pows by charter to ercet corporations: and has actually often exerted it in the erection of feveral matriculated companies, now fubfifting, of tradefinen fubfervient to the ftadents.
ithen a corporation is elected, a uame mutt be given to it ; and by that name alone it muft fue and be fued. and do all legal acts.

II After a corporation is fo formed and named, it acquires many powers and rights, which we are next to confider. Some of thefe are necefarily and infeparably incident to every corporation; which incidents, as foon as a corporation is duly erected, are tacitly annexed of courfe. As, 1. To have perpetual fucceffion. This is the very end of its incorpmation: for these cannet be a fucceffon for ever without an incorporation; and therefore all aggregate corporations have a power neceffarily implied of electing members in xice room of fuch as go cff. 2. To fue or be fued, implead or be impleaded, grant or receive, by its comporate name, and do all other acts as natural petfons may. 3. To purchafe lands, and hold them, for the benefit of themfelves and then tuceffors: which two are confequential to the fomer. 4. To have a common fal. For a corporation, being an invititle body, cannot manifelt its intentions by any perfonal act or oral dicourfe: it otherwife aets and fpeaks only by its cormmon feal. For though the particular members may exprefs their private conlents to any act, by words, or faning their names, yet this does not bind the corporation; it is the fixing of the feal, and that only, Which unites the feveral alfents of the individuals who compole the community, and makes one joint affent of the whole. 5 . To make by-laws or private farutes for the better government of the corporation: which are birding upon themfelves, nulefs contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws which may affect the king's prerogative or the common profit of the people, under penalty of L. 40, unlefs they be approved by the chancellor, treafurer, and chicf juftices, or the judges of affize in their circuits: and even though they be fo approved, flill, if contrary to law, they are void. Thefe five powers are infeparably incident to every corporation, at leaft to every corporation agreregate: for two of them, though they may be practifed, yet are very unneceffary to a corporation fole; viz. to have a corporate feal to teflify his fole affent, and to make ftatutes for the regulati u of his own conduct.

Corporations have a capacity to purchafe lands for thenfelves and lucceffors; but lley are excepted ont of the flatute of wills; fo that no devife of lands to a corporation by will is good; except for charitable ufes, by itatute $4_{3}$ Eliz. c. 4 whichexcretion is again greatly narrowed by the thatute 9 Geo. Il. c. 36. And alio, by a great variety of flatutes, their privilege even of purehading from any living granter is much abridgred; fo that now a corporation, cither ecelefaftical or lay, muft have a licence from the kine to purcliafe, befcre they can exert that capacity which is vefled in then Voz, V. Part II.
by the common law : nor is cen this inall cafes fuf- Cormara-
 of motmain. Suc Mortmain.

The generd duties of all bodies pulitic, confuered $\%$ in 2 in their corporate capacity, may. Ike thofe of natural perfons, be ceduced to this fiogle one: that of adting up to the end or defign, whatever it be, for which they ware created by their founder.
111. How corporations may be diffured. Arry particular member may be diefranchifed, or lofe his place in the corporation, by actins contrasy to the laws of the fociety, or the laws of the land: or he may refign it by his own volmontary. But the body politic may allo itfelf be diffolved in feveral ways; which difoll. tion is the civil death of the corporation : and in this cafe their lands and tenements fall revert to the perfon, or his heirs, who granted them to the corporation: for the law doth annex a condition to every fuch grant, that if the corporation be diffulued, the granter mall have the lands again, becaufe the canfe of the grant faileth. The grant is indeed only during the life of the corporation: which may endure for ever: bur when that life is determined by the difiolution of the borly politic, the granter takes it back by reverfon, as in the cafe of every other prant for life. The debts of a corporation, either to or from it, are totally extineruithed by its diffulution; fo that the members thereof cannot recover, or be charged with them, in their natural capacitics: arrecable to that maxim of the civil law, si givil unizergituti deluctur, fingulis non debetur ; nee, quod debet untiverytas, furnuli debint.

A corporation may be diffolved, r. By act of par~ liament, which is boundie?s in its operations. 2. By the natural death of all ite members, in cafes of an aggregate corporation. 3. By furrender of its franchifes into the hands of the king, which is a kind of fuicide. 4. By forfeiture of its chatter, through ricgligence or abufe of its frauchifes; in which cafe the law judgea that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular courfe is to bring an information in nature of a writ of quo zutranio, to inquire by what warrant the members now exercife their corporate power, having forfeited it by fuch and fuch proceedings. The exertion of this ast of law, for the purpofes of the ftate, in the reigns of king Charles and king James II. particularly by feizing the charter of the city of London, gave great and juat offence; though perhaps, in Atrictnefs of law, the procecdings in moft of them were fufficiently regular: but the juigment againft that of London was reverfed by act of parliament after the revolution; and by the fame fatute it is enacted, that the f:anchifes of the city of London thall never more be forleited for any caule whatfoever. And becaufe by the common law corporations were diffulwed, in cale the mayor or head offictr was not dulv elected on the day appointed in the charter or eftablifhed by prefcription, it is now prom vided, that for the future no corporation thall be diffolved upon that acconnt; and ample directions art given for appointing a new officer, in cafe there be no eltetion, or a void one, made upon the charter or preCoriptive day.

Cokberitioiv AC, is that which prevents any perfon 30
from

## C. 0 IR $[47+] \quad \mathrm{C} O$ R

Cerpocal finn being legaily deded into any office relationg to the erveroment of any riby or corpotation, unlefs
Coospl. withia a twelvemonth betore he has received the facra. ment of the I'oud's fupper, according to the rites of the church of Endard; and which enj ins him to take the oadhs of ablegiance and fupumacy when he tokes the oath if ofi e; otherwife his election is void.

CORPOREAT, thofe qualitics which ienominate a body. See Incurporead.

CORPOREITK, the qualite of that which is corpores', or hia body: or that which conbiontes or denomitates it foch.-The corptretion of $G$ od was the capial cerer of the bothromonophites. Some athors refa ach Testullian riehadmitsiag accoporcity in the

 maritans ot this day, with a belief of the corpurity f Gud. Many of the ancints believed the eoppuretiy of ancel:

CORPSE, a daca rody.
If any one, in takine up a doal body, Ateala the fnowd, or other apparel, it will be folony. Stcalinis only the erpfe itfelf is not fel ony; but it is punihable ns a mifdement $r$ ty inditument at common law.

CORPS, in architecure, is a tem borrowed from the French, fignifying any pat that projects or adtances beyond the naked of a wall: and which ferves 3.5 a ground for fune decoration or the like.

Corps de Butailk, is the main body of an army drawn up S. r battie.

Cokos de Gord, a poll in anarmy, fometimes under covert, fometiotes in tle open air, to receive a body of frdtery, who are relieved from time to time, and Gre to watch in their tuns, for the fecurity of a quarrer, a camp, Aation, isc.- The word is allo ufed for the men who watch therein. It is ufual to have, befode the great. a little corps de garde, at a good diftance before the lines; to be the more readily adventifed of the apernach of the enemy.

CORPULENCY, the fate of a perfon too much ] oaded with flem or fat.

Cormioncy is the nccafion of tarious difeales, and paricalanly the apoplexy. It was held infamous among the ancient Lacedremonians.

Sennertus mentions a man that weighed 600 pounds, and a maid 36 years of age who weighed 450 . Bight of Malden, who died at the age of 29 years in 1750 , weighed GI 6 pounds. Chiapin Vitelli, Marquis of Cerona, a noted Spanifh general in his time, from an excelfive corpulency, is faid to have reduced himfll, by drinking of vinegar, to fuch a degree of leanncls, that he could fold his kin feveral times round him.

Catile fnap, in the form of a bolus, an electuary, pills, or difiolved in a gill or more foft water, from one to fonr drachms, taken at bed-time, is Atrongly recommended with a view of reducing corpulency, if a difcourfe on its nature, caufes, and cure, by Maleolm Flemyng. M. D. Lond. i760. See Medicine-Index.

CORPUS, in anatomy, is applied to feveral parts of the animal ftructure; as corpus callufom, corpus cavermofun, ixc. Sec Anatomy, p. 739 and p. 740.

Corpes iz alfo ufed in matters of laming, for feveral works of the fame nature collected and bound iogether.

Cratian made a collection of the canons of the chunch, called corpus comonam. The cospus of the civil law is componed of the digeft, code, and intitutes. We have alfo a corpus of the Greek poets; and another of the Latin poets.

Corters Corigli, a fetival of the church of England, kept on the next Thurday after Trinitr funday, inSlituted in honour of the eucharit; to which alio one of the collegez in Oxford is dedicated.

CORPUSCLE, in Phytics, a minate particic, or phyfical atom, being fach as a natural bedy is made up of. By this word is not meart the elementaty particles, nor the hypullatical principses of chemifs; but fuch paticles, whethar of a fimple or componad nature, whole parss will not be diffilved nor ditipated by ordinave lequees of heat.

CORPUSCULAR PHIROSOPHY, that wiy of phis. Intwhing when cudetwoms wexplath things, and to a conent for the phenomena of nature, by the mution, furbe, ret, pr fition, \&ze of the ecopufles, or the minute perticles of matter.

Mr Boyle fums up the chief primeiples of the corpurcular hypotinelis, which now flowithes under the meclanical philotoply in thele particulars:

1. They fuppole that there is but one catholic or minerlal matter, which is an extended, impenetrable. and divilible fubitance, common to all bodies, and capable of all forms. 2. That this matter, in ouder to form the valt valiety of natural bodies, mut have motion in fome or all its affiguable parts; and that this motion was given to matter by $G$ xi the Creator of ail things, and has all manner of directions and sendencies. 3. Matter mult allo be aetually divided into parte, and each of thefe primitive putieles, fragments, or atoms of matter, mull have its proper magnitude or fize, as alfo its peculiar fustre or fhape. 4. They fuppore alfo, that othefe differently lized and haped particles may have as different orders and potitions, whereof great variety may arife in the compofition of badies.

CORRADINI de Sezza (Feter Marcellinus), a learned civilian and eardinal, born at Sezza, in $165 \%$, acquired the efteem and confidence of Clement XI. and died at Rume in 1743 . He was the anthor of a learned and curious work entitled "Verus Latium profanum \& facrum," 2 vols folio; and a hiltory of Sezza, in 4 to.

CORRADO (Schaftian), an Italian grammarian of the 1 6th century, tanght the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be profeffor of thole languages. He wrote feveral works, the moit eltecmed of which are, "Queftura in qua Ciceronis Vita refertur," an excellent performance; and, " de Linguâ Latinâ." He died is 1556.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the corrector gives the hirt proofs, to point out and amend the faulis, to be rectified by the compontor.

The corrections are placed on the margin of each page, right againit the line where the faults are found. There are different characters uftd to exprefs different corrections, as D or $\delta$, dele, for any thing to be effaced or left out. When any thing is to be inferted,

Conrectur the phace is marked in the line with a caret ", and the orrnfive intertion added in the margin. When a word, fyl-
lable, Sce is to be altered, it is craled out of the proof, and that to be put in its room written in the margin; always obferving, if there be feveral miftakes in the fame line, that the corrections in the margin be feparated by litele bars, or trokes, |. If a fpace be omitted, its place is marked with a caret, and the margin with 罂. If a face be wrong placed, as in the middle of a word, the two parts arc connected with a co ree, and the fame character put in the margin. II a letter be inverted, it is experfed on the margin with $y$. If any thing be tralfpofed, it is marked thus: The phorty the the folliest lyf ; for the fortef follics are the leff; and in the mangin is added tr. in a circle. If Roman chatacters are to be changed for Italic, or suge oerfit, a line is dawn onder them thas, and Koman or Ituli: added in the margin: if to capitals, a dumble line. If a word or fentence is enticty omited, the plase is marked with a caret, and in the margin is inferied the word out. If the letters of a word ftand too far afunder, a line is drawn under them, and in the matgin is put a crooked line or hook, thins -.

CORRECTOR, in general, denotes fomethiag that mends the faults or bad qualities of others.

Coksteror of the Staple, a clerk belunging to the naple, whofe bufinels is to wite down and record the bargains that merchants make there.

Conrfctor, in mediciue or pharnacy, an ingredient in a comporition, which guards againll or abates the force of another.

CORREGIDOR, the name of an officer of jufice in Spain, and conntries fuhject to the Spanifh govenrent. He is the chaief judge of a town or province.
correggio. See Allegri.
CORRELATIVE, fomething oppofed to another in a certain relation. Thes, father atad fon are contelatives. Light and darkncfs, motion and reft, ate cont lative and oppolite terms.

CORRIGIOLA, in botany: A genus of the trigynia order, belonging to the pentandia chafs of plants; and in the natural method ranking mider the 5 th onder, Alfoctunece. The calsy is pemaphyllous; the petals five; and one three cornerd feed.

Corrobordnts, of Corroborative Afed:cims. Soe Strengramers.
CORROSION, in a general fenfe, the action of grawing away, by degrees, the continuity of the parts of budies.

Corrosion, in chemiftry, an action of bodies, by means of puper menthums, that prodaces uew connbinations, and a change of their form, without converting them to finidity.
Corrosive sublimate mercury. See Cue. mistry-Indiox.

Corrlgator muscle. See Anatumy, Ticble of the Brafiles.

CORROSIVES, in furgery, are medicines whith corrode whatever past of the body they are applied to: fuch are bumt alum, white precipitate of mereny, white vitriol, red precipitate of mercury, butcer of antimony, lapis inferealis, aco,

CORRUPITCOI.AE, a fect who role ens of the Corspit
 ticir chiel Severos, the precended parriden on Ahxandria.

Their dillinguifing doetinge, whence they arrixed their name, was, that the buly of J, Fas Cirist was cormpible: that the fathons hand consed it; and that to deny it was to deny the truth of our Savionec paffion.

On the other hand, Julian of Mulicamaras, anothere Eutychian, a refugee, as will as Severis, in Alexandria, maintained that the boody of felua Chrilh had beea always incorrupeible ; that to fay it was corruptibis. was to make a dillinction between Jefus C arit and the Word, and by conlequence to make two matures in $\}$ :fus Chrill.

The people of Alexandia were diviled between the two opinions: and the partidus of Severus weac call ed corruptiolte, q. d. worthippers of forathing cor. ruptible: fometimes they were denominated cormpibiles; and the adhereats of Julian inompophitids of phonaflealde. The clergy and hoular powers itanted the firth; the morks and the people the latter.

CORRUPTION, the detruction, extaction, or at leat ceflation for a time, of the proper mode of exittence of any matural body. Soc Dutrefactun.

Corkuftion of Mood, in law, one of the conteguences of an attaindu; and is both upwads and downwands; fo that an autainted perlina can meither inhenit lands or other hiscdatansuts from has anceftors, no: retain thofe he is aluedy in pollifion of, nor tranfait them by defent tuany heir; but the tame thali efchat to the lurd of the fee, fubject to the king'o feperiar right of fonteiture; and the perfon attainted hath alio oblruct all defeents to his pollerity, wherever they are obtiged to derive a tithe through him to a remoter anceltor. S: Aittabiber.

This is une of thei montions which our laws bave Bhat A. adiopted from the feod connturions, at the time of 'sum.....s. the Norman conquett; a appears fiom is beins mo known in thofe tennes which are indifputably Sason, or Gavel kind : wheren, thumbioy treaton, accordag to the ancient Sa:on lawe, the land is forfited to the kiug, yet no corroption of blond, no impediment of defcents, enfues: and mindignent of mere falony, no efeheat acerves to the lord. But, by the law of England, derived as above, a man's blood is fo mivestaliy cortepted by attainder, that his funs can neither imherit to him nor to any other ancellor, at lealt on the part of their attainted father.

This comption of blood canmot be abfolntely removed but by anthority of parliament. The king may excufe the public pumithment of an offender ; but cannot abolith the private ight wheh has accerned, or may accrue, to individuals as a confeglecnce of the crimiual's attander. He may remit a forteiture in which the intereft of the crown is alone conctrned; but he cannot wipe away the corruption of blood; for therein a third perfon tath an intuctl, the lord who clains by efcheat. If therefore a man hath a fon, and is attainted, and afterwards pardoned by the king; this fon can mever inherit to his father, or lathe' 's anceItors; becaufe his patemal blood, being once thorongh. ly conrupted by his father's attainder, mult emtim. fo: but if the fon had been born after the padon, ho
(intru)
1iv'?.

Corbir
might mhent ; becute, by the pardon, the Eather is made a new mat, and may convey new inatritable blood to his after-bom children.

This conuption of blood, thens arifing from froblal principles, but perhaps evt-ndu? sither than even thefe principles will wayant, 1 ts been fong lowked upon as a peculiar hardhip: becaule the ojeretive parts of the feudal tenures being now in geaeral abolifhed, it feems unteafonable to referve ont of their mot? inequitable confequences; namely, that the children thould not only be reduced to prefent poverty (which, however fevere, is fufficiently jultified upon reatons of public policy), but alfo be laid under future difficulaies of inheritance, on account of the guile of their anceltors. And therefore in mott (if not all) of the new felonies treated by Parliament fince the reign of Henry VIII. it is declared that they thall not extend to any corruption of blood: and by the fatute 7 Aune c. 2 t. (the operation of which is poltponed by the ftatute ${ }^{1} 7$ Geo. 1I. c. 39.) it is enacted, that, after the death of the late pretender and his fons, no attainder for treafon fhall extend to the difinheriting any heir, nor the prejudice of any perfon, other than the offender himfelf: which provifions have indeed carried the remedy farther than was required by the hardhip above complained of; which is only the future obitruction of defcents, where the pedigre happens to be deduced through the blood of an attainted ancellor.

CORSAIR, a pirate or perfon who feours the feas, efpecially the Mediterranean, with a veffel armed for war, without commiflion from any prince or power, to plunder merchant-veffels. The word comes from the Italian corfore, of corfo, or a curfilus, by reafon of their courfes, or excurfions-The name is commonly given to the piatical cruifers of Barbary, who had their sife about the beginning of the toth censury.

A corfair is difinguifhed from a prionteer in this, that the latter does it under a commifion, and only attacks the veffels of thofe at war with the ftate whence his commiffion is derived. The punifhment of a corfair is to be hanged, without remiffion; whereas privateers are to be treated as prifuners of war. All corfair veffels are good prizes.

CORSELET, a little cuirafs; or, according to others, an armeur or coat made to cover the whole body, anciently wom by the pike.men, ufually placed in the front and flanks of the batte, for the better refif. ing the enemy's affaults, and guading the foldiers placed behind them.
CORSICA, (anc.geog.) an inand fituated in that part of the Mediterranean anciently called the Sea of Lis:iria, in length from north to fouth 150 miles, and where broadetl 50, (Pliny). The ancitnt inhabitants were the Phocenles, (Herodotus); from which they removed to Maffilia. To them fucceeded the Ligurians and Hifpani, as appears from the fimilitude of rites and cuiloms: afterwards two Koman colonies, one by Marius, the other by Sylla. T'o the Couth it is feparated from Sardinia by a narrow Arait called Tafgoc, or Fofla, (Pliny); fixty fladia or about feven miles in breadth, (Strabo). It was lamous for its barren rock5, its woods, and its honey; which laft was reckoned noxious, from the great plonty of jew trees, ac-
coming to Diujorus Sicubs and Virgil. Cucfi was Corfucd the wame of the people, (Livy); Cyruazus, the epithet, ( Virgil). The inand thill retains its ancient name Confra; fituate 1 between 8 and 10 degrees of eall longitule, and between 41 and 43 desrees of north latirude. It was formerly fibject to Genoz; though the natives for many years difputed their right. The illand is now in the hands of the French; and have lately, in confequence of the revalution in France, been admitted to a participation of all the rights and privileges of free citizens.

CORSNED, or Morsel of Execration, a foce cies of trial or purcation * anciently in ule amonr nts, *Ses Trial. and which probably arofe from an abufe of revelation in the dark ages of fuperflition. It confilled of a pisce of cheefe on bread, about an onnce in weight, whiels was confecrated with a form of exorcifm; deliving of the Almighty that it might canfe convulfions and palenefs, and find no patage if the man was really guilty; but might turn to health and nourifmment if he was innocent; as the water of jealouly among the Jews was, by God's cfpecial appoiatencat, to caufe the belly to fivell, and the thigh to rot, if the woman was guil. ty of adutery. This corfned was then given to the fulpected perfon, who at the fame time alio received the holy facrament: if indeed the corfined was not, as fome have fulpected, the facramental bread itfelf; till the fubfecuent invention of tranfubllantiation preferved it from profane ufes with a more profound refpect than formerly. Our hillorians affure us, that Godwin, Earl of Kent, in the reign of King Edward the Confeffor, abjuring the death of the king's brother, at latt appealed to his cormed, "per luciellam deghiuicithdem aljumait," which tluck in his throat and killed him. This cuttom has been long fince graduaily abolished, though the remembrance of it itill fubtifts in certain phrafes of abjuration retained anong the common people; as, "I will take the facrament upon it ; May this morfel be my latt;' and the like.

CORT (Cornelius), a celebrated engraver, was bora at Hoorn in Holland in 1536 . After having learned the firt principles of drawing and engraving, he went to Italy to complete his ftudies, and vifited all the places Camous for the works of the great mallers. At Venice he was courteoully received by Titian; and en. gtaved feveral plates from the pictures of that admi. rable painter. He at laft fettled at Rome, where he died 1578 , aged 42. According to Bafan, he was " the belt engraver with the burin or graver only that Holland ever produced. We find in his prints,' adds he, " correctnefs of drawing, and an exquilite tafte." He praifes alfo the tafte and lightnels of touch with which he engraved landfcapes, and that without the affllance of the point. It is no fmall honour to this artilt, that Agoftino Carracei was his fcholar, and imitated his tlyle of engraving rather than that of any other matter. His engravings are very numerous ( 15 I according to Abbé Marolles), and by no incans uncommon.

CORTES of Spain, a term purely Spanifh, fignir fying the courts, $i$. e. the ftates, or affembly of the flates, at Madrid.

Cortes, or Cortez, (Ferdinand), a Spanih genetal, famous for the conquelt of Micxico, and other

## $\mathrm{C} \mathrm{O} \mathrm{R}\left[\begin{array}{l}\pi\end{array}\right]$ <br> C O R

vitomies wer the natives of South America; but infamous for the conelties he committed upon the vas. quithed, without regard to rank, age, or Cex. It probably was on this account he was but coolly received on his return to Eutope by his royal matter Charles be Quint : it is even afferted that the emperor alked him who be was? to which Cortez replicd; "I am the man who lave given you more provinces than your ancellors have left you towns." Died in 1554 , aged 63 . See Mrxico.

COR'EX, in botany; the rind or coarfe nute bark of plants. The organiation of the outer and imner batks, which differ principally in the fineneds of their texiure, is particularly explained under the article Plante.

Wounds of the bark, and its feparatinns from the wood, whether naturaliy or artificially made, are ealfly cured, and made to unite again by proper care. If fections be made in the rinds of the ath and fycamore of a fquare figure, three lides cut, and the fourth uncat, and the whole be afterwards bound round with a pack-thread, it will all mite again, only leaving a fear in each of the three lides where it was cut. If leveral parts of the bark of either of thefe trees be cut off, and entirtly feparated from the tree; lome fhallower, leaving a part of the bark on, and othets deeper, to the wood itfulf; the pe pieces being again put into their places, and bound on with pack-thread, will not indeed mite, but a freth bark will grow in their places, and thruft them away: but if they be firit carefully laid on in the exact direction in which they originally grew, and then the whole part beyond the wound on every fide covered with a large plafter of diachylon, or the like, and this bound over with packthread to keep all firmly in their places, the pieces of bark, whether cut off thallower or deep down to the very wood of the tree, will firmly unite themfelves to the places where they originally grew. This cure will be performed in atout three weeks: but the outer rind of the feparated pieces will not be plump, but fomewhat frivelled; the edges alfo will recede fomewhat frem their orginal place; fo that there remains a fort of fear all round. Thefe experiments are beft made in the fpring feafon; for in the autumn and winter, the fap arifing but weakly, the parts that fhould unite wither before that is biou„ht about. The fuccels of thele experiments has made fome think that the whole branch of a tree fepatated and bound on agrain might unite with the reft. But the experiments that have been made in the moll favourable wanner for fuch a trial have all proved vain, the branch cut off withering always in a few days, however well united and carefully kept on.

> Cortex Peruviaus. See Cinchona.
> Cortix Winteramus. Sce Wintera.
> CORTONA (I'itro da). See Berretini.

Cortona, a very ancient town of Italy, mentioned by many of the Roman hiforians. It was originally called Corton, and lay to the not thward of the bake Thrafyments. It ftill retains the name of Cortona. E. Long. 13. O. N. Lat. 43.15.

CORTONEisE (Pietro Palo) See Gobro.
CORTUSA, bear's-ear sanicle; Agenus of the monogynia order, belonging to the pentandia clafs of
plants, and in tine :atmal meth l ranking under the Cormana 2 at order, Preis. The corolla is whect-thaped, with its thrat like an elearated rina; the caplule unilocular, oval, and quinquevalvel at the top. "Ilhere are two Species, boih of them vary luw, flowery, herbaceonz peremials, crownel by umbels of monoptalous, wheelfhaped flowers, of a finc rel coloner. 'They arc natives of mountainnos rocky parts ahroad, fo muil have a dry kean foil; or they may be kept in pots of dry fandy earth placed in the hade, and in fummermut be duly watered: and their propagation here is by fipping the roots in Oitober.

CORRUNNA, or Groyne, a port-tnurn of Gallicia in Spain, fituated on a fine bay of the A:lantic ocean, about $\hat{i} 2$ mides north of Compoltella: W. Long. 2. O. and N. I.nt. 43 . O.

CORUS, Omer, Homer, or Chomer, in the Jewth antiquitics, a meafure containing 10 baths or 75 gallons and 5 pints, as a meafure of things liquid, and 32 pecks and $I$ pint as a meafure for things dry. The corus or omer wasmolt commonly a meafure for things dry; and the greatelt that was ufed among the Jews. If contained, according to the rabbins, to ephahs or 30 fata or feahs. Corats is the moll ufual term in the hiftorical writers, and omer or chomer jomong the prophets.

Coros is alfo ured in fome of our old uriters for eight buikels or a quarter; deem coros tritici, five decem quarraria.

CORUSCATION, a glittering or gleam of light iffuing from any thing. It is chiclly ufed for a flath of lightning darting from the clouds in time of thunder.

There is a method of producing artificial corufca. tions or fparkling fiery metcors, which will be vilible not only in the dark but at noon-day, and that from two liquors aceually cold. The method is this. Fif. teen grains of folid phofphorus are to be melted in about a drachm of water; when this is cold, pour upon it about two ounces of oil of vitriol; let thefe be faken together, and they will at firt heat, and afterwards they will throw up fiery balls in great number, which will adhere like fo many fars to the fides of the glafs, and continue buming a conliderable time: after this, if a fmall quantity of oil of turpentine is poured in, without fraking the vial, the mixture will of itfelf take fire, and burn very furioully. The veffel thould be large, and open at the top.

Artificial corufcations may alfo be produced by means of oil of vitriol and iron, in the following manner. Take a glafs body capable of hodding three quarts; put into this three ounces of oil of vitriol and twelve ounces of water; then warming the mixture a litile, throw in, at feveral times, two ounces, or more, of clean irnn filings: upon this an cbullition and white vapours will aure: then prefint a lighted candle to the mouth of the veffel, and the vapour will take fire, and afford a bright fulmination or flofh like lightning. Applying the candle in this manner feveral times, the effect will always be die fame; and fometimes the fire will fill the whole body of the glafs, and even circulate to the bottom of the liquor ; at others, it will only reach a little way down its neck. The great caution to be uled in making this experiment is

## C. $\mathrm{O} \mathrm{R} \quad[473] \quad \mathrm{C} O \mathrm{R}$

Corvorat, the making the vapour of a proper heat: for, if too choughs were included. Every hamet was to provide
coll, few vapours will a ale; and, if made too hot, they will atife too falt, and will only take fire in the neck of the glafi, without any remarkable corufodtion.

CORVORANP, formerly written Cormorant. Set Pelicanus.

CORVUS, the Ravenor Crow kind, in ornithoIosy : a gemas of bids of the order of piax, the difinguifhing charactenitics of which are thefe: 'l'ae beak is convex and cultated; the nothils are covered with builly leathers; the tongue is forked and cartiIarinous; and the feet are of the walking kind. Tae fpecies are 19. The moll remarkable are:

1. The corax, or raven of Englifh authors, weighs three pounds, and is about tw's feet iwo inches in lenọh; the colour is black, fincly gloffal wich a lich blue ; the bell excepted, which is of a dully colour. They ate very docile birds, and may be trained up to fowling like hawks to fetch and cary like fonicls; they may be tauplit to fpeak like parrots; and, what is molt extracrdinaty of all, they may be taught to imitate the human wisce in finging. They have a great propentity to pilfer, often hiding things of value to the areat lofs of the owner, withour ufe to themfelves. They frequent the neighbourhood of great towns, where they are ufeful in de vourin the careafes and filth which would otherwife prove a nuifance. 'They, however, alfo deftroy many living animals; fuch as, rabbits, young ducks, and chickens, and not unfrequently lambs which have been dropped in a weak tate. In clear weather they fiy in pairs to a great height, making a decp loud noife, difierent from the common croaking. ' C teir feent is remarkably good; and they are very long lived. The quills of ravens fell for 12 s . fur humdred, being of great ufe in tuning the lower notes of an harpfichord when the wires are fet at a contilerable diftance from the fticks.- The raven makes its nett catly in the fring, laying 5 or 6 eggs , of a pale bluith-green colour fyotted with brown. With us it builds in trees; but in Greculand and Ictland makes its netl in the holes of rocks, compoling it of roots and twigs, together with the bones they have picked, and lining it with hair, mofs, \&c. The fleth of thefe birds, rank and unfavonty as we may well fuppofe it, is eaten in Greenland by many of the matives, who alfo ufe the flins as a wam under-covering.
2. The corone, or cartion-crow, in the form of its body agrees with the raven: allo in its food, which is carrion and other filth. It will alfo eat gram and infects; and like the raven will pick ont the eyes: for which reaton it was formerly diftinguifued from the rook, which feeds entirely on grain and infecte, by the name of the $y$, or gor-crow. Virgil fays that its croaking foreboded rain:

Tum soreix f tena I tuvam $\mathbf{v}$ cat inproba woce.
It was afo thourght a bird of bad omen, cfpecially if it happened to lefeen on the left hand:
$s_{\text {eje }}$ fimitua cava predixit ab lice cornix.
England brecds more of this kind of Lirds than any other country in Eurnpe. In the $24^{\text {th }}$ of Henry VIII. they were grown fo numerous, and thought to be fo prejudical to the farmer, that they were contidered as an evil worthy of parliamentary redrefs; an act was pafted for their dettruction, in which rooks and
crow-ncts for ten years; and all the mbabitants were obliged at certain times on aflemble daring that fpace ic confult of the proper means tor extipating ther. But thong'i the crow abonnds thus in Lriain, it is io rare in Siveden, that Linnens fpeaks of it only as a bird that he once knew killed there. It lays the fame number of eges as the raven, and of the fane coluur: immediately atter deferting their young they go in pairs. Boah the le birds are often fonad white or pied; an accident that befals bluk birds more fieguently than any others. Mi Pennant lays, he has obleaced one tntirely of a pale brown colour, not only in is plus. mage, but even in its bill and fect. The crow weighs about 20 onnces. Ins length is 18 inches; its breadels two feet two inches.

Concerning thefe birds, we have the following curious aneedote in Mr Edwades matnal hithors *. " The • Vol. v. reverend Mr Robinfon rettur of Oufby ia Weftmore. Pefexav. land and Cumberland, fays, that birds are natural planters of all forts of wood and trees. They diffeminate the kernels upon the eareh, which like nutherics binge them forth till they grow up to their natural Atrength and perfection.' ITe fays, 'About 25 years agn, coming from Rofecalte cally in the morning, I obferved a great number of crows very buly at their work upon a declining ground of a mofly lurface: I went ons of ny way on purpole to view their labour, and I found they were planans a grove of oaks. The manmer of their planting was thus: they firlt made litule holes in the earth with the ir bill.i, going about and about till the hole was decp enough; and then they dropped in the acom, and covered it with earth and mots. 'fhe feafon was at the latter end of auturn when all leeds are full sipe.' $M_{r}$ Robinfon feems to think that Providence had givea the crows this iallinct folely for the propagation of trees; but I imagine it was given them proseipally for their own pefervation, by hidiag provihon in time of plenty, in oreler to fupply them in a time of fearcity : for it is obferved in tame pies and dawokept about houles, that they will hide their medi when they have plenty of it, and fetch it from ther hiding-places when they want. So that fucin an hutinct in thele birds may anfwer a double purpole; both their own fupport in times of need, and the propatsation of the trees they plant : for wherever they hide a great number of nuts or grain in the earth, we camot fuppofe they find them all arain ; but that as many will remain in the plot of ground they make ufe of, as can woll grow by one anothel."
3. The frugilegu: or rook, is the combs of Virgil; no other fpecies of this kind being gregaious.

$$
\begin{aligned}
& \text { E pafle deculuns rgwine mugho }
\end{aligned}
$$

A very matural deferiptien of the evening return of thefe birds to their nefls.

The rook difiers not greatly in its form from the carrion crow : the molt remarkable diffarence is in the noftrils and root of the bill; which parts in the crow are well clothed with feathers, but in the rook are bare, or covered only with fome brilly hairs. Tais arifes from its thrulting the bill into the eath contimually, after the various worms and eruex of infects, on which it feeds; for it does not live on carrion, bike

## C O R

the laft feccies and ravens. BClides infots, it alfo feeds on all forts of grain, to fome inernvenince perhaps to the hufbandman, but :ho donbt doubly repaid by the good done him in extirpating the madget of the chaferbeetle, which in fome fealina deftroys whole crops of corns by feeding on the roots. The rook is a gregarious bird, fonetimes being foen in immenfe focks, fo as to alnot durken the air. 'l'hefe filghts they regularly perform moruing and evenine, except in bresding-time, when the dialy attendance of both male and female is required for the wfe of incubation, or feeting the youns: for it is obferved that thay dn both be thans. As thefe tirds are apt to fom then fotres thato focietics, fuch places as they frequent dn. ring the breeding time are callul mokeris; and they generally choufe a laree damp of the tallatt trees for this purpofe: bot malke in wreat a litter, and foch a Fesp tual chater, that nowhing that hatio and a leagh of time can reconcile one to the noife. The eges are like thofe of chows, biat hifs, and the fpots larger. They begia to buili in March, and aftor the bred.
 where, but linas been corenved to return to them in Angult: in Oetober they repair their nells. In Britiin they reman the whole year; yet we are told that both in Farce and Siletia they are binds of paffage. Whether they migrate or not in Sweden, we arenot told; but Litureus talks of their building there. The young birds are accounted good eating, eipecially if Rkimed ind put in a pie.
4. The cornix, or royfon erow, fretty much referables the rook, feeding on infeds, and flyine to. gether in great flocks. In England it is a bird of paf fage, vifiting that kingdom in the beginaing of win. ter, and leaving it with the woodencks. In the mavitione parts they feed on crabs and fhell- fifh. They are very common in Scotland: in many parts of the Highlands, and in all the Hebriles, Orknies, and Shetland, it is the only fpecies of genuine crow; the carrion and rook beine unknown there. It breeds and continues in thofe parts the whole year round. In the Highands, they breed indifferently in all kinds of trees: lay fix eggs: have a fluiller note than the common crows; are much more mifehievons; pick out the eyes of lambs, and even of horfes when engaged in bogs. They are, thenfore, in many places pro. feribed, and rewards given for killing them. For want of other food thefe birds will eat cran-berries or other mountain berries.
5. The dauricus, or white-breafted crow, is in length about 12 inches: the bill is black; the bead and throat are black, gloffed with blue; the neck and breat white; the reft of the body, wings, and tail, blue black; the legs of a lead-eolour; the claws black. The fpecimen figured by Buffon came from Senegal ; but it is by no means confined to that quarter. Pallas deferibes the fame fecies, which he fays come early in the fpring in great flights from China, and the fouthern Monguls eountry, into the parts about the lake Baikal, but mof frequent about the towns ard sillages on the river Lena, in which part the jackdaws and Reyfton crows are very feldom feen. It is faid they aie likewife found in valt numbers in the ifland of Johann, where thay live chiefly on infects and fruits, and make their nefts in trees.

## 

Corve feathers are white; the legs dury. Wie find thefe Lirds fattered in many parts of Eure pe, but no where fo plenty as in C rmany; they are found alfo in Sincden and Iyemmark, whare they fiequent the mombtainous parts. Sometimes they come in vaft focks into lrance, efpecially Burgundy. They vifit Eughand very feldom; are alfo found in North America, but not near the fea-coalls. One bas been brought from Kamfehatka by the late voyagers.- In manners this bird is faid to refemble the jay, laying up a tore of acorns and nuts. In fome parts it keeps chiefly in the pine forefts, on the kernels of which it then feeds; but is faid frequently to piarce the trees like the woodpecker, for which the bill feems not unapt. It makes its neft in holes of trees. Klein mentions two varieties, one fmaller than the other; the laigelt, he fays, breaks the nuts to pieces, and the other pierecs them. Both feed at times on wild berries and infects.
9. The pica, or magpie, is in length above t 8 inches, and weighs 8 or 9 ounces. The bill is black : the irides are hazel : the fcapulars, and all the under parts from the brealt, are white; the rell of the plumare, wings, and tail, black, glofed with green, purple, and blue, in different lights: the eleven firt quills are white in the middle on the inner wet, leffening by degrees ast.ley adranceinwards: the tail is very cuneiform, the two middle feathers being near if inches in length, and the out not only 5 inches and a half : the legs are black. We can form no judgment of the beauties of this bird, from thofe dirty mutilated fpecimens which we fee expofed daily in a wicker cage at every ftall. It is only in a fate of nature that they can be found; and whover views them in this tate, will do fo with aftonifment : for though the colours, at a diftant view, feem to be mere black and white, yet the fplendor that meets in every new fituation the eye of the beholder, will oblige him to own that there is not a more beantiful bird in Britain. In thefe parts it is every where common. Mr Latham has been able to trace this bird no farther fouth than Italy on the En. ropean continent ; and to the north, Sweden, and Denmark. Forlter met with it at Madeira; and it is alfo feen in America, but not common, and is a bird of paffage in thofe parts. At Hudfon's Bay it is called by the Indians Oue-ta-kec-a/Re, which fignifies HeartBird; but for what reafon does not appear. In manners it approaches to the crow, feeding almolt on every thing in turn, both animal and vegetable; and like that will kill young ducks and chickens, and fuck the eggs. It builds its neft with art, making a thomy cuver at top, leaving a hole on the fide for admittance : lays fix or feven pale greenifh eggs, thichly fotted with black. It is a crafty bird in every ftate, and if bronght up young, beconses exceedingly familiar, and will talk a great many fentences, as well as imitate every noife within learing, like a parrot, but not nedr so plain.

1o. The graculus, or rablegged crow, is but thinty feattered over the vorthern world: no mention is made of it by any of the Faunits; nor do we fund it in other pats of Europe except Britian and the Alps $1 t$ is produced in the illand of Canadia in Alia; and it vifits Eyypt towards the end of the intudations of the Nile. Excop: in Egypt, it affects mountainous and rucky N"gz。
places; builds its nef in hiyh cliffs or mined towero;
Corvus. and liys four or five egres, white spotese with a diry yollow. It feeds on infects, and alfo ou new-fown corn. They commonly fly higl, make a flatller noife than the jack-daw, and may be taught to fpat. It is a very tender bird, and unable to bear very fevere weather; is of an elegant, flender-make; active, reftlefs, and thicving; much taken with glitter, and io meddiing as not to be trulted where things of confequence lie. It is very apt to eatch up birs of lighted licks; fo that there are intlances of honfes being fet on fire by its means; on which account Camblen ctlls it incondiaria avis. It is found in Cornwal, Flintflire, Cacindivonfoive, and Anglelea, in the rocky cliffsalong the flomes. It is alfo found in Scotland as lar as Strathnavern, and in fome of the Hebrides. Its colour is wholly black, beautifully gloffed over with blue and purple : the legs and bill are of a bright orange colour inclining to red : the tongue is almoft as long as the bill, and a little cloven: the claws are large, hooked, and black.
11. The criftutus, or blue jay, is much fmaller than toe common jay. The bill is black and above an inch long: the head is creited and blue: a Atcak of the fides of the head and throat are of a bluith white, and there is a [pot of the fame over the eye: lins part of the neck and back is blue: the wings and tail are the fane: all the feathers of the latt, except the two middle ones, tipped with white; the feathers of both it and the wings flegantly barred with black, and the greater coverts and fecond quills tipped with white: the trealt is of a bloffom colour ; the belly and under tail-coverts white: the legs are dufly brown: the tail is nearly as long as the relt of the bird. The colons of the female are lefs bright than thofe of the male This fpecies is faid to be peculiar to North America, bur not feen farther north than the town of Albany. It builds in fwamps, and has a fuft delicate nute. Its food is hazel-nuts, chefnuts, and fuch like, which it breaks by placing between the feet, and pecking with the bill till the thell gives way. It is alfo very fond of maize ; and being a gregarions bird, often waites into flocks of 20,000 at leaft, which alighting on a field of jo or 12 acres foon lay walte the whole: bence it is reckoned the molt defluative bird in that country. They will often ake up with fatels and vermin thro' neceffity, but not while any thing they like better is to be got at. They are not accounted good to eat.
12. The canadenfis is in lerghl 9 inches, and weighs two ounces. The bill is blackih, and not ynite an inch long: the irides are blak: the forehrad and throat are of a dinty yellowin white; the himd head and fides of blackilh brown: the upper parts of the body are brown; beneath pale ah, palett on the breaft : the quills and tail are brown, tipped with white: tail is a little wedged: the legs and claws are blackin. Thefe bids intabit Caradn; and are frequent near Hudion's Bay, where they are called misiajom and Wijeijuck. They breed early in the fping; build in pise-trees; and have two, rarely three, young at a time. The egrirs are blue. They are not gregarions. Their food is hack mofs, woms, and fith. They are very bold pilforing birds, thealiag foom the traveller even falt meat, and devouring often the bait from the thaps fe: 4
 for the martins，as foon as the perfons who fet them
turn their backs．They lay up tores for winter；at which time they are feldon feen uulefs near habita－ tions．They do not bear confuennent well．What natural note thicy have，we are not told；but they are faid to act the mocking bird，in inatating that of others．－There are near 30 other fpecies．

Corrus（ Ravin），in aftronomy，a conflellation of the fouthern hemifphere；whofe itars in Ftolemy＇s Catalogue are 7 ；in＇Tycho＇s as many ；in the Britannic Catalogut 9.
Corvus，in Roman antiquity，a military engine，or rather gallery，moveable at pleature by means of pul－ lies；chiefly ufed in boarding the enemy＇s fhips to co－ ver the men．The conffruction of the corvus was as follows：They erected on the prow of their veffels a round piece of timber of about a foot and an half diameter，and about is feet long：on the top of which they had a block or pulley．Round this piece of tim－ ber they laid a ftage or platform of boards，four feet broad，and about i8 feet long，which was well framed ard faftened with iron．The entrance was long－ways， and it moved about on the above mentioned upright piece of timber as on a fpindle，and could be hoifted up within fix fee：of the top：abour this was a fort of parapet knee－high，which was defended with up－ right bars of iron fharpened at the end，and towards the top there was a ring，by the help of which and a pulley or tackle，they raifed or lowered the engine at pleafurc．With this moveable gallery they boarded the enemy＂s veffels（when they did not oppofe fide to fide），fometimes on their bow，and lumetimes on their fern，as occation beft freved．When they had grappled the enemy with thefe iron fpikes，if they happened to fwing broadfide to bruadide，then they entered from all parts；but in cafe they attacked them on the bow，they entered two and two by the help of this machine，the foremolt defending the foreparts， and thofe that followed the flanks keeping the bofs of their bucklers level with the top of the parapet．
CORYATE（Thomas），a very extraordinary per－ fonage，who feems to have made himíelf famous by his whimfical extravagancies，was the fon of a cleigy－ man，and born at Oldcombe in Somerfethure in 1577. He acquired Greek and Latin at Oxford；and coning to London，was received into the houfliold of Hen－ ry prince of Wales．If Coryate was not over witty himielf，he got acquainted with the wits of that time， and ferved to exercife their abilities，having more learn－ ing than judgment．He was a great peripatetic：for，in 1608，he took a long journey on foot；and after he re－ turned，publifhed his travels under the following itrange title，Crudities bafiliy gobbled up in five months Travels in France，Savey，Italy，Rbetia，Helveliu，fone purts of High Germany，and the Netheriumds，Lond． 1611 ，foo． In 1612 he fet out again with a refolation to fpend ten years in travcling：he whe inft to Conltantinople； and after travelling over a great part of the Eatt，dicd of a flux at Surat in the Eaft Indies．Some of the adcounts of his peregrimations are to be found in Pur－ chas＇s Pilgrinages．

Catullus，in his poem called sitys，gives a beautiful Vol．V．Part II．
defeription of them，reprefenting them as madmen．Corybas． Accordingly Maximus Tyrius fays，that thofe poffefed tica： with the firit of Corybantes，as foon as they heard the found of a Hute，were feized with an enthuliafm， $\qquad$
Coryius． and loft the ufe of thcir reation．And henec the Greeks ufe the word appubavtin，to corohantize，to fignify a perfon＇s being tranfported or poffefied with a devil． See Enthusiasm．

Some fay that the Corybantes were all eunuchs： and that it is on this account Catullus，in his Atys， always ufes feminine epithets and celatives in fpeaking of them．

Diodorus Siculus remarks，that Corybas，fon of Ja－ fon and Cy bele，pafing into Phrygia with his uncle Dardanus，there inflituted the worfhip of the mother of the gods，and gave his own name to the priefts． Strabo relates it as tire opinion of fome，that the Co－ ybantes were children of Jupiter and Calliope，and the fame with the Cabiri．Others fay the word had its urigin from this，that the Corybantes always walked dancing（if the expreffion may be allowed）or tolling the head，xputr．vris Ealociv．

CORYBANTICA，a fettival held in Crete，in me－ mory of the Corybantes，who educated Jupiter when he was concealed in that ifland from lis father Saturu， who would have devoured him．

CORYCEUM，in antiquity，that part of the gym－ nafium where people undrefled．It was otherwife call－ ed apotyterion．
CORYCOMACHIA，among the ancients，was a fort of excrcife in which they puthed forwards a ball， fufpended from the ceiling，and at its return either caught it with their hands，or fuffered it to meet their body．Oribafius informs us it was recommended for extenuating too grofs bodies．
CORYDALES，in botany，an order of plants in the Fragmenta Metbodi Naturalis of Linnxus，contain－ ing the following genera，viz．epimediun，hypecoum， leontice，melianthas，pinguicula，and utricularia．
CORIDALIS，in botany．See Fumaria．
CORYLUS，the Hazle：A genus of the polyan－ dria order，belonging to the moneccia clafs of plants； and in the natural method ranking under the 50 th order，Aimentacea．The male calyx is monophyllous， feale－like，trifid，and unitlorous；there is no corolla； the fanina cirlit in number：The fenale caly x di－ phyllous and lacerated；no corolla；two Ityles；and an egg－thaped nut．Mr Miller reckons three fpecies， though other botanifts make only two．They are all of the large flarub kind，hardy and deciduous；and have feveral varicties valuable fur dreir nute，as alfo for their variety in large wilderneffes and threbbery works． They will profper in almott any finil or fituation，and turn out to goad account when growing in coppices to cut as underwood，and as poles fur various uites，as hoops，fpars，hurdles，handles to hofandry imphements， walking tlicks，tifing rods，see for which purperfes they may be cut every 5 th， 7 th，or 8 th year，accorid－ ing to the parpofes for which they are defgened．The betc mothud of prupagating ther．is by lajers，though they may alfo be ralled from the nuts．

The kernels of the fruit have a mild，farinaceous， oily talle，agreable to monf palates．Squirrels and mice are fond of then，as well as fome birds，fuch as jays，nutcrackers，\＆c．A kind of chocolate has been 31
prepared

## $\mathrm{COR} \quad[4 \hat{2}] \quad \mathrm{CO}$ S

Corsmbife prepared from them, and there are in?arces of their is having been formed into bread. The oil expreffed is uftd by painters, and by chemiins, for receiving and retaining oflours. The charcond made of the wood is ufed hy painters in drawiag. Some of the Highlandcrs, where fuperilition is not totally fubfided, look upon the tree itfelf as unlucky; but are glad to get two of the nuts naturally conjoined, which is a grood omen. Theie they call crochombhich, and eary them as an efheacious charm againt witcherait.

Evelyn tells us, that no plant is nore proper for thickening of copfes than the hazle, for which he directs the following expeditious methocl. T'ake_a pule of hazle (ath or poplar may alfo be ufed), of 20 or 30 fuet in lenth, the head a littel lopped into the ground, fiving it a chop near the ground to make it fuceumb; this fallened to the earth with a hook or two, and covered with fome frefh mould at a competent depth, (as gardeners lay their carnations), will produce a great number of fuckers, and thicken and furrinh a curfe fpecdily.

CORYMBIFER $E$, in butany, the name of an order or divifion of the compound flowers adopted by Linnews after Ray and Vailant, in the former editions of his Fragments of a Natural Nethod. This title in the later cditions is changed for Diforidea, another name borrowed from Ray's Method, but ufed in a fomewhat different fenfe.

CORYMBIUM, in antiquity, an ornament of hair worn by the women. Its form was that of a corymbus.

Corymbiem, in batany: A genus of the monogamina order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the qoth order, Compofite. The calyx is diphyllous, uniflorous, and prifmatical; the corolla monopetalous and regular; there is one woolly feed below each floret.

CORYMBUS, properly fignifies a clutter of ivy Eeries. Among botanifts, it is a mode of flowering in which the leffer or partial flower-ftalks are produced along the common ftalk on both fides; and, though of unequal lengths, rife to the fame height, fo as to form a flat and even furface at the top. See Bota$N \mathrm{~S}, \mathrm{n}^{\circ} 273$.

CORYNOCARPUS, in botany: A genus of the monogynia order, belonging to the fentandria clafs of plants. The calys is a pentaphyllous perianthium; the corolla confits of five ronndifh, treet, and hollow petals; the ftamina five fubulated flaments arifing from the bafe of the petals; the anthere are ereat and oblong; the pericarpium a monofpermous, turbinatclavated nut.

CORypha, Mountan Palm, or Umbrella Tree, in botany: A genus of the order of $P_{\text {a }}$ imas , belonging to the monucia clafs of plants. The corolla is tripetalous; the flamina fix, with one piftil ; the fruit a monofpermous plum. There is only one fpecies, the umbracula, a native of the Weft Indies, where it is called codda-pana. It rifes to a confiderable height, and produces at the top many large palmated, plaited leaves, the lobes of which are very long, and are placed regularly round the end of a long fininy foottalk, in a manner reprefenting a large umbralla. The flowers are procuced on a branched fradix, from a compound
ipatha or fheath; they are hermphrodive, and cach Coryhzna confits of one petal, divided into three oval parts, and coutains fix awl-fhaped famina, furrounding a fiort flender lyte, crowned with a fi:nple figma. The germen is nearly round, and becomes a large globular fruit of one cell, including a large romisd fune. Thefe plums having a pleafint flavour are leld in citem by the Indians.

CORyPHENA, in ichatholoty, a menus belone. ing to the order of theracici. The head is declined and truncated; the banchuntege membrane has fis rays; and the back-fin runs the whole length of the bick. There are twelve fpecies, moll of them natives of forcign feas. The molt remarkable are the blae and pirut fifhes, deferbed by Mir Catefor. - The head of the firt is of an old Aructure, refembling that of the fpermaceti whale: the mouth is fmal!, each mandible amed with a fingle row of even teeth, fo clofely joined that they feem entire bones; the iris of the eye is red. On the track is a long pliant fin, fometwhat indented on the edge; behind the gills are two fins, one under the abdomen and ancther behind the anus. The tail is forked; and the whole fin entirely blue. They are taken on the coalls of the Bahama Inlands, ata in mot of the feas between the tropics. - The parrot-fih hath a large mouth, paved as. it were with blunt teeth, clofely connected, after the manner of the lupus marinus. The body is covered with large green feales; the eyes ave red and yellow ; the upper part of the head brown, the lower part and the gills blue, bordered with a duky red : a treak of red extends from the throat belind the gitis, at the upperend of which is a bright yellow fot. The fins. are five in number, one extending altnott the length of the back, of a bay or cimamon colour; there are two behind the gills, blended with black, green, and purplifh colours, with the upper edge verged with blue: under the abdomen is another red fon verged with blue: under the anus extends another long namow grecu fin, with a lift of red through the middle of it: at the balis of the tail on each fide is a large yellow fpot. The tail is large, forked, and green, with a: curved red line raming through the middle parallel. to the curve, and ending in two points. This finh is more efleemed for beanty than the delicacy of its, tafte. They are taken on the coalts of Hifpaniola, Cuba, and the Baluma Ifland.
CORYPHAUS, in the ancient tragedy, was the chicf or leader of the company that compofed the chorus: (See Chorus). - The word is furmed from the Greek xoguvr, "tip of the head." The corgpheus fpoke for all the reft, whenever the chores took part in the action, in quality of a perfon of the deama, during the courfe of the acts. Hence corgplaws had palled into a general name for the chief or principal of any company, corporation, fect, opinion, \&cc. Thus Enftacius of Antioch is called the coryphous of the council of Nice ; and Cicero calls Zeno the cory hesus of the floics.
CORYZA, in medicine, a catarth of the nofe. See Mifdicine-Index.
CORZOLA, or Curscola, an ifard in the gulph of Venice, divided from Ragufa in Dalmatia by a narzow itrait. E. Long. 18.o. N. Lat. 42.35.
COS, or Coos, (anc. geog.), a soble ifland on the coats
weft of Halicamafus, a homdred in conepafs, calied Mroopis; and hence "luncydides joins both names together, Cos Meropis: it had a commominal town Cor, Lut originally calted Af/ys, ulkea, mentioned by Homer; with a port locket of walled romd, (Syylax, Mela). The inand was fruifin, and yielded a generons wine, (Strabo). It boated of hippocrates and Apelks; eacli at the lead of his feveral profefion. It was the country of Philetas, as excellent clegiac poet, who fomribed in the time of Philip and Alexander: the preceptor of Pedens Phitadelphus: fo thin and light that he was ubliged to wear lead to prevent the being thews away by a puff of wind (Achian, Atheneus); much commended by Propertins. The vefles Colle, made of tilk, were famons for their finenefs and colour, (Horace, Propertins, Tibullis). In the fuburbs of Cos it od the tcmple of Afculapins, a noble ftruc. ture, and extrensely ich.

COS, the whetsone, in natural hiftory, a genus of virefent foncs, contiling of fragments of an indeterminate figure, fub-opaque, and granilated.

Of this genns there are feveral fpecies, fome confilting of rougher, and others of fincouther, or even of ahogether impalpable paticles; and uied not only for whet-hones, but alfo for mill-hones, and other the like purpofes.

COS rurcta, Turly, fone, a fpecies of flomes of the garnet kind, belonging to the liliceous clafs. It is of a dull white, and uiten of anequal colour; fome parts appearing mure compact than others. Its $f_{p}$ pecific gravity is 2508 : it ftrikes fire with fterl, and efirvefes with acids. Mr Kirvan found that 100 parts of it contain 25 of mild calcareous earth, and no fron. Cronfledt is of opiaion that there are probably two forts of flones known by this name, as that deferibed by Wallerias neither gives fire with fleel nor cfiervefees with acids. It is uied as a whetlone; and thofe of the finett grain are the bet hones for the moft delicate cutting tools, and even for razors, lancots, \& é.

COSCINOMANCY, the art of divination, by means of a ficve. The word comes from zorxiove, citrum, "a lieve;" and puvetia, divination. The fieve being fufjended, after rehearfing a formula of words, it is taken between two liugers only; and the names of the partics futpected repeated: he at whofe name the fieve turns, trembles, of fhakes, is reputed guilty of the evil in quation.

This mult be a very ancient praftice: Theocritus, ju his third ldyilion, nemtions a woman very thatful in it. It was fometines alfo practifed by furpending the ficee by a thead, or fising it to the points of a pat: of theers, giving it room to tum, and maning, as before, the prarties fuffected; in which laft manner cofinumancy is itill practifed in fome parts of Eurfand. It appears from Theocritus, that it was not only ufed to lind out perfons unknow, hut alfo to difcover the fecrets of thofe that were known.

CO-SECAN', in gtometry, the fceaut of an arch which is the complement of another to $90^{\circ}$. See Gemmetry.

COSENAGE, in law, a writ that lies where the trefail, that is, the tritaus, the father of the befail, or great graudiather, being leised in fee at his death of
certain lands or tewemems, dica; a Rranzer entere, and abates; the thall his heir tave thes writ of colemage; the fem of which fee in Fitah. Nat. Br. fol. 22 s .
COSENiNC, in hw, an ofience wherty any thing is done diceetfulls, in or out of rontracts, whith canot be fily ternad by any (fpecial mame. In the civil haw it is callent prifionverai. Sce Silebronate.

COSENZA, the cappital of the Wither Cadabria, in the kinghom of Naphes. E. Lang. :5. 35. N. lat. 39. 15. It is an archbthop's fre.

COSHERING, in the femble cuftoms, a kind of right of the lords to lie and $f$ att themflices and thoir followers at thcir temants houfics. The word colkerin: may pertaps be derived from the ohl Englih worl colpe, a cot us cottage.

COSLNE, in rigononety, the fuce of an arch which is the complement of another to $90^{\circ}$. See Gfumetry.
COSBLETIC, in phyfie, any medicine or preparation which senders the fikin foft and white, or helps to beautify and improve the complexion; as lip.falves, cold creams, cerufs, \&c.

COSMICAL, a term in aftronomy, exprefing one of the poetical rifings of a flar: thus a ttar is faid to rife cofmically when it rifes with the fun, or with that point of the ecliptic in which the fun is at that time: and the cofinical fetting is when a thar fets in the welt at the fare time that the fun rifes in the ealt.

COBMOGONY, in phyfics, fignifies the feience of the formation of the miverie. It is formed of roceor, the oworld, and $y$ :whesiz, 1 am bora.

In our conjectures about the formation of the wonld there are two principles which we ought never to lofe light of. 1. '1'hat of crealion; for certainly matter combly not give it felf exiltence, it muft have received it. 2. That of a Sipreme Intelifsence directing this creation, and the arrangement of the parts of matter, in confequence of which this world was formed. See Creation and Earth.
COSAOGRAPHY, the defeription of the world; or the art which teaches the confruction, figure, difpofitica, and relation of all the parts of the world, with the mamer of reprefenting them on a plane. The word comes from rosuos, worlh, and veat., I deficibe.

Cofmography confifts chiefly of two parts. Alronomy, which thows the flructure of the heavens, and the difpolition of the flars; and Gcorraphy, which flows thofe of the earth.
 take) an ancicut mathematical inflrument, ferving to mealine diftances, both in the heavens and on earth. The cofmoldhe is in great meafure the fame with the aftrol.ibe. It is alfo called ponmargiun, or the amiverfel infloment, by L. Mongard, in a treatife writton exprefsly upon it, pristed in 1 ora.

CUSNOLOGY (fromxomens atorth, and nors difcourf), the feence of the world in general. This Wohtus calls, gencral, or tranfendental cofinulusy, and has written a reatife on the fubject, wherein he endeavours to ex. plain how the world arites from fimple fubtances; and treats of the general principtes of the nodifications of material thimgs, of the elements of bodice, of the laws of motion, of the perfection of the world, and of the order and courlc of nature.
cusmopulite, or Cosmopolitas, a term $3 \mathrm{P}_{2}$ fome:

## C O S

Cuflacks. fometimes ufed to fignify a perfon who has no fixed living or place of abode, or a man who is a ftranger nowhere. The word comes from the Greek кoger, "world," and $\mathrm{T}_{2}$ as, "city."-One of the ancient philofephers being interrogated what countryman he was? anfwered, he was a cofmopolile, i. e. an inhabitant or citizen of the world.

COSSACKS, a name given to the people inlabiting the banks of the rivers Nieper and Don, near the Black Sea and borders of Turky. The word implies irregular troops of horfe. Thefe people are divided into European and Afratic Cofficks. The firtt confint of the Zaporog, who divell below the cataract of the Dnieper, fonte on the fide next to Ruffia, and others on the oppofite fide of that river ; the Lower and Upper Coffacks; the Bielogorod Coffacks; and a part of the Don Coflacks. The Afratic Coffacks are compofed of the refl of the Don Coffacks, the Grchin Coffacks, the Yaik Coffacks, and the Weftern Calmuks, who retiring from thofe that inhabited the fouth borders of Siberia under Yaiuki Can, fettled upoq the Wolga, and are dependent upon Ruffia.

The Coffacks were known by that name ever fince the $9+8$ th year of Chrift. They dwelt upon mount Cancafus, in the place now called Cabardy; and were reduced to the Ruffian dominion by prince Mftinaw in the year 1021. Many Ruffians, Poles, and others, who conld not live at home, have, at different times, been admitted among the Coffacks; but the latter, abitracted from thefe fugitives, muft have been an ancient and well governch nation.

Towards the beginning of the I6th century, the Zaporog Coffacks tixed their habitations on the fpacious phins that extend along the banks of the Dnieper. They had undergone confiderable hardhips from the ineurfions of the Tartars, for which they afterwards found means to avenge themfelves in an ample inanner. The Poles being ienfible how ferviceable the Coffacks might be in defending them from the ravages of the Tartars, and even of the Rutians, propofed to them terms of allianee. In 1562, they folemnly took them under their protection, and engaged to pay them an annual fublidy; in return for which, the Coffacks were to kecp on foot a fufficient body of troops for the defence of the Polifh dominions. With a view to bind them fill more ftrongly by ties of intereft, the Poles gave them the whole country between the rivers Dnieper and Neitter, and the borders of Tartary. The Coffacks applied themfelves with great induftry to the cultivation of this fertile fpot; fo that in a thort time it was interfperfed with large towns and handfome villages. Befides they continually haraffed the Tunks, and did them great damage by their incurfions; and in order to prevent the latter from purfuing them, or making reprifals, they poffefed themfelves of feveral finalliflands in the Duieper, where they kept their marazines, \&e. The hettinan, or general of the Coffacks, was not in the leall fubordinate to the ficld-marthal of Poland; but acted in cmaert with $\lim$ as an ally, and not as a fubject of that republic. But this alliance, though of fuch manifent advantage to both parties, was not of long duration. The Poies, feeing the valt improvements made by the Coffacks in the country they had given up to them, became envious of them, and actually.made an attempt
to hring them into fubjection, as we have feen in the Coffacko. hiftory of Poland. In 1648 the Coffacks gained great advantages over them, and next year came to an accommodation, in which they not only preferved their old immunities, but obtained additional privileges. The refult of all was, that thefe Coffacks remained under the protection of Rufia; and as their former country was entirely laid waite in the late wars, they fettled in the Ruflian Ukraine, upon receiving fornal affurances from the court of Ruffia, that no alteration fhould be made in their political conftitution, and that no taxes whatever fhould be laid upon them. The Coffacks, on the other hand, were always to keep in readinefs a good body of troops for the fervice of Ruflia: but in the year 1708 Mazeppa, their hettman or chief, went over from the Rufians to the Swedes; upon which Peter I. refolved to prevent fuch revolts for the future. To this end, after the battle of Pultowa, he fent a flrong detachment into the above mentioned little iflands in the Dnieper, whither the Coffacks had fled, with their wives and children, and all their effects; and ordered them all to be put to the fiword without dillinction, and the plunder to be divided among his foldiers. He likewife fent a great number of men into their country, and caufed feveral thoufands of the Coffacks to be carried to the conits of the Baltic, where they were put to all forts of hard labour; by which means he in a mamer extirpated the whole nation.

What diftinguithes the Zaporog Coffacks from all other people is, that they never fuffer any women in their fettlements, as the Amazons ate faid not to have fuffered any men among them. The women of thefe Coffacks live in other iffands of the Dnieper. They never marry, nor have any family : all their male children are inrolled as foldiers, and the females are left with their mothers. The brother often has children by his filter, and the father by his danghter. They know no laws but thofe which cuftom has introduced, founded on their natural wants; though they have among them fome priefts of the Greek perfuation. They ferve in the armies as irregulars; and woe to thofe who fall into their hands.

The country of thefe Coffacks, who are an affemblage of ancient Roxelans, Sarmatians, and Tartars, is called the Ocraine or Uhraine. It lies upon the borders of Ruffia and Poland, Little Tartary, and Turky, and was anciently a part of Scythia. Dy virtue of the latt treaty fettled between Ruflia and Poland, in 1693* the latter remains in poffeffion of all that part of the Ukraine which is fituated on the weft fide of the Daieper, and is now but poorly cultivated. That on the eaft fide, inhabited by the Coffacks, is in a mueh better condition, and extends about two hundred and fixty miles in length, and as many in breadth. It is one continued fertile plain, watered by a great number of fine rivers, diverffified with pleatant woods, and yields fuch plenty of all forts of graiu, pulfe, tobaceo, honey, and wax, as to fupply a great part of the Ruffian empire with thofe conmodities. Its paftures are exceeding rieh, and its eattle very large; but the inhabitants are greatly plagued by locults, which infeft this fine country. The houfes in the Ukraine are, like thofe of the Rullans, mofly built with timber.

## C 0 S

Coffacks. The Coffacks are tall and well made, generally hawknofed, and of a good mien. They are hardy, vigorous, brave, and extremely jealons of what is molt valuable in life, their liberty; fickle and wavering, but fouiable, cheerful, and iprightly. They are a very powerful people, and their forees conlift wholly of eavalry. Their dialect is a compound of the Polifh and Ruffian language; but the latter is the mont predominant. They were formerly Pagans or Mahometans; but upon their entering into the Polifh fetvice, they were baptized Chritians of the Romifh communion ; and now that they belong to Rulfia, they profefs themfelves members of the Greck church.

Each of their towns, with the diftrict betonging to it, is governed by an officer called ottomann or attamann.

The Don-Coflacks, fo called from their refidence upon the banks of the river Don, greatly refemble thofe already defcribed. In the year 1559, when the ezar lwan Baflowit\% was emperor of Rutlia, they voluntarily put themfelves under his protection, and are at this time on a pretty equal footing with the other Ruffian fubjects. They have feveral towns and villages upon the banks of the Don; but are prevented from extending thenfelves farther up the country, by the fearcity of freh water and wood in many places. Their chief fupport is grazing and agrieulture, and occalionally robbing and plundering, for which they want neither capaeity nor inelination. Every town is governed by a magiltrate called tamann; and the tananns, with their towns, are under the jurifdiction of two ottomanns, who refide at Therkafky. The troops of thefe Coffacks likewife confit entirely of cavalry. In this country all the towns and villages are fortified and encompaffed with palifades, to defend them againit the ineurlions of the Calmues and Kuban Tartars, with whom they are contimully at war. The Coffacks, in gencral, are of great fervice to garrifon towns by way of defenee, or to purfine an enemy; but are not fo good at regular attacks.

The Siet h Coffacks, who are alfo called Haidamacks, have their particular hettman. They iuhabit the Ruffian, Pulifh, and Tursith dominions, along the lanks of the Dnieper.

The Yaik Coffacks dwell on the fonth fide of the river Yaik; and upon the fuccefs of the Rufian arms in the kingdom of Attracan, voluntarily fubmitted to them. In thature they greaty refemble the cther Coffacks; though by their boorith manner of living, and intermarriages with the Tartars, they have not the flape and air peculiar to the rett of their countrymen. Their natural difpofitions and cuttoms are, however, nearly the fame. Hufbandry, fining, and feeding of eattle, are their principal employments; and, like the other tribes, they let lip no opportunity of making depredations on their incighbuurs. Their contanal wars with the Kara-Kalpacs and the Kafathaia-Horda oblige them to keep their towns and villagres in a fate of defence. They are indeed fubject to Ruffion waiwodes, to whom they pay an amual tribute in eorn, wax, honey, and eat:le; but they have alfo their parricular chiefs, who govern them according to their incient cuttoms. Though the generaiity of the Yaik Coffacks profefs the Greek religion, yet a great many relicts of Mahometanifm and Paganifm are itill found
among them. Being naturally bold and hardy, they make excellent foldiers; and they are not fo turbulent as the other Coffaeks. They live entirely at peace with the Calmuks and their other ncighbours, and even inaintain a commereial intercourfe with then.

COSSE de Geniste, an order of knighthood inflituted in 1234 , by Louis IX. at his marriage with Margaret of Provence. The motio on the collar of this order was, exaltut bumilis.

COSSET, among farmers, a colt, calf, or lamb, brought up by hand without the dam.

COSTA (Chriftopher a), a celebrated botanift of the 1 Gth century, was born in Africa, of a Portuguefe father, and went into A fia to perfect himfelf in the knowledge of dimples, where he was taken prifoner, but found means to make his eif:ape, and after leveral voyages, practifed phyfic at Bourgos. He wrote, 1. A Treatife on Indian Drugs and Madicines. 2. His Vorages to the Indies. 3. A book in praile of $\mathrm{W}^{\mathrm{r}}$. men; and other works.

COSTAL, an appellation given by anatomilts to feveral parts belonging to the fides: thas we meet with coftal mufeles, vertebræ, \&c.

COSTANZO (Angelo di), an Italian hillorian and poet, lord of Catalupo, was born in 1507 , of a noble and ancient family of Naples, and dierl about 1591. He wrote, I. A Hiftory of Naples, from 1250 to 1489 ; the beft edition of which is that of Aquila, in 1582, in folio, very farce. 2. Italian Poems, which are efteemed, and have had feveral editions.

COSTA-ricca, a province of North Ameriea in New Spain, and in the audience of Guatimala, bounded on the noth-eaft by the northern veean, on the fouth-weft by the fouth fea, on the north-weft by Ni caragua, and on the fouth-eaft by Veragua. The foil is not very fertile, though there is plenty of eattle. Carthage is the capital town.

COSNTARI) (George), a clergyman of the church of England, and author of feveral learned works, was born about the year i710. He was educated at Wadham College, Oxford; and took the degree of M. A. in 1733 . The firlt eeclefialtical fituation in which he was placed was that of curate of Inip in Oxfordhire. In 1747 he publifhed, in 8 vo, Some Obfervations tend. ing to illuttrate the Book of Joh. In 1750 he publithed Two Differtations: I. On the meaning of the Word Kefitab, mentioned in Job, chap. xlii. ver. in, 11. On the Signification of the Word Hormes. In 1752 he publifhed, in 8 so, at Oxford, D.ffertationes $1 /$. CriticoSacra, quarum prima explicatur Ezek.. xiii. 18. Attera vero, 2 Reg. x. 22. In 1755 he wrote a letter to D1 Bireh, which is preferved in the Britifh Mufemm, refpecting the meaning of the phrafesplarabarbarica. Some time after thisheundertook to publifhafeeond edition of Dr Hyde's Hiforia Religionis svterum Parfurwm, corumque Alagorum; and which was accordingly primted, under his infpection, and with his corrections, at the Clarendon Prefs at Osfurd, in 4 to, in 1760 . Mr Coftard's extenfive learning having now recommended him to the notice of Lord Chancellor Northington, he obtained, by the favour of that nobleman, in June $1-64$, the vicarage of 'Twickenham in Middlefex; in which fituation he continued till his death. In $\mathrm{m}_{7} 67 \mathrm{he}$ publifhed, in one volume quarto, 'The Hillory of Attronomy, with its. aftlication to Geography, Hillory, and Chronology:

Corre
"I Coflard.

C inverfy occatiorally exemplitied by the, Clibes. This work II was caiefly intended for the ufe of fludents, and conSolus. $1-$ tains a full and diftinat view of the feveral improvements made in geography and attronony. Mr Cofard has hown, "hy a gradual dedaction, at what time, and loy whom, the priacipal difooteries have been mads in geography and altronony; how each difeovers has pated the way to what tahowed; and by what cafy iteps, through the revolution of to many ages, thefe very uleful feiences have adivanced towards their pre©ont Rate of perfection." la rost he pablifaed, in Sro, A Letter to Nathanicl Praify Hallead, Equ; containing fome Remarks on his Preface to the Ce de of Gentoo Laws. This appears to have beer the lat of his pubhications. It contains fone eriticim:s which were intended to invalidate the opinion which Mr Halhead had conctived concerning the great antiquity of the Gentoo laws; and fome arguments againt a notion which had been adopted by feveral writers, drawn from the obfervation of tatural phenomena, that the world is far more ancient than it is reprefented to be by the Hebrew chronolory. Mr Coltard died on the toth of Janaary 178.2. He was a man of mommon learaing, and emireatly filled in Grecian and oriental literature. His private character was amiable, and he was much refpeeted in the neighbemhond in which he lived for his humavity and beacrolence.- Belides the works already mentiond, he wrote fome others; and was alfo the author of learned papers, inferted in the Plibofophical Tranfations, on aftronmical and chronological fubjects.

COSTIVENESS, a pretematural detention of the feecs, with an unufual drynefs and bardnefs thereof, and thence a fupprefion of their evacuation. See (the Inimen fubjoined to) Medicine.
COSTMARY, the Englin name of a fpecies of tanfy. See Tanaceturt.

COST'S, in law, imply the expences of a fuit recovered by the phaintil, together with damages. Colts were not allowed by the common law, the amercement of the vanquimed party being his only puninment: but they are given by Ratute.*. Colts are allowed in chancery for failing to make anfwer to a bill exhibitec, or makiog an infufisent anfwer: and if a firit anfwer be certitied by a waiter to be infuficient,

COTA (Rodriguez), a Spanifh poct in the 6 th century, was the author of the Trogi-cumedit de Calig'o y Mefilut, which has been thanlated into Latin by Gafpar Parthius, and into lirench by James de Lavardil:. The Spaniards fet a great value en this performance.

CO-TANGENT, the tangent of an arch wish is the complement of another to $90^{\circ}$. See Gromerry.

COTBUS, a town of Germany in Lower Luface. It is a ftrong important place, and has been fubject to the king of Prufia evor fince the year $16+5$. It is feated on the river Spree, 60 miles fouth-by-eall of Berlin, and 55 fouthecat of Wittemberg. Herc are a great number of French Proteltants, who have introduced manafactures; and this place is noted for excellent beer, pitch, and the cultivation of fix. E. Long. 15.21. N. Lat. 5 1. 40.

COTE, a tern ufed in courfing, to exprefs the advantage one greyhound has over another when he ruas by the fide of it, and, puttiag before it, gives the hare a turn. Sicucurrsing.

Core-Gare, a kiad of refufe wow, fo clung or clotted togcther that it eannot lie pulled afunder. By ${ }_{13}$ Rich. 11. flat. I. c. g. it is provided, that neither denizen or foreigner make any other refufe of wools but cote-gare and villein. So the printed llatute has it ; Lut in the paliament-roll of that $\bar{y}$ car it is cod-han. and rillein. Liot, or cote, tignifics as much as cottare in many places, and was fo ufed by the basons according to Verttegan.
COTELERIUS (John Baptif), follow of the Sorbonne, and king's Greek profeifor, was born at Nifmes in Languedoc in 1627 . He made a collection of the fathers who lived in the apoftulic age, which he publilhed at Paris in two rolumes folio in ati72; all reviewed and corrected from feveral MSS. with a Latin trantlation and notes. He alfo publifhed Monamenta Eiclyfe Grace, in 3 vols; being a colletion of Greck tracts out of the king's and M. Colbert's libraries, and which had never been publined before: to the he added a Latin tranflation and notes. He intendes a father profecution of this work; but his intende fludies lroke his conkitution, and deprived him of life in 1086. Befides his great Rill in languages and ecelefialtical antiquities, Cotelerius was remarkablo for his probity and candour.

COTERELLUS. Cotarius, and coterellus, accordiny to Spelman and Du Frefne, are Servile tenauts; but in Doomlday and other ancient MSS. there appars a dillinction, as well in their tenure and quadity as in their mame: for the cotarius hath a free foccarge tenure, and paid a lated firm or rent in provifions or money, with tome occational cultomary fervices; whereas the coterellus feems to have held in mere villenage, and his perfon, iffire, and goods, were difpofable at the pleafure of the turd.

CO'fERIE, a term adopted fiom the French trading affeciations or pantnerhips, where each perfon advan:es his quota of iluck and receives lis proportion of gain; and which retains its original neaning when applied to littie aftemblies or companics affociated for mirth and grood humour, where each one furnifhes his quota of pleafantry. Here they coin new words not underttood chicwhere, but which it becomes fafhionable for chers to uf: ; and they are thought ridiculous who the defendant is to pay fos.; 3l. for a fecond infufficient anfwer; 4 l. for a third, \&e. But if the anfwer be reported goud, the phantifr hall pay the defendant tos. cotts.

COSTUNE, a rule or precept in painting, by which the artift is enjoined to make crery perfon and thing fultain its proper charater, and not only obferve the ftory, but the circumfances, the feene of action, the country or place, and take care that the habits, amus, manners, proportions, and the like, exatty conefpond.

CoSTUS, in botany: A genns of the monogynin order, belonging tis thie monasdria clafs of plants; and in the natural methon ranking ander the tighth order, Siatumines. The corolla is interior, inflated, and ringent, with the under lip tritid. There is but one fpeenes, wiz. the arabicus, a native of the Indies. The root was formerly in fone efteem as an attenuant, and fervicable in venereal complaints; but it is now rarely pufcribed or met with in the thops.

## $\begin{array}{llllll}\mathrm{C} & \mathrm{O} & \mathrm{T} & {[887} & ] & \mathrm{C}\end{array} \mathrm{O} \quad$ T

Cotes are ignorant of them. It has been ufed of late to figII. nify a club of ladies.

COTES (Roger), an excellent mathematician of the 1 sth century. He early difcoveres an inclination to the mathenatics ; and at 17 years of age was admitred a penfioner of Timity College, Cambridge. In 1706 he was appointed frofellor of attonony in the profeflorthip fomeded by Dr llume archdeacon of Rocleetter, being chofen thie firt in that chair for his great merit and laming. In the ycar 1713, at the requelt of 1)r Richand Butler, he publithed at Canbrilge, in 4 to, a fecond edition of Sir lfaze Newton's Princifia, with all the improvenents which the author had annexed thereto; to which he prefixed an excellent Freface. He prepared icyeral ufful books for the Public; and wrote A Defoription of the great Meteor Which appeared on the (tho of March 1716 , publifhed in the Pliilufophial Tranfations. He lived bat a little while to carry on the difenurfes for which he was eminently qualitid; dying in tice prime of his age in : $: 16$, to the grat reght of all the lovers of the feiences.

COTESWOLD, feveral fleep-cotes, and fheep feeding on hills. It comes from the Saxou cote, i. e. cafu, "a cottage," and wohl, "a place where there is no woocar."

COTHURNUS, Busins, a very high thoe or patten raifed on foils of cork, wore hy the ancient actors in tragedy to make them appear taller and more like the heroes they reprefented; moft of whom were fuppofed to be giants. It covered the greatell part of the leg, and was tied beneath the knee. Felehylus is faid to have invented the cothurnus. See Buskin.

COTICE, or Cotise', in heraldry, is the fourth part of the bend; which with us is feldom or ever borne but in eouples, with a bend between them: whence probably the name; from the French cote, "fide:" they being borne, as it were, a-fide of the bend. - A bend theus bordered is faid to be cotifed, cotice. He bears fable on a bend cotifed algent three cinquefuils.

COTILLON, the name of a well-known brik dancs, in which eight perfons are employed. The term is French, and lignifies an under-petticorat.
cOTRONE, a town in the Hither Calabria, flandmige on the fite of the ancient Croton, though not occupying the fame extent of ground: (Sec Croros). It is fortitied with lingle wails, and a cafle erected by Charles V. Its private buildings are poor and fordid, the ftreets dimal and narrow. Chedfe and corn are the principle commodities. For the illowage of corn, there are ratrges of granaries in the fuburbs ; and the anmal export is abour 200,000 tomoti. The cheefe is tolerathly good; but has a great deal of that hot acrid tatte fo common to all checfe made with goats milk. The wine is not unpleafant, and appears fufceptible of improvenent by better management in the making and keeping.

COT"T, a partieular fort of bed-frame, fufpended from the beams of a thip for the officers to lleep in letwetn the deeks. This contrivance is much more convenient at fea than either the hammocks or fixed calbias: being a large piece of canvas fewed into the fenin of a cheft, about fix feet long, one foot deep, and from two to three fet: wide. It is extended by a
fquare wooden frame with a canvas bottom, equal to Cretame, its length and breadth, to retain it in an hosmontal Cortm. pofition.

Col"lige, Cortagium, is properly a little houfe for habitation widaont lands belonging to it ; tat. 4. Edw. I. But by a later thatutc, 31 Eliz. c. F. no man may build a cottage unlefs he lay four aures of land thercto ; except it be in manket-tewns or cities, or within a mile of the lea, or for the labitation of labourers in mines, failors, forciters, thepherds, \&c. and cottages erected by order of juftices of peace for poor imporent people are excepted out of the tatute. The four acres of land to make it a cottage within the law are 0 be freehold, and land of inheritance; and four acres holden by copy, or for life or lives, or for any number of years, will not be fuficient to make a lawful cottage.

COTTON, in commerce, a foft down fuhfance found on the gollypium, or cotton-trec. Sce Gossyplum.

Cotton is Ceparated from the Seeds of the plant by a mill, and then fpun and prepared for all forts of fine works, as fockings, waificoats, quilts, tapeltry, curtains, \&c. With it they likewife make mullin; and fometimes it is mixed with wool, fometimes with tilk, and even with gold itfelf.

The finelt fort comes from Bengal and the coaft of Coromandel.

Cotton makes a very confiderable article in commerce, and is dillinguified into cotton-wool and cottonthread. The firft is brought moltly from Cyprus, St John d'A:ce, and Smyrna: the moft efteemed is white, jong, and foft. Thofe who buy it in bales fhould fee that it has not been wet, moifture Being vesy prejudicial to it.

Of cotton-thread, that of Damas, called coiton d'ounce, and that of Jerufalem, called bazas, are the moft citeemed; as alfo that of the Welt India ifands. It is to be chofen white, fine, very dry, and evenly fpun. The other cotton-threads are the half bazas, the rames, the beledin, and gondezel ; the payas and montaliri, the geneguins, the haquins, the joffelaffars, of which there are two forts. Thofe of India, known by the name of Tutucorin, Java, Bengal, and Surat, are of four or five forts, dittinguihed by the letters $A, B, C$, \&e. They are fold in bags, with a deduction of one pound and a half on each of thofe of Tutucorin, which are the deareft, and two pounds on each bagr of the other forts. For thofe of liclebas, Smyma, Aleppo, and Jerufalem, the deduction at Amfterdam is eight in the lundred for the tare, and two in the hundred for weight, and on the value one per ceart. for prompt payment.

Cotton of Siam, is a kind of filky cotton in the Antilles, fo called bccanfe the grain was brought from Siam. It is of an extraurdinary tinemefs, even furpaffing filk in foftnefs. They make hofe of it there preferable to filk ones for their luthe and beanty. They foll from 10 to 12 and 15 crowns a pair, but the re are very few made unlef's for curiofity.

The munner of puckivg Cotzon as proflifal in the Antills. The bags are made of coarfe cloth, of which they take threc ells and a half each; the breadh is one cll three inches. When the bag has been well foaked in water. they hang it up, extending the moarth to crofs pieces of timber nailed to pofts fixed in it goes ind feven or eight feet high. He who packs or thereabouts bag, which is fix feet nine inches deep, , and preffes down the coton, which anether hands him, with hands and feet; obferving to tread it equally every whert, and putting in but little at a time. The beft time of packing is in rainy moilt weather, provided the cotton be under cover. The tag fivould contain from 300 to 320 pounds. The tare abated in the Antilles is three in the hundred. Cotton being a production applicable to a great varicty of marufactures, it cannot be too much cultivated in our own plantations that will adnit of it.

Cotion-Spirning, the art or procels of reducing cotton-wool into yarn or thread.

The molt fimple method for this purpofe, and the enly one in ufe for a long time in this country, was by the hand upon the well- known domeftic machine called a one-thread rubsect. But as the demand for cottongoods began to increafe, other inventions were thought of for expediting this part of the manufacture. About 50 years ago, onc Paal and others of London contrived an engine for a more eafy and expeditions methand of fiuning cotton, and for which they obtained a patent; but the undertaking did not prove fuccefsful. Some years theteafter, various machines were conAructed by different perfons for facilitating the fpiuning of cotton; but without prodacing any very material or lafling advantage. At length, about the year 1767, Mr James Hargrave, a weaver in the neighbourhood of Blackburn in Lancafire, conftructed a naachine by which a great number of threads (from 20 to 80 ) might be fpun at onec, and for which he obtained his Majelty's Fetters-patent. This machine is called a Jenny, and is the bell contrivance for fpinning woof or floute that has hitherto appeared. It is nuw commonly conilrocted for $8+$ threads; and with it one perfon can fpin 100 Englith hanks in the day, each hank cuntaining 840 yards.

Carding of cotton, as a preparation for fpimning, ufed formerly to be performed by the hand, with a fingle pair of cards, upon the knee: but this being a tedious in thod, ill fuited to the rapid operations of the new fpinning machines, other nethods were contrived for affording a quicker and more adequate fopply. The firt improvement for this purpofe was likewife made by Mr Hargave; and confilted in applying two or three cards to the fame board, and fixing them to a flool or fluck; whence they obtained the name of flock-cards. With thefe, one woman could perform two or three times as much work as the could do before in the common way. A till more expeditious method of carding, however, by what are cummonly called cylinder-cards, was doun afterwards invented, and is that which is now nof commonly practifed: but as feveral perions lay claim to this invention, it is not eafy to determinc to whom in particular the merit of it is due.
The next and nout capital improvements which this branch of manufacture received were from Mr Arkwright, a native of Lancathire, yow Sir Richard Arkwright of Cromford in Derty hire. He fritt brought forvard his new method of fiming cotton in 1768, for which he obtained a pratent in 1769; he afterwards, in 1775, obtained a patent for engines which
N' 23.
he had contructed to prepare the materials for fininning: though one of thefe patents, being clallenged at law, was fet afide fome years before it expired. The refult of Mr Arkwright's different inventions and improvements is a combination of machinery, by which cotton is carded, roved, and Jpun, with the utmolt exactuefs and equality; and fuch a degree of perfection attained in fpinning suarp, as is not to be equallied in any other part of the world. To thefe improvements this country is entirely indebted for the great extent of its cotton manufactores; large buildings having been erected for that branch both in England and Scotland, many of which contain feveral thous. fands of ipindles, each driven by one or more large water wheels; and fome of fuch extent as to fpin at the rate of one thoufand yards of twilt or warp yara in the minute.

Other machines have been invented at different times, and a variety of improrements made by different mechanics and manufacturers; one of which in particalar we molt not omit to mention. It is called a Mule, being a kind of mixture of machinery between the zuar $p$-machine of Mr Arkwright and the woof-machine or hand-jenny of Mr Hargrave ; and was alfo invented in Lancahire. This machine bids fair to be of great ufe in fpinning cotton yarn for muflins to a degree of finenefs never befure known in this country, being nearly equal in quality to thofe ufually brought from India.

Cotton Mills, are large buildings with peculiar machnery for carding, roving, and fipining cotton: (fee the preceding article.)-Thefe were entircly unknown in this country before the different inventions and improvements of Meffrs Ark wright and Hargrave; fince which time great numbers have been ercected in England, and feveral in Scotland.

The firft erections of the kind were by Meffrs Arkwright and Hagrave, both in the town of Nottinghain, and both nearly at the fame time. The engines were then driven by horfes: but fince that time they have been chiefly erected opon water-falls in different parts of the country; particularly the warp machines, which are better adapted for being driven by water than any other. The molt extenfive of thefe is in the village and neighboushood of Cromford in Derbyfire, and under the imenediate infpection of Sir Richard Arkwright. The firf that was crected in Scolland was for Mi Peter brotherllon, under the infpection and direction of Mr John Hackett from Nottingham; and is in the neighhourhood of Fennycuick near Edinburgh. Since which time feveral have been erected in the neighbuurhood of Glafgow, Paifley, Lanark, Perth, sec.

General State of the Cotfon Minuffatory. The facilities which the manufacturers of Great Britain lad fuddenly acquired, and the inmente capitals which they have fo recently laid ont in expenlive nachinery and other heavy eftablifmments for carrying on the cotton tiade, are unparalleled in the annals of the world. Above one hundred and forty cotton-mills are now built in Grat Britain, of which nearly two-thinds have been erected within thefe feven yeas. Befides thefe, there are above 20,500 hand-mills or jensies for fpinning the lhute for the twilted yarn fpun by the water-minils.

Above a million of money was, within this time,

ings, and auxiliary machivesy,
fuppofed at lealt, - 285,000 00
Total, - L. $, 000,000$ o 0
A power had been alfo created of working neasly two million of fpindles; and men, women, and children were trained to this bulincis, capable of cary ying the cotton manufacture almolt to any extent. In 1787 , the power of fpindles capable of being worked was eltimated as follows :
In the water-mills, In the jennies,

$\ldots \quad$| 286,000 |
| ---: |
| $1,665,100$ |

Total fpiudles, 1,951,100
In the branches applicable to muflin and callico, it was calculated that employment was given to 100,000 men and women, and at leadk 60,000 childien; many of the latter having ween taken from difiesent parifhes and hofpitals in Great Britain.

The quantity of the raw material of cotton wool confumed in this manufacture, which did not amount to $6,000,000 \mathrm{lb}$. in 1781 , and was only about $11,000,000 \mathrm{lb}$. fix years ago, had amounted in the year 1787 to the enormous height of $22,000,000 \mathrm{lb}$. and upwards ; and the aftonifhing rapidity of this inereafe is in fome meafure to be attributed to the extenfion of thefe branches to the goods of India, particularly the callicoes and mulins.

Britif callicoes were firft made in Lancafhire about the year 1772, but the progrefs was Now till within thefe laft 12 years. The quantity manufactured has fince extended from about 50,000 to $1,000,000$ of pieces made in the courfe of a fingle year.

Britifh mulins were not fuceelsfully introduced until the year 1781 , and were carried to no great extent until 1785 , after which period the progrels during two years became rapid beyonll all example. The acquiftion of cotton wool of a fuperior quality from Demerara and the Brazils, and the improvements made in the fpimang fine yaros upon the mule jemnies, had given a fpring to this branch of the cotton manufactory, which extended it beyond what it was poflible to have conceived. Above half a million pieces of mulin of different kinds, ineluding hawls and handkerchiefs, were computed to be annually made in Great Britain; while the quantity not ouly increafed daily with the new acceifion of powers that were burfling forth upon the councry, but the quality wasexceedingly improved; and fince a yearly fupply of about 300 bales of Ealt Indian cotton has been obtained hy the way of Oltend, yans have been fpun, and mullins have been wove, equal to any from India. Nothing, therefore, but a line raw material app-ded wanting to enable the Britifh manufacturer to carry this branch to the greatelt extent ; and, of all others, it is that fpecies of cotton goods which deferves moit to be encouraged, becaufe of the immenfe return it makes for lahour mose than any other branch of the cotton manufactory. Eaft India cotton woot has been fpun into one pound of yan worth five guimeas; and when wove into mulin, and afterwatds ornamented by children in the tambour, has

Vol. V. Part LI.
extended to the value of $L . r$; yielding a return of Coion. 5,900 for cont. on the raw material.

But the tate of the raw naterials, and the progreffive and altonifhing increafe of this manufacture, wht be beft explained by what follows:

|  | Cotton wool ufed in the Manufacture. | Suppofed Value whan man factured. |
| :---: | :---: | :---: |
| 1788, | lb. 5,101,920 | L. 2,000,000 |
| 1782, | 11,206,810 | 3,900,000 |
| 1783 , | 9,546,179 | 3,200,000 |
| 1784 | 11,280,238 | 3,950,000 |
| 1785, | $17,992,888$ | 6,000,000 |
| 1789, | 19,151,867 | 6,500,000 |
| 178\%, | 22,600,000 | $7,500,0=0$ |

Such was the progrefs of the Britin cotton mane factory till 1787 ; when, with eftablifhments and mechanical powers capable of hringing forward immente guantities of goods into the confumption, this manu. facture was checked by a great and fudden reduetion of the prices ol Eaft India goods of the fame fpecirs, which were fold above 20 pir cont. on an avcrage une der the loweft prices at which the Britifh manufacturer can afford to fell without lufs.

This conduct in the Caft India Company quickly operated to the great prejudice of the Britifh manufactures; and there is no faying how far thefe might be reduced, thould that company be allowed to prefs goods upon the market at prices which have no relation to the original colt, and under ciscumstances where the juft laws of competition cannot operate, and where every idea of protecting-dutics is annihilated in the effect of the general [jitem.

It is belicved, howeser, that the home-manufakture of this article, in all its different branches, has of late revived, and is likely to be carried on with greater advantage to the manufacturer than cver it was before.

Lavender Cotgon. Sec Santolina.
Ptilofoplic Cotrow, a name given to the flowers of zine, on account of their white colour and refemblance to cotion.

Cotton (Sir Robert), a molt eminent Englifh an. tiquarian, defeended from an ancient family, was born in 1570 . In his 18 th year he began to collect ancient records, charters, and other MSS. Canden, Seden, and speed, acknowledged their obligations to him in their refpective works. He was highly diftingni!ncd by queen Elizabeth, and by James I. who created him a baronet. He wrote many things himfelf; but our principal obligations to him are for his valuable library, confiting of curious manuferipts, \&c. which he was forty years in collecting. At his death in 163 I , he left the property of it to his family, though defigned for public ufe. A large acceffion was made to this library by private bencfactions before the death of the founder, and afterwards by the purchafes of his heirs, and donatious of others, who added to it a great number of books, chictly relating to the hiftory and antiquitics of our own nation. An adt of parliament was ohtained, at the requelt of Sir John Cotton, in 1700, for preferving it after his deceafe, under the above denomination, for public ufe. It is now lixed in the Britifh Muferm. For ftatutes rclatiog $3 Q$

Corrow (Charles), a burlefure poet, was defcended of a good family, and lived in the reigns of Charles If. and James 11 . Itis mat edebrated picce is Sarronialss, or 'roorgiae of the firit and fourth books of the Ancid. But hough, from the title, one would be apt to imagine it an imitation of Searon's famens Tavetic of the fame anthor, yet, upon examination, it would be frund greatly to excel nut only thats but every other attempt of the fame kind that hath been hitherto made in any language. He has alfo tranfated feveral of Lacian's dialogus, ia the fame manner, under the title of the Sceffer Soolfd;-and written another poem of a more ferious kind, entided the Honders of the I :okk. The exact period of either Mr Cutton's birth or his death, is no-where recorded; but it is probable the latter happened about the time of the revolution. Neither is it better knowa what bis circumftances were with refpect to fortune; they appear, however, to have been eafy, if one may judge from the turn of his writings, which is fuch as teems farcely pullibic fur any one to indulge whofe mind was nut perfectly at eafe. Yet there is one anecdute told of him, which feems to fhow that his vein of humour could mot rellatin itfelf on any confideration, viz. that in confequence of a tiagle couplet in his Virgit Trabofte, whectin he has made mention of a peculiar kind of ruff worn by a grandmother of his who lived in the Peak, he lolt an etlate of L. 40 for ennum; the old lady, whofe humour and telly difputition he could by no means have been a ltranger to, being never abe to forgive the liberty he had taken with her; and having her fortune whally at her difpofal, although the had hefore made him her fule heir, altered her will, and gave it away to an abfolute Atranger.

COTTUS, or Bull-bad, in ichthyology, a genus belonging to the order of thoracici. The head is broader than the budy, and the gill-membrane has lix rays. There are fix ficeies; the mofl remarkable are,

1. The gobio, or river-bull heal, is very common in all our clear brooks: it lies almelt always at the bott:m, enther on the gravel or under a fone: it depofits its fpawn in a hole which it forms anong the gravel, and quits it with great reluctance. It feeds on water infects. This fifh fldum exceeds the length of three inches and an half: the head is large, broad, Hat, and thin at its eircmuferenee, being well adapted for intinuating itfelf under llones: on the middle part of the covers of the gils is a fmall crooked fpine turn. ing inwards. The eyes are very frall: the irides yellow: the body grows flender towards the tail, and is very fmonth. The colour of this tifh is as difayrecable as its form, being dufky, mised with a dirty ycllow; the belly is whitith. The tatte, however, is excellent.
2. The cittaphractus, armed bull-head, or fogge, is very common on moft of the Britih coafts. It feldom exceeds five incles and an half in length; and even feldom arrives at that fize. The head is large, bony, and very rugged: the cnd of the nofe is armed with four fhort uprigat fpines: on the throat are a number of fhort whise beards: the body is octegoea!, and co-
vered with a number of ftrong bony crufts, divided into leveral conpartments, the ends of which projed into a flarp puiut, and form feveral echinated lines along the bock and lides frdm the head to the tail.
3. The forpius, or father-lafter, is not uncommon on the rocky codlls of this inand; it lurks under flones, and will take a bait. It feldom exceeds 8 or 9 inches in length. The lead is large, and has a molt formidable appearance, being armed with valt fints, which it can oppofe to any enemy that attacks it, by fwelling out its chocks and gill-covers to a large fize. The nofe and fpace contiguous to the eyes are furnified with flort fharp fpines; the covers of the gills are terminated by exceeding lone ones, which are buth itrong and verg fharp pointed. The mouth is larre ; the jaws curced with very finall teeth; the roof of the mouth is furnith. ed with a trimatal fipot of very minute teeth. This fpecies is very frequent in the Newfoundland lcas, where it is called foulping : it is alfo as common on the coatt of Greenland, in deep water near the thore. It is a prineipal food of the natives, and the foup made of it is faid to be agreable as well as wholefone.

COTULA, may-wed: A genus of the polyga. mia fuperfua order, belungigig io the fyngent fia clats of planta. The receptacle is almolt naked; the pappus marginated; the thorts of the dile quadriid ; ef the radiuj frequently none. 'Thete are fix fecies, all of them herba eous amuals, rifing fix or cight inches high, and adoraed with yellow flowers. There ase none of them natives of this country, and mott of them require attificia! heat.

Cotvla, or Cotgla, a liçuid meafure in ufe among the ancients.

Fannius fays, the cotyla was the fame thing with the hemina, which was balf a fextary.

$$

& \text { Heminas, rec:phtgeninas ex: rias umbs }
\end{aligned}
$$

Chorier obferves, that the cotyla was ufed as a dry meafure as well as a liquid one; from the authority of Thueydides, who in one place mentions two cotyle of wine, and in another two cotyle of bead.
COTURNLK, in omintholugy. See Tetrao.
COTYLEDCN, natel-wort; a genus of the pentagynia order, belonging to the decandria clats of plants; and in the natural nethod ranking under the 13 th order, Sacculante. The calys is quinquefid; the corolla menopetalous; there are five nectaiferous fcales at the bafe of the germen, and five capfules. There are tight fpecies, molt of them hardy fuceulent perenials; though fome require to be kept in a flove, as being natives of warm climates. They rife from half a foot to a yard and an half high, and are adorned with yellow flowers growing in umbels. They are eafily propagated either by feed or cuttings of their brancles.

COTYLEDONES, in anatoiny, are eertain glandular bodies, adhering to the chorion of tome animats.

Corrledones, in botany, the perifable purous fide-lobes of the feed, which involve, and for fome time funnif nourifment to, the embrjo plant. See Botany, P. 435.

COTYTTO, the goddefs of all debauchery. Her feftivals called Cotytitia were eelebrated by the Athenians, Corinthians, Thracians, \&c. during the night. Hor pricfts werc called bapta, and nothing but debauchory

## $\mathrm{C} O \mathrm{~V}$

## Couch

clecty and wartonancfs prevailed at the cciebration. A fertival of the fame name was ohferved in Sicily, where the votaries of the goddefs carricd about boughs hung with cakes and fruit, which it was lawful for any perfon to pluck off. It was a capital pmilment to reveal whatever was feen or done at thefe focred fentivals. It coft Eupolis his life for an unfuafonable reffeation upon them. The goddefo cotyto is fuppofed to be the fame as Proferpine.

COUCLI, in painting, denotes a lay, or impref. fron of colour, whether in oil or water, wherewith the painter covers his canvas, wall, wainfcot, or other matter to be painted.

The word is a fo ufed for a lay or impreffion on any thing, to make it firm and confitent, or to fereen it from the weather.

Paintings are covered with a couch of varnift ; a canvas to be painted muld firl have two couches of fze, before the colours be laid; two or three couches of white lead are laid on wood, before the couch of gold be applied: the leather-gilders lay a couch of water and whites of eggs on the leather, before they apply the guld or filver leaf.
The gold wire-drawers alfo ufe the word couch for the gold or filver laf wherewith they cover the mars to be gilded or filvered, be fore they draw it throurg the iron that is to give it its proper thicknefs.

The gilders ufe couch fur the quantity of gold or filver leaves applied on the metals in gilding or filvering. Each couch of gold is but one leaf, or two at n:of, and each of filver three to gild: if the gilding be hatched, there are required from cight to twelve conches; and only three or four if it be without teatching. To filver there are required from four to ten couches, according to the beauty of the work.

Couch-Grafs, in botany. See Triticum.
COUCHANT, in heraldry, is underttood of a lion, or other beaft, when lying down, but with his head raifed; which diftinguiftes the pofture of couchant from dormant, wherein he is fuppofed quite Atretched out and ancep.

COUCHE, in heraldry, denotes any thing lying along: thus, chevron-conché, is a chevron lying fideways, with the two ends on each fide of the fhield, which fhould properly rell on the bafe.

Coucher, or Courcher, in our flatutes, is wifed for a factor, or one that continues in fome place or country for traffic; as formerly in Gafoign, for the luying of wines. Anno 37. Ediv. IIL. c. if.

Coucher is alfo ufed for the general book in which any religious houfe or corporation regifler their pasticular acts. Anno 3 and 4. Edw. VI. c. ro.
couching of a Cataract, in furgery. See Elrgery-Index.

COVE, a fimall creck or bay, where boats and friall veliels may ride at anchor, fheltered from the wind and fa.

COVENAN l , in law, is the confert and agree ment of two or mure perfons to do, or nut to do, fame a $\varepsilon$, or thing, contracted between the:n. Alfo it is the declaration the parties make, that they will fland to fuch agreement, relating to lands or cther things; and is created by deed in writiog, fealed and executed by the parties, or otherwife it may be implied in the contract as incident thercto. And if the gerfons do
not perform their covenants, a writ or action of covenamt is the renedy to recover damages for the breach of them.
Compant, in eck ?aflical lintary, denotes a contract or convention agreed to liy the Scoteh in the year 1638 , for maintaining their religion free from innovation. In 1581, the general affembly of Scotiand drew up a confeffion of faith, or national covenant, condemning epifcopal government, under the name of bierurthy, which was figned by James 1. and which he etajond on al his fubjects. It was again fubferibed in 1590 and 1596. The fubfeription was tenewed in 1635 and the fubferibers ensated by oath to maintain religion in the fane flate as it was in $15 \%$, and to reject all innovations introduced fince that time. This oath aunexed to the confeffion of faith rectived the name of the covenant; as thofe who fubferibed it were called covenantits.

Corenant, in theology, is muchufed in connection with other terms: as, 1. The Covenant of Grace is that which is male between God and thofe who believe the gofpel, wherety they declare the: fubjection to him, and he declates his accoptance of them and favour to them. The gofpel is fomatimes denominated a covenant of grace, in oppofition to the Mofaic laiv. 2. Covenant of Redemption denotes, a mutual Aipulation, tacit or exprefs, between Chrit and the Father, relating to the redemption of finners by him, $p$ evious to any act on Chint's part under the character of Mediator. 3. Cownant of H'onks fignifies, in the langurge of fome divines, any covenant whereby God requires perfect olocdience from his creatures, in fuel a manner as to make no exprefs provifion for the pardon of offences to be committed againf the precepts of it, on the repentance of fuch fuppofed officndcrs, but pronounces a fentence of death upon them: fuch, they fay, was the covenant made with Adam in a. flate of imnocence, and that made with liand at Mount Sinai.

Solemn League and Corenant, wasetablinhed in the year $16_{43}$, and formed a hond of union hetween Scot. land and England. It was fworn and fubferibed by many in both nations; who hereby folemuly abjured popery and prelacy, and conbined together for tireir mutual defence. It was approved by the parliament and affembly at Wefminfler, and ratified by the general aftembly of Scotland in $16+5$. King Chanles 11. difapproved of it when he furrendered himide to the scots amy in $166_{4} 5$ : but in 1650 he seclared his andrubation both of thes and the national covenant by a folemn oath; and in Augult of the fame ycar, made a farther declaration at Dunfermine to the fame purpofe, which was alfo rencwed on occafion of his coromation at Scone in :6-1. The covenant was ratified by parliament in this jear, and the fubfeription of it required by crery member, without which the conltitution of the partianment was declared null and void. It preduced a feries of dillractions in the fubfoquent hillory of that country, and was roted illegal by parliament, and provifion made againd it. Stat. it. Car. II. c. 4

Ario of the Coremst, in Jewif antiquity. See Ares
COVFNTR1, a town of Warwickithire, in England, fituated in W. Long. 1. 26. N. Lat. 52.25. It is an ancient place, and is fuppofed to derive its name
from

## CO O <br> C. O U

Corentry. from a convent formerly fituated here. Leofric, earl of Mercia, who rhuilt the religious houfe after it had leen deftroyed by the Danes, and was lord of the place about the year $10: \%$, is faid, upon fome provocation, to have loaded them with heavy taxea. Being importuned by his lady, Godiva, to remit them, he confented, upon condition that hie hould ride naked through the town, which he little imagined the would ever comply with. But he found himfelf miftaken : for fhe accepted the offer, and rode through the town with her long lair fcattered all over her body; having firl enjoined the citizens not to ventare, on pain of death, to look out as the parted. It is faid, however, that a certain taylor conld not help peep. ing ; and to this day there is an effigy of him at the window whence be looked. 'l'o commemorate this extraordinary tranfaction, and out of refpect to the memory of their patronefs, the citizens make a procedfon every year, with the figune of a naked woman on horfehack. After Lcoficie's death, the carls of Chefler became lords of the citv, and granted it many privileges. At length it was annexed to the earldom of Cornwall ; and growing confiderable, had divers immunities and privileges conferred upon it by feveral kings; particularly that of a mayor and two bailiffs by Edvard III.; and Henry V1. made it, in ennjunction with fome other towns and villages, a diftinct county, independent of the county of Wanwick. But afterwards Edward IV. for their difloyalty, deprived them of their liberties, whieh were not reftored till they had paid a fine of 500 merks. By a charter from James I. an alderman is allotted to each ward, with the powers of the juftices of the peace within the city and its liberties. The walls were ordered to be demolifhed at the reftoration; and now nothing remains of them but the gates, which are very lofty. Coventry is noted for the two parliaments which were held in it; the one ealled the parliament of Dunces, and the other of $D_{e}$ vils. The former was fo called on account of the cxclufion of the lawyers; and the attainders of the dnke of York, the carls of Salithury, Warwick, and March, procured the other the epithet of Devils. The town-houfe of Corentry is mach admired for its painted windows reprefenting feveral kings and others that have been benefactors to the city. The chief manufactures carried on here are temmies and ribbands.
Coventry fends two members to parliament, and gives title of earl to an anc ent family of the fame name. Coventry is a bithop's fee. The bihoprick is faid to have been founded by Ofrry king of Mercia, in the year 656 or 657 ; and although it hath a double name, yet, like Bath and Wells, it is a lingle diocefe. It was fo extremely wealthy, that king Offa, by the favour of pope Adrian, conllituted it an archiepifc pal fee; but this title was laid afide on the death of that king. In 1075, Petur, the 3 th bilhop, removed the fee to Chefler. In 1ro2, Robert de Limfey, his immediate fucceffor, removed it to Coventry; and Hugo Novant, the fift bihop, removed it back to Litchlield, but with great oppoftion from the monks of Coventry. The difpute was fonally fettled in a manner nearly fimilar to that which is mentioned between Bath and Wells. Here it was agreed that the bifhop flould be ftyled from both places, ard that Coventry fhould have the precedcace: that they fould choofe the bio
fhop alternately ; and that they fhould both maise one chapter to the bilhop, in which the prior of Coventry fhould be the chief man. Matters continued thus till the Reformation, when the priory of Coventry being difolved by king Ilenry VlIl. the ftyle of the bithop contimed as before. But an act of parliament paffed, 33 d of king Heary VIIl. to make the dean and chapter of Litchficld one fole chapter to the bithop. This fee hath given three faints to the church, and to the nation one lord chancellor, three lord treafurers, three prefidents of Wiles, one chancellor to the univerfity of Cambridge, and one matter of the Wardmbe. 'the old church built by king Ofwy being taken down by Roger de Clinton, the 37 th bihup, he built the beautiful fabric that now llands in 1448 , and dedicated it to the Viruia Mary and St Chad. Daring the grand rebeilion, the church fuffered inuch; but, foon after the Reltoration, it was repaired and beatified. This diocefe contains the whole counties of Stafiord and Derby (execpt two parifhes of the former), the largett part of Warwickfhire, and near only one half of Shropthire, in which are 555 parithes, of which 250 are impropriate. It hath four archdeaconries, viz. Stafford, Derby, Coventry, and Shrewfbury. It is valued in the king's books at L. $559: 13: 2 \frac{3}{4}$, and is computed to be woth annually L. 2800 . The clergy's tenth is L. 590:16: $11 \frac{1}{7}$. 'To this cathedral belong a bifhop, a dean, a precentor, a chancellor, a treafurer, four archdeacons, twenty-feven prebendaries, five prieft vicars, feven lay clerks, or finging men, eight chorifters, and other under officers and fervants.

CO-VERSED sine, in geometry, the remainitg part of the diameter of a circle, afier the verfed fine is taken from it. See Geomftry.

COVERT, in law. - Feme Covert llenotes a womara married, and fo covered by, or under the protection of, her humand.

Corfrt-way, or Corridor, in fortification, a fpace of ground, leve? with the field on the edge of the ditch, three or four fathorss broad, ranging quite round the half moons and other works toward the country. It has a parapet raifed on a level, together with its banquets and glacis. See Fortification.

COVERTURE, in law, is applied to the fate and condition of a married woman, who is under the power of her huband, and therefore called fenme couvert.

COUGH, in medicine. See (Index fubjoined to) Medicine.

Cough, in farriery. See Farriery, $\int$ vi.
Cough, called the hufk, is a difeafe to which young bulloeks are fubject. In this diforder the wind-pipe and it oranclies are loaded with fmall taper worms. Farmers count the difeale incurable : but fomigations with mercurials, as cinnabar, or with fæotids, as tobacco, might prove ferviceable.

COUHAGE, or stinking-beans; a kind of kid-ney-beans imported from the Eaft Indies, where they are ufed as a cure for the dropfy. The down growing on the outbde of the pod is fo pointed as, like a nettle, to fting the flefh, though not with fo painful a femfation. This, by a corruption of the word, is called cowitch. The plant is a pecies of Dolichos.

COVIN, a deceitful compact or agreement between two or more to deceive or prejudice a third perfon:

## $\mathrm{C} O \quad \mathrm{O} \quad[493] \quad \mathrm{C} O \quad \mathrm{U}$

Covisg. As, if a tenant for life confpire with another, that this other fhall recover the land which the tenant hollw, in prejudice of him in reverfion I)r Skinner takes the word to be a corruption of the Latin conventum, and therefore writes it coocn. See Conspiracy.

COVING, in building, is when houfes are built projecting wer the ground plot, and the turned projecture arched with timber, lathed and plaftered.

COVINUS, among the ancients, a kind of chariot, in which the Gauls and Brit us ufed to fight in bathes.

COUL, or Cowl. See Cowl.
COULTER, in hufbandry, an iron-infrument, fixed in the heam of a plourh, and ferving to cut the edge of cach furrow. See Agriculturf.

COUNCIL, or Counsel, in a general fenfe, an affembly of divers confiderable perfons to concert meafures relative to the fate.

In Bitain, the law, in order to affit the king in the difcharge of his duties, the maintenance of his dignicy, and the exertion of his prerogative, hath affigned him a diverlity of comeils to advife with.
r. The firft of thefe is the high court of parliament. See Parliament.
2. The peens of the realm are by their birth hereditary counfellors of the crown; and may be called together by the king, to inpart their advice in all matters of importance to the realm, either in time of parliament, or, which hath been their principal ufe, when there is no parliament in being. Accordingly, Bracton, fpeaking of the nobility of his time, fay's, they might properly be called "confules a confulendo; reges enim tales fibi affociant ad confulendum." And in the law-bocks it is laid down, that the peers are ereated for two reafons: i. Ad confulembum, 2. Ad defendendiam, regem : for which reafous the law gives them certain great and laigh privileges; fuch as freedom from ariefts, \&c. even when no parliament is fitting ; becaufe the law intends, that they are always affiting the king with their counfel for the common-wealth, or keeping the reaim in fafety by their prowefs and valour.

Inflanecs of conventions of the peers, to advife the king, have been in former times very fiequent; though now fallen into difufe, by reafon of the more regular meetings of parliament. Si Edward Coke gives us an cxtract of a record, 5 Henry IV. concerning an exshange of lands between the king and the earl of Nor thunberland, wherein the value of each was agreed to be fettlod by advice of parlianent (if any thould be called before the feall of St Lucia), or niherwife by advice of the grand council of peers, which the king promifes to affemble $b$ fore the faid feall, in cafe no parliament hail be called. Many other inftances of this kind of meeting are to be fonnd under cur ancient kings: though the formal method of convoking them lad been fo long left off, that when king Charles I. in 1640, ifued out writs under the great feal, to call a council of all the pees of England, io neet and attend his majelly at Yorls, previous to the meeting of the long parliament, the earl of Clarendon mentions it as a new invention, not before lieard of; that is, as he explains himielf, fo okd, that it had not been practifed in fome hundreds of years. But th ugh thene had not for long before been an mitance, nor has there been any fuce, of affembling them in fo folemn a manner,
yet in cafcs of cmergency, our princes have at feveral Council. times thought proper to call for, and confult as many of the nobility as could calily he bronght together: as was particalarly the cafe with king James If. alter the landing of the prince of Orange; and with the prince of Orange himfelf, before he called the convention parliament which afterwards called him to the throne.

Befides this general meeting, it is ufually looked upon to be the right of each particular peet of the realm, to demand an andience of the kingr, and to lay before him with decency and refpect fuch matters as he thall judge of importance to the public weal. And therefore, in the reign of Edward II. it was made an article of impeachment in parliament againdt the two Hugh Spencers, father and fon, for which they were banifhed the kinglom, "that they by their evil covin would not fuffer the great men of the realm, the king's gnod counfellors, to fpeak with the king, or to come near him ; but only in prefence and hearing of faid Hugh the father and Hugh the fon, or one of them, and at their will, and according to fuch thinge as pleafed them."
3. A third council belonging to the king, are, according to Sir Edward Coke, his judges of the courts of law, for law-matters. And this appears frequently in the Englifh flatutes, particularly 14 Edward III. c. 5 . and in other books of law. So that when the king's council is mentioned generally, it muft be defined, particularized, and underfood, fectudum fubjectain naterien: " according to the fubject matter :" and if the fubject be of a legal nature, then by the king's courcil is underftood his council for matters of law; namely, his judges. 'Therefore, when by flatute 16 R:chard II. c. 5 . it was made a high offence to import into England any papal bulls, or other proceffes from Rome; and it was enacted, that the offenders thould be attached by their bodies and brought before the king and his council to anfwer for fuch offence; here, by the expreffion of king's council, were underftood the king's judges of his courts of juftice, the fubject-matter being legal : this being the general way of interpreting the word conncil.

4: But the principal council belonging to the king is his privy council, which is generally, by way of cmi . nence, called the council. For an account of its condi. iution and powers, fee the article $P_{R 1} \gamma$-Council.

Aulic Councte. See Aulic.
Common Counche, in the city of Enndon, is a cout wherein are made all bye laws which hind the citizens. It confuts, like the parliament, of two h ules; an upper compofed of the lord mayor and aldermen; and a lower, of a number of common-council $m \in n$, chofen by the feveral wards, as reprefentatives of the body of the citizens.

Councti of IFrar, an affiembly of the principal cirio cers if an army or fleet, occafionally called by the general or admiral to concert meafures for their ennduct with regard to fieges, retreaiz, engagements, \&c.

Council, in church-hilory, an aflembly of prelates and doeturs, met for the regulating matters relating to the doctume or difcipline of the church.

National Councrs, is an aftembly of prelates of a nation under their primate or patriarch.

Oicunenical or General Covisut, is an affembly which
regrefert3

Caunil, reprefents the whole body of the univeraichurch. Thic Counfel. Romanills reckon eighteen of them; 13 hilinger, in his tratife de Conciliis, fix; Mr Prideaux, feven; and bifhop Beveridge has increafed the number to eiglit, which, he fars, are all the general contils which have ever been teld fonee the time of the firt Chrifian emperor. They are as fullows: 1. The council of Nice, held in the reign of Curtantine the Great, on account of the herefy of Arius. 2. The council of Contantinople, called under the reign and by the command of Theudofius the Great, for much the fame end that the former councll was funmoned. 3. The council of Epbefus, convened by Theodofus the younger at the fuit of Netorius. 4. The council of Calcedon, heed in the reign of Martianus, which approved of the Entychian herefy. 5. The fecond council of Couttantinople, afembled by the emperor Intlivian, condemned the three chapters taken ont of the book of Theodorus of Mopfueftia, having firf decided that it was lawful to anathematize the dead. S.me authore tell us, that they likewife condemned the feveral errors of O rigen ab ut the Trinity, the plarality of worlds, and pre-exittence of fouls. 6. the third council of C nflantinople, held by the command of Contantius Pogonatus the emperot, in which they received the definitions of the five firf gereral councils: and particularly that againll Origen and ThemborusofMopfuellia. 7. The fecond Nicene comacil. 8. The funth council of Conflantincople, aftembled when Louis II. was emplror of the Weft. The regulations which they made are contained in twenty-feven canons, the heads of which are fet down by M. du Pin, to whom the reader is rufured.

COUNSEE, in a general fenfe, fignifies advice or inftuction low to behave in any difficult matter.
Counsex, or Adeocates, in Enitih coarts of law, are of two fpecies or degrees; Barristers and Serfeants. See thefearticles; alfo Advocate.
From both thefe degrees fome are ufually fetected to be his majefly's counfel, learned in the law' ; the two principal of whom are called his atturney-general. and Ghitior general. The firl king's counfel, under the degree of ferjeant, was Sir Fiancis Bacon, who was made fo boncris carfa, without either patent or fee: fo that the trith of the modern order (who are now the fworn fervants of the crown, with a flanding falary) feems to have been Sir Francis North, afterwards lord keeper of the Great Scal to king Charles II. Thefe king's courfel anfwer, infinme degree, to the advocates of the sevenue, advocati fifce, among the Romans. For they mut not be employed in any camfe againt the crown without fpeciai licence; in which relliction they agree with the advocates of the fifc: but, in the imperial law, the prohibision was carried niil farther, and perhaps was more for the dignity of the fovercign; for, excepting fome peculiar canfes, the fical advocates were not permitted to be at all concerned in private - fuits between fubject and fubject. A cultom has of late years prevailed of granting letters paterit of pro. cedence to fuch barriters as the crown thinks proper to honour with that mark of cifinction: whereby they are intitled to fuch rank and preaudience as are afingned in their refpective patents; fometimes next after the king's attotney-general, but ufually nest after his majelly's counfel next being. Thefe, as well as the oueen's attorney and fulicitor-general, rank promifcu-
ouny with the king's counfel; and, together with them, fit within the bar of their refpective courts: but receive no fularies, and are not fworn; and therefure are at liberty to be retained in caufes againt the crown. And all other ferjeants and barrifiters indiferiminately, (except in the court of common fleas, where only ferjeants are admited), may take upon then the prorection and defence of any fuitors, whether plaintiff or defendant; who are therefore called their clients: like the dependents on the ancient Roman opators. Thefe inded practifed gratis, for honour merely, or at molt for the fake of gaining infuertes: and fo likewife it is eftablified with us, that a counful can maintain no action for his fece; which are given, not as boatio vel co: lusio, but as quiddum bonorarium; not as a falary or hire, but as a mere gratuity, which a counfellor cannot demand without doing wrong to his reputation; as is alfo laid cown with regard in advocates in the civil law, whofe bonzrariam was dire Éed, by a decree of the fenate, not to exceed in any cafe 10,000 fetterces, or ab ut L. 80 of Englifh money. And in order to encourage due freedom of fpeech in the lawful defence of their clients, and at the fane tine to rheck the unfeemly licention'nefs of profitute and inliberal neen (a few of whom :alay fometines infinuate themfelves even into the moll honourable proffefons), it hath been holden that a counfl is not anfwerable for any matter by him fpoken, relative to the caufe in hand, and fuggelted in the client's inltructions; altho' it flould rellect upon the repuation of another, and teven prove abrolutely groundlefs; but if he mentions an untruth of his own iavention, or even upon inftructions, if it be impertiment to the caufe in hand, he is then liable to an action from the party injured. And counfu guilty of deceit and collufion are punifhable by the flatute Welm. 1. 3 Edw. I. c. 28. with imprifonment for a year and a day, and perpetual filence in the courts: a punifment hill fonctimes iallicted for grofs middemeanous in practice.

COUNSELLOR, in general, a perfon who advifes another: thus we fay, a counfllior at law, a privy counfellor, \&e.

Counsellor at Lazu, a perfon retained by a client to plead his caufe in a public court of judicature. See Adrocate, Barrister, Counsel, and Serjeant.

Privy-Counseilor. See Priar Countil.
COUNT, (Comes), a nobleman who poffifes a domain crected into a county. See. $\mathrm{V}_{1}$ count.

Englifh and Scottin counts we diflinguifh by the title of earls; fureign ones titll retain their proper name. The dignity of a commt is a mediun between that of a duke and a barun-According to the modern ufe, moll pleniputentiaics and ambafiadors affume the title of connts, though they have no county ; as the count d'Avaux, \&c.

Ancienty, all generals, counfellors, juedres, and Secretarics of cities under Chanlemigne, were calied counts; the dillinguifhing character of a duke and count being thie, that the latter had but one town under him, but the former feveral.
A count has a right to bear on his arm a coronet, adorned with three precious fones, and furmounted with three large pearls, whereof thofe in the middle and extremities of the coronet advance above the ret.

## C O U [ 495 ] C O U

Counts were nriginally 'ords of the court, or it the emperm's reti:une, and had their name comities, of comitondo, or á commando: he:ce the f: who were alnays in the valace, or at the emperor's fide, wete called scunts palatine, or comitis á latere. See Palatiae.

In the thans of the c nomonwealth, conites amones the Romans was a general natre for all thofe who accompaniced the proconfuls and propextors into the pros. vinces, there to forve the commonnealth; as the tribunes, prefects, teribes, \&2c.

Under the empenss, comites were the officers of the palc. Pioe orivin of what we now call connto feems aring to Amgutus, whotook feveral femators is be his comies, as Dinn oblerves, i.e to accompany him in nis voytures and cravels, and to affitt him in the hearins of cafes; which were thus julged with the fame auburity as in full fenate. Gallionus feems to have abolihed this counch, by Eurbiddeng the fenators being fond in the armies: and none of his fucceflors rextatlined it.

Thefe counfellors of the emperor were really counts, comites, $i$ e.companions of the pince; and they fometines took the vitle thereof, but always with the addition of the emperos's name whom they acconfanied: fo thet it was rather a man's of their office than a title of dignity. - Conllantine was the firt who converted it into a dignity; and under him it was that the name was firlt given ablolutely. The name onee ettablifhed, was in a litte time indifierently conferred, not only on thofe who fortowed the conar, and accomparied the emperor, but alio on mof kinds of oficers; a long lift whereof is given us by Du-Cange.

Eufebius tell, us, that Contmatine divided the counts into three claffes: the firt bore the title of ilhyfers; the fecond that of clarg/2mi, and afterwards fece.biles; the third were called perferiffom; Of the two fort clatics was the fonate compuled; thofe of the thind had no place in the fenate, but enjoycd feveral other of she privileges of fenators.
'Chere were counts who ferved on land, others at fea; fome in a civil, fome in a relizious, and fome in a legal capacity : as comes orarii, comes facrarumb lume tioniam, cames fucri conflforii, comes curic, comes capelle, sonics archiatrorum, comes commeriorion, comes weftarius, comes horrorum, comes opfoniorme or antone, comes domjizorum, coms equorum regiorun or comes flabuli, comes domoram, conies excubitorsm, comes notarioren, comes legum or profefor in jure, comes limitun or marcarum, comes portus Romx, comes futrimonii, sce.

The Francs, Germans, Bec. pathing inio Gatl and Germany, did not abolifh the form of the Ruman goverament; and as the governors of cities and provinces were called counts, comites, and dibkis, ciuces, they con. tinued to be called fo. They commanded in time of war; and $i$, tine of peace they adminifered jutlice. Thus, in the time of Charlemagne, counts were the ordinary judses and governors of the cities.

Thefe counts of eities were beneath the dukes and counts who prefided over provinces; the firlt being conftituted in the particular ecities under the jurifdiction of the latter. The conats of provinces were in nothing inferior to dukes, who themfelves were only governons of provinces. Uuder the lalt of the fecond race of French kings, they got their dignity rendered hereditary, and even uhrped the fovereignty when

Hngh Capet came to the crown: his authority was not hutficient to upare their encorachments: and hence it is they d te the privitege of wearing conenets in their arms ; they aflumed it then, as enjuging the rishts of fovereigns in their particolar dithicts or countics. But, by degrets, molt of the countics became re-united to the crenw.
'The quality of count is now become very different from what it was anciutly; being now no more than a title, which a king grans upon erecting a tertitory into a culunty, with a peferve of jurifdictun and fovereiraty to himfolf. At lirt there was no clanfe in the patent of erection, intinating the reverfion of the coumit to the coown in defanit of heirs male; but Chates IX. to preent their being tou numerous, orduincd that duchies and commice, in defaute of haise male, foadd ictura to the crown.

The priat of piccedence between counts and marquiles has been fomerty much controverted: the reafon was, that there are cuunts who are peers of France, but no marquifes: but the point is now given up, and marquifeg take place; thugh anciently, when counts were governurs of provinces, they were on a level even with dukes.

Willian the Conoucror, as is obrerved by Camden, gave the dignity of counts in fee to his nobles; annexing it to thas or that cousty or province, and allottins for their maintenance a certain propertion of money, arining from the prince's protita in the pleadings and forstitures of the provinces. To this purpofe he quotes an ancient record, thus: Hen. II Res Anglis Dis zerbis comidem criavit; fiatis nos feciffe Magoiatem Bigot cumitem do Novf. Éc. de iertio datarii de Norwich ce Norfulk, fout uliquis comes Angli.e, Eico.

The Germans call a count, graaf, or graff; which, according to a modurn critic, properly figmtics juldge; and is deraved from gravio or grafiro, of $2 p a p a, 1$ wrife They have feveral kinds of thefe counts or graff; as landgraves, marchgraves, barg-graves, and palfgraves, on counts palatine. Thefe lat are of two kinds; th:- former are of the number of princes, and have the iaveltiture of a palatinate; the others have only the title of count polustioe without the invelliture of any pa. latinate. Sume affert, that by publicly profeffing the imperial laws fur twenty years, the perfon acquires the dignity of a count palatine; and there are inftances of profeffors in law who have affuned the title accordingly: but there are others who quefion this right.

Count, in haw, elenotes the original declaration in a real action; as the declaration is in a perfonal one: the libellus of the civilians anfwers to both. - Yet, conut and declaration are fometimes confounded, and ufed for each other ; as, count in debt, count is appeal, \&ic.

Count-iWhel, in the Ariking part of a clock, a whecl which moves round once in 12 or $2+$ hours. It is fonntimes called the locking-zuborl. See Clocs-Mriking.

COUNTER, a term which enters into the compofition of divarfe words of our language, and generally implics oppofition; but when applied to decels, means an exact copy kept of the contrary party, and fometimes figatd by both parties

Counter-Changed, in heraldry, the intermixture, or oppofition of any metal with a colour.

Count, Conider.

## Counter

 IICorntar-Flory, in heraddry, is faid of a treffure whofe fower-defuce are oppofite to others. See Haraldry.

Cobvtrr-Dracuing, in painting, is the copying a defign, or painting, by means of a fine linen-cloth, an oiled paper, or other cranfparent matter, where the Atrokes $d_{j}$ pearing through are followed with a pencil, with or without colour. Sometimes it is done on glafs, and with frames or nets divided into fequares with filk or with thread, and alfo by means of inftru. ments invented for the purpofe, as the parallelogram.

Countfr-Ermine, in heraldry, is the contiany of ernine, being a black field with white fpots.

COUNTERIFEITS, in law, are perfons that obtain any money or goods by counterfeit letters or falfe tokens, who being convicted before julices of aflize or of the peace, $\&$ c. are to fuffer fuch pumiflment as mall be thoughe fit to be inflicted under death, as imprifonments, pillory, \&c.

COUNTER-roll, or Counter-stock, in the exchequer, that part of an ally which is kept by an officer of the comt.

Counter-Guart, in fortification, is a work raifed before the point of a bation, confiting of two long faces parallel to the faces of the baltion, making a faliant angle: they are fometimes of other fhapes, or othenwife fituated.

Counter-Light, or Comiter-jour, a light opponte to any thing, which makes it appear to difadvantage. A fingle counter-light is fufficient to take away all the beauty of a fine painting.

CoUNTER-March, in military affairs, a change of the face or wings of a battalion, by which means thofe that were in the front come to be in the rear. It alfo hignifies returning, or marching back again.

COUNTER-Mine, in war, a well and gallery drove and funk till it meet the enemy's mine to prevent its effect.

Counter-Paled, in heraldry, is when the efeutcheon is divided into twelve pales parted perfeffe, the two colours being connter-changed; fo that the upper are of one colour and the lower of another.

Counter-Part, in mulic, denotes one part to be applied to ancther. Thus the bafs is faid to be a coun-ter-part to the treble.

Counter-Pafont, in heraldry, is when two lions are in a coat of arms, and the one feems to go quite the contrary way from the other.

Countes. Point, in mufic: a term derived from the Latin prepotition contro and the verb pingere; becaufe the mufical charasters by which the notes in each part are fignified are placed in fuch a manner each with refoect to cach as to thow how the parts anfwer one another. See Composition.

Corintfr-Pointed (Contre-pointé), in heraldry, is when two chevrons in one efcuicheon meet in the points, the one rifing as ufual from the bafe, and the other inverted falling fron the chief; fo that they are connter to one another in the points. They may allo be counter-pointed when they are founded upon the fides of the flicld, and the points meet that way, cailed counter-pointed in fifs:

COUNTERPOISE, in the manege, is the liberty of the action and feat of a horfe-man; fo that in all she motions made by the horfe, he does not incline his $\mathrm{N}^{\circ} 93$.
body more to one fide than to the other, but continues in the middle of the faddle, being equally on his ttiorups, in order to give the horfe the proper and fea.

## fonable aids.

COUNTER-potent (Contre potmé), in helald. ry, is reckoned a fur as well as vair and ermine; but compofed of fuch pieces as reprefent the tops of crutches, called in French potences, and in old Englih porents.

- ColNtek. Pronf, in rolling-prefs printing, a print taken ofl from another feef printed; which hy being paffed through the prefs, gives the figure of the former, but inverted. To counter-prove, is alfo to palis a delign in black lead, or red chalk, through the prefs, after having moiltened with a fponge both that and the paper on which the counter-proof is to be taken.

Counter- Duatered (contre-ccurtel'), in heraldry, denotes the efcutcheon, after being quartered, to have each quarter again divided into two.

Countak-Saliant, is when twa beads are borne in a coat leaping from each other diredly the contray way,

Countek-Scart, in fortincation, is properly the exterior talus or llop of the ditel; but it is often taken for the covered way and the glacis. In this fenfe we fay, the enemy have lodged themfelves on the counterfcarp. Angle of the counter-fcarp, is that made by two fides of the counter-fcarp meeting before the middle of the curtain.

Counter Signing, the figning the writing of a fupe* rior in quality of fecretary. Thus charters are figned by the king, and counter-figned by a fecretary of ftate, or lord chancellor.

Counter-Time, in the manege, is the defence or refffance of a horle that interrupts his cadence, and the meafure of his manese, occafroncd either by a bad horfeman or by the malice of the horfe.

Counter, is alfo the name of a councing-board in a fhop, and of a piece of meial with a liamp on it, ufed in playing at cards.

Covivth of a Forfe, that part of a horre's furehand which lies between the thoulders and under the neck,

Countans in a Ship, arc two. I. The holow arching from the gallery to the lower part of the flraiglit piece of the then, is called the upper-counter. 2. The lower comater is between the tranfom and the lower past of the gallery.

Counter, is alfo the name of two prifons in the city of Iondon, viz. the Poultry and Woodtrest.

COTTNTORS, CONTOURs, or Counters, has been ufed for ferjeants at law, retained to defend a caule, or to fpeak for their client in any court of law.

It is of thefe Chaucer fpealis:
W.A flerifi had he licen, and a contiv 1 ,

Wras no where fich a worthy vavatuor.
They were anciently called forjeanl contours.
COUNTRIES, amons the miners, a term or apo pellation they give to their works under ground.

COLNTRY, anong geographers, is bided indiffer. ently to dernte either a kingdum, province, or leffer dill rict. But its molt frequeat ufe is in contradiftinction to town.

Cocnter-Dance is of Englih origin, thongh now tranfplanted into almots all the countries and courts of Eu:

Enrope. There is no ellablifhed rule for the compo fition of tunes to this dance, becaufe there is in inutic no kind of time whatever which may not be meafured by the motions common in dancing; and there ase fow fong tunes of any note within the lat cencury, that have not been applied to country-dances.

COUNTY, in geography, originally fignified the territoty of a count or earl, but now it is ufed in the fame fenfe with hire; the one worl coming from the French, the other from the $\mathrm{Saxon}^{2}$ - In this view, a county is a circuit or portion of the realm : into lif. ty-two of which, the whole land, England and Wales, is divided for its better government and the more eafy adminiftration of julice.

For the execution of the laws in the feveral counties, execpting Cumberland, Weftmoreland, and Durham, every Michaelmas term officers are appointed, under the denomination of /beriffs. Other officers of the feveral rounties are, a lord lieutenant, who has the command of the militia of the county; culdodes rotulorum, juftices of peace, bailiffs, high-conftable, and coroner.

Of the fifty-two counties, there are three of fpecial note, which are therefore termed counties palatize, as Laneatler, Chefter, and Durham. See Palatine.

Countr-Corporate, is a title griven to feveral cities, or aneient boooughs, on whieh our monarchs have thought fit to beftow extraordinary privileges; annexing to them a particular territory, land, or jurildic. tion; and making them counties of themfelves, to be $\boldsymbol{\pi}$-iverned by their own herifts and magiftrates.

Cocentr-Court, in Englifh law, a court ineident to the juridiction of the theriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40 s . Over fome of which caufes thefe inferior courts have, by the exprefs words of the flatute of Gloucefter, a jurifdiction totally exclufive of the king's fuperior courts. For in order to be intitled to fue an action of trefpafs for goods before the king's jutticiars, the plaintiff is directed to make aff. davit that the caufe of action does really and bone fide amount to 40 s . which affidavit is now unaccountably difured, except in the court of exchequer. 'The ftazute alfo 43 Eliz. c. 6. which gives the judges in many perfonal actions, where the jury affefs lefs damages than 40 s . a power to certify the fame and abridge the plaintiff of his full cofts, was alfo meant te peevent vexation by litigious plaintiffs; who, for purpoles of mere oppreffion, might be inclinable to inditute fuch fuits in the fuptrior conrts for injuries of a trifing value. The eonnty-eonrt may alfo hold plea of many real actions, and of all perfonal actions to any amount, by virtue of a fpecial writ called juficies; which is a writ empowering the theriff for the take of difpatel to do the fame jutice in his county-court, as miglit otherwife be had at WeRminfter. The freeholders of the county are the real judges in this court, and the theriff is the miniferial officer. The great conflux of freeholders, which are fuppofed always to attend at the county-court (which Spelman calis formen plebeia juflitic et thetrym comitione poteflatis), is the reafon why all acts of parliament at the end of erery tef. fion were wont to be there puhlifhed by the theriff; why all ontlawries of abfconding offenders are there proclaimer! ; and why ail popular elections which the Vot.V. Pat II.

4971 C O U
fiecholders are to make, as formerly of heriffs and confervators of the peace, and fill of coroners, vederors, and $k$ nights of the fhire, mull ever be made in plenocomitatu, or in full county-court. $\mathrm{B} y$ the dtatute 2. Edw. VI. e. 25. no connty-court flall be adj curned longer than for one month, confifting of 28 days. And this was alio the ancient ufage, as app:ars from the laws of king Edward the elder: prepofitus (that is, the Gheriff) ad quartam circiter. fotimanam fiequentem fopuli concioncm celdbato; cuique jus divito; hidy nue fingulas dirimito. In thofe times the county-court was a court of great dignity and $f_{\mathrm{f}}$ lendour, the bifhop and the ealdorman (or earl), with the principal men of the Mire, fitting therein to adminitter juftice both in lay and eccl faiftical eaufes. But its dignity was much impaired, when the bifhop was prohibited, and the earl neglected to attend it. And, in modern times, as proceed. ings are removeable from hence into the king's fuperior courts, by writ of pone or recordare, in the fame manner as from huodred eourts and courts-baron ; and as the fame writ of falle judgment may be had, in nature of a writ of error, this has occafloned the fame difule of bringing actiuns therein.

COUPAR, the name of a town in Scotland, capital of the ce unty ff life, lituated about io miles weft of St Andrew's: W. Long. 2.40. N J.at. 56. 20.Coupar is alfo the name of a village in the thire of An. gus, inhabied chiefly by weavers in the linen trade.

COUPED, in heraldry, is ufed to exprefs the head, or any limb, of an animal, cut off from the trunh, fmouth; ditinguifhing it from that which is called eraffed, that is, forcibly torn off, and therefore is rugged and uneven.

COUPED, is alfo ufed to fignifiy fuch croltes, bars bends, chevrons, Ex. as do not touch the fides of the efeutcheon, but are, as it were, cut off from them.

COUPEE, a motion in dancing, whercin one legs is a litule bent, and fufpended from the ground ; and with the other a motion is made forviaids.

The word in the original French fignifies a cur.
COUPLE-closs, in heraldry, the fourth part of in chevron, never borne but in pairs, except there he a chevron between them, faith Guillim, though Bloom gives an inflance to the contrary.

COUPLET, a divifion of a hymn, ode, fong, \&c. wherein an equal number, or equal meafure, of verfes, is found in each part; which divitions, in odes, are called ftropbes. - Couplet, by an abufe of the word, is frequently made to fignify a couple of verfes.

COURAGE, in ethies, is that qualicy of the mind, derived either from conflitution or prineiple, or both, that enables men to encounter difficulties and dangers. See Fortitudf.

COURANT, a Frenchterm fynonymous with sur. reat, and properly fignifies rumning. Sce Current.

Couravt, is allo a term in mufic and dancing: being ufed to exprefs both the tune or air and the dance. With regard to the firtt, courant, or currant, is a piece of mufic in triple time: the air of the courant is ordinarily noted in triples of minims; the parts to be sepeated twice It begins and ends when he who beats the meafure falls his hand; in contraditinction from the faraband, which ordinarily ends when the hand is aifed. With regard to dancing, the courant was long the molt common of all the dances practifed 3 R

Cusant.

## C O U

Corrap, in England: it confitis, effentially, of a time, a flep, Courayer. a balance, and a conpee; though it alfo adinits of other motions. Formaly they leaped the ir tleps; in which point, the courant differed from the low dance and parades. There are fimple courants and figured courants, all danced by two peifons.

COURAP, the modern name for a dillemper very common in Java and other parts of the EallIndies. It is a fort of herpes or itch on the arm-pits, groins, breatt, and face: the itching is almont perpetual; and the feratehing is followed by great pain aud a difcharge of natter, which makes the linen tick fo to the fkin as not eafily to be feparated without tearing off the crult. Courap is a general name for any fort of itch; but this diftemper is thus called by way of eminence. It is fo contagions that few efcape it. For the eure, gentle and repeated purging is ufed, and external! $y$ the fublimate in a fmall quantity is a good topic.
courayer (Peter Francts), a Roman Cathelic clereyman, dillinguifhed by great moderation, charity, and temper, eoncerning religious affairs, as well as by learning, was bora at Vernon in Normandy, 3681. While eanon regular and librarian of the abbey of St Genevieve at Paris, he applied to our archbilhop Wake for the refolution of fome doubts, concerning the epifcopal fuceefion in England, and the validity of our ordinations: he was encouraged to this by the friendly correfpnondence which had paffed between the arclabifiop and M. du Pin of the Sorbonne. The archbifhop fent him exact eopies of the proper reconds; and on thefe the built his "Defence of Englifh Ordinations," which was publifhed in Helland, 1727. This expofing him to a profecution in his own country, he took refuge in Eugland; where he was well rereived, and prefented the fame year by the univentity of Oxford with a ductor's degree. As it is Comewhat uncommon for a Roman Catholic clergyman to be admitted to degrees in divinity by Proteftant univerities, the eurions may be gratified with a figlit of the diploma, and the detor's letter of thanks, in "The prefent State of the Republic of Letters, for June $1,28$. In $1: 3^{6}$, he tranflated into French, and publified, "Father Paul's Hifory of the Council of Trent," in 2 vols. follio, and dedicated it to queen Caroline: who augmented to 200 l. a penfion of 1001 . a.year, which he had obtained before from the court. The learned Jer. Makkland, in a letter to his friend Bowyer, September 1746, fays, "Mr Clarke has given me F. Courayer's tranflation of the Hiftory of the Couneil of Trent; with whofe preface I am fo greatly pleafed, that if he be no more a lapait in other tenets than he is in thore he mentions (which are many, and of the $m \geqslant f t$ difinguifhed elafs), I dare fay there are very few coniderate Proteftants who are not as good Catholics as he is." His works are many, and all in Frenct: he trarinated Sleidan's "Hittory of the Reformation." He died in 1776, after two days illuefs, at the age of 95 ; and was buried in the cloitter of Weftminferabbey. In his will, dated Feb. 3d 1774, he declares, that he "dies a member of the Catholic chureh, but without approving of many of the opinions and fuperfitions which have been introduced into the Romifh ehuich, and taught in their fehools and feminaries; and which they bave inflated on as articles
of faith, though to him they appear to be not ouly not Courbaril founded in truth, but alfo to be highly improbable." And his practice was conformable to this declaration; for at London lie conftantly went to mafs, and at Ealing in the comotry, whither he often retired, as conflantly attended the fervice of the patifl church; deelaring at all times, that he "had great fatisfaction in the prayers of the church of England."
courbaril. See Hymenea.
COURIER, or Currier, (from the Frenclicourir, "to run,") a meffenger fent poil, or exprefs, to car. ry difpatches.
Antiquity, too, had its couricrs. We meet with :wo kinds: 1. Thofe who ran on foot, called by the Greeks bemerodromi, q. d. "euriers of a day." Iliny, Corn. Nepos, and Cæfar, mention fome of thefe who would run $20,30,36$, and in the eircus even 40 leagnes per day. 2. Riding eouriers (curfores equitantes), who changed horfes, as the nodern couriers do.

Xenophon attributes the firl couriers to Cyrus. Herodotus fays, they were very ordinary among the Perfians, and that there uas nothing in the wolld more fwift than thefe kind of meffengers. "That prince (fays Xenophon) examined how far a horfe would go in a day; and built flablee, at fuch ditances from each other, where he lodged hofes, and perfons to take care of them; and at each place kept a perfon always ready to take the packet, mount a fith horfe, and formard it to the next flage: and thus quite through his empire."

But it does not appear that either the Greeks or Romans had any regular fixed couriers till the time of Augultus: under that prince they travelled in cans; though it appears from Soerates thicy afterwards went on horfeback. Under the weftern empire, they were called vilutores; and under that of Conflantinople, curfores: shence the modorn mame. See Post.

COURLAND, a duely fimated between E. Long. 21. 26. and hetween N. Lat. 56. 30. and 57.30 . It is bounded by the river Dwina, which divides it from Livonia, on the noth; by Lithuanis, on the eall; by Samogitia, on the fouth; and by the Baric fea on the well; being 130 miles long and 30 browl. This duchy was formerly independent, and elected thir own duke; but is now fubject to Ruffa.

COURSE (route), in navigation, the angle contained between the weareft meridian and that point of the compafs upon which a fhip fails in any panticular direction.

Course, in architecture, denotes a continued range of flones, level, or of the fame height, throughout the whole lenath of the building; and not internpted by any aperture. It forms a parapet to the intermediate ipace between the tod $s$ of the building and the wings.

Course of Plinths, is the continuity of a plinth of Atone or plafter in the face of a building; to mark the feparation of the flories.
Course is alfo ufed for the time ordinarily fpent in lcarring the principles of a feience, or the ufual points and queflions therein. Thus, a fudent is faid to lave finithed his courfe in the humanity, in philo. fophy, \&c.

## C $\mathrm{O} \quad \mathrm{U}$

Course is alfo ufed for the elements of an ait es. hibited and explained, either in writing or by actual experiment. Hence our courfes of philofophy, anatomy, chemiftry, mathematics, sic. probably fo called as going throughout or ruming the whole length or c)urfe of the art, \&c.

COURSES, a name by which the principal fails of a fhip are dillinguifhed, viz. the main-fail, the forefail, and the mizen: the mizen May-fail and fore-lail are alfo fometimes comprehended in this denomination; as are the main-ftay-fails of all brigs and fehooners. Sursul.

COURSINE, among fportmen. There are three feveral forts of confica with gre-hounds: I. At the hare; 2. At the fux: and, 3. At the deet.

Fur the dice, thre are two fonts of courfes; the one in the paddork, the ofher cither in the forell or the purlicu. For the piddock courfe, there mut be the geehomd and the terrier, and the mongrel gre-hund, whofe buthefs it is to drive away the dece before the gre home's are Mipped; a brace or a leath are the nfual number nuped at a time, foldom at the utmolt more than two brace. la courfing the deer in the fosell or pulien, there are two viays in wie: the no is courfing fiom wood to wood; and the other, upon the lawns clofe by the keepel's lodge. In the courling from wood to wood, the way is to throw in fome young hounds into the wood to bring out the deer; and if any deer come out that is not weighty, or a deer or antler which is buck, fore, or forrd, then you are rot to flip your gre hounde, which are held at the end of the wood, where the keepers, who can guefs very weil on thefe occafons, expect that the dees will come out. If a proper deer come out, and it is fufpected that the brace or leafh of gre-hounds lipped after him will not be able to kill him, it is proper to waylay him with a couple of frefh gre-hounds.

The courfing upon the lawn is the mof agrecahle of all nther ways. When the keeper has notice of this, he will lodge a deer for the courle; and then, by coming under the wind, the gre-hound may be brought ncar enough to be flipped for a fair courfe.

The bell method of courfing the bare, is to go out and find a hare fitting; which is eafily done in the fummer, by walking acrofs the lands, either ftubble, fallow, or corn grounds, and calting the eye up and down: for in fummer they frequent thofe places for fear of the ticks, which are common in the woods at that fealon; and in autumn the rains falling from the trees offend them. The reft of the year there is more trouble required; as the buthes and thickets mult be beat to roufe them, and oftentines they will lie fo clofe, that they will not llir till the pole almult touches them: the fportfmen are always pleafed with this, as it promifes a good courfe. If a hare lies near any clofe or covert, and with her head that way, it is always to be expected that the will take to that immediately on being put up; all the company are therefore to ride up and put themfelves between her and the covert before fhe is put up, that the may take the other way, and rull upon open ground. When a hare is put up, it is always proper to give her ground, or lazi, as it is called; that is, to let her run 12 fcore yards, or thereabouts, before the gre-hounds are fip-
ped at her ; otherwife the is killed too foon, the freater Coarfing. part of the port is thrown away, and the plealiare of obferving the fever:t turnings and windings that the creature will make to get away is all loft. A good fportfman had rathet fee a hare fave herfelf after a fair courfe, than lee her murdered by the gre-hounds as foon as flac is up.

In courfing the fox, no other art is required, than fanding clofe, and in a clear wind, on the outhde of fome grove where it is expected he will come out; and when the is come out, he nuit have head enourh allowed him, otberwife he wili return butck to the corvert. The duweft gri-hemad will be able to owertake him, after all the odds of dikance neceliary; and the only danger is the foriling the dog by the fox, which too frequently tappens. For this rafon, no gre-iound of any value chould be run at this coonfe; but the ltrong, hard, bitter dogs, that will feize any thing.

The laws of courfing eflablifhed by the duke of Norfisk, and other fortfinen of the kingdom of England, are thefe:

1. He that is chofen fewterer or letter-lonfe of the dogs, fhall receive the gre-hounds matched to run togecher into liis leafh as foon as he comes into the field; he is to march next to the hare-inder, or him who is to fart the lare, until he come to the form; and no horfenan or footman is to go before or lideways, but all daaght b. hind, for the ipace of about $4{ }^{\circ}$ yards. 2. A hase ought never to be courfed with nore than a brace of gre-hounds. 3. The harefinder is to give the bare three fohoes before he puts her up from hes form or feat, to the end that the dogz may be prepared and attend her flating, 4. If there be not a particular danger of loing the liare, fhe fhould have about twelve feore yards law. 5. The dog that gives the frit turn, if after that there be neither cote, dip, nor wrench, wins the wager. 6. A go-by, or bearing the hare, is accounted equivalent to two turns, 7. If neither dog turns the hare, he that leads to the latt covert wins. 8. If any dog turns the hare, ferves himfelf, and turns her again, it is as much as a cote, and a cote is efteemed as much as two turns. 9. If all the courfe be equal, he that bears the hare thall win ; and if he be not borne, the courfe flall then be judged dead. 10. If a dog take a fall in his comfe, and yet perform his part, he may challenge the advantage of a turn more than he gave. 11. If a dog turn the hare, ferve himfelf, and give divers cotes, and yet in the end fhall ftand ftill in the fitd, the other dog, if le turns home to the covert, although he gives no other, thall be adjudged to win the wager. 12. If by misfortune a dog berid over in the courfe, that courfe fhall be adjudged void, and he that did the mifchief is to make reparation to the owner. 13. If a dog gives the lirit and laft turn, and there be no other advantage betwixt them, he that gives the odd turn wins. 14. A cote is when a gre-hound goes end ways by the fide of his fellow, and gives the hare a turn. 15. A cote ferves for two turns, and two trippings or jerkings for a cote; and if the hair turns not quite about, the only qurencheth, in the fportiman's phafe, 16. If thete be no cotes given by either of the gre-hounds, but one ferves the other at turning, then he that gives the moft turns wins the wager. 17 .

Sometimes

## $\mathrm{C} O \quad \mathrm{U} \quad[\mathrm{soo}] \quad \mathrm{C} O \quad \mathrm{U}$

Cont. Sometimes a hare does not tum, but wienches; for fhe dues not turn excent fle thens as it were round. In thede cafes, two wreaches flat for one turn. 18 . He that comes inftint at the death of the hare takes her up, and faves her from breaking; be cherimes the dogs, and cleanfes their mouths from the wool: he is adjudged to have the hare for in pains. 19. Findly, thote who are jadges of the leafh, mult give their judgment before they depart ont of the field, or elfe it is not to ftand as valid.

COURT, an appendage to a houfe or habitation; conliting of a piece of ground inclofed with walls, but open upwards.

Court is alfo uled for the palace ot place where a king or fovereign prince refides.

Court, in a law fenfe, is defined to be a place wherein jultice is judicially adminittered. And as, by our excellent conftitution, the fole executive power of the laws is velted in the perfon of the king, it will follow that all courts of juttice, which are the medium by which be adminitters the laws, are derived
Bhack?
Cumment. from the power of the crown. For whether created by aet of parliament or letters patent, or fubliting by
baron incident to every manor, and other inferior ju. riddetions: where the procedings are not earolled or recorded; but as well their exikence $2 s$ the trith of the matters themin contained thall, if difputed, be tried and determined by a juy. Thele courts can hold no plea of matters cogrizable by the common law, unlefs under the value of 40 s ; nor of any forcible injury what loever, nor having any procefo to arret the perfon of the defendant.

In every court there mult be at lealt three conftituent parts, the afor, reus, and judlex: the ador, or plaintiff, who complains of an injury done; the retu, or defendant, who is called upon to make fatisfaction for it; and the judex, or juticial power, which is to examine the tuth of the fact, to determine the law arifine upon that fact, and, if any injury appeas to have been done, to afcertain and by its officers to apply the remedy. It is alfo ufual in the fuperior courts to have attorneys, and advocates or counfel, as affiltants. See Attorney and Counsel.

Coukt-Buron, in Englih law, a court incident to every manor in the kingdom, to be holden by the fteward within the faid manor. 'This court-baron is of two natures : the one is a cuftomary court, appertaining entisely to the copyholders, in which their cft tites are transferred by furrender and admitiance, and other maters tranfated relative to their tenures only. The other is a court of common law, and it is the court of the barons, by which name the freeholders were fometimes anciently called : for that it is held before the frecholders who owe fuit and fervice to the manor, the fteward being rather the regithar than the judge. Thefe courts, though in their nature didinat, are equally confounded together. The court we are now confidering, viz. the freeholder's count, was compoled of the lord's tenanis, who were the pares of each other, and were bound by their feodal tenure to affift their lord in the difpentation of domettic juttice. This was formerly held every three weeks; and its molt important bufinels is to determine, by writ of right, all controverfies relating to the right of lands within the manor. It may allo hold plea of any perfonal actions, of debe, trefpalis on the cafe, or the like, where the debt or damages do not amount to 40s. Which is the fame fum, or three marks, that bounded the jurifdiction of the ancient Gothic courts in their lowelt inliance, or fierding courts, fo called becaufe four werc inftituted within every fuperior diftrict or hundred. But the proceedings on a writ of right may be removed into the county-court by a precept foom the fheriff called a tolt, quia tollit atque eximit caufame curia baronum. And the proceedings in all other actions may be removed into the fuperior courts by the king's writs of pone, or actelas ad curiam, according to the nature of the fuit. After judgment given, a writ alfo of falle julgmont lies to the courts at Wellminfter to rehear and review the caufe, and not a writ of error; fur this is not a court of record: and therefore, in fome of shefe wits of removal, the firft direction given is to caufe the plaint to be recorded, recordari ficius loguelam.

Gaurt-Martial, a court appointed for the punifhing offences in offieers, foldiers, and failors, the powers of which are regulated by the mutiny-bill.

For other courts, lee Admiralty, Arches, Benciz, prefcription (the only methods by which any count of judicature can exift), the king's confent in the two former is exprefoly, and in the latter impliedly, given. In all thefe courts, the king is fuppofed is conemplation of hw to be always prefent; but as that is in fact impolible, he is there reprefented by his judgres, whofe power is only an emanation of the royal prerogative.

For the more fpeedy, univerfal, and impartial adminittration of juftice between fubject and fubject, the law hath appointed a prodigious varicty of courts, fome with a more limited, others with a more extenfive jurifdiction ; Come condtituted to inquire only, others to hear and determine; fome to determine in the firf inftance, others upon appeal and by way of review. See L.aw, ${ }^{\circ}$ xcviii. xexix. c. cxli. clvi. clvii. clviii. and the refpective articles in the order of the alphabet. One diltinction may be here mentioned, that runs throughout them all; viz. that fome of them are courts of recorl, others not of record. A court of record is that where the acts and judicial proceedings are enrolled in parchment for a perpetual memorial and tellimony: which rolls are called the recorts of the court, and are of fuch ligh and fupereminent authori$2 y$, that their truth is not to be called in queftion. For it is a fettled rule and maxim, that nothing thall be averred againlt a record, nor thall any plea, or even proof, be admited to the contrary. And if the exiltence of a record be denied, it thall be tritd by nothing Lut itfelf; that is, upon bare infpection whether there be any fuch record or no ; elfe there would be no end of difputes. But if there appear any miftake of the clerk in making up fuch record, the court will direet him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine or imprifon; fo that the very erection of a new jurifdiction with power of fine or imprifonment, makes it inftantly a court of record.- A court not of record is the couri of a private man; whom the law will not intruft with any difcretionary power over the fortune or liberty of his fellow-fubjects. Such are the courts-

Countr, Common-Pleas, Chancery, EcclesiastiDathy, Faculty, Requfsts, Hustings, Chivalry, Fore t. Stannary, Star-Chamber, Prerogative, University, Legate, Leet, Mayor, Piepoudre, sic.

COURTESY, or Curtesy, of England; a certain tenure whereby a man marrying an heirefs feized of lands of fee timple, or fee tail general, or feized as heir of the tail fpecial, and getteth a child by her that cometh alive into the world, though both it and his wife sie forthwith; yet, if the were in poffefton, he flall keep the land during his life, and is called tencont fer legen $\operatorname{Ing} \mathrm{F}_{\mathrm{i}}$, " or tenant by the courtiy of Eingland:" becaufe this privilege is not allowed in any country except Scotland, where it is called curialitus Scotice.

COURTESAN, a woman who proflitutes herfelf for hare, ctpecially to people of fuperior rank. Lais, the famous 'Wheban courtefan, Itands on record for requiring no lels than 10,000 crowns for a fingle night. Of all places in the world, Veaice is that where courcefans abound the molt. It is now 300 years fince the fenate, which had expelled them, was obliged to recal them; in order to provide for the fecurity of women of honour, and to keep the nobles employed lett they fhould turn their heads to make innovations in the fate.

COURTRAY, a town of the Auftrian Netherlands, fituated on the river Lys, about 23 miles fouth-well of Ghent, and 14 eaft of Ypres. E. Long. 3. 10. N. Lat. 50.48.

COUSIN, a term of relatina between the children of brothers and filters, who in the firlt generation are called coufin-germens, in the fecond generation fecomlcoufins, evc. If frung from the relations of the father's fide, they are denominated faternal coufins; if on the mother's, maternal.

The word is ordinarily derived from confanguinews; though Menage brings it from congenius, or congeneus, q. d. ex eodem gencre.

In the primitive times, it was allowed coulin-germano to marry, to prevent their making alliances in heathen familics: but Theodolios the Geat prohibited it, under pain of death; on pretence that they were, in fome fort, brothers and filters with regard to each other.

Cousin (John), a celebrated French painter, who excelled in painting on glafs. His pieture of the Laft. Judgrent, in the veltry of the Minims of the Wood of Vincennes, is much admired. He was alfo a good fculptor. He wrote feveral works on geometry and perfpective; and died after the year 1689.

COUSU, in heraldry, fignifies a piece of another colour or metal placed in the ordinary, as if it were fewed on, as the word imports. This is generally of colour upon colour, or metal upon metal, contrary to the general whe of heraldry.

COUTANCES, a port town of Normandy, and capi:al of Coutanin, in W. Long. 1. 32. Lat. 49. 10. 'This town, anciently called Confantia or Cofedia, is pleafantly fituated anong meadows and rivulets about fix miles diflant from the fea. By the remains of a Ruman aqueduct, and other ancient ruins, it appears to be a place of great antiquity. It is the lee uf a bihop iuffragan of Rome; and has a magnificent Guthe.
dral, cheemed onc of the fineft pieces of Gorlicic ar. Conthut chitecture in Europe. The trade of this town is very inconliderable, and the fortifications are quite demo-

Cowley. lifhect. They have feveral teligious houfes, and two parochial churches.

COUTHUILAUGH, from the Saxon couth, "knewing" and vetlaygh, "ontlaw;" he that wittingty receives a man outlawed, and cherifhes or conceals him: for which offence he was in ancent times fubject to the fame punithment with the outlaw himelf.

COVER'l', in heraldry, denotes fomething like a piece of hanting, or a pavillion falling over the top of a chief or other ordinary, fo as not to hide, but only to be a covering to it.

COW, in roology. S. e Bos.
Cow-Burner. See Buprestis.
Sco-Con, in zoology. See Trichecus.
Cow-Itch, or Coubage, in botany. See Couhage, and Dolichos.

Cow's-Lip, in botany. Sce Primula.
COUNARD, in heraldry, a term given to a lion bome in an efutcheon with his tail doubled, or turned in $h$ tween his legs.

CuWEL (Dr Jolsn), a learned and eminent civiliar. born about the year 155\%. In 1607 he compiled a Lau Distionary, which grave great offence to Sir Edwand Cuke and the common lawyers: fo that they firt accufed him to Jumes I. as affertiog that the king's prerogative was in lume cales limited; and when they failed in that attempt, they complained of him to the hoale of commons, as a betrayer of the rights of the people, by affrting that the king was not bound by the laws; for which he was committed to cuftorly, and his book publicly burnt. He alfo publifhed $1 n$ fituitons 'Juris Anglicani, in the manner of Jultinian's Inltitules; and died of the operation for the fone, in 1611.

COWES, a town and harbour on the north-ealt coat of the Ine of Wight, in Hamphire. It has no market, but is the bell place for trade in the whole ifland; but as it lies low, the air is accounted unherlthy. It is eight miles fouth-eaft of Portfmouth. W. Long. 1. 25. N. Lat. 50. +5 .

COWL, or Cous, a fort of monkifh habit worn by the Bernardines and Benedictines. The word is formed from cucullus, by confounding the two firt fyllables into one, as being the fame twice repeated.There are two kisds of cowls: the one white, very. large, worn in ceremony, and when they affilt at the office; the other black, worn on ordinary occafions, in the ferects, \&c.
F. Mabillon maintains the coul to be the fame thing in its origin with the fcapular. The author of the apology of the Emperor Henry IV. diltinguifhes two forms of couls: the one a gown reaching to the feet, having lleeves, and a capuchin, ufed in ceremonies; the other a kind ol hood to work in, called alfo a fcapular, becaule it unly covero the liead and thoulders.

COWLEY.(Abraham), an cminent poct, was born at London1618. His father, who was a grocer, dying before he was born, his mother procured him to be admitted a king's fcholar at Weltminter. His firt inclination to poetry arofe on his lighting on Spencer's Fairy Queen, wien he was but juf able to read: and this inctination fo

## C O WV [ 502$] \quad$ C O $W$

 poens; a collcction of which was publithed in 1613 , when he was but 15 . He has been reprefented as polfeffici of fo bad a memory that his teachers could never lring him to retain the ordinary ruks of grammar. But the fact was, as Dr Johnfon notices, nut that he conld not leain or retain the rules; bat that being able to perform his exerciles without them, he fpared himfelf the labour. In 1636 he was elected a fcholar of Tiinity College, Cambridge, and removed to that miverlity. Here he went through all his exercifes with a remarkable degree of reputation: and at the fame time mut have purfued bis poetical tum with great eagernefs, as it appears that the greatelt part of his poems were write berore he left that univerfity. He had taken his degree of Mafter of Arts before $16+3$, when, in confequence of the turbulance of the times, he, among others, was ejected from the col. lene: whereupon, retiring to Osford, he entered himfelf of St $J$,hn's college: and that veny year, under the denomination of a fcholar of Oxford, publifhed a fatire called the Puritan and the Papif. It is apparent, hoxever, that he did not remain very long at Oxford: for his zeal to the royal caule engaging him in the fervice of the king, who was very fenfible of his abilitics, and by whom he was frequently employed, he attended his majelly in many of his journeys and expedations, and gaired not only that prince's effeem, but that of many other great perfonages, and in particular of Lord Falkland, one of the principal fecretaries of flate.During the heat of the civil war, he was fettled in the Earl of St Alban's family ; and when the queen. mother was obliged to retire into France, he accom. panied her thither, laboured Itrenuoully in the affais of the royal family, undertook feveral very dangerous journeys on their account, and was the principal inItrument in maintaining an epiltolary correfpondence between the king and queen, whofe letters he cyphered and decyphered with his own hand. His poems intitled The Mittrefs, were publifhed at Loncon in ${ }^{1} 647$; and his comedy called The Guardian, afterwards altered and publifhed uader the title of Cutter of Coleman-Alrect, in 1850 . In 1656 it was thought proper by thofe on whom Mr Cowley depended that The thould come over into England, and, under pretence of privacy and retiement, fhould give notice of the potlure of affaiss in this nation. Upon his return he publifhed a new edition of all his poems, confiting of four parts; viz. I. Mifcellanies. II. The Miltrefs, or Several Copies of Love-Verfes. III. Pindarique Odes, vritten in imitation of the Style and manner of Pindar. IV. Davideis, a facred Poem of the troubles of David, in four books.

Scon after his arrival, however, he was feized, in the fearch after another gentleman of confiderable note in the king's party : but although it was through miftake that he was taken, yet when the republicans found all their atzempts of every kind to bring hin over to their party proved ineffectual, he was committed to a fevere confinement, and it was even with confoderable difficulty that he obtained his liberty; when, venturing back to France, he remained there, in his former fituation, till near the time of the king's re-
tu n. During his ftay in England he wrote his Two B ooks of Planti, publithed firlt in 1662; to which be af.erwards added four hooks more; and all lix, together with his other Latin poems, were printed at Londoa in 1678 . It appears by Mr Wood's Fafli Oxoni. $\mathrm{cr} \int \mathrm{cs}$, that our poet was created doctor of phyfic ac Oiford, December 2. $165 \%$.

Soon atter the rettoration he became poffefted of a very competent eftate, throngh the favour of his principal frients the duke of Buckingham and the earl of St Alhan's; and being now upwards of 40 years of age, he took up a refolution to pafs the remainder of a life which had been a fcene of tempelt and tumult, in that lituation which had ever been the object of his wifhes, a iludious retirement. His eagernch to get out of the bullle of a court and city made him lef careful than he might have been in the choice of a healihful habitation in the country; by which means he found his folitude from the very beginning fuit lefs with the conditution of his body than with his mind. His firt rural refidence was at Barn Elms, a place which, lying low, and being atear a large river, was iubject to a variety of breezes from land and water, and liable in the wiater-time to great inconvenience from the dampnels of the foil. The confequence of this Mr Cowley too loon experienced, by being feized with a dangcrous and lingering fever. On his recovery from this lie removed to Cherffey, a fituation not mach more healthy, where he had not been lons before he was feized with anorher connming difeate. Having languilhed under this for fome months, be at length got the betcer of it, and fecmed pretty well recovered fiom the bad fymptom; when one day in the heat of funmer 1667, Itaying too long in the fields to give fome directions to his labourers, he caught a moit violent cold, which was attended with a defluxion and itoppare in his treaft; and for want of timely care, by treating it as a common coll, and refuling advice till it was palt remedy, he departed this life on the 28th of July in that year, being the 49th of his age; and, on the 3 d of Augult following, he was interred in Wellmintler-abbey, wear the athes of Chaucer and his beluved spencer. He was a man of a very amiable character, as well as an admirable genius. King Charles II. on the news of his death, deelared "that Mr Cowley had not leit a better man behind him in England." A monument was erected to his memory by George Villiers duke of Buckingham in 1675 .

Belides the works already mentioned, Mr Cowley wrote, among other things, A Propolition for the Advancement of Experimental Philofophy; A Difcourle by way of Vition concerning the Grovernment of Oliver Cromwell; and Several Difcourfes by way of Elfays in profe and verle. Mr Cowley had defigned alfo a Dilcourle concerning Style, and a Review of the Principles of the Primitive Chrillian Church, but was prevented by death. A fpurious piece, intitled The Iron Age, was publiffed under Mr Cowley's name daring his abfence : and, in Mr Dryden's Mifcellany Poems, we tind A Poem on the Civil War, faid to be written by our auchor, but not extant in any edition of his works. An edition of his works was publithed by Dr Spratt, afterwards bifhop of Rochetter, who alio prefixed to it an account of the au-

## $\mathrm{C} O \mathrm{~V} \quad[5037 \quad \mathrm{C} O \quad \mathrm{X}$

Cowley. thor's life. The reverend editor mentions, as very excellent of their kind, Mr Cowley'z Letters to his Friends; none of which, however, were publithed.

The moral character of Mr Cowley appeas, from every acconnt of it, to have been very execllent. "He is reprefented by Dr Spratt (fays Dr Johnfon) as the mof amiable of mankind ; and this potthmous praife may be fafely credited, as it has never been contradid. ed by envy or by faction."

As a poet, his merits have been variouly eflimater. Lord Clarendon has faid he made a flight above all men ; Addifon, in his account of the Englif poets, that he improved upon the Theban bard; the duke of Buckingham upon his tomb-lone, that he was the Englifh Pindar, the Horaes, the Virgit, the delight, the glory, of histimes. And with relpect to the harthnefs of his numbers, the eloquent Spratt tells ne, that if his verfes in fome places feem not as foft and thuwing as one would have them, it was his choice and not his fault.
"Such ( (ays Mr Knox) is the apphafe lavihned on a writer who is now feldom read. "lhat he cond ever be elteemed as a pindaric poet, is a curions literary phenomenon. Hetotally mittook his own gerius when he thought of imitating Pindar. He totally mitook the genius of Pindar, when he thought his awn incoherent fentiments and numbers bore the lealt refon. blance to the wild yst regular fublimity of the Theban. He neglected even thofe forms, the frophe, antitrophe, an I epode, which even imitative duhefs can copy. Sublime imagery, vehement pathos, portic fire, which conflitute the effence of the Pindaric ode, ase inempatitle wish witty conceits, accurate antithefes, and valgar expreffin. All thefe imply the roolnc fs of deliberate compofision, or the meannefs of a little mind; both of them moit repugnant to the truly Pindaric oide, in which all is rapturons and noble. Wit of any kind wond be improperly difplayed in fuch compontion; but to increafe tha abfurdity, the wit of Cowley is often falfe. That he had a taite for Latin poetry, and wrote in it with elcgance, the well known epitanh on himfelf, upon his retiremern, and an admirable imitation of Horace, are-full proofs. But furcly his rhetorical biorrapher makes ule of the figure hyperbole, when he affirms that Couley has excelled the Romans themfelves. He was iaferior to many a writer of lefs fame in the Arufe Ancilianue. But fill he had great menit ; and I mull confls I have read his Latin verfes with more pleafure than any of his Englifh can afford." Efteys, vul. ii. p. 353-355.

To Cowley's compofitions in profe Mr Kinox hath paid a very !onourable tellimony. He fays, that in this department he is an elegant, a pleafing, a judicious writer; and that it is much to be lamented that he did not devote a greater part of his time to a kind of writing which appeared natural to him, and in which he excelled.

Dr Jofeph Warton obferves, that it is no earicature of Cowley to seprefent him as being poffeffed of a frained affedtation of ftriving to be witty upon all occaftons. "It is painful (add's this excellent critic) to ccufure a writer of fo amiable a mind, fuch integrity of manners, and fuch a rweetnefs of temper. His fancy was brilliant, frong, and fprightly ; but his talte
falke and unciafical, even thongt he had much lean- Cowser, ing."
I) Beattic has charactrifed Cowley in the filowing terms. "I know not whether any nation ever produced a more fingular genius ihan Conles. Ile abound, in tender thonghts, beanitul lines, and emphatical expelfons. His wat is inexhautible, and his learning extenlive; but his tutte is generally barbarous, and feems to have been formed upou fuch models as Donne, Martial, and the worll parts of Ovid: nor is it polfible to read his longer peems with feafure, while we tetain any relifh for the limplicity of ancient compotition. If this anthon's ideas had been fewer, hio conceits would have been lefs frequent; fo that in one refpect learning may be faid to have hurt his genins. Let it does mot appear that Grock and Latin did him any harm; for his imitations of Anacreon are almoll the only parts of him that ane now remembered or read. ITis Davideis, and his tranflations of Pincar, are deflitute of hamony, fmplicity, and every other chaflical grace."

Bur the works of this celebrated poet have been no whese fo amply eritienfed as in his Lite by Dr Johnfon. Aiter a particular examination of the different pieces, the Doctor, in taking a general review of Cowley's poetry, ubierves, That "he wrote with abundant fertility, but negligent or unfkilfal felection; with rauch thought, but with little innagery; that he is never pathetic, and rarely fublime, but always cither ingenius or lamed, either acute on profound." Of his prole he ipeaks with great apprubation. "No author (lays he) ever kept his verie and his profe at a greater dnfance from cach other. His thumghts are natual, and his tyle has a fmooth and placid equabiJuty, which has never yet obtained its due commendation. Nuihing is far-fouglat or hard-laboured; but all is rafy, withont fecblenefs, and familiar without groff: nefs." Upon the whole, he concludes as follows: " It may be affirmed, withour any encomiattic fer vour, that he brought to his poctic labours a mind replete with learning, and that his paffages are cmbell:fhed with all the oraments which books could fupply; that he was the firt who imparted to Englith numbers the enthutiafm of the greater ode and the gaiety of the lefs ; that he was qualified for forightly lallies and for luly flughts; that he was among thofe who fieed tranhation from lervility, and, inftead of folluwing his author at a ciltance, walked by his fide; and that if he l.ft vertiteation yet improvable, he left hikenife from time to time fuch fpecimens of excellence as enabled fueceeding poets to iniprove it."
$S$, many of Cowley's productions bing now efteemed fearcely worthy of a perulal, white whers of them are ditinguithed by their beaury, Dr Hurd (the prefent bifhop of Worcester) thought proper to makea felection of them, which he publufhed in 1772 , under the title of Select Works of Mr Abraham Cowley, in two volumes; with a Preface and Notes by the Editor.

COX (Richard), a learned prelate, and principal pillar of the Reformation, was born at Whaddon in Buckinghamfhire, of low parentage, in the ycar $1499^{\circ}$ From Eaton fchool he obtained a fcholal thip in King's. college in Cambridge, of which he brcame a fellow in
$\qquad$ $\longrightarrow$

Cor. 1510: he was thence invitet to Oxford hy Cardinal W, ley, and was there nutio one of the junion canons of Cadinal Collere. In 1525 he was incorporated kichelor: and the following year took the degree of matter of arts in the fame univerfity. In this fituation he becane remakable for his learning and poetical abilities; but his attachment to the opinions of Lutleer rendered him hateful to his fupcriors, who Atripped him of his pefer ant, and threw him into prifon on a fuppicion of hesey. B-ing, however, foon releafed, he was chofen matter of Eaton fchool, which flourithed remarkably under his care. In 1537 he commenced doctor of divinity at Cambridge; in 1540 was made archdeacon of Ely; and the following year prebendary of that cathedral, on its being new founded by king Henry VIlI In $15 t^{6}$ he was made dean of Chrif-church, Oxfori. By the recommendation of Archbithop Cranmer and Bithop Goodrich, to the latter of whom he had been chaplain, he not only obtained the above preferments, but was chofen preceptor to Prince Edward; on whefe acceffion to the throne he became a favcurite at court, was fworn of the privy council, and made king's almoner. In 1547 he was elected chancellor of Oxford ; in $854^{8}$ canon of Windfor; and the next year dean of Weftminter. About this time he was appointed one of the commiffoners to vilit the univerfity of Osford; in which office his zeal for reformation was fo exceffive, that he deftroyed a number of curious and valuable books, for no better reafon than becaufe they were written by Roman Ca tholics. On the acceffion of Queen Mary he was ftripped of all his preferments and committed to the Marthalfea. He was, however, foon releafed, and immediately left the kingdom. Having refided fome time at Straburg with his intimate friend Peter Martyr, on the death of Queen Mary he recurned to England, and, with othe: divines, was appointed to revife the liturgy. He often preached before the queen; and in 1559 was preferred to the fee of Ely, which he continued to enjoy upwards oc $2 t$ years. He was, how. ever, no favourite with the queen: the reafon affigned for which was, his zealous oppofition to her retaining the crucifix and wax-candles on the altar of the royal chapel; alfo his Itrenuous defence of the marriage of the clergy, which her majity always difapproved. He died on the $22 d$ or July 1581 , aged 81 . He was a man of confiderahle learning, a zealous and rigid bulwark of the church of England, and an implacable enemy bech to Papifts and Puritans. In a letter to Archbithop Patker, he atvifes him to proceed vigoruny in reclaiming or punifing twe Puritans, and not to be difoouraged at the frown of thofe court-favourites who protected them; affuring him that he mistht expect the bleffing of God on his pious labours to free the church from their dangerous attempts, and to eftablifh uniformity. - This zeaious reformer we find had not totally loft fight of the popith text, coundel them to come in: but a fronger proof of his implacability and felf-importance appears in his letter to the lord treafurer Burleigh, in which he wamly expolt lates with the conecil in interpofing in behalf of the Pisritanc, or meddling ia affairs of the church, admonif:ing them to keep theit own fphere. Such language from a bifhop wolld make a modern privy council ttare. Hisw:, sarc, 1, Two Latin Orations on the Difpute $\mathrm{N}^{5} 93$.
between Dr Trefham and Peter Martyr. Lond. 1549, 410. 2. Liturgy of the Church of England ; in compilin2, and afterwards correcting which, he was principally concerned. 3. 'The Lord's Payer in ver!e, commonly printed at the end of David's falme by Sternhold and Hopkins. 4. Tranflation of the four Golpels, the Acts of the Apoftles, and the Epistle to the Romans, in the new tranlation of the Bible in the reign of Queen Elizabeth. 5. R(foluti ns of fome Quettions concerning the Sacrament, in the Collection of Records at the end of Burnet's Hittory of the Reformation. 6. Several Lettes to the $Q$ ieen and others, publithed in Strype's Annals of the Reformation. He is alfo faid to have been concerned in the declaration concerning the divine inflitution of biflops, and to have affited Lilye in his Grammar.

COXWOLD, a town in the North-riding of Yorkfluire, $1+$ miles north of York. W. Long. 1. 10. N. Lat. 54. 16.

COYPEL (Anthony). an excellent French painter, born at Paris in 1661. Noel Coypel, his father, being chofen by M. Colbert to be director of the academy at Rome, he took his fon with him into Italy, where Anthony Coypel formed himfelf on the works of the grcateft mafters, and on his return to Frarce was made firft painter to the Duke of Orleans. That prince employed him in painting the grand gallery of the royal palace, and allowed him a penfion. In 1744, he was director of the Academy of Painting and Sculpture. In 1715 , he was made firit painter to the French king, and was ennobled on account of his merit. He died in 1722. M. Coypel, his fon, alfo excelled in the fame art.

COZENING; tricking, or defrauding.-In law, it denotes an offence where any thing is done deceitfully, whether belonging to contraets or not, which cannot be properly termed by any fpecial name.

COZUMEL, an inand near the weftern coak of Jncatan, where Cortez landed and refrefeed his troops before entering upon the conquert of Mexico. W. Long. 89. O. and N. Lat. 13. 0.

CRAB, in zuology. See Cancer.
$C_{\text {RAB's }}$ Clarus, in the materia medica, are the tips of the claw's of the common crab broken off at the verge of the black part, fo much of the extremity of the claws only being allowed to be ufed in medicine as is tinged with this colome. The blacknefs. however, is on!y fuperficial; they are of a greyifh white within, and when levigated furnif a tolerable white powder.

Crab's claws are of the number of the alkaline abCorbents, but they are fuperior to the generality of them in fome degree, as they are found on a chemical analytis to contain a volatile urinous falt

CRAB's Eyes, in phar acy, are a trong concretion in the head of rhe cray-filh. They are rounded on one fice, and depreffed and finuated on the other, confiderably heavy, moderately hard, and witheut fincll. We have them from Holland, Mufcovy, Poland, Dennark. Sweden, and many other places.

Crab's eyes are much uled both in the Mop-medicines and extemporaneous preferiptions, being accounted not only abforbent and drying, but alfo difcuffive and diaretic.

Cast-Lice, a troublefome kind of vermin, which ftick

## $C \quad \mathrm{~F} A$

Crab, Cracatou.

Nick fo fat with their claws to the Rin as to render it difficult to diflodge them. Boing riewed with a glafa they nearly refemble the foall crah-tim; whence they otained their popular name. They are alfo called phifule, mopiones, pothle, and follato: they ufually inf.tl the arm pits and puden.la. They will be quickly coltroyed, and drop off dead, upon the application of a rag wet with the milk of fublimate. This fort of vermin is reckoned to prognoticate fpeedy mortality to thofe whom they abandon without being remored be intdicine.

Crab, a fort of wooden pillar, whofe lower cml, being let down through a hlip's decks, refls upon a focket like the capltern: and having in its uppes end three or four holes, at different heights, through the middle of it, one above ancther, iato which loug bars are thruft, whofe length is ncarly equal to the breadth of the deck. It is apployed to wind in the cable, or to purchafe any other wighty mater which requires a great mechanical power. This difers from a capRern, as not being furnifhed with a dium-houk, and by having the hars io go entirtly through it, reaching from one fide of the deck to the other; whereas thote of the captern, which are fuperior in number, reach only about cight inches or a foot into the drum-head, according to the fize thereof. This machine is reprefented in Plate CXXYit. n 4 . Sec alfo Capstern.

CRAq-7ures, a name in Jamaica for a kind of uleer on the foles of the feet, with hard callous lips, fo hand that it is difficult to cut them. The aygt. cerul. fort. is their curs.

CRACATOA, the moft foutherly of a clufter of inands lying in the entrance of the ftraits of Sunda in the Ealt Indies. Its whole circumference does not exceed nine miles; and off its north-caftern extremity is a fmall ifland forming a rodd, in which Ceptain Cook anchored when vifiting this mand on his laft vegage. On the fouthern part of the fmall iland is a reef of rocks, within which is a tolerable fielter asaint all mortherly winds, there being 27 fathoms water in the mid channel, and 18 near the reef. Between the two intinds there is a narrow paffage for beats. The hore that conflitutes the welt fide of the road runs in a north-uctlerly direction, having a bank of coral running into the fea for a litule way, fo that it is difficult for boats to land except at t'e time of ligh water; tut the anchoring gromd is very good and fice from rocks. In the inland parts the goond is elevated, rifing on all fides gradually from the fea, and is entirely covened with wood, excepting a few fyots which are cleared by the inhabitar is fur fowing rice. The climate is reckened very healthy in comparifon with the neightorring cosuntrics, but is very thinly inhabited. There are abundance of taite on the coral reefs; but wher iefrethenents are farce, and fold at an exorbitant price. liater is not pleniful: Captain Cook was ohliged to fupply himfelf fiom a fmall fpring appolice to the fouthern extremity of the fmall ifand above mentioned. To the fou:' ward is a hot fpring, whofe waters are ufed as a bath by the inhabitan's. The road where the Refolution anchored liss in S. Lat. 8. 6. and by obfervation, in 105. 36. E. long. by the time keeper in $10.4 .4^{8}$. The variafion of the compafs one degree W. On ulie full and Vol. V. Pathll.
change days it is high water at feven oodock ia the Crackow. morning, and the tide rifes three feet two iaches perpendicular.

CRACKOH, a city of Tolamd, fituated in a palatinate of the fame manc, E. Long. 20. 16. N. La? 50. 8. It was formerly the capital of Poland, whete the kings were eleited and crowned, and was once atmoll the centre of the Polifl dominions, but is now a frontier town; a proof how much the power of thia republic has been contraited.

Crackow thands in an extonfive plain, watered by the Villula, which is broad but flatlow: the city and its fuburbs occupy a ratt track of ground, but are fo badly peoples, that they fearcely contain 16,000 inhabitants. The great fquare in the mildle of the town is very fpacions, and has feveral well.tuilt houfes, once richly furnifhed and well inhabited, but moot of them now cither untenanted or in a fate of melaincholy decay. Many of the fireets ale broad and handfome; hut almott every building bears the moft thriking marks of ruined grandeur: the churches alone feem to have proferved their original fplendor. The devaltation of this unfortunate town was begun by the Swedes at the commencement of the piefeat century, when it was befieged and taken by Charles XII. but the mifutiefs it fuffered from that ravager of the north were far lefs defructive than thofe it experienced during the late dreadful commotions, when it uadrwent repeated lieges, and was alternately in pofficon of the Ruflians and Confederates. The effeets of cannon, grape, and mulset thot, are hill difcenible on the walls and houfes. In a word, Crackow exhibitz the remains of ancient magnificuce, and lonks like a great caf ital in ruins: from the number of fallen and falling heores one would imagive it had lately been facked, and that the enemy had left it only yetterday. The down is furrounded with high walls of brick, ftrengthened by reund and fquare towers of whimfical fopes, in the ancient thyle of fortification: there walls were built by Venceflaus king of Bolemia during the fhort period in which he reigned over I'uland.

The univerfity of Crackow was formerly, and not uajutly, called the mother of Polifin literature, as it principally fupplied the other feminaries with profeffors and men of learning ; but its lufte has been greatly obfcured by the removal of the royal refidence to Warfaw, and lill more by the late iatefine convulfions. In this city the art of printing was firf introduet into Poland by Haller; and one of the cartiett books wis the Conflitutions and Statutes compiled by Cafmir the Great, and afterwards augmented by his fuceeffurs. The charakers are Cithic, the fune which were univerfally ufed at the invention of priming : the great initial letters are wanting, which hous that they were prubably painted and aftirvads worn away. The year in which this compilation was printed is not politively known; but iss publication was certainly anterior to 14,6 , as it does not contain the Hatutes palfed by John Albert in that year. The moll flowihing period of the univerfity was under Sigianond Angu!tus in the acth century, when feveral of the Gernan refurmers fled from the perfecutions of the emperor Charles V. and found an afylum in this city. 'They gave to the world feveral verfions of the facred wio

3s tinge,

Crackow. tings, and other theological publications, which diffufed the reformed religion over great part of Puland. The protection which Sigifnond Augufus afforded to men of learning of all denominations, and the univerial toleration which he extended to every fect of Chritians, created a fufpicion that he was feeretly inclined to the new church; and it was even reported that he intended to renounce the catholie faith, and publicly profefs the reformed religion.

Towards the fouthern part of the town, near the Viftula, rifes a fmall eminence or rock, upon the top of which is built the palace, furrounded with brick walls and old tovers, which form a kind of eitadel to the town. This palace owes its oriyin to Ladillaus Jaghellon; but little of the ancient Atructure now appears, as the greatelt part was demclithed by Charles X11. in 1702, when he entered this town in triumph after the battle of Chiffow. It has been fince repaired: the remains of the old palace confilt of a few apartments, which are left in their ancient tate as they exilted in the latt century. This palace was formerly the refidence of the kings of Poland, who, from the time of Ladifaus Lokrtec, have been erowned at Crackow. The Polifi and Gernaan hitlorians differ concerning the time when the title of king was firll elaimed by the fovereigns of this country ; but the molt probable aeconnt is, according to MrCoxe, that in 1295 Premiflaus affumed the regaltitle, and was inaug urated at Gnefna by the archbifhop of that diocefe. He was fucceeded by Ladiflans Loketec, who offending the Poles by his caprieious and ty rannical couduct, was depofed before he was crowned; and Venceflaus kine of Bohemia, who had married Richfa daughter of Prenifaus, being eleeted in his ftead, was in 1300 confecrated at Gnefina. Ladifaus, after flying from his comtry and undergoing a Feries of calanitous adventures, was at length brought to a fenfe of his mifconduet. Having regained the afiection of his fubjects, he was reftored, in the lifetime of Venceflaus, to part of his dominions; and he recovered them all upon the demife of that monareh in the year 1305; he governed, however, for fone ycars without the title of king; but at length in 1320 was crowned at Crackow, to which place he transferred the ceremony of the coronation; and afterwards cnacted, that for the finture his fuccefors fhould be inaugurated in the calhedral of this eity.

Since that period all the fovereigns have been conlecra-- ©d at Crackow, excepting the prefent king. Previous io his election a decree was iflued by the diet of convocation, that the coronation fhould be folemnized for this turn at Warfaw, without prejudiee in future to the ancient right of Crackow; a provifo calculated to fatisfy the populace, but which will not probably preyent any future fovcreign frem being crowned at Warfaw, now become the capital of Poland and the refidence of its kings. The diadem and other regaiia ufed at the eoronation are fill kept in the palace of Crackuw, under fo many keys, and with fuch care, that it was inpoffible to obtain a light of them.

Adjoining to the palace flands the cathedral, alio within the walls of the citadel. Here all the fovereigns, from the time of Ladifans Loketec, have been interred, a few only excepted, viz. Louis and Ladifbans III. viho were kings of Hungary as well as of Poland, and whole bodies were depolited in Hungary;

Alexander, who died and was buried at Vilna; Henry of Valois, interred in France; and the late monarch Augutus III. The fepulchres of the kings of Poland are not diftinguifhed by any peculiar magnificence: their figures are carved in marble of no extraordinary workmatifhip, and fome are without inferiptions.
'llhe bithop of Crackow is the firlt in the kinglom, duke of Saveria, and very often a cardinal, His revenues are larger than thofe of his metropolitan the archbifhop of Gnefna, and are computed to amount to 40,000 dollars for annum.

CRADLE, a well known machine in which infants are rocked to flecp.

It denotes alfo that part of the ftock of a crofs-bow wherc the bullet is put.
Cranle, in furgery, a cafe in which a broken leg is laid after heing fet.

Cradle, in engraving, is the name of an inftruments ufed in feraping mezzotiatos and preparing the plate. It is formed of fteel, refembling a chiffel with one floping fide, upon which are cut hollow lines very near each other, and at equal diftances. 'The acting part of this tool is made circular, and the corners are reunded. After being properly tempered, it mult be tharpened on the whetfone. There are various lizes of this inftrument.

Cradle, among flipwrights, a frame placed under the bottom of a fiip, in order to conduct her finoothly and fteadily into the water when fle is going to be launched; at which time it fupports her weight while flue flides down the defcent or lloping paifage called the cuays, which are for this purpofe daubed with foap and tallow. See Plate CL.

CRAFI', a general name for all forts of veffels eniployed to load or difelarge merchant flips, or to carry alonglide or return the ftores of men of war. Such are lighters, hoys, barges, prames, \&c. Sce thofe articles.

CRAKE, or Corn-crake. See Rallus.
CRAIL, or Careil, a parliament town of Seotland, fitnated on the fea-coalt of the cosnty of life, about feven miles fouth-eaft of St Andrew's. W. Long. 2.20. and N. Lat. 56. 17.

CRAMBE, Sea-cabbage, Sea-beach Kale, or Sea-colewort, in botany: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquofa. The four longer filaments are forked at top, with an anthera only on one point of eaeh; the fruit a dry, globofe, and deciduous berry. There are three fpecies, all of them herbaceous efenlents with perennial roots, producing annually large leaves refembling thofe of cabbage freading on the ground, with flrong flower-ftalks and yellowifh flowers. Only one of the feecies is a native of Britain. It grows wild on the fhores of many of the maritime counties of England, but is cultivated in many gardens as a choice efenlent; and the young robuft fhoots of its leaves and flowrr-ftalks, as they iffue forth from the earth after the manner of alparagus !hoots, are then in the greateft perfection for ufe. At this period they appear white as if blanched, and when boiled eat exceeding fweet and tender. Its principal feafon for ufe is in April and May. This plant may alfo be employed in the pleafure-ground as a flowering perennial, for the

C:aneria falks divide into fine branchy heads of fowers. It is in autumn or furing, where the plants are to remain,
which, when two years old, will produce fhoots fit for ufe, will multiply exceedingly by the roots, and continue for many years.
CRAMERLA, in botany, a genus of the monogynia order, belonging to the tetrandria clafs of plants. There is no calyx ; the corolla has four petals; the fuperior nectary is trifid, the inferior biphyllous; the fruit is a dry, monofpermous, and echinated berry.

CRAMOND, Over and Nether, two villages about four miles weft of Edinburgh ; of which ouly the laft deferves notice, as having been once a famous naval fation of the Romans. It is fituated at the mflux of the river Almon into the Furth. Three Roman roads meet at this place, which wals called by them Alaterva, and whither they brought their grain for the fupport of their troops. The village contains about 300 inhabitants. Here are the remains of a bath and fudatory; and many altars, medals, se. have been dug up.
CRAMP, a kind of numbnefs or convulfion, oceafioned by a thick vifcid vapour entering the membranes of the mufcles, which contracts or extend the neck, arms, legs, \&e. with a violent but tranfitory pain; being ufually driven off with friction alone. The word comes from the German krampfe, which fignifics the fane.

A glafs of tar water, to be drank night and morning, has been recommended; and a rod of brimftone, when held in the hand, has given prefent relief.

Cramp-Fik, or Torpecto. See Raja.
$\epsilon_{\text {R. M M }}$. Iron, or Cramps, a piece of iron bent at each end, which ferves to falten together pieces of wood, Rones, or other things.

CRAMPONEE, in heraldy, an epithet given to a crefs which has at each end a eramp or fquare piece coming from it; that from the arm in chief towards the finiter angle, that from the arn on that fide downwards, that from the arm in bafe towards the dexter fide, and that from the dexter arm upwards.

CRANAGE, the liberty of ufing a crane at a wharf, and alfo the moncy paid for drawing up wares out of a fhip, \&c. with a crane.

CRANE, in ormilhology. See Ardea.
Crane, in mechanics, a machine ufed in building for raifing large flones and other weights. See Mechanics.
Crank"s Bill, in botany. Sec Geravium. Cranf-Fby, in zoology, a fpecies of Tipula.
CRANGANOR, a Dutch factory on the Malabar coalt in the Eaft Indics, feated in E. Long. 75.5. N. Lat. ro. o. See Cochin.

CRANIOLARIA, in botany: A genus of the angiofpermia order, bclonging to the didynamia clafs of plants; and in the natural method ranking under the 40th order, Porfonate. The calyx of the flower is double, the under one tetraplyllows, the upper one a monophyllous fpatha; the tube of the corolla very long; the capfule almott the fame with that of the marlyman; which fee. There are two fpecies, both natives of hut climates, and neither of then pofiffed of any remarkable property.

CRANIUM, in anatomy, an affemblage of feveral bones which cover and cocluie the brain and ecrebci-
lum, popularly called the foull. See Aratomy, Crank $\mathrm{n}^{\circ}$ 11. The word comes from the Greek rawn, of "I xpaves, galea, "hetmet ;" heeaufe it ferves to defend Cranmer. the brain like a luad-piece. Pcarom, again, derives xpex.ov from the Celtic cron, becanfe of its ronednefo.

CRANK, a contrivance in machine:, in maner of an elbow, only of a fquare form, prujecting out from an axis or fpindle; and ferving, by its rotation, to raife and fall the pifons of curgines for raifing water or the like.

Crank, in fea-language. A thip is fuid to be crank. ficke, when, for want of a fufficient quantity of ballata or cargo, fle camot bear her fails, or cant bear bur furall lail, for fear of overfetting. - She is faid to he cromé ly the ground, when her fhoor is fon narruw that the cannot be brought on ground without danger.

Crank is alfo an iron brace which fupports the lano thom un the poop-quarters, \&e.

CRANMER (Thumas), a eckerated archbihop, reformer, and martyr, was the fon of Thomas Cranmer, Efq; of Aflacton in Nottinghamflire, whicre our author was born in 1489. At the age of 14, he was admitted a Itudent of Jefus' College, Cambiidge, of which he afterwards beeame fellow ; but marrying the tclation of an im-keeper's wife, he loft his fellowhip and quitted the college. On the death of his wite he was re-admitted fellow of Jefus' College. In 1523 he took the degree of doctor of divinity, and was made theological lecturer and examiner. The plagnie being at Cambridge, he retired to the houfe of a relation ar Waltham Abbey, where, mecting with Fox the king? almoner, and Gardiner the fecretary, he gave his opinion concerning King Henry's marriage with Catharine much to the fatisfaction of his majelty. This opinion was, that intead of difputing about the validity of the King's marriage with Catharine, they fhould reduce the matter to this fimple quellion, "Whether a man may marry his brother's wife or no?" When the king was told of it, he faid, "This fellow has got the sight fow by the ear." He then fent for him to court, made him one of his chaplains, and ordered him to write in vindieation of the divorce in agitation. This book having quicted the tender eonfcience of the King, be was delirous that all Europe Thould be convinced of the illegality of his marriage with Queen Catharine; and for that purpofe fent Cranmer to France, Italy, and Gernany, to difpute the matter with the divines of thofe countries. At Nurembere Cranmer married a fecond wife. Being returned to England, in March 533 he was confecrited arehbilhop of Canterbury; in May following he pronounced the tentence of divorse between the king and Queen; and foon after manied the amorous monarch 1, Ama Boleyn. Buing now at the head of the church, he exerted himfelf in the bulinfo of the Reformation. 'llue Bible was tranlated into Eughth, and momatuics diffued principally by lis mears.

In 153 , the royal confeience again required the affillance of our archbithop: in this year he divorct the King from Am Bulcyn. In 153; he vifted his diocefe, and condeavourcel to abolifh the lupuritious of fervation of holidays 1 In 1539 he and fonce of the bifhops feth unier the King's difpleafure, becaufe they could mot be brought to give their confent in paliament that the monalterics flould be fupprefed for the King's fole

Cranmer. nle. He alfo fremuounly oppofed the act for the fix articles in the houfe of lords, fpeaking three days againg it ; and upon the paffing of that itatute font away his wife into Germany. In 1540 he was one of the commiflioners for infpecting into matters of religion, and explaining fome of its chicf ductrines. The refalt of their commifion was the book intithed $A$ neceflary Erudition of any Cluitian Man. After Loud Cromell's death (in whole behalf he had writen to the King), he retired and lived in great privacy, meddling not at all with tate afiairs. In $15+1$ he gave orders, purfuant to the King's oirectons, for taking away fuperltitious thrines; and, exchanging Bithoplbourn for feke foourn, united the latior to his divecefe. In $15+2$ he procured the "Act for the admanement of true religion and the abolifhment of the contrary;" which moderated the rigour of the dix articles. But the year following, fone enemies preferring aucufations againt him, he had like to have been ruined, had not the King interpofed in his behalf. His majeity continued aftervards to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdum. In $154^{6}$ he crowned young Fdward, during whofe nourt reign he nromoted the reformation to the unmot of his power; and was particularly inftrumental in compofing, correcting, and eftablining the liturgy by act of parhament. He had alfo a thare in compiling the thirty-nine articles of religion.

In 1553 he oppofed the new fettlement of the crown upon Lady Jane Gray, and would no way be concernin that affair (though at lalt, through many importunities, he was prevalled upon to fet his hand to it); neither would he join in any of Dudley's ambitious projects. Upon Queen Mary's acceflion to the throne, he was committed to the Tower; partly for fetting his hand to the inftrument of Lady Jane's fucceffion, and partly for the public offer he had made a little before of juftifying openly the religious proceedings of the late king. Some of his friends, forefeeng the ftorm that was likely to fall upon him, advifed him to fly, but he abfolutely refufed. In the enfuing parliament, on November the 3d, he was attainted, and ar Guildhall found guilty of high treafon; wherenpon the fruits of his archbifhopric were fequeltered. In Aprili 554, he and Ridley and Latimer were removed to Oxford, in order for a public difputation with the Papilts; which was accordingly held there towards the middle of the month, with great noife, triumph, and impudent conhdence on the Papifts fide, and with as much gravity, learning, modefty, and convincing fufficiency on the fide of the Proteftant bifhops. The 2oth of A pril, two days after the end of thefe difputations, Cranmer and the two others were brought before the commiffioners, and afked, Whet her they would fubferibe (to Popery) ? which they unanimounly refufing, were condemned as heretics. From this fentence the Archbifhop appealed to the juft judgment of the Almighty; and wrote to the council, giving them an account of the difputation, and defiring the Queen's pardon for his treafon, which it feems was not yet remitted. By the convocation which met this year, his lofence of the true and catholic Doctrine of the Sacrament of the Body and Blood of our Saviour Chrift was ordered to be burnt. Some of his frieds pctitioned the Queen in his behalf;
putting her in mind how he had once preferved her in her father's time by his earneft intercetlions with him for her, fo that the had reafon to believe he loved her, and would fpeak the truth to ler mose than all the reft of the clergy. All endeavours in his tehalf, however, were imeffectual ; and the Archbifhop beingr degraded and molt ignominioul! treated, was at lait nlattered and terrilied into an intincere recantation and renunciation of the Pateltarit taith. But this tramph was not fuficient to gratify the pious vengeance of the Romith Mary. On the 2 gth of F<b. 1556 , a writ was figned for the buming of Clammer; and on the 2 ith March, which was the fatal day, he was brought to St Mary's church, Cambridge, ank placed on a kind of dage over argaint the pulpit, where $\mathrm{D}_{1}$. Cole plovolt of Eton was appointed io preach a fermon on the ocerion. While Cole was ha anguing, the unfortumate Cranmer expreffed great inward confulion ; often lifting up his houds and cyes to heaven, and frequently pouring out doods of tears. At the end of the fermon, when Cole detired him to make an open profetion of his fath, as he had promifed him he would, he firlt prayed in the moft fievent maner; then made an exhortation to the people prefent, not to fet their minds upon the word, to ubey the King and Queen, to love each other, and to be charitable. Af. ter this he made a confellon of his faith, begimming with the creed, and concluding with thefe words: "And I believe every word and fentence taught by our Saviour Jefus Chrift, his apoflles, and prophets, in the Old and New Teltament. - And now (added he) I come to the great thing that fo much troubleth my confcience mure than any thing I ever did or faid in my whole life; and that is the fetting abroad a writing contrary to the truth, which I here now renunce as things written with my hand contrary to the truth which I thought in my heant; and wirten for fear of death, and to fave my life if it might be: that 1 s , alt fuch bills and papers which I have written or figned with my hand lince my degradation, wherein I have written many things untue. And forafmuch as my hand offended, writing contrary to my heart, my hand hall firft be punifhed; for, may I come to the fire, it Mall be lirit bumed. As for the pope, I refufe him, as Chrift's enemy and antichrilt, with all his falfe doctrine. And as for the facrament, $l$ believe as I have taught in my book againt the Bihop of Winchetter." Thunderftrack as it were with this unexpected declaration, the enraged Popilh crowd admonithed him not to dif. femble. "Ah! (replied he with tears), fince I lived bitherto, I liave been a hater of falfehood and a lover of fimplicity, and never before this time have I diflembled." Whereupon they pulied him off the ftare with the utmoft fury, and hurried him to the place of his martyrdom over againf Baliol College; where he put off his clothes in halte, and ftanding in his fhirt, and without shoes, was fattened with a chain to the gake. Some freffing him to agree to his former recantation, he anfwered, foowin! his hand, "This is the hand that wrute it, and therefore it thall firtt futter pumithment." Fire being applied to him, he liretched out his rint hand into the fame, and held it there umnoved (except that once with it he wiped his face) till it was confumed; crine with a loud voice," This hand hath offended;" ind often repeating, " This unwor-

## C R A [ 509 ] C R A

"ranner. thy right laand." At latt, the fire getting up, he foon expired, never fitrring or crying out all the while; only keeping his eyes fixed to heaven, and repeating more than once, "Lord Jefus receive my firit." Such was the end of the renowned 'Thomas Cranmer, in the 6 , th year of his are.

It was noticed above, that after the paffing of the act for the fix articles, Archbinhop Cianner fent his wife into Cermany. But the afterwards returned again to England: and Mr Strype infurns us, that "in the time of King Edward, when the marriage of the clergy was allowed, he brought her forth, and lived openly with her." Mr Gilpin fays, 'he left bethind him a widow and childeea: but as he always kept his family in obfourity for prodential reafons, we know little aront them. They had loen kindly provided for by Henry Vfll ; who, withont any follicitation from the Primate himfolf, gave him a conididerable grant from die Abbey of Walbeck in Nortinglamilhire, which his fanity enoyed after !his deccafe. King Elward made forme aldition to his prisate fortune; and lis heirs were rettored in blond by an act of parliament in the reign of Elizabeth."

Archbithop Crammer wrote a great number of books: many of them he publihed himfelf; and many of them fill remain in MSS. viz. two folio volumes in the king's library, feveral letters in the Cutton collection, \&c.

Mr Cilpin remarks, That "the charakter of the A rchbihop hath been equally the fubject of exargerated praife and of undeferved cenfure. The moft indefenfible parts of the Archbifiop's character are the readinefs with which he fometimes concurred in the unjultifiable proceedings of Henry VIII. and the intances wherein he fhowed himfelf to be actuated by intolerant priaciples.
"He firlt recommended himfelf to Henry by the zeal which he difplayed in promoting the King's divorce from Queen Catharine. As to this, it may be allowed, that Dr Crammer might think the marriage wrong: but though it polibly might be a point of confcience with the King, it culd however be nene with him ; and there was manifeftly a difference between advifing not to do a thing, and advifing to undo it when atready done, at lealt in a matter of fo difputable a mature. On the other hand, to repudiate a woman with whon the Kiug liad cotabited near 20 years as his wife, and to illegitimate a daugher, bred up in the hifleft expectations, and now marriageable, were acts of fuch cruelty, that it feems to indicate a want of fecling to be in any degree acceffery to them. To this thay be added, that the notoricty of the King's paffion for Ann Boleyn, which all men believed to be, if nut the firt mover, at leait the principal fpring of his preteniled fereples, threw a wery indelicate inputation on all who had any concern in the affair. No ferious churchman, one would imagine, could be fond of the idea of adminitering to the King's pafions. It is with concern, therefure, that we fee a man of Dr Cranmer's integrity and limplicity of manners acting fo much out of character as to compound an afair of this kind, if not with his confcience, at leaf with all deicacy of fentiment ; and to parade through Europe, i: the quality of an ambafladnr, defending every where the King's jous intertions. Fut the caule (continues

Mr Gilpin) animated him. With the illegality of the Cramm.... King's marriage, he endcavoured virtually to eltablifh the infufficiency of the pope's difpenfation; and the latter was an argument fo acar his heart, that it feems to have added merit to the former. We cannot indeed account for his embarking for zealouly in this butinefs without fuppofing his principal inotive was to free his country from the tyranny of Rome, to which this ltep very evidently led. So defirable an end would in fome degree, he might imagine, fanctify the means."

Of two of the inflances of perfecution in which Archbihop Cranmer was concerned, Mr Gilpin gives the following account. "Joan Bocher and George $\mathrm{p}_{\text {ath }}$ is were acculed, though at different times; one for denying the humanity of Chrit, the other for denying his divinity. They were both tried and condemned th the thake: and the Archbithop not only confented to thefe acts of blood, but even perfualed the averfion of the young King into a compliance. "Your majefty mul ditingain (faid he, informing his royal pupil's confcience) between common opinions and fuch as are the efferitial artieles of faith. Thefe latter we mult on no accornt fuffer to be oppofed." Mr Gilpin jultly obferves, that "norling even plaufible can be fuggeited in defence of the Archbiflop on this occafion, except only that the firitit of Popery was not get wholly repreffed." Thefe inftances of injultice and barbarity were indeed tutally indefenfible, and a great difgrace to Cranmer and to all who were concerned in them. It does not appear that he endeavoured to promote the death of Lambert; but, as Mr Gilpin obferves, it were to be wifhed he had rid his hands of the difputation likewife. 'The public difputation, in which Cranmer bore fome part, proved the means of bringing Lambert to the itake.
One of the melt honourable tranfactions of Arch. bifhop Cranmer's life, was the firm fland that he made againtt the act of the fix articles. This act was fo ftrongly fupported by the King, that even the Proteltants in parliament made little oppofition to it. But Cranmer oppofed it with great zcal and fleadinefs. " The good Archbinop (fays Mr Gilpin) never appeared in a more truly Clrititian light than on this occafion. In the midat of fo general a defection (for there were numbers in the houfe who had hitherto thown great forwardnef in reformation 'he alone made a fland. Three days he maintained lis ground, and bafled the arguments of all oppofers. But argument was not their weapon, and the Archbihop faw himfelf obliged to fink under fuperior power. Heary ordered him to leave the houfe. The Primate refufed: ' It was God's bufinefs (he faid), and not inan's.' And when he could do no more, he boldly entered his proteft. Such an inftance of fortitude is fufficient to wipe off many of thofe courtly Itains which have faltued on his memory."
Fis behaviour in the cafe of the Duke of Norfolk was alfo intitled to great commendation. "The latt act of this reign (fays Mr Gilpin) was an act of bood, and gave the Archbihop a noble opportunity of fowwing how well he had learned that grat Chrittian leffon of forgiving an enemy. Almoft without the fradow of jultice, Henry had given directions to have the Duke of Norfolk attainted by an act of parliancut. 'The Fing's mandate flood in lien of guilt, and the bill

## C R A [ 5 ro ] G R A

Conmer. Bihop of Winchefler, had been fo great an enemy to the Archbihop as the Duke of Norfolk. He had always thwarted the Primate's meafures, and oftener than once had practifed againt his life. How many would have feen with fecret pleafure the workings of Providence againlt fo rancorous an enemy; fatisfied in having themfelves no hand in his unjut fate! But the Archbihop faw the affair in another light: he faw it with horror; and although the King had in a particular manner interefted himfelf in this bufinefs, the Primate oppofed the bill with all his might; and when his oppofition was vain, he left the houfe with indignation, and retired to Croydon."

He was indeed remarkable for the placability of his temper, and for fhowing kindnefs to thole by whom he had bzen greatly injured. Hence it is mentioned in Shakefpeare's Henry VIII, as a common faying concerning him:

## "Domy Lood of Canterhury <br> But ore fiewd urn, and he's yu'r friend far ever."

Archbihop Cranmer was a great friend and patron of learsed foreigners who had been perfecuted for their attachment to the principles of the Reformation. Mr Gilpin fays, "the fuffering profefiors of Proteftantifm, who were fcattered in great numbers about the various countries of Europe, were always fure of an afylum with him. His palace at Lambeth might be called a feminary of learned men; the greater part of whom perfecution had driven from home. Here, among other celebrated reformers, Martyr, Bucer, Alefs, Phage, found fanctuary. Martyr, Bucer, and Phage, were liberally penfioned by the Archbihop till he could otherwife provide for them. It was his wifh to fix them in the two univerlities, where he hoped their great knowledge and firit of inquiry would furward his defigns of reftoring learning; and lie at length obtained profefforfhips for them all. Fucer and Plage were fettled at Cambridge; where they only fhowed what might have been expected from them, both dying within a few months after their arrival. But at Oxfurd Martyr acted a very confpicuous part, and contributed to introduce among the Itudems there a very liberal mode of thinking.

Of the learaing of Archbihop Cranmer, Mr Gilpin remarks, that "it was chiefly confined to his profeffron. He had applied himfelf in Cambridge to the fludy of the Gieek and Hebrew languages; which, though eftermed at that time as the nark of herefy, appeared to him the only fources of attaining a critical knowledge of the Scriptures. He had fo accurately ftudied canon law, that he was efteemed the belt canonit in England; and his reading in theology was fo extenlive, and his collections from the Fathers fo very voluminous, that there were few points in which he was not accurately informed, and in which he could not give the opinions of the feveral ages of the church from the tinres of the Aputtles. He was a fenlibie writer, rather nervous than elegant. His writings were eutively contined to the great controverfy which then fubfited, and contain the whole fum of the theological tanning of thofe times. His library was filled with a very noble collection of books, and was open to atl men of letters.
Mr Gilpin, after remarking that Arclbihop Cran-
mer preached often wherever he vifited, fays, "In his Cranmer. fermons to the people he was very plain aud intruc. tive; inalting chicfly on the effentials of Chriftianity. The fubjects of his fermons, for the molt part, were from whence falvation is to be fetched, and on whom the confidence of man ought to lean. They infifted much on ductrines of faith and works; and tanght what the fruits of faith were, and what place was to be given to works; they infructed men in the duties they owed their neighbuur, and that every one was our neighbour to whom we might any way do good; they declared what men ought to think of themfelves after they had done all; and, lafly, what promifes Chrit hath made, and who they are to whom he will make them grood. Thus he brought in the true preaching of the Gufpel, altogether different from the ordinary way of preaching in thofe days; which was to treat concerning faints, to tell legendary tales of them, and to report iniracles wrought for the confirmation of tranfubltantiation and other Popilh corruptions. And fucl a heat of conviction accompanied his fermons, that the people departed from them with minds poffeffed of a great hatred of vice, and burning with a defire of virtut."

He was a great economit of his time. Mr Gilpin fays, "he rofe commonly at live o'clock, and continued in his ftady till nine. Thefe early hours, he would fay, were the only hours he could call his own. After brcakfat he generally fpent the remainder of the morning either in public or private bufmefs. His chapel-hour was eleven, and his dimner-hour twelve. After dinner he fpent an hour either in converfation with his friends, in playing at chefs, or in, what he liked better, overlooking a chefs-board. He then retired again to his fludy till his chapel-bell rang at five. After prayers, he gencrally walked till fix, which was in thofe times the hour of fupper. His evening meal was facing. Often he ate nothing; and when that was the cafe, it was his ufual cultom, as he fat down to table, to draw on a pair of gloves; which was as much as to fay, that his hands had nothing to do. After fupper, he fpent an hour in walking and another in his Itudy, retiring to his bedchamber about nine. This was his ufual mode of living when he was moll vacant, but very often his afternoons as well as his mornings were engaged in bufinefs. He generally, however, contrived, if poffible, even in the baielt day, tuderotefome proportion of his time to hio books befides the morning. And Mr Fox tells us, he always accuItomed himfelf to read and write in a ttanding polture; ettceming confant fitting very pernicious to a fludious man."

Mr. Gilpin alfo obferves, "that he was a very amiable matter in his family, and admirably preterved the dificult nuediam between indulgence and reltraint. He hati, according to the cuftom of the times, a very numetuns retinue, among whom the morl exact order was obferved. Every week the theward of his houfehold held a kind of court in the great hall of his palace; in which all family affairs were fettled, fervants wages were paid, complaints were heard, and faults examined. Delinquents were publicly robuked, and after the third admonition dificharged. His hofpitality and charities were great and noble; equal to his ftation, greater often than his abilities. A plenti-

Cranny ful table was among the virtues of thofe days. His was always bountifully covered. In an upper room was fpread his own, where lie feldom wanted company of the firt diflinction. Here a great many learned foreigners were daily entertained, and partook of his bounty. In his great hall a long table was plentifully covered every day for guells and Atrangers of a lower rank; at the upper end of which were threc fmaller tables, defigned for his own officers and inferior gentlemen. Among other inflances of the Archbifhop's charity, we have one recorded which was truly noble. After the deftruction of monafteries, and before hofpitals were erected, the nation faw no fpecies of greater mifery than that of wounded and difbanded foldiers. For the ufe of fuch miferable objects as were landed on the fouthern coalts of the ifland, the Archbifhop fitted up his manor-houfe of Beckefburn in Kent. He formed it indeed into a complete hofpital ; appointing a plyyfician, a furgeon, nurfes, and every thing proper, as well for food as phylic. Nor did his charity thop herc. Each man, on his racovery, was furnifhed with money to carry him home, in propurtion to the ditance of his abode."

To conclude with the character given by Mr Hume: "Archbifhop Crammer was undoubtedly a man of merit ; poffeffed of learning and capacity ; and adorned with candour, lincerity, and beneficence, and all thofe virtues which were fitted to render him ufeful and amiable in fociety. Ihis moral qualities procured him univerfal refpect; and the courage of his martyrdom, though he fell fhost of the rigid inflexibility obferved in many, made him the hero of the Proteltant party."
CRANNY, in glafs-making, an iron inftrument wherewith the necls of glaffes are formed.

CRANTARA, among the ancient Britons, was a fort of military tignal ufed for collecking the ditant and feattered warriors to the flandard of their chicf. A prince having immediate occafion for the alfiltance of his followers to 1 epel fome fudden invalion or engrage in fome expedition, bofides ftriking the fhicld and founding the horn to give warning to thofe who were within hearing, he fent the crantara, or a llick bumt at the cond and dipped in the blood of a goat, by a fwift meflenger, to the nearef lamet, where he deli vered it without faying one word but the name of the place of rendecvous. This crantara, which was well underfood to denounce deitruction by fire and fword to all who did not obey this fummons, was carried with great rapidity from village to village ; and the prince in a little time found himfelf furrounded by all his warriors ready to obey his commands.

CRANTOR, a Greck plitofopher and poet, wats born at Solos in Ciiicia. He Ifft his native country where he was admired; went to Athens, and there ftudied with Polemon under Venocrates. He was confidered as one of the chief fupporters of the Platonic feet; and was the firft who wrote commentaries upon Plato's works. He flourifhed 270 years before Chrit.

CRAPE, a light tranfparent Ruff, in manner of gauze; made of raw lik gummed and twifled on the mill; woven without croffing, and much ufed in mourning.

Crapes are either craped, i. e. crifped, or fmooth; the firt double, exprefing a clofre mourning; the
latter fingle, ufed for that lefs deep. Note, White is referved for young people, or thote devoted to virginity. The filk cictinca for the firt is more twitted

Cramila, than that for the fecond; it being the greater or lefs degree of twiting, elpecially of the warp, which produces the crifping given it when taken out of the loom, feeped in clear water, and nobed with a picce of wax for the pupafe.

Crapes are all dyed raw. The invention of this Atuff came originally from Bologna: but the chief manufacture of it is faid to be at Lyons.

Hillory tells us, that St Bathilda, queen of France, made tine crape (crepa) of gold and fiver, to lay over the body of St Eloy. The Bollandifts own they cannot lind what this crepa was. Binet fays, it was a frame to cover the body of the faint: but others, with reafon, take it to be a tranfparent Ituff, through which the body might be feen; and that this was the crepa whence our word crape was formed.

CRAPULA, among phylicians; a term for SURFlit.

CRASHAW (Richard), who was in liis lifetime honoured with the friendfhip of Cowley, and fince his death by the praife of Mr Pope, who condefeended both to read lis poems and to borrow from them; was the fon of William Crathaw, an eminent divine, and educated at the Charter-houfe near London. He was then fent to Pembroke hall in Cambridge, and was afterwards of Peter-houfe, where he was fellow; in both which colleges he was dillinguilhed for his Latin and Englith poctry. Afterwards he was ejected from his fellowfhip, together with many others, for denying the covenant in the time of the rebellion; and he changed his religion, being by catholic artifices perverted to the church of Rome; not converted, but rather, as Pope fays, outivitted. He went to Paris, in hopes of recommending himfelf to fome preferment there ; but being a mere fcholar, was incapable of exccuting the new plan he had formad. There he fell into great diltrefs, which Cowley the poet hearing of in $16+6$, very kindly fought him out, gave him all the affiftance he could, and at latt got him recommended to Henrietta Maria queen of England, then refiding at Paris. Obtaining from her letters of recommandation, he travelled into Italy; and by virtue of thofe: letters became fecretary to a cardinal at Rome, and at laft one of the canors or chaplains of the rich church of our lady at Loretto, Come miles diftance from thence, where he dicd and was burici aloout 1650. Before he left England he wrote certain poems, entited, Slets to the Temple; "becaufe (fuys Wood) he led his life in the temple of God, in St Mary's church near to his college. 'There, as we learn from the preface to thefe poems, he lodged under T'ertullian's roof of angels. There he made his nefl more gladly than David's fivallow near the houfe of God; where, like a primitive faint, he offered more prayers in the night than others ufually offer in the day. There he peniaed the faid poems called Steps to the Fempic for batepy Scals to climb to Ildeven bj'. 'To the faid Steps are joined other poems called The Dedistots of the Mafes, wherein are feveral Latin poems; which, though of a mere haman misture, yet they are fweet as they are imocent. He hath alfo written Carmem Dio noflro, heing hymns and other facred poems, adheffed to the come tels of Denbigh. He was excellent in five langragres Lutides

## 

Crutis betaces his mother tungue, namely, Hebrew, Greek, Latin, Italian, and Spanih.

CRASİ (from xpayour, to mix), the temper of the bluod peculiar to every conflutiona.

Crasis, in grammar, is a figure whereby two difierent letters are either contracted into one long letter or a diphthong. Such, e.g. is onis for pazs; annin $f$ or
 tracted into $;$; and $\propto$ into $n$; and and o intor.

CRASSAMENTUM, in phyfic, the theick red or fibsous pat of the bloorl, otherwife cailed cruor, in contraditinetion to the ferum or aqueaus part.

CRASSULA, lesser orpive, or hapeiver: A genus of the pentagymia order, belonging to the pentandria clafs of plants; and in the matural method ranking under the $13^{\text {th }}$ order, Suculcatio. 'The calyx is pentaphyllons; the petals five, with five nectariferons fades at the bafe of the germen, and five capfules. I'heir are $1_{7}$ (pecies, all of them natives of warm chimates. Several of them are cultivated in this country, but require the affifance of artiicial heat for their prefervation. They rife fiom one foot to fix or eight in height, and are ornamented with oblong, thick, fucculent leaves, and fumblemared pentapetalous fowers of a fearlet, white, or grecnifh colour. They are propagated by off-fets or cuttings; and mult be potted in light fandy compor, retained in a funuy part of the green-houfe adl winter, and wery faningly watered. Tn fummer they may be placed in the fall air in a flueltered place, and in dry weather watered twice aweck.

CRSSSLS (M. Licinius), a celdbated Roman, fumamed Rich on account of his opulence. At firt he was very ciremacribed in his eircumfances, but by efucating tlaves and felling them at a high price be foon entithed himfelf. The cructies of Cima veliged him to leave Rome, and he retired to Spain, where he remained concealed for 3 monchs. After Cinna's death hee pafed into Afriea, and thence to Ital\}, where he forred Sylla and ingratiated himfelf in his favour. When the Gladiators with Spartacus at their head had ipread an umiverfal alam in Italy and defeated fome of the Ruman generals, Craffus was fent againit them. is battle was fought, in which Craflus faughtered 12,200 of the Alaves, and by this decifive bluw foon put an end to the wa:, and was honomed with an oustio at his return. He was foon after made conful with 'unpes in the year of Rome 682 , and in tisis hish office he difplayed his opndace by entemaining the popalace at 10,000 tables. He was afterwards Cenfor, and fommed the firt thinmsirate with Pompey and Cxfar. As his love of riches was more predominant than that of gloy, Craffus never imitated the ambitions conduct of his colleagues, but was fatisficd with the province of Syria, which feemed to promife an incxhatible fource of weath. With hopes of enlarging his poffeffona he fit off from Rome, though the umens prowed unfawnobic, and ewory thing feemcd to threaten his ruin. Fle crofied the Euphrates, and forgetful of the rich cities of Babylon and Selencia, he hatkened to make himidf mater of Parthia. He was betrayed in his march by the delay of Artavaldes, king of Armenia, and the perfidy of Ariamnes. life was met in a large plain by Surena the general of the forces of Orodesking of Partlia, and a battle was $\mathrm{N} 23^{\circ}$
fought in which 20,000 Romans were killd and Cratagus xo,000 taken prifuners. 'The darknefs of the night favoured the (feape of the rett; and Cralfus, furced by the mutiny and turbulence of his foldiers, and the treachery of his guides, trufted himfelf to the general of the enemy on pretence of propofing terms of accommodation, and he was killed. His head was cut off and fent to Oroder, who poured inelted guld down his throat, and infulted his misfortunes. 'Though he has been called avaricious, yet he thowed hinfelf always ready of lending money to his friends without intereft. He was fond of plilofophy, and his knowledge of hilory wos rreat and extenfive.

CRATIEGUS, wild-sertice tree, hawthorn, \&c.: A gemus of the digynia order, belonging to the icofandria clafs of plants; and in the natnal method ranking under the 36 th order, Pomate es. 'I'he calys is quinquefid; the petals five; the bersy inferior, difpermots. There are ten \{pecies, all of the tree and thrub kind, hardy and deciduous. 'Ilofe mott valuable for economical and ornamental parpofes in gardening are the following.

1. The oxjeanthus, hawthorn, or white-thorn, grows naturally all over Europe. In the llate in which we are uied to obferve it, it is nothing better than a tall, uncouth, irregular harub; but trained up as a ftandard, it fiwells to a large timber fize, with a tall Aem and a full fpreading head. The fandard hawthorn, whether we vietv its flowers in the fpring, its foliage in the fummer, or its fruit in the autumn and winter, is one of the moth omamental plants, flanding lingly, that can be fcattered over a park or lawn. Its uies will be explained under the article Hedges.

In order to propagate a quantity of quick, one method is generally practifed; namely, foll buyins the hatw, and taking them up to fow the October folluw. ing; though, fays Hanbury, there is another way more preferable; namdy, to prepare the beds, and fow the haws foon after they are gatherd. Whoever purfues the former method, hating gathered what guantity of haws will anfwer his purpofe, flould in tome bje-corner of the hitchen-garden or nurfery dig an hole or pit capacions enough to receive them; fome of the earth which came out of the hole, alter the haws are fut in it, fhond be laid nuon them; and being thes carcfully covered down, they may remain there till October. Then, having groind well dug, and cleared of the roots of all troublefome weeds, and the mould being hit for working, the beds hould be made for the haws. Four foct is a very grood width for thele beds, as they may be eafly reached over to be weeded; and if the alleys between be each one foot and a half wide, they will be of a good fize. The beds being manked out with a line, fulicient mould mult be raked out to cover the haws an inch and an half deep. 'This being done, and the bottom of the beds being made level and even, the havs fhould be fown, and afterwards gently tapped down with the back of the fpade: and then the fine mould, which had been raked out of the Leds, mut be thrown over them, covering them an inch and a half deep. In the fpring the plants will come up, and in the fummer following fhould be kept clear of weeds; though it does fometimes happen, that few of them wilh appear till the fecond foriug ifter fowing. Sumetimes the

ia base buncles in May, and the tree in on mod a Ceseme. bearer that it will ofon almar covered wheh them. 'lheir colome at their folt anpearatce is a deliont: white: They afocrwads dic to a frime pol chan, and are frequenty focecded by famblimerfict batit. Glafonbury thom dillers in ar iefpect from the coms non lawthom, ond that it fometiones fowers in tho winter. It is faici to have onizinally been the faff of Jofeph of Arimathea, that motle countellor who bis-
 bey of Ghatomary, attended ty cleven aropanions, came ove into lmain, and fomsed, in homen of the Bleffed Virgin, the lith Chillian chanch in this ifle. As a proof of his miffon, he is faid to have fluek his Ataff into the ground, which immedintely thot forth and bloomed. Thhis tree is faid $t$ o base blonfomed on Chillmas-day ever fince, and is univerally dallaguifed by the name of the Gleponhary thon. Hankury fay:, I have many plants that wete migimally propagated from this thom: and they ofen lower in the winter, hat thare is no exat time of then foweting ; for in finc feafons th.cy will fometines be in how be. fore Chriftmas, fonctimes they afford atacir thofons in Fetoruary, and fometimes it fo happens that they will be out on Clivitmas-dio.
2. The azarolus, ci azotote thom, is.a mate of Italy and the fouth of France. It will grow to be fifeern or tixten feet high. The leaves are lugre, nearl. trifid, fervaled and oit in. The fowers are large, come out in Mav, and in the different varicties are fueceeded by frut of differthtye, thage, and selith. The prin. cipal varicties of this fpecien are: 'The ayarole with frong thoms: the ararne with an thoms; the faged deaved azarole; the oriental mediar.
3. The aria theophacti, called the athitrendfoce, is a mative of moll uf the cold countries of lampo. It wibl erow to lie wome than thenty feet high. ' 「his tece is engagiag at ail times of thic ; atr, and catches the attention ceven in the winter for shon we foe it daud, thench makel of lues, with a the thata nom. with fonoth branches, ©potict with white, at the en? of which are the bud:, fucthad fire the next ocats保ont, giviag the twic a hah and line appeanave. In the faring the liaves conns out of courte, and luok ot lightfully, baving their ufper forface feren and the

The fowers are porduced at the vid of the brander in May: they are whice, gow in low handes, hat ving meally forttalk; and are feccecded by red herrics, wheh will be sipe in antuma.
4. The tomimatio, wihd ferve, or maple!eated forvion, is a Jurge growing trec, native of Englans, (Earmany, Sinitmand, and Bugundy. It will arrive to nea: lifty feet, and is worth propagenting for the fake of the timber, which is sery white and hard. 'Ilfis the grows naterally infeveral words in England ; and it is the falut of this fperies that is tied in banche :m expuied for fale in the atumn: It is satberel it the wouds, and by fome perfons is manh liket. 'flat leaves in fomes degree refemble tho of the maphe-tane in thase ; their kpper furface is a fine gren, their er

## $\left.\begin{array}{llllll}C & \text { A } & {[14}\end{array}\right] \quad$ C R A

Cratagth. Cer hoary; and they grow alternately on the branches. The flowers come out in May, exhibiting themfelves i: large clutuers at the ends of the branches: They are white, and are fucceded by the aforefaid eatable Eruit, which when ripe is of a brown colour, and abotit the faze of a large haw.

The coccinea, or Virginian a\%arole, is a native of Viarinia and Canada. It will grow to be noar twenty foet ligh. The llem is sobult, and covered with a light-coloured bark. The branches are produced without order, are of a dark brown colour, and poffefled oi a few long fiarp thoms. The kaves are fpearfhaped, oval, fmooth, and ferrated; of a thickifh confiltence, and ofete remain on the tree the greatefl part of the winter. Each feparate Hower is large: but as few of them grow together, the umbels they form ase rather fmall. They come out in May, and are flece ceeded by large dark-red-coloured fruit, which rijens late in the autumn. The varieties of this fpecies are: The pearleaved thorn; the phan-leaved thorn with very long hlrong fpines and large fruit; the plumleaved thorn with flort fpines and fmall fruit.
6. The crus galli, or cockfpur thom, is a native of Virginia and Canada, and grows to about twenty feet ligh. It rifes with an upright item, irregulanly fonding forth branches, which are fmooth, and of a brownith colour, fpotted thinly with fmall white fyots. It is armed with thoms that refemble the fpurs of cocks, which gained it the appellation of cockfpur thorn. In winter the lear-buds appear large, turgid, and have a bold and plafant look among others of different anpearanecs. In fummer this tree is very delightuf. The learcs are onal, angular, forrated, fmooth, and bend backwards. They ane about four inches long, and three and a half bruad: have five or fix pair of flong nerves umang from the mid rib to the border; and die to a brownilh-red colour in the autumn. The fowers are produced in vesy large umbels, making a nohle fhow in May; and are fucceeded hy large frait of a bright red colour, which have agood effect in the winter. The principal varieties of this fpecies are: The cuckfpur hawthun with many thorns; the cockfpur hawimen with no theras; the cockfpur with catale fruit. " The bitter was font me ( Gays Hanbury) from America with that name, and I have raised fome trees of the feed; hut they here not yet produced any fuit. fo that I cannot pretend to fay how far it may be defrate; though I have heen informed it is relifhed in America by fome of the inhabitants there.
7. Whe tomentofa, goofebery-leaved Virgina hawthom, grows to aood icven or cight feet bigh. The branches are teader, and cl.fely ict with tharp thorns. 'The lanes a.e cumenom, uvit, ferrated, and hairy wher!eth. The fowers are fmall, and of a white culuter: 'They are produced from the fides of the brarch: s about the end of May; and are fuccected by yellow fruit, which ripens late in auttumn. There is a varity of this called the Caroina Hawthorn, which has longet ard whiter leaves, larger howers and fruit, ata no thoms.
S. The viridis, or green-latwed Virginia hawthorn, has the fem and banches altegether deflimete of thorns. The leaves are lanceolate, oval, nearly trilobate, ferrated, inouth, and green on both fides. The flowers are white, mederately large, come out the end of May,
and ate fucceeded by a roundih fruit, which will be Ciategus ripe late in the autumn.

The refpective fpecies are all propagat ${ }^{\text {d }}$ by fowing Crater. of the feeds; and the varieties are continued by budding them upon llocks of the white thom. 'This latter method is generally practiled for all the forts; though when good leeds can be procured, the largeit and moll beautiful plants are raifed that way. 1. In onder to raife them from feeds, let thefe be fown foon after they are ripe, in beds of freh, light, rich earth. Let alleys be left between the beds, for the conveniency of weeding, and let the feeds be covered over with fine mould about an inch dsep. The fummer following the beds mult be kept clean of weeds, and probably Come few plants will appear: But this is net common in any of the forts; for they generally lie till the fecond fpring after fowing before they come up. At the time they make their appearance they muft be watered if the weather proves dry ; and this mould be occafionally repeated all fummer. They fhould alfo be condantiy lept clean from weeds; and in the atituma the Arongell may be drawn out, and fet in the nurfery-ground, a foot afunder, in rows that are two feet ditant fromeach other; while the weakelt may remain until another year. During the time they are in the nurfery, the ground betwcen the rows mould be dugevary winter, and the weeds conitanty hoed down in the fummer; and this is all the trouble they will require until they are planted out for good, which may be in two, three, or more years, at the pleafure of the owner, or according to the purpores for which they are wanted. 2. 'Whefe trees are eafily propagated by budding alfo; they will all readily take on one another; but the ufun tlocks are thole of the common hawthorn. In order to have thefe the belt for the purpofe, the haws thould be got from the largetl trees, fuch as have the foweft thorns and largelt leaves. After they are come up, and have plood one year in the feed-bed, the frongell fhould be planted out in the nurfery, a foot afunder and two fect diffant in the rows; and the fecond fummer after many of them will be fit for working. The end of July is the belt time for this bufnefs; and cloudy weather, night and morning, are always preferable to the heat of the day. Having worked all the difienent furts into thefe loocks, they may be let alone until the latter cod of Sipems. ber, when the bais matting thould be taken ofi. In the winter the ground between the rows hould be dug, and in the fpring the flock hould be headed about talf a fout above the bud. The young thoots the focks will alwaysattempt to put out, hould be as conflantly rubhed off; for thefe would in proportion ftarre the bud and top its progrefs. With this care feveral of the forts have been known to foot fix feet by the autumn; and as they will be liable to be blown out of their fockets by the high wind; which often happen in the fummer, they thould be fighty tied to the top of the dock that is left on for the purpore, and the will help.to preferve them.

CRATCHES, in the manege, a fwelling on the paftern, under the fetlock, and fometimes under the hoof; for which reafon it is diftinguifhed into the finew cratches, which affect the finew, and thofe upon the cronet, called quitur-bones.

CRATER, Cup, in attronomy, a conftllation

## C R A [ 515 ] C R A

Crater of the fouthern hemifphere; whofe Rars, in Ptolemy's Catalogue, are feren ; in 'Tycho's, sight; in Hevelius's, ten; in the Britanic Catalogue, dhaty-one.

Crater is alfo ufed to figuify the mouth or opening of a volcano or burning muntain, from whence the fire is difelarged. See Volcano.

CRATES, of Thebes, a famous philofopher, was the diciple of Diogenes the Cynic. It is faid that he threw all his money into the lea, that he might the more frecty apply himeff to the lludy of ptilofophy. Others aflet that he placed it in anether perfon's lands, with orders to give it to his children if they thuld happen to be fools: For (faid Crates), if they howld be philooiophers, they will have no need of it: in which eafe it was to be given to the people. Ile flourihted about 328 years before Chrift.

He ought nor to be conforndeco with Crates, a famous academic phithfopher, the difciple and fiend of Polenon. This lat Crates had Arctilaus and other celcbrated philolophers for his difeiples; and flourifhed about $3 c 0$ years befure Chrilt.

CRATEVA, the garlic pear: $A$ genus of the monery yna order, belonging to the dudecandria elafs of plants: and in the natural mothod ranking under the 25 th order, Putuminer. The corolla is tetrapetalous; the ealy $x$ quadrifid; the berry inferior dilpetmons. There are iwo fpccies, both of them natives of feveral parts of Iodia. They are both of the thee kind ; and are chiefly diftinguifhed by their fruit. The tapia, or garlic pear, has a fnooth round fiuit about the fize of an orange, with a hard brown fhell or cover, which inclofes a meally pulp, filled with kidney-fhaped feeds. It hath a ftrong fruell of garlic, and communicates the fume to fuch animals as feed upon it. The tender buds foom the young branches being bruifed and applied to the naked Rkin, will bliter as effectually as cantharides. It rifes to the height of about 30 fect. The other grows to the fize of a very large tree, with trifoliate leaves, fawed on the edges. The flowers have the fimell of roles, and are fucceeded by an oblong fruit of the lize of an apple, covered with a very hard bony thell, and containing a foft flelly pulp, having the talle of quinces. From the flowers of this plane is obtained by difillation a water highly odoriferous and cordial. The pulpy part of the fruit is prepared into varions kinds of marmalades, which are exceedingly agreeable to the tafte, and are much ufed by the grandees in thofe countries where the trees ate native; they are allo reckoned ferviceable in dyfenteries. Both fpecies may be propagated in this country by feeds. Thefe are to be fown upon a hot-bed in the fpring; and when the plants come up, they are to be treated in the manner directed for the Annona.

CRATINUS, an ancient comic poet, of whom we fhould farcely have known any thang, had not Quintilian, Horace, and Perfius, mentioned him, Eupolis, and Ariltophanes, as the great malters of what we call the ancient comedy. It is gathered that he died in the 87 th Olympiad. Suidas tells us that he wrote 21 plays, and that he was fplendid and bright in his charaters.

CRATIPFUS, a celebrated peripatetic philofopher, was a native of Mitylene, where he taught phi.. bofophy ; but at lengtly went to Athens, where Brutus and the fon of Cicero were his difciples. Pompey
went to Sce hime after the battle of Pharialia, and pro- Crato pered to him his defenties in relation to the belief of a Puvidence; when Cratippus comfurted him, and by 11 forcibde anyments anfwered lis objeetions. Ite wrote fome pieces about divination: and is luppofed to be the fame with him whom 'Tertullian, in his book $D_{c}$ dhima, has ranked among the writers upon dreams.

CRATO, a fraall town of Portugal, in the province of Aleatejo, with a rich priory. It is the chief commandery which the knights of Malta Lave in Portugal, W. Lang. 3. 12. N. Lat. 38. 50.

CRAVAN, a town of Prance, in Burgndy, reasarkable for its good wine, and for a battle fonshat there between the Englifh and French. It is feated near the conduence of the rivers Cure and Yonne. E. L.ung. 3. 30. N. Lat. 47. 42.

CRAVEN, or Cravent, a word of reproach, ufed in trials by batcl. See Batten.

CRAX, in ornitholugy, the curafiou, a genus of birds, belonging te the order of gallinge. 'The bafe of the teak of edch mandible is covercel with wax; and the feathers of the head are curled. There are five ipecies, viz. 1. The alecator, or Indian hen of Sloane, is about the fire of a fmall turkey. It is black, with a white belly. A yellow wax covers about one half of each mandible; the tongue is entire; the temples are bare and black; the tail is roundifh, and confilts of it prine feathers; the legs are Arong, and of a dufky bown colour. They are frequent at Guiana; and are called porecfe by the natives from their cry, which is fomewhat limilar; are pretty numerous in the woods, and make mo fmall part of the food of the planters, being fupplied therewith by the Indian hunters; and their fefh is reckoned delicate, much like that of a turkey. They are eafily brought up tame, and are frequently found in the Dutch fettlements of Berbice, Effequebo, and Demerary. They are called at Brafil by the name of curaffo. It is found in the warm parts of America. 2. 'The rubra, or Permvian hen, is red, with a bluifh head: it is a native of Peru. Thefe birds are natives of Mexico Plate CL?. and Peru. They feed on fruits, and perch of nights on trees : the fleth is white; and elteemed very good food. They are frequently kept tame in our menageries in England, and readily mix with other poultry, feeding on bread and grain; but this climate is not near warn enough for their nature, they not being able to bear the dampnefs of the grafs of our meadows, which renders them fubject to have their toes rot off. They will often live in this ftate fome time; and in one inflance which Mr Latham faw, the whole of one foot was gone, and but part of one toe left on the other, before the creature died. 3. The mitn, or Brafilian pheafant, is black, with a dulky belly, and red wax: it is a native of Guinea and Brazil. 4. 'The globiccra, has a yellow protuberance between the noftrils, and is of a bluifh-black colour : it is likewife a native of Brazil. 5. The pansi, or Mexican pheafant of Briffonius, is of a bluifh colont, with blue wax, and the tip of the tail and belly white: it is a native of Mexico.

## CRAY-fish, or Craw-Fi/b. Sce Cancer.

The flefh of cray-fin is cooling, moillening, and adapted to nourifh fuch as labour under atrophies. There are various methods of preparing thefe animals; they may be either boiled or fried, and then taken out
 Wer. an parts of them ane-evable cacept their claws atd tail:. I'reparations and broths of craytili are cele. beated rot orly for a palatable alment, but alfor for anforing fome medicinal intentions, as heing of a mintaniog quality, and thestaing up and correcting acioneny. The broth is prepard of fux or cire craw hin, which having ther heads cut off, and their intellines extracted, ate to be burted and bided in the
 ly red; after winc: the $\mathrm{li}_{\frac{1}{2}}$ wor is to be haned off and feafored, as thecufemy redsire. Tasis broth may he
 frato, or edocr filances: acarding to the iutention
 fummer math:tho.

The delisate flwour of thefe fifo depencs in a orpat
 food, their 8, a peteferes tie retith of it: but whan they feed on aitei thing, they are often rendered of no value, ly ane hlatourcomananatad to their flen by them. There are ereat quantitis of the?e fith in ine sirer Otra, on the Dorders of Silefs ; but the peotle find them face eatable, beonute of a bitter aromatic f.e:our, poly difacreable in focd. It has been lince ofiened, tiat thic calames armanaris grows in valt aEandance on the banks of that tiver, and that thefe zreatmes feed very greedidy upon its roots. Theie have a atery remarkatle biturnels mived with their aromaic hasour, whil: freth, which ges ofy very much in the drying; and on comparint the tate of theferoots with that of the cray fin, there reatins no doubt of the one heine owine to tle other.

They abound in the river Don in Mufeovy, where they are laid in heaps to putrefy; after which the Runces called orak's eyes are picked out. Thefe animals are very weedy of ten, and it ack il great numbers abour warcales thow into the water where they are, and newr kave it white any remains. They alro fece ondead fogs when the come iatu their way. In Swifulaud there are fome coay-fil whind are ied while they are alive, and others bluith. Sume kinds of them allo will rever beconse rai, even by boiling, but continue blackih.

The cray fin dicharges it elf of its ftomach, and, as M. Geoffroy thinks, of is intetines too. Thefe, as they putrefy and diffolve, ferve fur food to the animal; during the time of the reformation, the old fomach feems to the the frit fond the new one digetts. It is only at this tine that the thones are found called crab's eye; they hegin to be furmed when the old Nomach is detroget, and are aftervaids wrapped up in the new ont, where they decreafe hy degees thll they entirely dilappear.

CRAYER (Capar de), was born at Antwerp in 1585, and was a dicicile if Raplacel Coxiz, the fon of that Coxis who had thatied urder Raphatl; but he foon iheswed fuch proofs of grnins, and of an elerated cagacity, thar he far furpaind his mater, and therefore quiteal him. Aturwayds the made judicions nfervations on the particnlar cegell! ncies of the moll renowned mafters to which he hod any accels; and taking aatue for his contane direct T and guide, he forred Fur bimflf a manner that wes exceedinery plealing. The nor? work which ultablhed tims in the favour of the court it Biuffels, was a potait of Cadisal Eer.
dinand, brother to the King of Spain, which he paint. cd ai full length, aud as large as life. In that picture he lucceeded fo happily, that it was fent to Madrid, and received there with fuch concurrent approbation of the king and the whole coust, that it laid the foundation of the fame and fortune of Crayer. Fur the king, as an acknowledrment of the painter's merit, fout him a gold chain wath a medal ; and adred, as a farther intlance of his favour, as appoint nemt for a counderable penfion. Bur nothing phaces the talents of Crager in a Aroaver light, then the tellimony of io excelleit un artit as R bens. That great man went to Antwerp particularly to viif C-ayer, and to fee lis work; and after exarnining attentively a picure of his paincing, in the reic.tany of the abtoy of At fers.
 Fas Crayr. If of wa this mater lefs ditinuathed lig $V$ Undes, who always exprettid a real elterm and friencihip for him, and pained his pertrait. He had fomentat lefo fice in iis computituns than Rubens, buthis kurgn is freguently more conteit. Hifs compolition generally confled of a linath namber of ti-
 cumbering his defign with luperninous particulais, of loading his futject with any thine that leemed nut in contribute to its elegance or probabilicy. He grouped his figures with hagular ikill, and has exprefins hane ali the truts of natuse. . There is a renark tole variety in his draperies, and an cqual degee of fimpliciey in their folde; and as to his colouring, it is admistle. Of all his cutcmporary painters, he was accounted to approach nearett to Vandyck, not only in hiflory bat in portrait. He principally painted religious fubjects, and was continually at work; and although he lived to a greas agz, yet his temperance and confliant regularity preiferved to him the full ufe of all his fuculties; and to the iaft month of his life his pencll retained the fame force and freetom which it puffiled in his mott vigorous time. The lintject of that picture which was To honoured by the approbation of Rubens is the Centmion aighting from his horte to protrale himfeif at the feet of our Saviour. It is a capital defign of Crayel; and aithough it corints of a gireat number of figures, the harmony and union are well preferved.
CRAYON, a general name for all coloured tones, earths, or other minerals and fubllances, ufed in deligning or paining in patel; whether they have been heaten and reduced to a patte, or are uled in their primitive confltence, after lawing or cuting them into long narrow lips. In this laft manner are red crayons made, of blood Rone or red chalk; Hack ones, of charcoal and biack lead. Crayons of all other colours are compol.tions of earths reduced to pafte.
Cरaron-Painueg. Whether the painter works with oil-culume, water colours, or crayons, the grand object of his purfuit is lill the fame: a joll imitation of nature. But e ect feccies has its peculiar rules and methods. Painting with crayons requires in manay re$f_{p} \mathrm{ct}$, a treatnent different from painting in of colous; becanfe all colouro wifa day are in their natare of a much wamer complexion than when wet veith cill, 3 zic. For this reaion, in order to produce a rich pieture, a much greater potion of what pain. ters term couling tizas unt be applied in crayon painting than wuid be judicoons to ufe in cils. Without any danger of a mitake, it is to be fuppofed, the not

## $\mathrm{C} R \mathrm{~A}$. [5! ] C R A

being aequainted with this ohfervation is one great caute why to many oil-painters have no better fucecfs when they atempt crayon-painting. O1 the contrary, crayon-panters being fo munh aled to thene teints which are of a cold natue when wed wet, are apt to introduce them ton much when they paint with ouls, which is felfom productive enf a gond effect.

We thall now endeavon to give the tudent tome diackionc towards the attaimment of excellence in this art.

Of the Alphlication of the cirarins, with fore trovious Difpofitions. The Etatent mut provide himelt sith frace thong bhe paper, the thicker the betfer, if the granin is not too coalle or knuty, thongh it is almoft impunfibl: w get any enirely free from knots. The kumes thond be 1 valled with a penknile or razor, othenwife they whil prove sxecedingly twablefome. Af. ter this is done, the yaper mal be palled wry frooth on a liuen cloth, previoully trained on a deal frame, the fiz: according to the artil's plcalure: on this the pinture is to be execoted; wat it is nata eligible ant to pa le the paser uatill the whole fubject is firt dad-coloured. The methed of doins this is rery eafy, by lay ing the paper with the dead-culur on its face, mon a imooth board or table, when, by means of a bruth, the hackide of the paper mu! be cowered with patle; the frame, with the frained cloth, mutl then be land on the patted fide of the papar; after which turn the painted fide uppermot, and lay a piece of clean paper upon it, to prevent fmearius it: this being done, it may be troked gently owcr with the hand; ty which mana all the air between the cloth and the paper will be forced ont.

When the pate is palicety dry, the fudent may proceed with the painting. The advantages arihog fora pating the paper on the frame according to this nucthod, after the pieture is begun, are very great, as tac ordyons will adhere much beter than any other way; which will enatle the tudent to finif the picture with a firmor body of colour and greater lufte.

Wien the painters want to make a very correct copy of a pietare, they penerally make ufe of tifany or black gauz? ftained tight on a frame, which they lay flat on the lubject to be imitated, and with a piece of fetchine chalk trace all the outlints on the tiffany. lhey then lay the canvas io be painted on fat upon the floor, placing the tiffany with the chalked linesupon it, and with an handkerchief bruft the whole over; this prefents the exact outlines of the pieture on the canvas. The crayon-painter may alfo make ufe of this method when the fubject of his imitation is in oils; but in cosping a crayun-piture, he mult have recourle tot the following method, on account of the glafs.

The pictare being placed upen the eafel, let the ontlines be cirawn on the glafo with a fordl camet's hair pencil dipped in lake, ground thin with oils, which mal be done with great exactnefs. After this is accomplifhed, tater a fieet of paper of the fame lize and place it on the glatis, Atroking over all the liaes with the hand, by which means the celonr will adkere to the paper, which melt be pierced with pio-holes pectty clofe to each other. The paper intended to be nfed for the paintiog mult next be laid mpon a table, and the pierced paper placed upon it ; then with fome fine-punded charena!, tied up in a piece of lawn, rub over the pierced line:, which will give an exact ontline; but great care mult be tation not to biufh this
off till the whole is drawn over with thasehing chalk, w!ich is a comporition mate of whiting and tobaceopipeclay, rolledlike the eryom, and pointed at exth end.
 will be nolt pradent to mabe a contceit drawingrof the oudines on another paper, the fie of the picture be is goines, to paint, which ke may trase by the precedines, meinod, becaufe erroneaus trokes of the kectchiner chalk (which are not io be awnded sibhout great 5 pertnels) will prevent the crayons from adtue inig to tho paper, owing to a certain grecafy quabity in the compofition.

The fudent will find the futing poftare, with the box of crayons in tis lap, the molt co wanot nethe 1 for him te paint. The pait of the pieturc lie $i$, im. mediately painting fould be rather below his face: Con, is it is phaced too ligh, the am will he fatignen? Let the winduws of the rom whare lie paints be dar ened, at leat to the heisets of in foet from the ground; and the fubject on be painted hould befuated in fuch a manner, that the lightt may fall wh every advantage on che face, avordins tun marh hatew, which leluom has a gond efle Et in patrait-painting, fepecially if the face lie painta from has any degree of delicacy.

Befire he begins to paint, let him to attentive to his futject, and appropdate the action or attitude proper to the age of the fulpuet: if a child, let it be childin; if a young lady, experfs more vivacity than in the majeltic beauty of a midde-aged woman, who alfo inutuld not be exprefled with the fane gravity as a perfon far advanced in years. Let the embellihments of the picture, and introduction of birds, animals. Ne. be regulated liy the rules of propriety and contitency.

The features of the fince being correctly drawn with chalkz. let the ftudent take a crayon of pure carmine, and carefully draw the noitri and toge of the nofe rext the thadow; then, witlo the fainteit carmine teint, lay in the highelt light upon the nole and forehead, which muft be executed broad. He is then to proceed gladually with the fecond teint, and the fucceeding ones, till he arrives at the Chtdows, which mull be covered brilliant, enriched with moch lake, camine, and deep green. This method will at hirf oflinfavely llike the eye, from its crude appearance; but in the finithing, it will be a good foundrion to produce a pleafrag effect, colours being much more catily fullied when too bright, than when the firf coloneme is dull, in afe the picture into a brithant Atate. The feveral pearly teints difcernible in finc complexions mu't be imitated wihh blue verditer and white, which anfeers wo the mitramarisetunts wedi: olle. But if the parta of the face where thele teinta appar are in thadow, the crayuns compofed of thack and white muat be fundis. tod in their place.

Though all the face when firt coloured format no laid in as brilliant as puntblo, yereach part numbld he kept in its proper tone ; by which neans the rownety of the face will be pleferved.

Let the atudemt be careful when le bogins the ow: to draw them with a crayon inclined to the carmin. teint, of whatever colour the iries are of the mots. iny them in brilliant, and at firif nut loaded with cer lour, but executed lightly: no notice is to be taken et the pupid jet. Whe turent mull let the light of the

## Cryyom.

 n-rcye incline very much to the blue caft, cautiounly a. voiding a faings white appearance, (which, when once introduced, is feldom overcome), preferving a brad thadow thrown on its upper part, by the eyclath. A block and heavy teint is alfo to be avoided in the eye-brows; it is therefore beit to execute them like a broad glowing thadow at firt, on which, in the finining, the hairs of the brow are to be painted; by which method of procecding, the former teints will flow themflues through, and produce the mott plea-部gefict.The itudent thould begin the lips with pure carmine and lake, and in the foadow ufe fome carmine and black; the drong vermilion teints hould be laid on afcerwards. He mut be:are of executing them with diff, harfl lines, gently intermixing each with the neighouring colours, making the thadow beneath broad, and enriched with brilliant crayons. He mult form the corner of the mouth with carmine, brown ochere, and greens, varioully intermixed. If the hair is dark, he hould preferve much of the lake and deep carmiace teints therein ; this may eafily be overpowered by the warmer hair teints, which, as cobferved in painting the eyc-brows, will produce a richer effect when the picure is finithed; on the contrary, if this method is unknown or neglected, a poverty of colouring will be difecrnible.

After the itudent has covered over, or as artits term it, has dead-coloured the head, he is to fiveeten the whole together, by rubbing it over with his finger, beginning at the ftrongel light upon the furehead, paffug his finger very lightly, and uniting it with the next teint, which he mult continue till the whole is fweetened together, often wiping his finger on a towl to prevent the colours being fullied. He mult be cautious not to fmooth or fweeten his picture too often, becaufe it will give rife to a thin and feanty tffeet, and have more the appearance of a drawing than a folid painting ; as nothing but a body of rich colours can conlitute a rich effect. To avoid this (as the fludent finds it neceflary to fweeten with the finger), he muft commonly replenith the picture with more crayon.

When the head is brought to fome degree of forwardnefs, let the back-ground be laid in, which mult be treated in a different manner, covering it as thin as poffible, and rubbing it into the paper with a leather Fump. Near the face the paper fhould be almolt free from colour, for this will do great fervice to the head, and by its thinnefs give both a foft and folid appearance. In the back ground alfo, no crayon that has whiting in its compolition hould be ufed, but chittly fuch as are the moll brilliantand the leaft adulterated. The ground being painted thin next the hair, will give the fudent an opportunity of painting the edges of the hair over in a light and free manner when he gives the finifhing touches.

The fudent having proceeded thus far, the face, hair, and back-ground being entirely covered, he muft carefully view the whule at fome diftance, remarking in what refpect it is out of keeping, that is, whit parts are too light and what too dark, being particularly attentive to the whitc or chalky appearances, which nuut be fubdued with lake and carmine. The above method being properly put into execution, will produce
the appearance of a painting principally compofed of three colours, viz. carmine, blaek, and white, which is the beft preparation a painter can make for the producing a fine crayon picture.

The next itep is, to complete the back-ground and the hair, as the duit, in painting thefe, will fall on the face, and would much injure it if that was completed firlt. From thence proceed to the forehead, finifhing downward till the whole picture is completed.

In painting over the forehead the lalt time, begin the hirhett light with the molt faint vermilion teint, in the lame place where the faint carmine was firle laid, keeping it broad in the fame manner. In the nex: thade fucceeding the lighteft, the fudent arat work in lome light blue teints, compofed of verdite. and white, intermixing with them fome of the deeper vermilion teints, fiveetening them together with great caution, infenfibly melting them into one another, increating the proportion of each colour as his judgment thall direst. Some brilliant yellows may alfo be ufed, but iparingly; and towards the routs of the hair. ftrong verditer teints, intermixed with greens, will be of fingular fervice. Cooling crayons, compoled of bluck and white, fhould fucceed thefe and melt into the hair. Beneath the eyes, the fweet pearly teints are to be preferved, compoled of verditer and white, and under the nofe, and on the temples, the fame may be ufed; beneath the lips, teinis of this kind alfo are proper, mixing them with the light greens and fome vermilion.

In finifhing the cheeks, let the pure lake clear them from any dult contracted from the other crayons; then with the lake may be intermixed the bright vermilion; and lalt of all (if the fubject hould require it), a few touches of the orange-coloured crayon, but with extreme caution ; after, fweten that part with the finger as little as poffible, for fear of producing a heavy difagreeable effect on the elnecks: as the beauty of a crayon-picture conifts in one colour thowing itfelf through, or rather between, another: this the thudent cannot too ofien remark, it being the only method of imitatiag beautiful complexions.

The eye is the moll difficult feature to execute in crajons, as every part mult be expreffed with the utmott nicety, to appear finifhed; at the fane time that the painter mult preferve its breadth and folidity while he is particularizing the parts. To accomplifh this, it will be a good general rule for the fludent to ufe his crayon in fweetening as much, and his finger as litule, as poffible. When he wants a point to touch a linall part with, he may break off a little of his crayon againft the box, which will produce a corner fit to work with in the minutelt parts. If the eye-lafhes are dark, he mult ufe fome of the carmine and brown ochre, and the crayon of carmine and black; and with thefe he may alfo touch the iris of the eye (if brown or hazel), making a broud thadow, caufed by the eye-lam. Red teints of vermilion, carmine, and lake, will execute the comers of the eye properly; but if the eye-lids are too ted, they will have a difagreeable fore appearance. The pupil of the eye mutt be made of pure lampblack: between this and the lower part of the iris, the light will catch very flrong, but it mult not be made too fudden, but be gently diffufed round the pu-

## C $\mathrm{R} A$

 pil till it is lot in fhade. When the eychalls ane fufficiently prepared, the thining fpeck mult be made with a pure white crayon, which thould be tint broken to a point, and then laid on firm; but as it is profible they may be defective in neatnefo, they thond be eorreeted with a pin, taking off the redumbant pate, by which means they may be formed as neat as can be required.The difficulty, with refpect to the nofe, is to preferve the lines properly determined, and at the fame time fo artfully blended into the cheek, an to experts its projection, and yet no real line to be perceptible upon a clofe examination ; in fome circumbners it thould be quite blended with the cheek, which appears behind it, and determined entircly with a fishat tuech of red chalk. 'fhe fhadow caufed by the note is generally the darket in the whole face, partaking of no reflection from its furrounding patts. Camme and brown ochre, carmine and thack, and fuch brilliant crayons, will cumpole it beft.

The thudent having before prepared the lips with the Atrongeit lake and earmine, sece muil with thefe eslours make them completely correct; and when fivithing, introduce the floug vermiliom, tut with great caution, as they are extremely predominant. This, if properly tonehed, will give the lips an appeanance equal, if not fuperior, to thofe executed in cils, wetwithtanding the feeming fuperiority the latter has, hy means of glazing (A), of which the former is entirc! y deftitute.

When the fludent paints the neek, he flonk awoid exprefting the mufcles too flrong in the flem, nor mould the bones appear too crident on the chetl, as both have an unpleating effect, denoting a vinkent agitation of the body; a circumfance feldom neceflay to exprefs in portrat-painting. The mofl needfiry part to be exprefied, and which thould erer be obferved, (even in the molt delicate fuljects), is a ftrong marking juit above the place where the collar bones unite; and if the head is much thrown over the thoulders, fome notice fhould be taken of the large mulche that rifes from behind the ear, and is inferted inta the pit between the collar bones. All iuferior mufches flowats be, in general, quite avoided. The tudent will find this cantion utceflary, as mod fubjects, efpecially thin perfons, have the mufcles of the nect: much more evident than would be judicions to imitate. Ao fuw neeks are too long, it may be neceflary to give fome addition to the flem, a fault on the other lide being quite unpardonable, nothing beiog more ungraceful than a fhort neek. In colouring the neck, let the ftudent preferve the ftem of a pearly liue, and the light not fo ftrong as on the chell. If any part of the breat appears, its tranfparency mult alfo be expreffed by pearly teints; but the upper part of the chen hrould be coloned with beautiful vermilions delicately blended with the other.

Of the Drajery. Dark blue, purple, blaek, pink, and ail kinds of red draperies alfo, thould ve firft tint ged with earmine, which will render the colours much more brilliant than any other method; over this thould
be laid on the paper the mallle teint (a mediam between the lighte and dark tegnts, of which the drapery is to be painted, e except the dark mutces of thadore, wheh thould tee laid on at list as deep as polible; thede, fivectened with tha buser, being dedisute of the fmaller fulds, will exhibit a malte:ly breadth, which the l fier folds, when akdol, umght by mo means to delfrov. With the light and dark teinte, the finaller parts are next to be made witle frewdom, caecoting as mueh with the crayon, and as little with the finger as ponible; in each fold tomelaing the hat troke with the cravon, which throke the finger math never wach. In the cafe of reflections, the fimple tonch of the craton will he two hard, thendore fingering will be necellary afterwardi, as reflected lights ars alnatys moure reatle than thore which are direct. With reipeet toreflec. tions in gemeral, they mut alwas partake of the fame colour as the uhject reflefting, but in the cafe of himgle figures, it may be ufelul to mate fome particular obfevations.

In a bhe drapory, le the rellections be of a greenirn caft ; in green draperies, make them of a yelluw teint; is yellow, of an osange: in orange, icflect a redjih eall ; in all reds, fomething of their own mature, bat inchined to the y llow: black thould have a reddith reflection; the reflection of a reddilh teint will alfo prefont purples to the bett adsantage.

Of whatever colour the dapary is, the reflection on the face mult partake thereof, oinerwife the picture, like painting on glafs, will have but a gaudy edect.

Linen, lace. far, ke. fhould be touched firitedy with the erayon, fingering very little, except the latter; and the lat tonches, even of this, like all other parts, hould beexecuted by the erayon, without fweetening with the finger.

The methods above recommended have been practifed by the mott celcbated crayon-painters, whofe works have been held in publice eltimation; but the knowledge of, and ability to execute, each feparate part with brilliancy and truth, will be found very infufs. cient to conftitute a complete painter, without his judgment enables him to unite them with each other, by cornctaefs of drawins, propricty of light and thadow, and hamony of columing. In order to necomplith this, the Atudent foould carefully avoid finifhing one part in particular, till he has properly conlidered the connction it is to lave with the rell. The neglect of this is the principal reafun why the performanes of indifierent painters are fo dellitute of what is termed breadth, fo confpicanully beatiful in the works of great malters. It mult be granted, that this obfervation relates more paticularly to large compofitions, where a divertety of figutes rebuires fuch a judicions difpofition, that cach may allitt in the combination of a kind of univerfal hamony; yct, even in portrait-painting, the ftadent fhond be particularly attentive to obferve this idea of breadth, if he is cedious of acguiring that importance and dignity which conltitutes excellence in painting.

Gf the Muterials. 'rae perfection of the crayons confilts,

two ! *etl. The nest gradation finuid be eorpoled Crayon. of cequal çantities of camme and viliting, of which form cravons may be made. 'The thind eompontion flontis bive one fourth carmane and three tomaths whiting ; of the make fix etagons, wheds vall be a gencl aropotion wish the $r$ th. 'The lat teint thould be made of whiting, reay fanaty tinged with carmiot, of which make abomt eight ciayors, which wall come fute the abovememinned propation. As la we comFonal tents are levigatet, they are to be laid inumedi..t.ly inow the chalk, that toe monare may be atFatred to the propur degree of drgnefs tor forming into anyons, wheh may be lnown by ita luting the gieater part of its admelive quality when taken into the band: if the confitency is pound to be right, it moy be then laid upon the glaf, which havag u* pores will prevent the moiture from becoming ico dry berore it is consenient to form it iuto dayons, othenwith the ereyons would be full of cracks and very b:it:le, which will be a greatimeonenionce when they are ul.din paintiag.
2. Lata. Tois is a colon very apt to be hard ; to prescat which the ftudent malt obferve the followng panculars. Take about hate the quantiry ul like intended for the crayons and phide it rery bite whet jpirits of wine ; let it doy and then fulveriae it, whach is eafly done if the lake is good; then take the other half, and gind it with fpirits, alter which mix it with the pulverized l:ke, and lay it out directiy in cragons on the chatk. 'Inis colour will nut bear golling. 'Yi.e fomple colour being thus profaicd, prieed with the conepoutd enavons as direeted before, and in the fame degrees of gradation as the carmioic itino.
3. Vemition. The keft is inclined to the carmane taint. Nothir (is required to prepare this colour more than to mix it on the thome with ift water or fpirito, after which is may be reiled intu cragons. 'lie difice tent teint are pr coucd by a mixture of the timple colon with whiting, accu-ding to the proportions already gisen.

1I. D:ufs. 1. Pramian blee is a colour very apt to bit:al, and is rencered !oft with more enthenits than calmine and lake. The fame nothod of nianation is to be tollowed with this as directed with retpect to lake, only it is uectraty to grind a larger guantity of the pate © lur, as it is chistly wed ter panting draperizs. The diffementeints may be made according to necthty, or the fancy of the painter. 2 Lhereverdiser is a coluor natmathy gritiy, and theretore it is necefley to wall it well. Its fatioles are to cuale as to regive fome bindurg mater to unite them, otherwife the cravons will nuw abhete tugthe. To acconphif tais, ake a quant ty fufferat tuform two or torece crayons, to wiri had a piece of flarle! plaAlr of Paris abrut the lize of a pea; mix thefeveltogether, and form the crayono uprom the enath this blue is exiremely thillicht, ind wall be of great ufe in
 ed with whting as diaceted in the former inllances, and are hizhly fervicable tor painting flath, w produce thofe pearly tofats fo beautifui in cratun-pictures. It is not accifary to mix the compennis whith fiata, as clear water mill do diandient.
11. Grezns. Brilliant-greens are prollucen with great difficulty, In Siwitzcrland, they have a metho.

Crayon. of making them far fuperior to ours. We ufually take yellow ochre, and after grinding it with fpirits, mix it with the powder of Pruflian blue, then temper it with a knife, and lay the crayons on the chaik, without rolling them. Inftead of this, fome ufe king's yellow mixed with Pruffian blue, and others brown ochre and Pruffan blue. The clayons made of the two laft may be rolled. Various teints may be produced by thefe colours, according to fancy or nceeffity ; fome to partake more of the blue, and others of the yellow.
IV. Yellows. r. King's-yellow is the moft ufeful and the moll brilliant, levigated with fpirits of wine, and compofe the different teints as before directed. Yellow ochre and Naples yellow ground with firits will make ufeful crayons. 2. Orange is produced with king's-yellow and vermilion ground together with fpirits, and the teints formed as in other cafes, but no great quantity of them is required.
V. Browns. I. Cullen's-earth is a fine dark brown. After fixs or eight of the fimple crayons are prepared, feveral rich compound teints may be produced from it, by a mixture with carmine, in varivus degrees. Black, carmine, and this colour, mixed 10 gether, make ufeful teints for painting hair; feveral gradations may be produced from each of thefe by a mixture with whiting. Roman or brown ochre is an excellent colour, either fimple or compounded with camine. Whiting tinged in feveral degrees with either of thefe, will prove very ferviceable in painting. 2. Umber may be treated in juft the fame manner, only it is neccflary to levigate it with fpirit of wine.
VI. Purples. Pruffan blue ground with fpirits and mixed with pulverized lake, will produce a good purple. Carnine thus mixed with Pruflian blae, will produce a purple fomething different from the former. Various teints may be made from either of thefe com. pounds by a mixture with whiting.
VII. Black. 1. Lamp-black is the only black that can be ufed with fafety, as all others are fubject to mildew; but as good lamp-black is very fcarce, the fudent will, perhaps, find t molt expedient to make it limfelf; the procefs of which is as follows: Provide a tin cone, fix it over a lamp at fuch a height that the flame may jult reach the cone for the foot to gather within it. When a fufficient quantity is collected, take it out, and burn all the greafe from it in a crucitle. It muft then be ground with fpirits, and laid on the chalk to abforb the moifture. Various grey teints may be formed from this by a mixture with whiting, as mentioned in former inftances.2. Vermilion mixed with carmine: this is a compofition of great ufe, and teints made from this with whiting will be foond to be very ferviceable. 3. Carnine and black is another good compound, of which five or fix gradations fhoull be made, fome partaking inone of the black, and others having the carmine molt pretominant, befides feveral teints by a mixture with whiting. 4. Vermilion and black is alfo a very ufeful comprond, from which feveral different teints flould be made. 5. Prutfian thee and black is another good compound, and will be fourd of fingular fervice in panting draperies.
It is impoffble to lay down ruce for the forming Yos. V. Part IL.
crery teint neceffury in compofing a fet of crayons, there being many accidental compofitions, entirely depeadent on fancy and opinion. The ftudent frould make it a rule to fave the leavings of his colours: for of thefe be may form various teints, which will occafionally be ufcful.
Of rolling the crayons, and diftofing then for painting. The different compofitions of colours muft be cut into a proper magnitude, after they are prepared, in order to be solled into paftils, for the convenience of uling them. Each crayon flould be formed in the Icft hand with the ball of the right, firt formed cylindrically, and then tapered at eath end. If the compofition is too dry, lip the finger in water; if too wet, the compofition mult be laid upon the chalk ayain to abforb mone of the moiture. The crayons flould be rolled as quick as polfible; and when finifhed, muft be ldid upon the chalk again, to abforb all remaining moiHure. After the gradation of teints from one colour are formed, the fone flould be well fcraped and cleanfed with water before it is ufed for another colour.

When the fet of erayons is completed according to the rules prefcribed, they flould be arranged in claffes for the convenience of painting with them. Some thin drawers, divided into a number of partitions, is the moft convenient method of difpofing them properly. The crayous fhould be depolited according to the feveral gradations of light. The bottom of the partitions mult be covered with bran, as a bed for the colours; becaufe it not only preferves them clean, but prevents thcir breaking.
The box made ufe of when the fludent paints, fhould be about a foot fquare, with nine partitions. In the upper corner, on the left hand (fuppoling the box to be in the lap when he paints), let him place the black and grey crayons, thofe being the moll feldom ufed; in the fecond partition, the blues; in the third, the greens and browns; ir the firl partition on the left hand of the fecond row, the carmines, lakes, vermilions, and all decp reds; the yellows and orange in the middie, and the pearly teints next; and as thefe laft are of a very delicate nature, they muft be kepe very clean, that the gradations of colour may be eafily diftinguifhed: in the loweft row, let the firf partition contain a picce of finc linen rag to wipe the crayons with while they are ufing; the fecond, all the pure lake and vermilion teints; and the other partition may contain thofe teints which, from their complex nature, cannot be claffed with any of the former.

CRAZE-mits, or CKazNG-Mill, a mill ia all refpeCts like a grift-mill to grind corn, and is fo called by the tin-miners, who ufe it to grind their tin, which is yet too great, aftes trambling.

CREAM, a general name applicable to all fubtano ces that feparate from a liquer, and are collerted upon its furface; but is more particularly applied to the following.

Crasm of Jime, is that part of the lime which had been diffulved in the water in its caullic flate, but having again attracted fome fixed air from the atinoiphere, becomes incapable of folution, and therefore feparates from the water in the mild Itate of chalk or limedtone.

Greas: of AIIIk, generally called fimple cream, is the 3 U mot

CREAT，in the manege，an uther to a riding ma－ fter：or a gentleman bred in the academy，with intent to make himfelf capable of teaching the art of riding the ereat horfe．

CREATION，in its primary import，feems to fig－ nify the bringing into being fomething which did not before exit．The term is therefore molt generally ap－ plied to the original production of the materials where－ of the vifible world is compufed．It is alfo，however， ufed in a fecondary or fubordinate fenfe，to denote thofe fubfequent operations of the Deity upon the matter fo produced，by which the whole fyttem of na－ ture and all the primitive genera of things received their form，qualities，and laws．

Tlitre is no fubject concerning which there lave been more difputes than this of creation．It is cortain that none of the ancient philofophers had the fmailct idea of its being polfible to produce a fub－ Atarce out of nothing，or that even the power of the Deity himfelf conld work without any materials to work upon．Hence fome of them，among whom was Arittotle，afferted that the world was eternal both as to its matter and form．Others，though they believed that the godis had given the world its form，yet imagined the mathials whereof it is compofed to have ben ter－ mal．Indeed the opinions of the ancients，who liad not had the benefit of reclation，were on this head fo con－ fufed and contaviactory，that mothing of any confe－ quence can be dedued from theen．The freethinkers of our own and of former ages have denicd the polfibi－ Sity of creation as being a contradiction to reafur，and of confequence lave taken the opportunity from thence to diferedit revelation．On the other hand，many de－ fenders of the facred writings have allerted，that crea－ sion out of nothing，fo far from being a contradic－ zion to reafon，is not only prubable，but demonitra－ hy certain．Nay，fome have gone fo far as to fay， that from the very infocetion of the vihile fyllem of rature，we are able to infer that it was once in a thate of non－exiftence．It would be impofitible for us， however，to enter into the multiplicity of arguments ufed on both fides；nor can we pretend to fettle it， as the fubject is confeffedly above human comprehen－ Gon．

As to the works of creation which the Deity is known to us to have performed ；all other beings，be fide himielf，are his creatures．Men and other ani－ mals that inhabit the earth and the feas，all the im－ menfe varieties of herb，and plants of which the ve－ vetable kinglom conalis；the plube of the earth，and the expanfe of the ocean；thete we know to have been pionduced by his power．Betides the terrehrial world which we inlabit，we fee many other maturial bodies dipofed around it in the wide extent of face．The rhous which is in a particular maner conaceted with
our earth，and even dependent upon it ；the fun，and Creation． the other pianets with their fateliites，which，like the earth，circulate round the fun，and appear to derive from him light and heat；thofe bodies which we call fixed ftars，and condider as illuminating and cherithmg with heat each its peculiar lyitem of planets；and the comets which at certain periods furprife us with their appearance，and the nature of whote connection with the general fyftem of nature，or with any parti－ cular fyftem of planets，we cannot pretend to have tully difcovered；－thefe are fo many more of the Deit－＇s works，from the contemplation of which we can－ not but conceive the mof awful idtas of his crative power．

Matter，however，whatever the rarietits of form under which it is made to appear，the relative ditpo－ fition of its parts，or the motions comnumicated io it，is but an inferior part of the works of creation． We believe ourfelves to be animated with a much high－ er principle than brute matter；in viewing the manoers and economy of the lower amimats，we can learee avoid acknowledging even them to confitt of tomething more than various modifitations of matter and motion：The other planctary bodies which feem to be in circumblan－ ees nearly analorous to thofe of our earth，are fure－ ly ，as well as it ，deftined for the habitations of rational， intelligent beings．The exitence of intelligrences of an higher order than man，though infinitely below the Deity，appears extremely probatle：－Of thofe fpiritual beings called Angels we have exprefs in－ timation in feripture；（fecthe article Angels．）Such are our nutions concerning the exiltence of beings ef－ fentially diftinct from matter，and in their nature far fupenior to it：thele，too，mult be the creatures of the Deity，and of his works of creation the noblett part． But the limits of creation we malt nut pretend to de－ fine．How far the regions of fpace catend，or how they are filled，we know not．Ho：s the planetary worlds，the fun and the fixed flars，are oceupied，we do not pretend to have afcertained．We are even ig－ norant how wile a diverfity of forms，what an iatiaty os living animated beings may inhabit our own globe． So confined is our knowledge of creation；yet fo grand，fo awful，that part which our narrow under－ dandings can compreliend！

Coneerning the periods of time at which the Deity executed his feveral works of creation，it canot be pretended that mankind have had opportunities of re－ ceiving very paricular information．From vewng the phenomena of nature，and confidering the general laws by which they are regulated，we cannot draw any conclutive or even plaulible inference with refpect to the precife period at which the univerfe mult have begm to exilt．We know not，nor can we hope to afertain，whether the different iytems of planets cir－ culating round ous fun and the other fixed ftars，were all created at one period，or each at a dififent periud． We camor cven determine，from any thing that ap－ pears on the face of nature，whether our earih was not created at a later period than any of her fellow planets which revolve round the fame fun．Aftronomers are， from time to time，making new difcoveries in the ha－ rens；and it is inpofible to fay whether fome of thefe fucceffive difcoveries may not be owing to fuccelfive creations．

Plilofuphers have，indeed，formed fome curious con． 1 jectures

Creation.
jectures concerning the antiquity of the earth, from the appearances of its furface, and from the nature and difpofition of its interior Arata. The beds of lava in the neighbourhood of volcanoes have afforded ground for fome calculations, which, though they do not fix the period of the earth's origin, are yet thought to prove that period to have been much more remote than the carlieit age of facred or profane hiftory. *In the neighbourhood of mount Aitna, or on the files of that extenfive mountain, there are beds of lava covered over with a confiderable thicknefs of earth; and at leaft another, again, which, though known from ancient monuments and hiftorical records to have iffued from the volcano at leaft 2000 years ago, is ftill almoft entirely deftitute of foil and vegetation: in one place a pit has been cut through feven different ftrata of lava; and thefe have been found feparated from each other by almoft as many thick beds of rich earth. Now, from the fact, that a itratum of lava 2000 years old is yet fantily covered with earth, it has been inferred by the ingeniuns canon Recupero, who has laboured 30 years on the natural hiftory of mount Etna, that the loweft of thefe ftrata which have been found divided by fo many beds of earth, mull have been emitted from the volcanic crater at leatt 14000 years ago; and confequently that the age of the earth, whatever it may exceed this term of years, cannot pollibly be lefs. Other facts of a limilar nature likewife concur to juftify this conjecture.

But all thefe facts are as nothing in comparifon with the long feries which would be requifite to ettablifh fuch a conjeeture as in incontrovertible truth. And, befides, any evidence which they can be fuppofed to afford, may be very eafily explained away. The bed of lava which in the courfe of 2000 years has fcarce acquired a covering of earth, is confefled to fland in a fituation in which it is expofed to the fpray of the fea, and to all the violence of winds and rains. In fucl a fituation, it cannot be thought that a thick bed of earth could, in any length of time, be formed on it : we nuight as well expect depth of fuil and vigorous vegeation on the craggy cliffs of hills. In crevices here and there over it, in which the earth has been retained, there is a depth of foil which fupports large trees. This fact, therefore, admits of no fuch inference as that which Recupero has pretended to deruce from it. The beal circunftances, again, of the feven trata that have been pierced through, are very different. They are fituated at Jaci Reale, in a fitnation where flowers of ahes from the volcano mull frequently fall: and where whatever falls malt be naturally retained and accumulated:-fo that feven beds of carth might be formed on thefe feven trata of lava much fooner than one thin layer could be formed on the flratumabove mentioned. In other places, fone of which are within the influence of the fame awful volcano, and fome adjicent to that of Vefurius. foil is known to have acemmated on lava with the help of fonwers of athes from the volcanues, wilh fufficient rapidity to jultify this fuppofition concerning the coverings of the flata at Jaci Realc. From the obfervation of thefe phenomena of volcanots, therefore, no facts lave been gainced that can help us to determine with any certainty the earth's arge. Ard fo wide is the rariety of circumatances to be here taku into ac-
count, that it cannot be hoped that this defideratum will Creation, be ever fupplied from this quarter. See further the article Earta; $1^{2} 177$ and $i_{7}$ s.

But by examining the compoftion and arrangement of the interior trata of the sclole, and by viewing the general appearance of its fuffoce, the ingenuity of philofopliers has, with better hopes, fonghit to gucfs at the length of time during which it muth have exitted. Obferving the exuriz of fea and land amimals depofited at profound depths under ground, and ac. companied with vegetable bodics in a good thate of prefervation, as well as with oleaginous and hituminous fubftances which have in all probability been formed from vegetable bodies; and remarking at the fane time with what confulion the other materials, compofing the cruft of this terreftial ball, are, in various inftances, not arranged, but calt together; they have concluded that the earth mout have exilled for many an age before the earliell events recorded in facred or profane hiftory, and mult have undergone many a revolution, before it fettled in its prefent Hate. Such at hate are the ideas which Buffon and M. de Luc, and afo Dr Hutton $\ddagger$, feem detirous to inn- $\ddagger$ Ed. Pher prefs us with concerning its changes and antiqui- Tranf. ty.--It will be only doing jartice to thefe phif, fo-vol. a phers to acknowledge, that they have collected, with amazing indultry, almot every fact in the natural hifory of the earth that can ferve to give plaufibility to their conjectures. But fill their facts, berides the inconfiftency of many of them, a•e by far ton feanty to warrant the conclufions which they bave pretended to deduce from them. See the article Earth
The voice of profane hiltory is far from being de- Acounts of cifive concerning the age of the world; nor is it to be the metiquiexpected that it thould. When the earth firt arofe ty of the inperthat horlo earth frem mankind were not fpectaturs of the event: and we fury. may naturally imagine that the firt human being who occupied it, would be too much bufied in furnifing themfelves with the immediate neceflaries and the conveniences of life, to think of curious refearches into its origin, or even their own. Profane hiltury is not, however, without accomats of the age of the earth and the origin of human fociety; but thofe accomans are various and contradictory. - Plato in his dialogue intitled Crititur, mentions his celebrated Atalantis to have been buried in the ocean about yoos years before the age in which he wrote. He afferts it to have been well known the Egeptian pivits and to the cotumporary inhatitonts of Attica. The leanted word. indeed, gen-rally agte in regarding lis accounts of that ifland as a fietion, which the author himelf die! not detiga to be menderthood in any wiler light: furae, however, are morecrednome, and inthers go fo far as to acknowledge doubes: and, is the exittence of fuch an iflud, at a perinel fo dutant, be admittel as a fact worthy of any creine, the age of the woth may be reckoned as at icent confiduraldy mone than 12,000 years. The pretentions of the Chinefe reprefene the world as fome handrels of thoufands of years older: and we are alro the" that the allmonenical records "Trmerat of the anciont Chaldeans carried back the origin of haj. vol. i. focicty to a very remote periud; in lefs than 473.000 piogne. yare. Creation are fo difcordant, and fo flenderly fupported by evidence, that we cannot hefitate to reject them all as falfe; the fables of hiftorians fearce merit fo much at-

4
Theeranf tention as the liypothefes of philofophers. as fore in may realonably expect more accurate and more creas ftated in dible information concerning the antiquity of the Eiftory. globe. As the authenticity of the Holy Scriptures is fo incontrovertibly eftablihed, wherever they afford evidence concerning any fact, that evidence mult be regarded as decifive. A fact fo important as the prefent may be thought highly worthy of a place in them. Unfortmately, however, even the facred writings do not fix the era of the creation with funficient accuracy; they leave us, in fome mealure, at a lofs whether to extend what they fay concerning that era to the whole contents of ercated fpace, or to confine it to our earth and its inhabitants: different copies give different dates; and even in the fame copy, different parts relating the fame events, cither difagree or do not fpeak decifively with regard to the length of the time in which they paffed. - In the beginning of the fisth chipter of the firt book of Kings, the time which elapfed between the departure of the childen of Ifrad from Egypt. and the period at which sulumon laid the fouadation of his temple, is faid to have been 480 years: And in the book of Judges ayain, + Crivercal the age of all the patriarehs amumts to 592 years. $\dagger$ Fite wal. .t The Fitbrew copy of the bible, which we Chritians Figger.
they may be confidered as nearly fixing the true pe. Creation riod of the creation of the earth.

Profane hillory cannot be expected to contain an account of the hilt events which paffed after the ercation of the fubftances of which the unverie condits. Tlae conjectures of ancient philofuphers on this fubjoct cannot merit atteution; for vague tradition, and the appearances of nature, the only data on which they could procetd in forming their conjectures, could admit of no fair inductions conctrning thole events; and befides, inftead of liftening to tradition, or examining the appearances of nature, they genctally cunfulted imagination, and imagination alone, on fuch oncafions. Here, thetefore, we have nothing to hope but from the facred writings. From them we may expect hiftorical information, not to be obtained from any other lource. What they communicate is communicated on disine authority; and it is only on wach authority we can receive any accounts concerming the creation.

A fow hints in the book of Jub, afford the carliof Hints coninformation to befound in the leriptures concoming the creation of the world. "Where walt thou when I laid the foundations of the earth, when the murning jub. fars fang together, and all the fons of Godmouted fur joy*?" "Behold, he put no trutim nistervants, and his angels let charged with fully.f." "And unto man, crxamii. (or to Adam), he faid, dieheid, the fear of the Lurd ver $4 \& \%$. is whidum, and to depart from enl is underitandingt." Thefe paffages ratler hint at tian relate facts. But it has been infered from them, that there ware tars in the firmament, and angels in haven, before the formation of cur glube; that angels as wid do man have fallen ; and that other injunctions, betides that of abfiaining from the forbidden fiuit, were lad on Adam when be was hirt placed in Patadie $\|$. If the inter. pretatiun be admitted as juit, the finit of thele facts Noinformitio. on the head to be obe Thred from a:y other Tuarce hae lacred hiwory.

.he bouls ofjub.
Chap.t Ch 1 V . 4er.I9. Ch xavä. Ver. 2x. the creation of the world $39++$ years before the Clusiftian era. The Samaritan bible, again, fixts the era of the creation 4305 years before the birth of Chritt. And the Greck tranlation, known by the mame of the Septagint verfion of the bible, gives 5270 as the number of the years which intervenell between thofe two periods. As many other different calculations of the years contained in the fame internediate fpace of time, unight be formed upon other dates in the facred wolune, difering in the different copies. By compa:ing the various dates in thie facred writings, examining how thefe have come to difagree and to be diverfified in different copics, endeavouring to reconcils the mont authentic profane with facred chronolugy, and ekiug wut deficiency of dates and evidence with conjecture; fome ingerious men have formed fehemes of chronulogy, plaufble indeed, but not fupported by fufficient authoritics, which they would gladly perfuade us to receive in preference to any of thole above mentioned. Uher natics out from the Hebrew bible $+00+$ years, as the term between the creation and the birth of Chrift: Jofephus, according to Dr Wills and Mr Whitt $n$, makes it 4058 years; and M. Pezvon, with the help of the Septiagine, exterds it to 58.2 years. Chare's fyatem is the mult generally received.
But though thefe difierent fyttems of chronology arc fo inconitiont and fo fonderiy fupported, yt the difierences among thens are to incuniderabic in comparifon with thofe which arife before us when we contemplate the chronolegy of the Chinefe, the Chaldeans, ind the Eayptians, and they agies fo well with the general information of authentic hite $y$ and with the appearance of gature and of fociety, that
may be confuencel as forming, as it were, a point with Lear. 1 , which ourknowhedge of the watks of the Deity com. beroes: the period of time at which the feond eoent took place is nut fpecified; and the precept to Adam mut no doubt have been uttered after he was formed and infuised whik intelligence. Yet with regard to the linf of the above quotations from the book of Jub, the ont? one that is of importance io us at prefent, it muat be akbow'suged, that it has been dillerentiy underrtwod. The morning itars might ling together, and the fons uf Bod thout for juy, on account buth of their own creation and of the creation of the carth at one time; ard yet Job, having been himelf made a colfious buiug at a much later period, not be aole to tell where he was at that era of exulting gratituede and congratnlation.

Iviufeo r lates, that* " in the Esginiag God created a faicaethe havens and the earth. And the ea.th (continues munt of he) was without form and roid; and darkutis was the creupun the face of tae deep: and the firit of Gud movel rpon the fuce of the waters. And God faid, Let there oe light: and there was light. And Gud faw the light, that it was good: and God divided the light from the datinnefs. And Gud called the light day, and the darknefs he called night: and the everanis and the muming were the ent day." During tive ficcied. ing days the woik of areation was carried on. On

## C R E <br> [ $5: 5$ ] <br> ( R E

Creation. the fecond day, a firmanent was made to feparate the waters, and that firmanent called bazen: on the third duy, the waters were collected into feas, and the land from which the waters retived canted to produce grais and trees and other plants: on the fourth day, hights were made to appear in the femmment ; to enlighten the earth, to divide the day from the night, and to ditlinguifh time into fuafons and joars: on the nith day, the feas were peopled with whales and uther fithes, and the air with fouls: on the fixth day, the carth wes furnithed with reptiles and quadrapids of all kinds; and on the fame day, the tirlt humen pair, the progenitors of all the human race, were created in Gouds
own mage

Some diffeutices occur in comparing this accumnt of and aquenus, and oltaginous, and aerial particles which Dr Bumet ands in it ; he confines not the faas within
as cruft of carth; nor does he inforn us that the Creation kencry of mature was not divenfinid by hills and whes. Pefiches, the author of this theory has, without ary cuideree, mppoled matter to hase been originally uader the iathence dhaws very dillereat from thole by which it is at prefont regulated. Oil, indecd, while ditid, floats above water: but in a conerete Itate, it fi:ks in water like other folid bodis. If rudueed into that it ite by combination with terrene matters, fufficiont torender the mixture proper for the mombinment amd production of vegetables; its fecentie gravety will be flill greater, and it will confoquenty link 10 much the fooner. How a concrete lubtance, cuarting of earth and oil, comld Hoat on water, appeas an incepplicalle enigmab. But we ned not bere take fanther pains in combating and trumphing over this thoory, which has lung fince fallen and funk to its grave.

N1 Whiston treats both the feriptures and the Mr Wh:laws of mature with greater reverence. Yet he cer- tion's theon tainly involses himfelf in no trifing dutheultes in at. r . tompting to fulve thofe which Mules prefents. He fuppufes the fun, moun, and thats to be all more anciont than the carth. The chaos from which the carth was formul. he reprefents as having been originully the atmuphere of a comet. 'The lis days of the ereation he wand perfadde us to believe equal to lix of our bealis: for lie is of opinion, that the carth dad not revolve daly ruand its axis, but only amaully round its orbit, tial after the fall of man.

On the tia a day or year, therebore, the more porsderous paits of the chous were acconding to this theory conglomerated into an orb of earth, the chinks and interltices wer that urb tilled up with water, and the exterior part or atmofpliere raretica, for as to admit fome faint glimmering of the rays of the fun.

On the fecond day, the atmofphere was diffufed to its due extent around the earth, and reduced to a degree of rality and purity winch rendered it itill more iuitable for the tranfmilfion of light; the carth was ifill more comblidated; and the waters being almolt entirely cocluded fiom the interdices which they lefore secupied, were partly fpread over the furtace of the earth, and partly raifed in sapour into the atmotphere or firmament.

On the thind day, the carth's furface become fo irrogalar, in one place riling into hills, in another finking into vales, as to caufe the waters, which were befure equally difafcd, to cullect into feds and lakes, leaving large thate of ground unocoupied. And no fooner was a part of the earth's fuaface leat bare by the wates, than the general influence of the fun prodaced on it a sith corvering of herbarge, and all the defferent fuecies of vegetable's.

On the furith day; the earth was rendered fubject to dife regular influctice of the fun, moon, wathas.
()n the fifth day or yedr, things were fo far advanced, that fothes and fowls were now produced from the waters.

On the funh day was the carth furnithed with aninats; and the lurd of all the uther mimats, man, was now created.

Sud is Mr Mthfun's accoment of the phemomena of ofmetione the Mutaie creation. But be likevili allumes mach on Mata muse than can be scafombly grantud. The atmon thats then fonesty

Ceation. Sphere of a comet could not well be the primitive chaos; it is not an obfcure, but a pellucid fluid ; and its exterior frata, if of the fame nature with the matter of our earth, muf be feorified by its near approaches to the fun. Had the earth not begun to move round its axis till after the work of creation was completed, the immoderate degrees of heat and cold which its dificrent parts would have alternately felt, would in all probability have proved fatal to both plants and animals. Even the mof artful interpretation of Mofes's words cannot reprefent him as meaning to inform us that the fin and moon were created at different periods. But philofophy will farce permit us to imagine that the moon was formed befre the earth. And therefore we cannot upon good grounds agree with Mr Whifton, that the creation of the earth was later than that of thenryand original formation of the earth, and the changes which objections. it has undergone, is M. de Luc. This cofmologit, like Mr Whifton, thinks that the days of the creation were much longer periods of time than our prefent days. He feems to think that the earth bad exifted long before the Mofaic creation; but began at that era to experience new changes, and to be regulated by new laws: that all the different events defcribed by Mofes in his hiftory of the creation, actually took place in the order in which he relates them; but that Mofes's days are indefinite fpaces of time, which mull have been very iong, but of which we cannot hope to afeertain the procife length. Thefe are ingenious conjectures; but they do not appear neceflary, nor are they juftified by facts. For a fuller and more clofe invelligation of this part of the fuhject, we muft refer to the article Earth : and fhall now clofe the prefent aricle with a fhort explanation of what appears to us the $m$ of natural way of underlanding Mof's's account of the creation.

It las been conjectured *, with great probability, that the creation of which Moles is the hitorian, was neither confmed to the carth alone, nor extended to the whole univerfe. The relation which all the planets of the folar fyitem bear to the fame illunating body conntenances the conjecture, that they, together with the luminary by which they are enlightened, werc all created at one period: but it wonld perhaps be to conceive too meanly of the benconlence, widom, and astive power of the Deity to fuppole that before that period thefe had never been exerted in any work of creation. Yet even here we have not demonitrative evidence.

On the fuppofition that the whole folar fyften was created at once, which has at leaf the merit of doing no violence $t$, the marrative of Murs, the creation of the fun and the cther planets may be underflond to have been carried on at the fance time with the creati.n of the ath. In that cafe, even in the courfe of the firt day, thomb not longer than our prefent days, thofe folies might be reduced to fuch order, and their relutive moti ins fo far eftablifhed, as to be gin elie difimetion between lighe and darknefs, day and 1.2chi.

Cu the fecend day, we may naturally underfand from Mufes's ratrative, that the atmofphere was puriijed, and the fyecific gravitics of aqueous vapour and
atmolpheric air Co adjufted, as to render the latter capation of fupporting the former.

On the third day the waters were finf collected into lakes and feas: buc in what manaer, we cannot well determine. Some call in the operation of earthquakes; athers tell us, that when the earth was firlt formed, the exterior frata were, at different parto over its furface, of different feccitic gravities; and that the more ponderous parts now funk mearer the common centre, while the lighter partsilill remaining equally, emote from it as before, formed ifands, continents, hills, and mountains. liut thefe are mere fancies; and we have not facts to offer in their fead. On the later part of this day vegetables utre caufed to fpring up over the earth. Their gowth mult have been much more rapid than we ever behold it now : but by what particular act of fupernatural power that might be effected, we thould in viin inquire.

On the fourth day the fun, moon, and Atrs, were made to appear. But acco:ding to the conjecture which we have mentioned as plaufible, though without aleribing to it the evidence of certain truth, thofe heavenly bodies are to be conlidered as haviag been created before this day. But they might now begin to exert their full influence on the easth in the fame manner as they have fince continued to do.

The creation of the inanimate world was now finifh ed, and the eartl prepared for the reception of animals. On the fifth day, therefore, were the living inhabirants of the air and the waters created.

On the lixth day the inferior animals inhabiting the earth were firf created; and after that, the whole work was crowned by the creation of a male and a female of the human fpecies. 'To the account of the creation of the animals, nothing certain can be added in explanation of Mofes's narrative. No morc but one pair of the human fpecies were at fint created: the fame economy might poffibly be oblerved in the creation of the inferior animals."

CREBiLLON (Profper Joliot de), a French writer of tragedy, and ufually ranked after Corneille and Racine, was born at Dijon in $\mathbf{1 6 7 4}$. He was originally deflined to the profefion of the law, and placed at Paris with that biew; but the impetuolity of his pafions rendering him unfit for bufnefs, he was mged by fome friends, who difcerned very well his natural turn, to attempt dramatic compofitions. He complici, but not till after many refulals; and gave at length a tragedy, which met with great ficecels. He then marched on in the carecr he had begun, but was checked by a fit of love for an apothecary's daughtel ; which fit of love erded in marringe. His father, donbly enraged at his fon for thus furrendering himfelf to the two demons of Love and Poetry, difinherited him; hut falling fick fome years after, in 1 r07, he re-eflablithed him in all his rights, and died. Crebillon was, however, little better for his acquilitions, the greatell part being probably walled before they came; and thus, though ligh in fame and at the prime of life, he titl continued poor. He lolt his wife in 1711, and fortune long frowned upon him, till at faft lie obtained a place in the French academy, and the employment of cenfor of the police. He vas afterwards in good circumftances, and happy to tiac end of his life, which was a very long one; for he did not

## C R E

Lettors of Creblt, are thofe given to perfons in whom a merchant, \&ec. can truit, to take money of his correfpondent abroad, in cale he happens to need it.

Credit is alfo ufed for the currency which papers or bills have in the public or anong dealers. In this fenfe credit is faid to rife, when, in negociating the fhares of the company, they are roceived and fold at prices above mer, or the thadad of their fiat ercation. Diferechit is oppoled to credit, and is ufed where muney, bills, \&e. fall blluw pur.

Credir was allo ancicotly a right which lords had over their vaffalo; confliting in this, that during a certain time they might oblige them to lend them money. In this fente, the Duke of bintanny had credit during lifteen days on his own fubjects, and thofe of the bithop of Nantes; and the bilhep had the fance credit or right among his fubjects and thofe of that prince.

CREDITON, a market-town in Devonfire, comfidcrable for a grood woulten manufactory: it is fitaated about 9 milis north-welt of Exeter, in W. Long. 3. 50 and N. Lat. 50.50.

CREIITOR, a perfon to whom any fum of momey is dae, cither by obligation, promife, ow otherwife. Sue Debt.

CREDULITY denotes a weaknefs of mind, by reafon of which a perfon gichs his affent to propolitions or facts, before he has confadered their evidence.

CREECH (Thomas), eminent for his trandlations of ancient authors both in profe and verfe, was fun of Thomas Creech, and born near Shemorne in Durfetfhire in $1659^{\circ}$. He was educated in grammar learning under Mr Cirganven of Sherborne, to whom he afterwards dedicated a tranfation of one of 'Theocitus'sIdylliums; and entered a commoner of Vadham college in Oxford in 1675. Wood tells us that his father was a gentleman; but Giles Jacob fays, in his Lives and characters of Englifh I'oets, that his parents circumtances not being fufficient to afford him a liberab education, his difpulition and capacity for leaming raifed him up a pation in Colonel Strangeways, whote esencolity fupplied that defoct. Be that as it will, Creech dithinguifoed himfelf much, and was accounted a good philufopher and poot, and a diligent Aludent. Jume 13.1683 he took the degree of mater of arts, and not long after was clected probationer fellow of Allfouls college ; to which, Jaceh oblerves, the great reputation acquired by his tranflation of Lucretius recommended him. Wood thls us, that upun this uccation he gave finglar proofs of his claffical learning and philofophy before his examiners. He alfo took the degree of B. D. on the 18 th of March 1696 . He now began to be well known by the works he publined; but Father Nicerom obferves, that they wote of wo great adsantage to his fortunc, fince his circumflarces whe always indifurent. In royg, having taken bely orders, he was prefented by his college to the !iving of W Chwy in Hortfordhire; but this le had not hong enjoyed before he rut an end to his wwa lifc. The motives of this fatal catatrophe have been variondy repredented. 'I he anthor of the Nourelles de la Repuligue dis Lattres informs us, that in the ? ear 1700 Mr Cuceld fell in love with a soman who rated hime
river or habour, with a rope faitened to it, to hook and draw up any thing from the bottom which may have been loft. See Plate CL.

CRLLLIUS (John), a famous Socinian, born in 1590 , in a village near Noremberg. In 1612 he went into Poland, where the Unitarians had a fchool, in which he became profeffor of divinity, and minitler at Crackow, where he died in 1632, aged 42. He was the author, 1. Of a famons Treatife againt the Myftery of the Trinity; 2. Commentarics on a part of the New Teftament ; and other works. All of them are fearce.

CREMA, a city and bihop's fee of Italy, capital of a diftiict of the Milanefe, called from it Cronafoo: it Atands almoft in the middle between Milan and Mantha. in E. Long - 10. 15. and N. Lat. 45. 20.

CREMASTER, in anatomy, the name of a mufcle of the tefticle, of which there is one on each fide. See Anatomy, Table of the ATufces.

CREMATION is fometimes ufcd for burning, particularly when applied to the ancient cuflom of burning the dead. This cultom is well known to have prevailed among molt eaftern nations, and continued with their defcendants after they had peopled the different parts of Europe. Hence we find it prevailing in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Chritianity abolifhed it.

CREMONA (anc. geog.), a Roman colony, with municipal rights, fettled bejond the Po, below the confluence of the Addua, on the report of Hannibal's march into Italy (Pulyhius) : a town at this day flll maintaining its name and flourifing ftate. It was an opuicnt and mercantife city; but fuffered greatly in the civil wars of Augultus (Virgil). In the war with Vitellius, it was deftroyed by the partizans of Vefpafian; but was foon after rebuilt by the munificence of the citizens and exhortations of Vefpafian, (Tacitus). Nuw capital of the Cremonefe in the ducliy of Milan. E., long. 10. 30. Lat. 45.

CRENATlid, iubotany. Sce Botany-Index.
CRENELLE, or Imbatteed, in heraldry, is ufed when any honourable ordinary is drawn, like the hattlements on a wall to defend men from the enemies thet. This attribute belungs to the arms of fuch as have defended callics for their prince or country, or of fuch as are filled in architecture.

CRENOPHY'LAX, in antiquity, a magitrate of Athus, who had the infpection of formains.
CREODIBA, in the cuntums of the middle are, a robbery and murder comnnitted in a woud, where the body of the perfon killed was tharnt in order to prevent any difucery of the crime The word, fays Wendelinus, is compoanded of cray and diven, that is, "wood-rebbers."
CREOLES, a name given to the families defeended from the Staniards who firlt futeled at Mexico in America. Thefe are much more numerous than the Spaniard propely fo called, and the Mulatoes, which two other fuccies of inhalntants they diftinguifh; and are excluded from all confaderable employments.

CREON, king of Corinth, was fon Syfiphus. He promided his daughter Glauce to Jafon, who had repudiated Medea. To revenge the fuccess of her rival, Medca fent her for a prefunt a goon covered with poifon. Glauce put it on, and was feized with fuddenpains.

## C R E

Creon Her body took fire, and the expined in the greatedt tor11 repia ments. The houfe alfo was coniumed by the fire, and Creon and his family flared Glauce's fate.

Crbon, fon of Menietius, was father to Jocnla, the wife and mother of Ot lipus. At the death of Laius, who had marifed Jocatla, Crcon afcended the vacant throne of 'Thebes. As the ravages of the Sphynx ivere intolerable, Creon offered his crown and daughter in marriage to him who could explain the enigmas which the monter propofed. Oedipus was hoppy in his explan itions, and he afcended the throne of Thules and marrid Jucatha without knowing that foe was his mother, and by hor he had two fons, Poly nices and Cowects. Theie two fons mutually agred after their father"s death to ragen in the kingem cach a year altornatioly. Etcocles foft afecoded the throne by right of fenmity; but when he was once in power he refufcel to sefirn at the appointed time, and his brother led againd him an arnes of Argivesto fupport his right. The wat was decided by a fingle combat between the two hrothers. Thay botla killed one another, and Crenn afembed the thone till Leodamus the fon of Eteocles flould be of a fusficient age to affume the reins of ercmanent. In his regal capacity he commanded that the Argives, and more paticularly Polynices, who was the caufe of all the bloodmed, flould remain unburied. If this was in any manner difobeyed, the offenders wete to be buricd alive. An. tigone the filter of Pulynices trangreffed, and was accordingly punibed. Hemon the fon ef Croon, who was paffionately fond of Antigone, killed himelf on her grave, when his father refuted to grant her pardou. Croon was afterwards lilice hy Thefons, who had made war with him becaufe he refufed burial to the Argives.

CREPANCE, in the manege, a chop or cratch in a horfe's leg, given by the fpunges of the thues of one of the hinder feet cronling and thiking againt the other hinder foot. This cratch degenciates into an uleer.

CREPIDA, among the Romans, a kind of תippers or thocs, which were always worn with the pallium, as the calici were with the tora.

CREPIS, hawk-weed: A genus of the polygamia fuperflua orker, belonging to the lyngenefia clafs of plants; and in the natural method ranking under the $40 t \mathrm{l}$ order, Compofitu. The receptacle is naked; the calyx calyculated with deciduous feales; the pappus feathery and llalked. There are it fpecies, moft of them herbaccous annuals, riling to the height of a foot or a foot and an half; and having their branches terminated by ligulated componad red and yellow flowers. Thefe are very large. and confith of many fiat forets fpread over one another imbricatim, and when fully blown appear as if radiated. They are rery confpizuons and beantiful : and appear in June, Tuly, and Auguft. They are fucceeded by plenty of feed, whiel: if permitted to featter on the ground, will produce a number of young plants without further trouble.

CREPITATION, that noife which fome fales make over the fire in calcination, called alfo dituna. tion.

Crfpitation is alfo ufed in furgery, for the moife made by the ends or pieces of bones, when the far-

Vol. V. Part II.
geon moris a limb to afiure limfelf by his ear of the Crepundia cxittence of a hracture.

CREPUNDIA, in antiquity, a tcrm ufal to cx-Crefent prefs fuch things as were expofed along with children, as rings, jewels, \&c. ferving as tokens whereby they afterwards might be known.

CREPLSGCULUM, in attronom;, twilight; the time from the firl dawn or appearance of the morning to the rifing of the fun; and agim, between the: fetting of the fin and the lath remains of day.

1'upis derives the word from creperus ; which, he fays, ancicntly figniliced uncortain, doubfuh, q. d. a dho liourlisht. 'The crepufoulum is ufualiy computed to begin and end when the fun is about is degrees below the horizun; for then the Atars of the dixth magnitude difappeat in the morming, and appar in the cocnimg. It is of longer duration in the folftices than in the equinoxes, and longer in an obligue han in a light fphere.

The ercpufella are oce:tion 1 by the fan's rays refracted in our atmoppere, and reftectod from the particles thereof to the eyc. See 'I'whagur.

CRESCLENT, the new moon, which, as it begins to recede from the fun, thows a litte rim of light, terminating in points or horns, which are ttill increating till it become full and round in the oppofition. The word is formed from crefios "I grow."

The term is afo ufed for the fanc igure of the moon in its wane or decteate, lout inpropetly; becalufe the points or homs are then turned towares the wed, whereas they look to the eat in the juft crefeent.

Crescent, in heraldry, is a bearing in form of a half moon. 'lhe Ottomans bear linople, a crefeent montant, argent.
'The crefcent is frequenty ufed as a difference in coat-armour, to ditinguin it for that of a fecond bro ther or junior family.
'The firure of the crefeent is the Tukifl Cymbol; or rather is that of the eity Byzantiom, which bore this device from all antiquity; as appears from medals ftruck in loonour of Auguitus, Trajan, \&c.

The crefent is fometimes montant, i. e. its puints look towards the top of the chief, which is its moft ordinary reprefentation ; whence fome contend, that the crefeent, abfolutely fo called, implies that dituation; though other autho:s blazon it montant, when the homs are towards the dexter-fide of the efeutcheon, in which pofition others call it incruiffant.

Crefcents are faid to be aloffed, when their backs or thickett parts are turned towards each other; their points looking to the fides of the micld. Crofocnt inwerfed, is that whore points look towards the bottom: turned crefents, are placed like thore adoffed; the difference is, that all tiscir points look to the dexter-ficle of the thicld: conturnud cirfients, on the contrary, look to the finiter fide: affronted or appointed crifeents, are contrary to the adoilicd, the points looking towards each other.

Crbscent is alfo the name of a military order, inftituted by Renatus of Aujou, King of Sicily, \&c, in $144^{8}$; fo called from the badre or fymbol thereof, a ercfecnt of gold enamelled. What gave occafion to this eftablifment was, that Renatus took for his de vice a crefcent, with the word lea, "praife," which, in $3 X$ the.

## C R E

Crefcertia, the fyle of rebus, makes loz in crefcent, q. d. by ar-Crefim- vancing in surpue, one merits fraife.

CRESCENTIA, the calabash-tree: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the naturil method ranking under the $2 ;$ th order, Putamine. The ealy $x$ is bipartite and equal: the corolla gibbous; the berry pedicellated or Raliced, unibocular, and pulypermons; the feeds bilocular. There are two fpecties.

1. The cujete, with oblong narrow leaves and a large oval frut, is a native of Jamaica and the Leeward Iflands. It hath a thick tumk covered with a whitith bark, which rifes from 20 to 30 feet high, and at the top divides iato many branches, forming a large and reumar head, gamifhed with leaves, which come ont irre rulariy, fometirues lingle; at other times many arife ont of the fame kent : the flowers are produced from the fides of the large banches, and fometimes from the tumb, flanding upon long footitalks. They have but one petal, which is irregular ; and they are of a greenith yellow colour, it iped and foutted with brown. 'Thefe are fucceeded by very large fruit, generally foperical, fometimes oral ; and at othertimes they have a contracted neck like a buttle ; and are fo large, that when the pulp and feeds are cleaned out, the thells will contain three pints or two quarts of liquid. The fruit is covered externally with a thin kin of a greenith-yellow colour when ripe. When this is peeled off, there appears a hard ligneous thell, inclofing a pale yellowith foft pulp of a tart unfavoury flavour, furrounding a great number of flat heart-fhaped feeds. 2. The latifolia, or broad-leaved calabafh, feldom nifes more than 15 or 20 feet high, with an upright trunk, covered with a white fmoath bark, fending out inany lateral branches at the top, garnifhed with leaves three inches in length, and one and a quarter broad, ranged alternately. The flowers come out as in the former fpecies; but are fmaller, and of a deeper yellow colour. The fruit of this fort is fometimes round, fometimes oval, but of very mequal fizes. Both thefe fpecies are eafly propagated by feeds; but the plants are too tender to live in this country, unlefs they are conftantly kept in a ftove.

The fhells of calabathes are made ufe of for various purpofes. At Barbadoes, befides 'drinking-cups and punch-bowls, there are made of them foons, difhes, and other utenfils for the naves. Some of thefe fhells are folarge, as to be capable of holding 15 pints of water. 'The pulp is feldom eaten, except by cattle in the time of drought. The wood, which is hard and fmooth, is made into fools, chairs, and other furniture.

CRESCIMBENI (John Maria), an Italian, was born at Macerata in Ancona, i663. His talents for poetry and eloquence developed themfelves early. His verfes at frift had too much pomp and point ; but refiding in Rome, and reading the beft Italian poets, brought him back to nature. Hie not only reformed himfelf, but undertook to reform bad tafte in general. From this motive he projected the ellablihment of a new academy, under the name of Arcadia; the members of which at firf did not exceed $I_{4}$, but afterwards increafed much. They called themfelves the Shepherds of Arcadia, and each took the name of fome fhepherd and fome place in that ancient kingdom. The founder of this fociety was appointed the director of it in 1690 , and held this bonourable poft $3^{8}$ years;
namely, to the year of his death, which happened in 1723. Amons a great number of works, in verfe and profe, the principal is, An Hiftory of the Italian Poctry, very much efteemed, and reprinted, 1731, at Venice, in fix volumes itg. This hiftory is accompamied with a commentary, containing ancedotes of 1 talian poets. He publithed alfo An Ilithory of the Academy of Areadia, logether with the 1 Lives of the moit illuftrions Arcadians: and many other work.

CRESSY, or Cressy. See Cressy.
CRESS, watek-cress, or cresses, in butany. See Sisumbrium.

Indim Cruss. Sce Trormonum.
CRESSSY, a port-town of Picardy in France, about 44 miles fouth of Calais, and 27 north-well of Abbeville, remarkable on account of the victory obtamed there orer the French by Edward III. of Eingland, in the year ! 3 fo. E. Long. 2. o. N. Lat. 50. 20.

Fdward having eneountered and orercome many difficulties in his expedition, was at latt fo clofely followed and haralled by the Fiench army, commanded by the King of France in perfon, that he detemined to make a thand at this place, and to give lis purfuers a check. For this parpofe he chofe his ground with great judgment, on the gentle dechivity of a hill, with Fienry's a thick wood in his rear. He ordered deep entrench- Vol iv. ments to be made on cach Hank, and waited with p. 178. firmnefs the approach of his enemies. The King of France, dreading nothing fo much as the efeape of the Englith, began the march of his great army from Abbeville carly in the morning, Auguft 26. and continned it feveral hours with great cargernefs, till he received intelligence that the Englifh had halted at Crefly, and were prepared to give him battle. He was advifed at the fame time not to engage that day, when his troops were much fatigued with their march, and in great diforder; and he was difpofed to have taken this advice. But the difcipline of thefe times was fo imperfect, that the orders given for halting were not obeyed ; and one corps of this mighty holl impelling another, they contimued advancing till they came into the prefence of their enemies in much confufion.

Edward had employed the forenoon of this important day in drawing up his army in the molt excellent order, in three lines. The firfit line, which conlifted of 800 men at arms, 4000 Englith archers, and 600 Welih foot, was commanded by his young, amiable, and heroic fon, the Prince of Wales; alfiled by the Earls of Warwick and Oxford, and feveral other noblemen. The fecond line, compufed of 800 men at arms, 4000 halbaudiers, and 2,400 archers, was led by the Earls of Arundel and Northampton ; the laft line, or body of referve, in which were 700 men at arms, 5300 billmen, and 6000 archers, was ranged along the fummit of the hill, and conducted by the King in perfon, attended by the Lords Moubray, Mortimer, and others. When the anny was completely formed, Edward rode along the lines, and by his words and looks infpired his troops with the moft ardent couragre and frongelt hopes of victory. He then commanded the cavalry to difmount, and the whole army to it down upon the grafs, in their ranks, and refseh themfelves with meat, drink, and reft. As foon as the French army came in view, they fprung from the ground, full of trength and fpirit, and llood ready 20 receive them.

Ihe King of France, affited by the Kings of Bohemia

Creffy. hemia and Majorca, the Dukes of Lorraine and $S_{s}$ voy, and feveral other fovercign princes, with the fower of the French nobility, laboured to reftore fome degree of order to his prodigious amy, and drew it up alfo in three lines, but very indikinety formed. The firt line was commanded in chief by the King of hoo hemia; the lecond by the Earl of Alençon, the King of France's brother; and the therd by philip in porfon; and each of thefe lines contained a greater number of troops than the whole Englifh army.
The battle of Crefly was begun about three o'chock in the aftermon, Ausuft 26. by a great body of Genote crois-bowmen, in the French fervice, who let fly their quarrels at too great a diftance to do any execution, and were prefently routed by a flower of arrows from the Englifh arehers. The Earl of Alençon, after trampling to death many of the flying Genoefe, adyanced to the eharge, and made furiousattack on that corps commanded by the Prince of Wales. The Earls of Arundel and Northampton advanced with the fecond line to fultain th. Prince, and Alenfon was fupported by as many troops as could crowd to his affitance. Here the battic raged for fone time with uncommon fury ; and the Eanl of Warwick, anxious for the fate of the day and the fafety of the Prince, fent a meffenger to the King, intreating him to advance with the third linc. Edward, who had taken his fland on a wind-mill on the top of the hill, from whence he had a full view of both armies, alked the mefienger, if his fon was unhorfed, or wounded, or killed? and being anfwered, that the Prince was unhurt, and performed prodigics of valour, " Go then," faid he, "and tell my fon and his brave eompanions, that I will not deprive them of any part of the ghory of their victory." This flattering meffage being made known, infpired the Prince and his troops with redoubled ardour; and the King of Bohemia, the Earl of Alençon, and many other great men, being flain, the whole firft and fecond lines of the French army wese put to flight. Philip, undifmayed at the flaughter of his troops, and the fall of fo many prinecs, adraneed to the charge with the line under his immediate command. But this body foon Thared the fame fate with the ether two ; and Philip, after having been unhorfed, and wounded in the neck and thigh, was carried off the field by John de Hainault, and fled with no more than five knights and about 60 foldiers in his company, of all his mighty arny, which at the beginning of the battle confifted of more than 120,000 men. Sueh was the famous vietory of Crefly, the greateft ever gained by any King of Eughand. After the battle, the King few into the arms of the Prince of Wales, and grafping him to his bufom, cried in an ecftacy of foy, "My dear fon, you have this day flowed yourfelf worthy of the knighthood which you lately received, and of the crown for which you have fo, bravely fought ; perfevere in your honourable coumfe." The Prinee, as nodelt as he was trave, funk dowa on his knees, his face covered with bluthes, and berged lis father's bleffing. Edward continued with liis army at Crefly three days, cmployed in numbering, and burying the dead. The French had left on thii bloody feene the King of Boincmia, 1 other prisces, 80 lannerets, 1200 knights, 1,500 geatlemen, 4000 men of ams, and 30,000 other soldierso.

ClREs'l', in amoury, demotes the uppermont part of an armoury; or that fat rifing over the cafle or helmet. - Next to the matle, hays Gulim, the ereft or cogrizance clams the highof place, being feated on the moll cminent part of the helinct; yet to asto ad. mit an interpolition of fome cterol, weath, chapeau, crown, \&e.

The ancient warriors wore crells to frike terror in their cnemies, as the light of the foots of animats they had killed; or to give them the more fommble mien, by making them appear taller, \&ec.

In the ancient tournaments, the camalie:s had plames of feathers, efpecially thofo of whathes and herons. for their erells; thele tufts they called phamarts ; and were placed in tubes, on the tops of hish caps on bonncts. Some had their cretts of leather; others of parchment, palkeboard, \&ce. painted or varnithed, to kecp sut the weather; others of tleel, wood, \&e. on which were fonetimes reprefented a member or ordinary of the coat; as, an eagle, Heur-de-lys, \&c. but never any of thole called bonourable ordinaries, as pale, foffe, \&o. The cretts were changeable at pleafure; being reputed no other than as an arbitrary device or ornament.

Herodutus attributes the rife of crelts to the Carians, who firlt bore feathers on their catks, and painted figures on their buckers; whence the I'ertians called them cocks.

The ereft is efteemed a greater mark of nobility than the armoury, as bemg borne at tournaments; to whieh none wat admitted till they had given proof of their nobility Sometimes it ferves to dikinguith the feveral branches of a family. It has alloferved, on occalion, as the diftinguithing badge of factions. Sometimes the erelt is taken from the device; but more ufually it is formed of fome piece of the arms: thus, the emperor's crell is an eagle; that of Catile. a caltle, \&c. Families that excharge arms, as the houfes of Branfwack and Cologne have done, do not ehange their crefts; the firlt ftill retain the hot fe, and the latter the mermaid.

Crest, in heraldry, the figure placed above the holmet in an atchievement. See Heralimy.

CREst-fillen, a fault of an horfe, when the upper part of his neck, called the crefl, langs to one fide : this they eure by placing it upright, clipping away the fpare fkin, and applying platters to keep it in a proper pofition.

CRETA, or Chalk, in natural hifory. SceChale.
CRETE, one of the largelt illands in the Miditerranean, lying between 22 and 27 degrees of eaft longitude, and between 35 and 36 degrees of movth latitade. According to Strabo, the illand is 287 miles in length; and according to Pliny, 270 ; and aecording to Scylax, 312. As tu its breadth, it is not, as Pliny obferves, above 55 miles where widelf; whenee it was ftyled, as Stephanus obferves, the Long yfand. It has the Archipelago to the north, the African fea to the fouth, the Carpathian fel to the call, and the Io. nian to the wit. Anciently it was known by the nanues of Aeria, Chthoniu, Idea, Curete, Murieris, Sic. but its inoll eommon name was that of Crete.

The Cretan mythologifls, quoted by Diodorus Siculus, relate that the lirlt inhabitants of the ifland were the Ductyli Idei, who dwelt around mount Ida; $3 X 2$ they they were regarded as magicians, becaufe they poffersed a variety of knowledge, and were particularly ikilled in religions myteries. Orphens, who ditinguifed himelf fo highly in poetry and multe, was their difciple. They difcovered the ufe of fire, iron, and brafs, and inented the art of working thrie netals in Be recenthins, a mountain near Aptera. Thofe invaLuable difeoveries procured thent divine honours. One of them, named Hercules, rendered himfelf fanous by his courage and great exploits. He inflituted the Olympic ganes: thourh potterity, by a miftake arifing from his bearing the fame nane, liave afcribed that inftitution to the fon of Alemena; who, indeed, trode in the flups of his predecefior, and raifed himfect alfo to immortality.

The Dactyli [dxi were the anceftors of the Curetes. Thefe laft, at firt iwhabited the forefts and caves of the mountains. Afierwards they entered into domellic life, and contributed, by their inflitutions, to the eivilization of mankind. Tikey taught men to colleft Aocks of fheep, to tame the ferocity of wild animals for domeftic purpofes, and to invite bees into hives, that they mi fhe rifte them of the fruit of their Jabours. They firt prompted men to the chace, and taught the ufe of the how. They were the inventors of fwords and of military dances. The noife which they made, by dancing in armour, hindered Saturn from hearing the cries of Jupitet, whofe educatien Rhea had cutrutted to them. With the afiltance of the nymphs, they brought up that god in a cave in mount Ida, feeding him with the milk of the goat Amalthea, and with honey. -

To this period mytbology afferns the origin of the Titans: their abode near Gnoffus, where food the palace of Rhea: their travels over the whole earth : their war againft Ammon, and his defence by Bacshus; the nuptials of Jupiter and Juno, celcbrated nigh the river Therenus in Crete; the gods, godefefes, and heroes, who defiended from them.

The moft illullrious of thofe heroes were Minos and Rhadamanthus. 'They are faid to have been the fons of Jupiter and Europa, who was conveyed into the illand on a bull. Minos becoming king, built feveral cities; the mont confiderable of which are-Gnoffus, on that fide of the ifand which faces Afia, Phoeftus on the fouthern hore, and Cydon on the wettern, facing Peloponnefus. He gave to his fabjects a code of admirable laws, which he pretended to have received from liss father Jupiter in the grotto of mount Ida.

Rhadamanthus dilinguifned himfetf by the impartiality of his judgments, and by the inflexible feverity with which hee inficted punihment on the impious and wicked. His empire extended over the chief ifles of the Archiplaro, and the inhabitants of the adjaecnt coalds of Atia fubmited to him on account of his high reputation for prohity and juffice. Mythologits have confituted him judge in the regions below, to determine the future fiate of the rightcous and the wicked. They have conferred on him the fame honours which were betlowed on Aines, the juftelt of kings.

Thus far have boen followed the Cretan traditions as they are telated by Diodorus; but hiftorians difer about the truth of them. There are a variety of opinions concerning the frat indubitants of Crete. Stra- after feverail pages on the fubject; "I am not fond of fables; yet I have detailed thefe at fome length, becaule they are connected with theology. Every difcourle concerning the gods fhould examine the religious opinions of antiquity, and dilinguith them from fable. The ancients were pleafed to conceal their knowledge of nature under a veil. It is now impoffible to unfold the meaning of their eniginas. But by expoling to light the numerous allegories which they have lefe us, and hy examining attentively their mutuat relations and differences, genius may perhaps be abie to unfold the truths which are couclied under them."

But leaving mythology for the more certain records and monuments of hiltory, we find that Crete received its name fiom Crés, the firlt of its monarchs. He was author of feveral ufeful inventions, which contributed to the happinels of his fubjects. Prompted by gratitude, they endeavoured to perpetuate the memory of his favoms, and to immortalize his name, by naming the inand after him.

In order to difinguifh the true Cretans from lrangers, they were named Etestates. A number of colonies, from different parts of Greece, fettled in the inand. The agreeablenefs of the climate, and the fertility of the lot, invited them to fix their labitation there. The Lacedrmonians, Argives, and A. thenians, were the principal people who fent colsnies into Cretc. This is what makes Homer lay, "Crete is an extenfire illand in the midft of the flormy main. The foil is rich and fertile. It contains an immenfe nomber of inhabitants. It is adorned with an hundred cities. Its inhabitants fpeak in various langugges. Wre find there Achrans, valiant Eteocretes, Cydonians, Dorians, and godlike Pelafgians." The Etcocretes inhabited the fouthern divifion of the inland; they built there the eity of Profus, and erected a temple to Dictiean Juve.

Crés was not the only monarch who reigned in the ifland of Crete. He had a feries of fueceffors. But bitory affords little information concerning them: only the names of a ftw of them are preferved, and a frall number of everts which happened under the reign of fome others, - but blenucd and disfigured with an intermixture of fable. Among thofe monarths we find two Jupiters, and two of the name of Nimos. However, mont writers confound them, and aleribe to one thofe tranfations and exploits. which thould be hased between the two.

This remark chiefly regards Minos, who was eftemed the wifeit legillator of antiquity. The office af. ligned him in the regions below, is a clear and certain proof of his having gaince an exalted reputation by his jultice. Greece, fays Plato, has with great propricty adopted the laws of Crete; for they are fonnded on the folid bafis of reafon and equity, and have a natural tendency to render the people, who live in fubjection to them, opulent and happy. One of thofe laws forbade "the Cretans ever to carry their feitivity fo far as to intoxicate themfelves with wine." The following was very fuitable to reprefs the prefumptuous ardour 'of youth, " Let young people not canvafs the laws with an indifereet curiofity; let them not examine whether the lawgiver has done right or wrong in promalgating them; but let them join unamimouny

## 

Crete. nimouny in declating them good, fince they proceed from the gods. If any of the old men pereeive fomething in then meriting amendenent, let him meation it to the magill rate, or difcufs it with his equals, but never in the prsence of the ymarg people." That excellent code was engraven on tables of brafs; and Tados, chief miniter to Minos, vilited all the towns and cities in the ifland, three times a-year, to obferve in what manner the laws were exccuted and obeyct. The king of Crtete, well knowing that the narvelious is neceflary to command the belief and enforce the obedience of the people, pretended that he had received thofe taw, from his finther Jupiter, in the grotto of mount Ida. In the fame manner, Lyeurgus, before promulgating his laws, repaired to Dejphos, and gave out they had received the fancion of Apol1o. A like reafon induect Numa to pritem to an intinaey with the nymph Eeria, and Mathomet to aferibe his doetrines and inllitutions to the rev Lation of the angel (iabricl.

In contraditaion to this aceount, ethers of the ansients defuibe Minos as a prince impotenty abandoned to the froy of his paffions, and a babbarous conqueror. Falling paflonately in love with the nympth Diaynna, who refuled to gratify his wihes, be purfued hir to the brink of the those, and forced ther to plunge into the fea, where the was faved by fome fihermen, who received her in thail nets. He was the firlt of the Greeks who appeared in the Mediteranean at the head of a naval armament. He conquered the Cyclades, expelted the Carians, fitablifhed Cretan colonits in thofe inlands, and committed the goverment of then to his fon.

Being infornued, while he was at Paros, that his fon Androgeus was flain at Athens, he dechered war againt Egens, and impofed on him a difgraceful tribute; from the payment of which Thefeus ditivend his country. Lie touk arms againll Nilus, king of Megara, mate him prifoner by the treaclery of his daughter Scylla, and put him to death, together with Megarus, the fon of Hippomanes, who had brought fone forces to his affiftance. Dadalus, wha had by fome means incurred his dipleafure, defpairing of pardon from fo tevere and infexible a priace, employed the refourecs of his inventive genius, in order to efape from his power. He fed to sicily, prained the protection of king Cocalus, and obtained an aiylum in his court. Valerius Flaccus has deferibed his flight in a very lively and pieturefque manner "Thus Dxdalus, with the wings of a bird, afcended from mount lda. Betide him flew the eomrade of his flight, with morter wings. They appeared like a clund rifing in the air. Minos, feeing his vengeance thas eluded, flowed with impatent rage. In wain he followed with his tyes the fecure flight of his enemies through the wide expanfe of heaven. His guards returned to Gorynia with their quivers filited with arrows." The Cretan monarch did not, however, give up his prey. He equipped a flect, purfued the fugitive to Sicily, and fell before the walls of Camicum.

It is plain, that thofe actions cannot agrec to the character of that jufl monarch, whofe merits raifed him to the office of determining, in the regions below, the unalterable fate of the righteons and the wicked. We may, therefore, reafonably conclude,
that Minos the legindtor is a different perfon from Cirte. the conqueror; that it was the former who gained a luning reputation by his wiflom and juftice ; and the latter who fatbened moit of the itands of the Archipelagos, but being entaved hy his pations, tarnithed his getory by his cruedey and mercileds thint for vengeance.

The lat king of Crete was ldomeneus. 'lh his prince, accompanied by Morion, conducter is Prips to the athitance of A 天amemmon. Somer informs us of the illultrions exploies by which be fornalized himfelf before the walls of 'l'roy: At his cioparturs, he committed the gavernment of his kingtom to lacucus his adopted fors, proming him the hand of his davegher Clifithera if he areverned wifely in his abefence. That amhitious young maa foon forgnt the farours maich hat been fo havihity beflowed on him. Caming a nomber of patifans, he in a thon time afpired to the immediate pulfeffin of the erown. His impatience would not wait till he thould obtain it lawfully by marriage. Flatenimg himetf, from the lomio abence of the kiag, that he was perthaps fallen betore 'lroy, he determined to monnt the throne. Mida, wife to Iduremens, and the princels Chitither, were an obfacle to his wifles. But ambition knows no redraint. and tamples under foot the moft facred obligations. The bate wretch hasing feduced the people from that allerimee, and captivated the affections of the nobles, facrificed thofe unfortenate victins in the temple. When lionencus, crowned with lancls, landed on the coalt of Cicte, Leucus, who had now firmly eftablifhed his power, attacked him with an armed force, and otliged him to rembark. A different account is alfo giten of the banifhment of Idomeneus. Servius fays, that he had vowed, in a ftorm, to facrilice to the gods the fint perfon that his eyes fhould behuld on the Cretan hore; that his fon having met lim firt after his arrival, he fultilled lis vow, by facrificing him; and that the ifland, being foon after depopelated by peftilence, the inhabitants looked upan that amicion as the efoct of divine vengeance, and expelled the parricide; who, retiring to ltaly, founded Salentum, on the Meflapian coal. Hut that opinion appears emircly gromedefs. Hillory mentions no fon of ldomeneus. If he had a fon of his own blood, why did he adopt Leucus : Why did he intruft to lim the govemment of the illand, when he promifed lim his daughter in marriage? The more probable opinion is, that the plague was introduced inte the ifland by his flips, when he returned from the fiege of Troy, as Herodotue afferts; and that Leucus artfully made ufe of that pretext to expel his lawful fovereign from the ifland. But it appears that the ufurper did not long enjoy the frait of his crimes. Soon after the departure of Idomencus, monarchy was abolithed, and the govemment of Crete became republiean.

The republic of Crite has been celebrated by the panegyrie of Plato, ferved Lyeurgus as a model for that which he eltablifhed in Lacedemon, and was beheld by all Greece with refpect and admination. Slanbo has thought it not unworthy of his peneil, and hata confecrated the leading features of its conllitution to lating fame in his immortal work. It was indeed a fyltem of leginature, whofe direct tendency was to call forth the buds of virtue in the heart of infancy; toopenandexpand

Crete. them in routh; to infpire man, as he reaehed maturity, with the love of his comery, of glory, and vilibe:ty; and to comfort and fupport the infirmities of age with the relpect and eftecm due to the experience and wifdom of that period of life. It laboured to form affectionate fiends, patriotic citizens, and worthy magiftrates. It made no afe, however, of a multitude of acts and fatutes to produce thofe incltimable advantages. They Howed all from one fource; the public education of youth, judicioufly directed. The virtuons examples iet before youth in the courfe of that education, the illuftious deeds which were recited to them with high applaufe, the honours conferred on valour and on noble actions, the opprobrium invariably calt on viee; thefe were the only means which the Cretan lawgiver made affe of to form a warlike, humane, and virtuous nation.

The Cretan government, foon after the expulion of Idomencus, hecame arifocratical. The power was divided between the nobles and the people. Yet as the chief employments were occupied by the nobles, they directed the adminittration of alfuirs. Ten magiftrates were ammally clected, by a majority of voices, in the national affembly. Thefe were named Cofmoi, and their public office and character were the fame with thofe of the Ephori at Sparta. They were the generals of the republic in tine of war, and directed all affairs of any importance. 'They had the right of choofing certain old men for coundellors. Thofe old men, to the number of twenty-eight, compored the Cretan fenate. They were chofen from among fuch as had difcharged the office of Cofmoi, or had diftinguifhed themfelves by extraordinary merit and bhamelefs probity. Thofe fenators continued in office during life, poffeffed a weighty infuence, and were confulted in every affair of any importance. This body was a barrier oppoled by the wildom of the legilator againft the ambition of the ten chief rulers. He had impofed anothee reltaint on their power, by lin iting the period of their adminitration to one year. His forelight went till farther. The fufirages of the people might be obtained by bribery or perfonal influence, and of confequence their choice night fometimes fall orn a man unworthy of fo honourable an oftice. When that happened, he who had been undefervedly adranced to the dignity of Cofmoz was degraded, either in a national affembly, or fimply by the voices of his colleagues. This, doubthefs, is what Plato alhudes to, when he fays, "Neither the comnonwealth, which approaches too near to a monarehical conititution, nor that which aficets a licentions liberty, is founded on the folid bafis ef a jult medium be:ween anarchy and defpotim. O Cretans! O Lacedemonians! by clablithing fours on firmer foundations, fou have avoided thofe fatal extremes."

Such were the dittibution of power and the adminitration of publie affairs in the Cretan government. Its implicity was admirable. A people who were bleffed with the facred enjoyment of liberty, but poffelfed not fufficient knowledge and difcernment to dirceit themfelves, lected magiturates, to whom they delegated their authority. Thofe magiltrates, this arraycd with fovereign power, chofe fenators to alfit and direct their deliberations. Thefe counfellors
could neither enaer or decide of themfelves: but they held their ofice for life : and that circumitanee con. tributed to itrengthen their infuence and to inereafe their experience. The magiftrates were animated by the mott powerful motives to ditinguith themfelves when in office, by unwearied activity in the public fervice. On one fide, they were rellained by the fear of degradation; on the other, actuated by the hope of becoming one day members of the national council.

Yet let us enquive what means the Cretan lawgiver ufed to form virtuous citizens. All che Cretans were fubjected to the power of their magiltrates; and divided into two elaffes, the adults and the jouth. Men arived at maturity were admitted into the hill. 'The fecond confited of all the youns men who were not bclow the age of feventeen. The fociety of adults eat together in public halls. There ruters, magittrates, poor and rich, feated together, partook, without diItaction, of the fame fimple fare. A large bowl, filled with wine and water, which went round the company from one to anuther, was the only drink that they were allowed. None but the old men hada right to call for more wine. Doubtlefs, that people, fo celebrated for wifdom, were not Atrangers to the power of beauty ; for a woman was appointed to prelide at each table. She openly diltributed the mot exquifite meats to thofe who had dittinguifned themfelves by their valour or Wifdom. That judicious preferenee was fo far from exciting envy or jealonfy, that it only prompted every perfon to deferve it by brave and prudent conduct. Near where the citizens lidt, two tables were laid, which they named Itopitable; all Itrangers and travellers were entertained at the $f$ : and there was alfo a particular hone fet apart by the pubiic, in which they might fpend the night.

To fupply the public expences, every citizen was obliged to bring a tenth part of his annual income into the treafury. The chief magiltrates were to take eare that every perfon contributed his proportion. In Crete, fays Ariftotle, one part of the fruits of the earth, of the prodace of the flocks, of the revenucs of the flate, and of the taxes and curboms, is facred to the gods: the other is diftributed among the members of the community; fo that men, women, and children, all fubditt at the public expence.

After dmmer, the magiltrates and fenators ufually fpent fome time in deliberating on the affairs of the fate; they nest recounted the noble deeds which had been done in war, celebrated the comrage of their molk ditinguifhed warriors, and animated the youth to heroic valour. Thofe affemblies were the firft fehool of the youth. At the age of feven, the boy was permitted to handle the bow;-from that time he was admitted into the fociety of the adults, where he continued till the age of leventeen. There, fitting on the ground, and clothed in a plain and coanfe drefs, he ferved the old men, and liftened, with refpectin filence, to their advices. His young heart was inflamed with the recital of noble deeds in arms, and glowed with ardour to imitate them. He acquired habits of fobriety and temperance. And being conflantly witnets of illutrious examples of moderation, wiflom, and patriutitin; the fieds of virtlie were thus
fown

Crete. fown and foftered in his heart before he attained the ufe of reafon.

He was early accuftomed to arms and to fatigue, that he might learn to endure exceflive hat or cold, to clamber and leap amone hills and precipices, and to bear manfully the blows and wounds which he might receive annid the gymallic exercifes or in battle. Flis education was not confined to the gymnaftic exereifes; he was alfo tanght to fing the laws, which were written in verle, with a certain ipecies of melocly; in omder that the charms of mufie mieht difpote him to learn then with more plafure, and might imprefs them more deeply on his leart, and that, if he thonld ever tranfgrets them, he might not have the excufe of ignomance to offer. He next leamed hymas in homour of the gods, and poems comperfed in prate of herocs. When he raathed his fewentcenth yoar, he retired from the focicty of the adults, and became a mombor of that of the young men.

Here his cducation was till carried on. He exercifed himbllf in huncing, wellimg, and fighting with his companions. 'The lyre played tunes of martial mulic; and he leaned to follow exactly the fomds and meafure of the mufician. Thofe fuorts and exercifes were fonetimes attended with danger; becaufe arms of thecl vare fometimes uifed in them. One dance, in which the youth afpired molt ardently to excel, was the Pyrrhic, originaly invented in Crete. The performers in that dance were arrayed in complete armour:--they wore a light thort coat, which did not fall below the knce, and was bound with a girdle going twice round the wailt : on their feet and legs were bufkins; above thefe they bore their arms, -and performed various military evolutions to the found of mufical indtruments. "The Lacedemonians and Cretans," (fayz Libanius), "cultivated dancing with amazing ardour ; they confidered, that their laws had dirccted them to practife it for the moll important purpofes: and it was farce lefs dilhonourable for a Laccdemonian or Cretan to neglect the military dances, than to defert his polt in battle."

Thofe Cretans who were opulcat and high-born, were permitted to form focietics of young men of their own age. They often flove, with ensulation, who fhould form the moft numerous one. The father of the young man who formed one of thefe focieties, ufually prefided in it. He had a right to edncate thofe warlike youth, to exercife them in ruming and in hunting, to confer rewards and inflict punifhments.

Friendhip was in high ellimation among the Cretans; hut, fays Strabo, the manner in shlich they conducted the intercourfe of friendthip was pretty extreordinary. Inflead of mild perfuafion, they made ufe of violence, to gain the ohjects of their affections. He who conceived an affection for a young man of his own age, and withed to attach him to himfelf by indiffoluble bonds, formed a felsome for carrying him off by violence. 'Three days before putting it into asecution, he communicated it to his cumrades. They could not then interfere to prevent is ; becaufe if thes had, they would have appeared to think the joung man unworthy of fuch an exceffive attachment. At the appointed day they affemblud to protedt their companion. If the ravifuer appeared to them not unworthy of the object of his affection, they made, at finf, a faint refitance in obedience to the law-but,
at laft, joyfully faroured his enterprific if, on the other hand, they thought him miworthy of the object of his choice, they made fuch reliftance as to preven: him from executing lois defign. 'lohe feigned refiltance continued till the ravilher had conducted his friend in10 the hall of that fociety to which he belonged. 'I'ley dis not regard him. Who poftered fuperior beanty and gracefuluets of perfon as the moft amiable; but him who had moll diftinguithect himfelf by his morletly and valour.

The ravither loaded his young triond with favouss. and condueted him whencrer he defied : they were accompanied by thofe wholad favoured the rape: he carried him from leat to feath, proenred him the playfures of the chace and good cheer; amel after ming all poffible means to gain his heart for the conve of two months, brought him back to the city, and was obliged to give him up to his parents. But frif he pretented him with a fuit of armour, an ox, and a drinking-anp; which were the ufuat and legal prefouts on fuch accations. Sometimes his generofity wost fill fartber; and he made more expenfive prefents; to defray the expence of which his comrades contributal. 'The yong man facrificed the ox to Jupiter, and gave an cotertainment to thofe who had aflitted when he was carried off. Ee then declared his fentiments concerning a connection with his ravihter, and whld whether or not it was agreeable to him. If he had reafon to complain of the treat ment which he had received, the law allowed him to forfake a friend fo unwortly of the name, and to demand his punithment.

It would have been difgraceful, adds Strabo, to a young man, who was handfome and well-born, to be rejeeted by his friconds on account of the depravity of his manners. Thofe who had heen carried off received public honours. Theirs were the froft places in the halls and at the race. They were permitted to wear, during the reft of life, thofe ornaments which they owed to the tendernefs of friendthip; and that mark of diltinction teltified to all who faw them, that they had been the objects of fome fond attachment.

When the youth had finifhed their exercifes, and attained the legal age, they became members of the clafs of adults; heing then confidered as men, they were permitted to vote in the national affemblies, and were intitled to ftand candidates for any public office. They were then obliged to marry; but did not take home their wives till fuch time as they were capable of managing their domettjc concerns.
" 'The leginator (fays Strabo) had confidered liberty as the greateft bleffing that cities can enjoy. Liherty alone can fecure the property of the citizens of any fate. Slavery either robs them of it, or renders. it precarious. 'Ihe firt care of nations flould therefore be to preferve their liberty. Comeord drengthens and fupports lier empire; fhe flourithes wherever the seeds of diffenfion are extinguithed. Almof all thofe hollititics which prevail among nations or individuals fpring cither from an inordinate defire of wealth or the love of luxury. Introdnce, inftead of thofe banelul principles, frugality, moderation, and equality of conditions; you will thus banith envy, hatred, iujuftice, and haughty difdain." This was what the Cretan lawgiver happily effected. Aud the community, which was regulated by his wife inflitutions role to glory, opulence, and power; aud was he
lefophers of Greece: but the highoft hunous it ever obtaned, was that of ferving Lyeurgus as a model for the admirable form of government which he eftaklifhed at Sparta.

The repuhblic of Crete continued to flourilh till the ate of Julins Cxfar. No other date has enjoyed fo long a period of frength and grandeur. The leginature, regarding liberty as the only fure batin of a nation's happinefs, had inilituted a lythem of laws, the natural tendency of whicle was, to inffire men with an aident paffion for liberty, and with luch viitue and valour as are neceftary to fupport and defend it. All the citizens wene foldiens ; all of them were filled in the art of war. The valiant youth of other mations reforted to Crete, to learn the exercifes, mancurres, and evolutions, of the military art. "Philopecmen (fays Plutareh) beng imputient of indolence, and eager to acquire fill in arms, embarked for Crete. Alter fpending a conliderable time in the mobleft exercifes anong that bave people, who were filled in the art of war, and accuftumed to an auftere and temperate life, he returned to the Aehrans. The knowledge whith he had acquired made him fo eminent anoug them, that he was immediately appointed general of their cavaly."
On the other hand, the leginator, being perfuaded that conquetts are generally unjuit and criminal, that they often eyhault the ftrength of the victorious nation, and almolt always corrupt its mamers, endeavoured to prefure the Cretans from the ambition of conqueft. The fertility of the ifland abundantly fupplied their wants. They needed not that commerce fhould introduce among them the riches of foreign countries, along with which luxury and her train of attendant wices would alfo be introduced; and he knew Jow to infpire them with an indifference for fuch acquifitions without experesty forbidding then. The gymuatic exercifes, which occupied the leifure of the grallant youths; the pleafures of the clace; the ardour of friendnip ; the public fhows, at which all the different orders of the community, both men and women, uffed to affemble; the love of equality, order, and their country, with which he inflamed every breaft the wife inftitutions, which mited a whole nation fo clofely that they compofed but one family;-all thefe ties attached the Cretans to their native ifland: and finding at home that happinefs which was the object of their wifhes, they never thought of wandering ahroad in fearch of an imaginary glory, or of extending their empire over other nations. Therefore, from the period at which that thate anlumed a republican form till the time when they were attacked by the arms of Rome, the nation was not once known to fend an hoftile force into the territories of any of their neighbours. This inftance of moderation is unparaleded in hiltory; no other nation can divide the glory of it with the Cretans. Individuals indetd might leave their country to cngare in foreign armies. Thofe prinues and fates who knew their valuur and fill in arehery eagerly fought to take them into their pay; all the neighbouring monarchs were defirous of having in their armies a body of Cretan archers. Over the whole world none were more celebrated than they for bending the bow. "The arrows of Gortynia (Fays Clatdian),

N 94.
m'S the deftiand mark.'

Though the multitude of independent cities which flourinced in Crete did not uaite their arms to fubjugate the neighbouring illands, and drench them with the blood of their inhabitants; yet they were not fo wife as to live in peace among themfelves. Difcord often llalked among them with her flaming toreb. The mult powerful winhed to enflave the rell. Sometimes Gnulins and Gortynia marched with focial banners againh their neighbours, levelled their fortreffes, and fubjected them to their power; at other times they attacked each other with hollite violence, and faw then bravelt youth perith amid the horrors of cinls war. Lyctos and Cydon oppofed an invincible barrier to their ambition, and prefered their own liberty. The laft of thele cities had acquired fuch ftrength and influence, that the held the balance between the rival powers of the illand. Thofe wars deltroyed a number of the cities, and drenched the native country of Jupiter with blood.

To what fource mult we attribute thofe intefine diffontiuns? One part of the illand was occmpied by the Etcocretes, the original inhabitants; the reit was peopled with culonies from Athens, Sparta, Argos, and Samos. Perhaps the ancient gradges which had fubfilted among thofell rangers, being itill unextinguihed in their breats, were eafily rekindled by accident os cincumtlances, and inflaned with new fury. We may alfo fuppofe, that the mult powerful among them, exulting in their fuperionity, would endeavour to take advantage of the weaknefs of the relt, and difregard all laws bet thofe of force; befides, the glowing ardour of the youth, trained to military exercifes, was ever ready to fly to arms. Such, prubably, were the eaufes which tomented difcord and hofitity among a people living under the fame religion, cuftoms, and liws. Whatener thefe might be, the Cretans, being perfuaded that the from union of their fuldiers was efiential to vistory, arrayed the bravell youths of the army in fplendid robes, and caufed them to facrifice to friendhip before engaging is battle. In fome countries it would be very proper to ublige the generals, on fuch occafions, to facrifice tu concord. If fuch a lacrifice were performed with fincerity, it might pieferve their glory undained, and puvent fuch duluges of blood from being watted without producing any advantages to the itatc.

Their palion for war did not extinguilh in the breafls of the Cretans that exquifite fenfibility which is the mother and nurfe of the fine arts. "The Cretans (fays Sozomen) gave an illull rious proof of their mumificence to getius, by making Homer a prefent of a thoufand pieces of filier ; and to perpetuate the memory of this act of generolity, they recorded it by an infeription on a public column." In Crete, adds Ptolemy, men are itill more defirous of cultivating their underfandings than of exerciling their bodily powers. Ofter when diffentions arofe, the voiee of widdom and the charms of poefy recalled them to reafon and harmony. Thales of Gortynia, the preceptor of LycurGus, was one of their molt celebrated philofoplers. Being both a poet and legifator, he made an happy ufe of his abilitics and knowledge to extinguifh among his countrymen the kindling farks of difcord. "His poems were monal difcourfes in verfe, which recalled the

## C R E

the people to concord and fubmifton to the laws. Ufing a regular meafure, he recommended the aullerity of his fubject by the infinuating and powerfal charm of fentiment. So powerful were the effects of his verfes, which addreffed at once the ears, the heast, and the underftanding of his hearers, that their rage was gradually fuftened. Next, opening their hearts to the love of peace, the advantages which be deforibed in glowing colours, they forgot their intertine diffentions, and ranged themfelves around the thandard of concord." That fage is faid to lave invented tumes for the military dances and for the Cretan Pyrrhic. Men who felt fo trongly the intluence of poetry and mufie could fearcely be enemies to pleafure. Accordingly they had a cuftom of diftugntang their fortunate days with white fint liones, their unfortunate days with black. At the end of the year they counted the number of their white foncs, and reckoned that they had lived only fo many days as were dittinguifhed for having been fortunate. They dici not think mere exillence, without the erjoyment of pleafure, worthy of the name of life. Fon this reafon, they canfed to be inferibud on their tombs: "He lived fomany days; he continued in exithence fo long."

A pafinn for glory is eafly awaked in a feeling and generous breaft. The Cretans eagerly repaired to the famous folemnities of Greece, and were often crowned at the Olympic, Nemæan, and Pythian games: others of them were favourites of the mufes, and verfified the predicions of prophets, or celebrated the glorions deeds of their heroes. Several of them diltinguifhed themfelves by liftorical compofitions. At the mof ancient games, a prize is faid to have bien beltowed on the poet who fung the nobleft hymn in honour of Apollo: Chryfothemis of Cute fung and gained the prize.

The rasages of time have deprived us of almoft all their works; and if Pindar had not preferved the memory of fome of their erowns, we hould not know even the names of the conquerors who wore them. The temple of Diana at Ephefus, built by the Cretan Ctefipon and his fon Metagenes, was not proof againt the frantic hand of the incendiary. Thofe ingeaious architects had built it on the principles of the Ionic order: to the colllinefs of the materials, the elegance of the architecture, the fymmetry of the parts, and the majcity and perfection of the whole, they had added folidity and ftrength, without which the reft munt have been of fimall value. Their names have defeended to potterity, but the pillars of chat monument which has perpetuated their memory have been difperfed or deftroyed. Scarce a veftige remains of that building which was efteemed one of the feven wonders of the world.

Nations are effaced from the earth like the monuments of their power, and after the revolution of feveral ages we can fearee trace in their pofterity any remains of their ancient character. Some of then exill longer, others fhorter; but we may almolt always calculate the period of their duration by the excellence of their laws, and the fidelity with which they fupport and obey them. The republic of Crete, being eflablifhed on a folid bafis, knew no foreign mafter for a period of ten conturies. She bravely repelled the attacks of thofe princes who attempted to enflave her. At leagth the time arrived when the warlike and victorious Ro-
mans afpied to the empire of the world, and would fuffer none but their fubjects or llaves to inhabit within the reach of their arms. Floms docs not feruple to acknowledge, that the Romans had no otlyer motives for invading Cacte but the ambitious defire of fubduing the renowned native country of Jupiter. "If any perfon with to know the reafors which induced us to attack Cicte (fays he), the true reafon was our dotire to fublue fo celebrated an illand. The Cretans had appeared to favour Mithridates, and the Romans thought preper to declare war againf them on that pretext. Mark Antony, father of the triumvir, attacked them with frong hopes of fuccefs; but was feverely punthed for his prefumption and imprudence. The Cretans took a great part of his feet, burgr up his foldiers and failors on the matts anid the fails and cordage, and returned in triumph into their harbours."

The Romans never forgot nor forgave a defeat. As foon as the Macedonian war was brought to an happy conchufion, they again took arms agtimt the Cretans to revenge their ignominy and lofs. Quintus Metellus was fent to Crete with a powerfal armament. Hemet with an obitinate and vigorous refiftance. Panarus and Lathenes, two experienced leaders, collecting a budy of 20,000 young warniors, all eager for battle, and of determined courage, employed their arms and arrows fuccefsfully againt the Romans, and protracted the fate of Crete for three years. Thofe conquarors could not make themfelves mafters of the illand be fore deftroying its bravelt warriors. They loft a great number of troops, and bought a bloody victory at the price of many a danger and much fatigue. However, their ufual grod fortume at lengtl prevailed. The fint care of the conqueror was to abolifh the laws of Minos, and to effablifh in their room thofe of Numa. Strabo, that enlightened philofopher, complains of this act of feverity ; and informs us, that in his days the original laws of Crete were no longer in force, becaufe the Romans compelled the conquered provinces to adopt their civil code. To fucure themfelves fill more fully in the poffeffon of the illand, they fent a powerful colony to Gnoflus.
From that era to the prefent time, that is, for a period of 1 goo years, the Cretans have no longer formed a feparate nation, nor made any figure among the fates and kingdoms of the world: their noble and ingemous manners, their arts and fiences, their valour and their virtues, are no more. They have lont thele with the lofs of liberty. So true is it that man is born for limelf; and that, when deprived of that aid which Nature has defigned to llrengthen and fupport his weakueis, the glame of genius and the ardent glow of valour are extinguifhed in his brealt ; he becomes incapable of vigorous refolution, and finks below the natural virtue and dignity of the \{pecics.

The ifland of Crete, joined with the fmall kingdom of Cyrene, on the Lybian coalt, formed a Roman province. It was at firft governed by a proconful; a queftor and an affifant were afterwards font there; at lat, as Suetonius.informs us, it was put under the government of a comful. This ifland was one of the firlt places in the world that were favoured with the light of the gofpel. St Paul introduced the Chrillian faith into Crete; and his difciple 'Titus, whom he laft there
to cherih and cultivate that precious plant, became the firt bithop of the ifland. In the reign of the emperme Leo, it had twelve binops, who were all fubject to the patriarch of Confantinople. Confantine feparated Crete from Cyrene in the new divition which the made of the provinces of the empire. Leaving three fons, Conftantius, Conftantine, and Conitams, he affigned Thrace and the eaflern provinces to the firn ; to the fecond, the enpire of the Wett ; the iland of Crete, Africa, and Illyria, to the third.

When Michacl Balbus fat on the throne ef Conftantinople, the rekellion of "Thomas, which lated three rears, cauted him to negket the other pares of the empire. The Agarenimes (a people of Arabia), who Wad conquered the fincll provinces of Spain, feized that opportmity. They fitted out a confiderable fleet, phandered the Cyclades, attackel the illand of Cuete, dad made thecrilues mallers of it without oppotition. In order to fecure their conquell, they built a fortrefs which they named Kbanduk, "intruchment." From that citadel the barbaians made inroads into the interior parts of the ifland, carrying havock and devallation wherevtr they appeared. By repeated attacks, they Gublued all the cities in Crete except Cydon. Michael made tome ineffectual efforts to expel them fium Cretc. The emperor Bifilius, the Macedonian, was sut more fuccefsful. They defeated him in a bloody battle; but being vanquithed by one of his generals, they were fubjected to the payment of an anatult tribute. At the end of ten years, the Arabians refufed the tribute. It was relenved for Nicephorns Phocas, who was afterwards emperor, to deliver this free ifland from the yoke of the Inidels. He landed on the ifund with a numerous army, boddly attacked them, and routed them in various engagements. The Saracens, no longer daring to mect fo formidable a general in the field, fled for protection to their fortrelles. Phocas being fentifully fupplied with all the walike machines necertary for a tiege, levelled their walls, and alarmed their hearts with teryor. He took their cities and fortrefies, and drove them into Khandak their metropolis and latt refource. In the courle of nine months he fubdued the whole inland, took their king Curup and his lieuterant Aremas prifoners, and reunited to the empire a province which had been 127 years in the hands of the lufidels. It remained under the dominion of the Romans till the time when Baldwin Connt of Flanders, being raifed to the throne, liberally rewarded the fervices of Boniface Marquis of Montferrat, by making him king of Thellalonica, and adding the inland of Crete to his kingdom. That lord, being more covetous of gold than glory, fold it to the Venetians in the year 1Igt; under whom it affumed the uame of Cavdia. Suc the fequel of its hiftory under that article.

CRET1O, in antiquity, a certain number of days allowed the heir to confider whether he would act as heir to the deceafed or not; after which time, if he did not act, he was excluded from the eftate.

CREUX, a term in feilpture, much afed by the French; though not yet, that we know of, naturalized among us: but the want of a word of equal import in Englifi, as it has frequently put us under a secellity of uling this in the comfe of the prefent
work ; fo it pleads Irougly for its admifion into our language.

Creux originally fignifies a bollow, cavily, or pit, out of which fomething has been fcooped or dugg : hence it is ufed to denote that kind of feulpture and graving where the lines and figures are cut and formed within the face or plane of the plate or matter engraven on. In which fenfe it ftand oppofed to relicvo; where the lines and figures are embolfed, and appear prominent above the face of the matter.

CREW, the company of failors belouging to a thip, boat, or uther vellel.
'The failors that are to work and manace a fhip are regulated by the number of lats it may carry; each lait making iwo ton. The erew of a Dutch hup, from fote 50 latts, is feven failors and a fwabber ; from 50 to 60 latts, the coew contifts of cight mun and a fwab. ber ; and thus increafes ar the rate of one man for every tea laits; fo that a fhip of roo lalls las 12 men, Sec. Finglith and French ciews are uftally fronger than 1)etch; but always in about the fame proportion. In a thip of war there are feveral particular crews, or ganges, as the boatfwain's crew, the carpenter's crew, the gumber's crew, \&ic.

CREVIFR (John Baptist Lewis), a Paritian, was trained under the celebrated Rollin, and afterwards became profeffor of rhetotic. Upon the death of his mafler, in $174^{1}$, he took upon him to finifh his Roman Hitory. He publifhed other works, and was greatly ferviceable to the caufe of virtue and religion as well as letters. His death happened, 1765 , in a very adranced age. Befides the continuation jult mentioned, he publifhed, 1. An edition of Liroius, cum Notis, in 6 vols $4^{\text {to }}, 1748$; and afterwards another edition, better adapted to the nefe of his pupils, in 6 vols. finall 8vo. 2. La HifRoire des Emperiars de Romains Tufur a Confantitt, $17+9,12$ tom. 12 mo . 3. Hifoire ae l'Unirerfité de Paris, 7 tom. 12 mo . \& Rhetorique Francoife, a juft and ufeful werk. 5. Objervations fur l'Efpril des Looix. Here he ventured out of his depth; he thonld have kept within the precincts of the belles letters.

CREUSA, in fabulous hiftory, dangh:er of Creon king of Corinth. As the was going to marry Jafon, who had divoreed Medea, the put on a poifoned garment, which immediately fet her body on fire, and fhe expired in the moft excruciatiog torments. She had received this gown as a gift from Mclea, who wifhed to take that revenge noon the infidelity of Jafon, Some call her Glauce. (Orid. da Art. Am. I. v. 335.) A darghter of Priam, king of 'Troy by Hecuba. She married. Wneas, by whom mite bad, among other children, Afcanius. When Troy was taken, the fied in the night with her hubaad; but they were feparated in the midt of the confufion and tumult, and Eneas could nut recover her, nor lear where the was. Some fay that Cybele faved her, and carried her to her temple, of which the became priettefs. 1'auf. 10. c. 26.-Vir. AEn. 2. v. 562.

CREX, in ornithology: a fpeeies of Rallus.
CRIB, the rack or manger of a flable, or the fall or cabbin of aa ox. It is alfo ufed for any fmall habitation, as a cottage, sec.

Crib, in the Englifh falt-works, a name given to a fort of cufe ufed in fome places infead of the drab, to

Cribbage put the falt into as it is taken out of the boiling Crichtion. piln.

Cribbage, agrame at cards, to be learnt only by practice.
CRIBRATION, in pharmacr, the pafling any fubftance throngh a lieve or fearee, in order to feparate the finer partiekes from the groller.

Cribrosum os, in anatomy, called alfo os ethomoites. See Alnatomy, $1^{\circ} 17$.

CRICELABiA, the drising a ring or hoop. Driving a hoop was one of the ancient gymmaftics: this loop was as high as the breall of the perfon who ufed it. It was commended for rendering the limbs pliable, and for flrengthening the newes.

CRICETUS, in zoology. See Mus.
CRICHTON (James), ascotscentleman, who lived in the 16 th century, and who, on account of his extraordinary endowments both of body and mind, obtained the appellation of " the admirable Crichton;" loy which title he has continued to be diftinguithed down to the prefent das. The time of this cthebrated perfon's birth is faid, by the generality of writers, to have been - MS Me-in $155^{1}$; but, accurding to Lord Mmehat ${ }^{*}$, it appears, from feveral cicunntances, that he was born in the month of Augnd 1560. There is a difference likewife between the Earl of Buchan and other biographers, with regard to the fantily of Crichton, and the rank and fituation of his father. The common aceounts aficit, that James Crichton's father was Ro. bert Crichton of Clmic, in the county of Perth; and that this Robeat Crichton commanded Queen Mary's arny at the battle of langride in the year $156 \%$. But from the Bat of Buchan we larn, that this genteman was of Eliock in the fame comnty, and that he was lerd advocate of Scolland in queen May's reign from 1561 to 1573 ; part of which time be held that office in conjonction with Spens of Condic. The nother of Janes Crichton was litizabeth stuart, the only duagher of Sir James Stuart of licath, when was a defcendant of Rolett duke of Athany, the third fon of king Robert the fecond, by Elizabeth Muir or More, as the is commonly cailed. It is hence evident, that when the admiable Erichton beated (as he did abouad), that he was fremg trom Seottin king", he tail nothing but what was agrecable to truth.

James Crichton is faid to have reccived his grammatical education at Perth, and to have ithdied phithfophy in the univerfity of St Androw. His tutar in that miverity was: Mr John Rutherford, a profeffor at that time famous for his learning, and who dithinguifhad limelf by writing four books on Arifunde's hugic and a comm?ntary on his potics. According to Aldus Manutins, who ealls Crichton firt coutio to the king, he was alfo inthucted, aleng with his majelly, by Buchanan, Heplurn, and Roberton, as well as by Rubleefford; and he had fearcely arrived to the ecth year of his ouge, when he had run through the whole *icle of the feimees, and conld fpeak and write to perfection in ten different languages. Nor was this all ; for he hat hikewife improved himfelf to the higheft degree in ridhing, flancing, and finging, and in playing upunall forts of imfruments.
Criciton, being: thus accomplified, went abroad upon his travels, and is faid to have gone to l'aris; of his tranfactions at which place the folluning account
is given. He caufed fix placarde to be fixed on all the Crieten. gates of the fehools, halls, and collegese belonging to the univerfity, and on all the pillars and perls hefure the houfes of the moit romowned mon for literature in the city, inviting all thofe whowere well verful in any art or feience, to difpute with him in the college of Navare, that day fix wecks, by nine of the clock in the morning, where he would attend them, and be ready to anfwer to whatever thmallow propofed to him in any art or feicnce, and in any of thefe 12 languages, Hebrew, Syriac, Arabic, Greek, Latin, Spanith, French, Italian, Englith, Dutch, llemith, and Sclaronian; :und this cither in verfe or profe at the difcretion of the difputant. During this whole time, in* ftead of clofely applying to his thulies, he regardad nothing but hunting, hawking, tilting, vaulting, riding of a well-managed horfe, toffing the pike, handling the muffet, and other military feats; on ele hac employed himelf in domettic games, fuch as balls, concerts of mufic vocal and influmental ; cards, dice, tenmis, and the like divelions of youth. 'This condute fo provaked the fludents of the univerfity, that, bereath the placard which was fixed on the Navarre gote, they eaufed the following words to be written: "If you woold meet with this monter of perfction, to make fearch for him either in the tavern or 1,awdy-houfe, is the radiell way to find him." Neverthelefs, when the day appointed arsived, Crichton appeared in the college of Navarre, and acquitted himfalf beyoud experfion in the difputation, whichafted forn mine o'eluek in the moming till fix at aight. At leagth, the prefident, after costulling ham highy for the many rare and excellent colowments which God and nature hal betowed upon him, rofe from his chair, and, accompanied by four of the mofteninent frofetions of the univerfity, gave him a diamond riug, and a purfe fu:l of gold, as a teltimony of their love ard faronr. The whole ended with the repated acclemations and hazzas of the fretators; and herce foward our young ditputant was callod, "the atanimid Crichton." It is ajded, that he was for littic fatigued with the difpute, that he went on the very nest day to the lounc, where lie bad a math of tioting (an e:arcife then ia much requelt, and in the prefonce of fome of the princes of the court of France, and a great many ladies, carried away the ring 15 times fucc thively.

Abont two years after this we find hina at Rome, where he affixed a pacard upon all the eminent places of the eity, in the following terms: Nos. Factus Cisichtonas Siatas, cuitungue rei fropoflice ex improvifo refpordebimus. In a city which atherunded in wit, this bohd challenge, to anfiver to any queflion that could be propofed to him without his being previouny adertifed of it, could not efape the ridicule of a parsquinade. It is faid, howeter, that being nowife dikouraged, he appeared at the time and place appuinted; and that, in the prefence of the pope, many cardinals, bithops, doctors of divinity, and profeflors in all the fciences, he difplayed fuch womkerful pronts of his miverfal knowledge, that he eacited no Lefs furprife than he had done at 1'aris. Eocealini, who wais then at Rome, gives fomething of a dificent relation of the matter. According to this :mblonr, the parquinade arainlt Crichton, which was to the folluwing effect, "Ald he that will fie it lit himg go to

## C R I [ 540 ] C R I

Crichen. the fign of the Falcon and it gloall be fiown," made fuch an imprefion upon him, that he left a place where he had been fo gridsiy affronted as to be put upon a level with jusulersand mountebanks.

From Fiome he went to Venice; where he contracted an intimate fricndihip with Aldus Manutius, Laurentius Maffa, Speion Speronius, Johannes Donatus, and various other learned perfons, to whom he prefented feveral poems in commendation of the city and univeifity. At lengith he was introduced to the Doge and Senate, in whofe prefence he made a fpecech, which was accompanied with fuch beauty of cloquence, and fuch grace of perfou and manner, that he received the thanks of that illuftrious body, and nothing was talbed of through the whole city but this rara in terris avir, this prodiry of nature. He held, likewife, difputations on the fubjects of thcology, philofophy, and mathematics, before the mof eminent profelfors, and large multitudes of people. His repuration was to great, that the defire of feeing and hearing him hrought rogether a valt concourfe of perfons from different quarters to Venice. It may be colledted from Manutius, that the time in which Crichton exhibited thefe demonfrations of his abilitics was in the year 1580.

During his refidence at Venice, he fell into a bad ftate of health, which continued for the fpace of four months. However, before he was perfectly recovered, he went, by the advice of his friends, to Padua. the univerfity of which city was at that time in great reputation. The uest daty after his anival, there was a meeting of all the learned men of the place, at the houfe of Jacobus Aloy fus Comelius; when Crichten opened the aftembly with an extemporary poem in praife of the city, the miverfity, and the company who had honoured him with their prefence. After this, he diputed for fix hours with the mof celebrated profefors on various fubjects of leaming ; and he expofed, in particular, the errons of Arifotle and his commentators, with fo much fulidity and acutenefs, and at the fame time with fo much modelty, that he excised maverfal admintion. In conclufion, he delivered extempore an onation in praife of ignorance, which was concucted wilh fach iagenuity and elegance, that his hearers were atomifed. This exhibition of Crichton's talents was on the Ifth of March 15 Si . Soon after he appointed a day for another difplatation to be held at the palace of the bifop of Padua; not for the purpore of affording higher proofs of his abilities, for that could not polfibly be done, but in complance with the earncti folicitations of fome perfons who wete not preient at the former aftenbly. Howerer, fewal circmaftanes oceurred which prevented this muting from taking place. Such is the ascomt of Minutius: but Imperialis relates, that he was informed by his father, who was prefeat upon the occalion, that Crichton was appofed by Archangetus Mercenarius, a fanous philofopter; and that he aequitted himedf fo well as to obtain the approbation of a very honourable company, and even of his antagonift himidf.

Amidit the difcourfes which were oceafioned by our younc Scotfman's exploits, and the kigh applaufes that were beflored upon his genius and attainments, fome perfons there were who enderwoured to detract from his merit. For ever, therefore, to confound thefe in-
vidious impugners of his talents, he canfed a paper to Crichton. be fixed on the gates of St Juhn and St Paul's church, wherein he offered to prove before the univerfity, that the errors of Arithotle, and of all his followers, were almoft immomerable; and that the latter had failed both in explaining their matter's meaning, and in treating on theological fubjects. He promifed likewife to refute the dreans of certain mathematical profellurs; to difpute in all the feienees; and to anfwer to whatever fhould be propofed to him or abjected againft him. All this he engaged to do, either in the common logical way or by numbers and mathematical higures, or in 100 forts of verfes, at the pleafure of his opponents. Accurding to Mautius, Crichton fufaned this conteft, without fatigue, for three days; during which time le fupported his credit, and maintained his propolitions, with fuch firit and energy, that, from an unufual concourfe of people, he obtained acelamations and praifes, than which none more magnificent were eser heard by men.

From Padua, Crichton fet out for Mantua; where there happened to be at the time a gladiator, who had foiled, in his travels, the moft famous fencers in Europe, and had lately killed three who had entered the lits with him in this city. The duke of Mantua was much greved at hasing granted this man his protection, as he fuund it to be attended with fuch fatal confequences. Crichton, being informed of his Highnefs's concern, offered his fervice, not only to drive the murderer from Mantua, but from Italy, and to fight him for 1500 pitlules. Though the duke was unwilling to expofe fuch an accomplifhed gentleman to fo great a hazard; yet, relying upon the report he had heard of his warlike atchievements, he agreed to the propofal; and the time and place being appointed, the whole cuart attenced to behold the performance. At the beginning of the combat Crichion food only upon his defence; while the Italian made his attack with fuch eagernefs and fury, that, having overacted himfelf, he began to grow veary. Crichton now feized the opportunity of attacking his antagonift in return; which he did with fo much dexterity and vigour, that he ran him through the body in three different places, of which wound he immediately died. The acclamations of the fpectators were loud and extraordinary upon this occafon; and it was acknowledged by all of them, that they had never leen Art grace Nature, or Nature fecond the precepts of Art, in fo lively a manner as they had beheld thefe two things accomplitined on that day. So crown the glorg. of the aetion, Crichton betlowed the prize of his wictoy uron the widuws of the three perfons who had lute their lives in liohting with the gladiator.

It is afferted, that in confequence of this and his other wonderful performances, the duke of Mantua made chavice ufhiin for preceptor tuhis fon Vincentio di Gonzaga, who is repreiented as being of a riotous temper and a diflulute life. 'The arpointment was highly pleafing to the court. Crichton, to teltify his g. atitude to his friends and bencfactors, and to contribute to their diverfion, framed, we are told, a comedy, whercin he expofed and ridiculed all the weakneffes and failures of the feveral employments in which men are engaged. This compolition was regarded as one of the molt ingenious fatires that ever was made upor mankind. But the roof

## C P I

Cricheon. moft aftonifhing part of the flory is, that Crichton fufained 15 characters in the reprefentation of his own play. Among the rell, he acted the divine, the phiilofopher, the lawyer, the mathenatician, the phyfician, .and the foldier, with fuch inimitable grace, that every time he appeared upon the theatre he feemed to be a diffcrent perfon.
From being the primcipal atur in a comedy, Crichton foon became the fubject of a dreadful tragedy. One night, during the time of carnival, as he was walling along the flreets of Mantua, and playing upon his guittar, he was attacked by hadf a dozen people in makis. The affallants found that they had no ordinary perfon to deal with, for they were not able to maintain their ground atainh him. In the iffuc, the leader of the company being difarmed, pulled of lis makk, and berged his lify, telling him that he was the prince his pupil. Crichton immediately fell upon his knecs, and waptied his concern for his miftake; alleging, that what he had done was only in his own defence, and that if Gunzagat had any dufign upon his life, he might always be nather of it. Then taking his own fuord liy the point, he prefented it to the prince, who immediately received it, and was for irritated by the affiront which he thought he had futtained in being foiled with all his attendants, that he inflantly ran Crichton through the heart.
Various have been the conjectures concerning the motives which could induce Vincentio di Gonzaga to be guilty of fo ungenerous and brut: 1 an action. Some have aferibed it to jealoufy, afferting that he fufpected Crichon to he more in favour than himfelf with a lady whom he paffonately loved; and Sir Thomas Urquhatt has told a Hory upon this head which is extravagant and ridiculous in the highefl degne. Others, with gicater probability, reprelent the whole tranfuction as sure refult of a drunken frolic : and it is uncertain, accordiny to Imperialis, whather the meeting of the prince and Crichton was hy accident or detign. However, it is agreed on all bands that Crichton lof his life in this rencounter. The time of his deceafe is fuid, by the generality of his biographers, to have been in the beginning of July 1533 ; but Lord Buchan fixes it to the fame month in the preceding year. 'fhere is a difference, likewife, with regard to the period of life at which Crichtor died. The common accounts declare that he was killed in the $32 \mathrm{~d} y$ yar of his age: but Imperialis afferts that he was only in his $22 d$ when that calamitous event took place; and this fact is contirmed by lord Buchan.

Crichton's tragical end excited a very great and general hamentation. If Sir Thomas Urquart is to be credited, the whele court of Mantua went three quarters of a year into mourning for him: the epitaphs and eleyies that were compoled upon his death and ftuck upon his hearfe, would exceed, if collected, the bulk of Homer's works; and, fur a long time afterwards, his picture was to be feen in moft of the bedchambers and galleries of the Italian nobility, reprefenting him on horfeback, with a lance in the one hand and a book in the other. The fame author tells us, that Crichton grained the eftem of kings and princes, by his magnanimity and knowledge; of noblemen and gentemen, by his courtlinefs and breeding; of knights, by his honourable deportment and
preguancy of wit: of the sich, by his affability and Crichoon. good followthip; of the poor, hy his munififence and libecality; of the ohd, by his conllaney and wifdom; of the young, by his mirth and gallantry; of the learned, by his univerfal huowledge; of the foldiers, by his undaunted valour and courage: of the merchants and artificers, by his upight dealing and honetty; and of the fair fex, by his beauty and handfomenefs, in which reffect he was a mallerpicece of nature.

Jranmes Imperialis, in his life of Crichton, fays, That he was the wonder of the late age; the prodigious production of nature; the glory and ornament of Parnadfus, in a tlupendous and mufud mamer ; and that, in the judgment of the learned world, he was the placens of hitcrature, and rather a fhining particle of the Divine Mind and Majefly than a model of what could be attaned by human induftry. The fame zuthor, after highly celcbrating the beauty of his perfon, allirts, that his extraurlinary cluquence and his admirable howledge of things tuftificd that he poileffed a trength of genius wholly divine. "What (adds this write) can more excecd one comprehenfion, than that Crichton, in the zift year of his age, Thould be mather of ten different languages, and perfectly well verfed in philofophy, mathematics, theology, polite literature, and all other fcicnces? Befides, was it ever huard in the whole cumpafs of the globe, that to thefe extraurdinary endowments of the mind thould be added dingular isill in fexciag, dancing, finging, riding, and in every exercife of the gymmatic art:" Nay, limperialis, in his account of Crichton's deach, deciares, that the report of fo fad a catalrople was fpread to the remotell parts of the canth ; that it diflurbed univerfal nature; and that in her grief for the lof's of the wonder the had produced, the threaten. ed never noure to confer fuch honour upon mankind. Compared with thefe extavagancies, the afertion of Bayle that Crichton was one of the greateft prodigies of wit that ever lived, and the reftimony of Fedix Aftolfus concerning his wonderful memory, may be confidered as modelit encomiumis.

Such are the accounts which, by a fucceffion of writers, and particulaty fince the time of Mackenzie, have been given of the admirable Crichton. Thefe accounts are inded fo wenderfal, that many perfons have been dilpofed to confider then as in a great meafure, if mot entirely, fabulous. We thall thercfore fubjoin from the Bicgraphia Britannia the fullowint, oblervations of Dr Kippis, with a view to afcertain what pertion of faith is due to the different parts of the preceding narrative, or at leatt to affilt the reader in fonning a proper judgrment concerning then.

The Doctor begins with obferving, "'That no ceredit can be granted to any facts whichidepend upon the fole authority of Sir Thomas Urquhart. Mir Pennant inded fpeaks of hin with appruhation; and Ur Samuel Johnfon laid a lenels on his veracity, in the account of Crichton which he dictated to Dr Hawkforth. and is inferted in the sift number of the Adventurer: of which account it may be obferved, that it is only an elegant funmary of the life written by Mackencic. But with all deference to thefe refpeciable manes, I mult declare my full perfuafion that Sir Thomas Urquhart is an authorwhofeteftimony to fucts iototally yaw or-

## C R I [542] C R I

Crichter thy of regard; and it is furpming that a porufat of his Lumbers woes not ftrike every mind with this convition. His productions are fo ines prefitly atfard and extrangant, that the only rational judenment waich can bepeonounced concerning himis, that he walitale, if at ahl, bet. ter than a madman. 'lo the character of his having been a madman matl be added that of hishoing a liar. Stvere as this tom may be thought, lapprehend that a diligent examintion of the tratife which contains the memorials conceming Crichan wutld thow that it is Ruiefly true. But of hiv total difrecard to truth there is incontelable evidence in atmother work of his, intitled, The true Pedigree and Lional Defoent of the mott ancient and honourable l'amily of the Urqu?nat's in the Houte of Cronarty, from the Crcation of the World until the year of God 16,52 . In this work it is shmot jucrecible what a number of talfities he has intonted both with efpect io names and facts. Perhap a more fagrant inftance of impoltare and lietion was atre: exhibied; and the abfurdity of the whole pedigree is beyond the power of words to exprefs. It can only be felt by thuie who have perufed the, tract itfelf. Such a man therefore can jufty lo intitled to no degice of credit, efpecially when he has a purpofe to ferve, as was the cafe with Sir Thomas Eirquatre. This defign was to exalt his own family and his own mation at any rate. Wit! refpect to his own nation, there was no occafion for haring recourfe to fiction, in order to difplay the luftre of Scotland, in the eminent men whom it has produced in arms and literature. The pencil of truth alone would have been amply fufficient for that purpole.
"So far therefore as Sir Thomas Urquhart's authority is concerned, the wonderfal exhbitions of Crichton at Paris, his. triumph at Rome, his combat with the gladiator, bis writing an Italian comedy, his fuftaining fifteen characters in the reprefentation of that comedy, the extraordinary flory of the amus which is deferibed as the caufe of his death, the nine months mourning for him at Mantua, and the poems hung round his healf to the quantity of Homer's vorks, mut be regarded as in the highedt degree doubtful, or rather abolutely falfe. I cannot forbear mentioning two circumtances, which thow how much Sir Thomas Urguhart was deftivte of prutence, as well as of ferupulolity, in his violations of truth. He fays that the duke of Mantua was pleafed to confer upon the roung lady that was Crichton's miftrets and future wife, a penfon of tive lundred ducats a year ; and that
the prince alfo beftowed as much upon her diring all thee days of his life, "which was (adds Bir Thomes) but fhent; for he did not long enjoy himfelf after the arofs fate of for miferable an accident. Now it is wedl known that Vincenzo di Gonzagafucceeded his father in the dokedom of Mantua in 159 F , and that he did not die till the year 1612; which was almoft, if not cntirely, thirty years after Crichton's deceafe. 'ine other inflance of the imprudence of Sir Thomas Urqulate in the rontrivance of his ficions, occurs at the conclution of his marative, where he afferts tha the writy of the flory which he hath related coneerning the inenmpatable Crichton. 'anty be certifed by two thoufand mon yet living who have knewn him.' 'Tete thatfant men yef liavig! that is, in 3 保z, fixty-nine or fewenty years after Crichton's death, for fuch was the thate of Sir Thomas pultication. Uur author would have been fadty purgled w collect together thefe iwo thenfand living in itnefles who conid certify the verity of hisitary.
" With regard, honever, to the account which is given of the prodigious exertions of Crichtom, both corporal and mental, at Paris, Mekenzie imazines that he has fornd a full consmation of them in a paltage produced by him trom the Difruifiomes of Stephen Pafquier, and which he confoders as the teilimuny of an eye-witnefs. But the whole of what hos been built upon it by Mackensie and tuceseding biographers, is fo mded on a miftake In the quotation from the Difanfiones, the mane of Cichton is not mentioned, and the author doth not appear to have been perfonally prefent at the cxhibitions of the extraordimary youth there deferibed. The expreffions which are "uppoted to carry that meaning may" well be referred not to the witer himfelf, but to his countrymen the French, before whom the young mam is faid to have difghayed his furprifing talents. But the difcullion of this point is totally needleis, becaule the paffare in quetlion is not an original authority: The book intitled Stophani Paforeri Difemfiriones, is only an abridgement in Latin of Patpuier's Des Recherdes do ho Fromes. Now in this lait work there is indeed an atconnt of a wonderful yuth, fuch as is related in Mackenzic's quotaion, and from which that patiane was formed. Bint this wonderful youth, whoever hee might be, was not the admirable Crichton: for Paf. quer, who does mot tell his name, exprefsly Gays that he appeared in the year $1+45$ (a). The evidence, therefore, produced by Mackenzie falls entirely to the ground.
(a) This matter has lately been fet in a clear light hy a lamed and judicious writer in the Ediaburgh Magazine for May 1787 , whofe letter is as folluws.
"S 1 R,
"We are informed by Sir Juhn Hawhins, that Dr Johnfon dictated from memory that account of the perfon vulgarly nancel the Achmirable Crithton, which is to be found in one of the papers of the Adventurer.
"'That account is phainly an abridgenent of the Life of Crichton 1 y Dr George Mackenric. Dr Mackenzie fuppores that Pafquier, the Fremch lawyer and antiquary, was an eye wituels of the feats performed in arts ats well as in arms by Crichton. This is one of the groffec erors in biography which has occurred to me in the courfe of my reading: and it is an error which 1 percive is gaining ground daily, and bids fair in a fhort time to be rcceived as an indifputable truth.
"The error fecms to have arifen from the following circumflance: Dr Mackenzie had never read the original work of Pafquicr intited Recherches de la Fromis; what he quotes concerning the quouthrful voung mang

Crichtor. ground. Indeet, if the fory of Crichton's exploits at Paris had been true, no man was more likely to be aequainted with them than Stephen Parquitr, who lived at the tine, and who would be fond cnough of recording tanfactions fo extraodiary. It may farther be obleaved, that Thuanns, who was likewife a contemporary, and who in his own life is very particuhor in what relates to learmed men, makes no mention of Cricliton. The only anthority for his having ever reliced in France at all (Sir Thomans Urgulart excepted) is that of Dr John Johniton, who fays Gallia pectus excolit. But this amounts to no proof of the truth, of the tranfactions related by Urqulart. The whule whish can be deciuced from it is, that Crichton, in the courfe of his travals, might make fome fay in france for the purpufe of improvenent. Evon this, bowever, dorl not agree with the narration of Imperialis, who informs us, that when trubles arofe in icicotlandion as. comit of reli mion, and quen Mary fell intos fo many calamities. Crichan was fent by his ffather directly from that comery to Venice as a face of fecurity.
"It is acknoxledged by Gir Jom Haxkins, that Sir Thomas Urquant has produced no authoritios in fupport of his furprifing narrations But this defect, Sir John thinks, is fupplied in the Life of Crichtom which is given in inf Pennaut's Tour. I an under the neceffity of faying, that this is hy no means the cate. The article in Pennant was not drawn up by that ingrenious and learned genteman, but is the taanfeript of a pamphlet, that was printed fome years ago at Aberdeen; and which pamplatet is nothing more than a republication, with a few verbal alterations, of the Life of Crichton written by Mackenzie. It doth not, therefore, furnifh a ningle additional teftimony in confirmation of Sir Thomas Urquhart's ftories, excepting in the miffaken indance from Pafyuier. In other refpects it only horrows facts from Sir Thomas Urquhart, without ettablifhing them upon frefh proofs. It is obfervable, that the earlier biographers of Crichton had no knouledge of mof of the trafactions enlarged
upon by this extravagant writer: fors if ther hat Crichton. known them, ther would have hear engenly diforied to relate them, and to do it with cuery ciremoftance of exaggeration. How mach this was the character of Thomas Dempiter, with regand to hi', own countrymen, is fulticiently underfoot, and hath frequently been remarked; and yet his account of Cuichton is uncommonly modut, compared with thate of fucceeding aythors. The extravagance of lmperialis is respeet to Crichom has aready appeared. 'Therefeen; indeed to have been an unierfal tendeney in the wio te: of this young Scotlinan': Jife to proluce wonde: and attoniament. Mackenzie remarks, that Imperict lis could not but know the truth of all, or at leaft or moft of, the things he has related enncerning Crichton. fince he lived upon the places in which the were tranfieted, and had thea from an cye and ear witnefs, even his owalather. It is, however, to be remembered. that Imperialis's Mufenm Híloricum was not publinad till 1640 , nearly fixty years after the events recorded Ey him haplesed; to which may be added, that the information he derived from his father was probably very imperfect. Imperialis the elder was not born till 1568, and confequently was only thirteen years uld when Crichan difplayed his talents at Padua. What real dependence, theretore, coudd there be on the accuracy of the account given by a youth of that age? He coukd only relate, and perhips from inadequate in telligence, the things which were talked of when he was a boy. Befidds, his autlonity is appealed to fur no more than a lingle fact, and that a doubtful oner lince it docs not accord with Manutius's narative : and who ever heard of the famous philofopher Arcangelus Mercenarius?
"The truth of the matter is, that, fome night circumfances excepted, neither Dempter nor Imperialis have produced any evidences of Crichton's extrior. dinary abilities hefides thofe which are recorded by the younget Alcus Manutius. He therefore is to be regarded as the only living authority upon the fub.
ject.
is taken from a Latin abridgement of that work; he refers to Sioph. Pafch. Difquif. lib. v. cap. 23. and her gives his quotation in Latin; intecd it does not appear that Dr Mackenzie had ever heard of the originat work. Now Pafquier, inftead of faying that he was an cye-witnefs of the wonders exhibited by Crichton, fays, in the noft mequivocal terms, that what he relates avas taken from a manufcript which was occalionally ufed by him,' ( d'wn livere cerit a la nacin dont je m'aide felan les occurreness). And he adds, ' 1 will reprefent the Aory in its own fimple garb, without any artifieial colowing, fo that my readers may be the more inclined to
 job/feres plus $\left.(d, \dot{F})^{\prime}\right)$. He then tranferibes the narative from the MS. which places the appearance of this phenomenon in the year 444 , a full century before the birth of war Crichton. Sce Rucberches de la France, lib. vi. c. 38,39 .
" Dr Mackensie, although he had not read the origima of Pafquier, appears to have read an author who quotes the fame fory: 'The learned M. du Iannoy (has he), in his Hitory of the college of Navarre, finding the hifory of this difpute recorded in a MS. Hitlory of the College of Navare, and the like account of a Spaniard in Trithemius, confunds the two together, and mbs our author of the glory of this action, and places it in the year 1445; whereas it fhould be in the year 1571.' This charge of robbcry is fingular enongh.
"Let me only ald, that Pafquier tranferibes fome verfes written by George Chaftelain, a French poet in the reign of Chanles VII kins of Fiance, which allude to the fame fory; and that Pafquier himfelf was born at Paris in 1528, Falkd his life in that city, and was an eminent lawyer and pleader in 1571; fo that it is impoffible the feats of Crichton, had they been really performed at Paris, could have been unknown to him, and moft improbahie that, kaowing them, he would have onitted to mention them; for, in the fame lib. vi. c. 39 . he is at pains to prodicc examples of great proficiency, difplayed by mea in a much humbler rank of bife than that of philufuplers and prablic difputants.

1 am, \&r.".
wat clofely connceted with hion in friendhip; and be relates feveral things on his own perfonal knowledge. tee is a pofitive and uncoubted witnefs with refpect to our young Scotman's int:llectual and literary exertions at Tenice and at Padua; and from hin it is that our aceount of them is given above. Neverthelefs, even Aldus Manutins is to be read with fome degree of caution. Dedications are apt to affurne the yly of exaggeration, and this is the cafe with Manutias's dedication of the Paraloxa Cieronis to Crichtou. In addition to the general language of fuch addrefles, he might be carried too far by his affecion for his friend, which appears to have been very great: nor was the younger Allus emineut for fteadinefs and comfteney of character. It is even faid that by his imprudencies he fell into contempt and milery. But independently of any confiderations of this sind, it may be obferved, that Manutius's narrative, previouly to Crichton's arrival at Venice, conld not be derived from perfonal knowledge. For that part of it (which is fufficiently erroneous) he was probably indebted to Crichton himfelf. Neither dues he appear to have been an eye-witnefs of the whole of the difputations which were held at Padua; for fpeaking of his young friend's praife of ignorance, he relates, that thofe who were prefent told him afterwards how much they were fruck with that oration. However, at the other difputation, which lafted three days, Manutius feems certainly to lave attended; for he concludes his accounts of it with faying, that he was not only the advifer but the fectator of Crichton's wonderful contefts. It is evident, however, from the dedication, that his extraordinary abilities were not univerfally acknow ledged and admired. Some there were who detracted from them, and were difpleafed with Manutias for fo warmly fupporting his reputation.
"As to the real caufe and manner of our young Scotiman's death, both of them fill remain in fome degree of obfcurity. That he was killed in a rencounter at the carnival at Mantua, is teltified by too many authors to be reafonably doubted. But whether there was that particular malignity on the part of Vincenzo di Gonzago, which is commonly aferibed to him, may be confidered as uncertain.
"One important method yet remains by which we may be enabled to form a judgment of Crichton's genius, and that is from a perufal of the four poems of his which are fill preferved. It is, however, to be feared, that thefe will not exhibit him in a very high point of view. Some fancy, perhaps, may be thought to be difplayed in the longeft of his poems, which was written on occafion of lis approaeh to the city of Venice. He there reprefents a Naiad as rifing up before him: and, by the order of the Mufes and of Minerva, directing him how to proceed. But this is a fentiment which fo eafly prelents itfelf to a claffical reader, that it can farcely be confidered as deferving the name of a poctical invention. The three other poems of Crichton have ftill lefs to recommend them. Indeed his verfes will not Atand the tell of a rigid examination even with regard to quantity.
"What then is the opinion which on the whole we are to form of the admirable Cricliton? It is evident that he was a youth of fuch lively parts as excited
great prefent admiration, and high expcetations with segard to his future attainments. He appears to have had a fine perfon, to have been adroit in his bodily exercifes, to have poffeffed a peculiar facility in learning languages, to have enjojed a remarkably quick and retentive memory, and to have excelled in a power of declamation, a Auency of fpeech, and a readinels of reply. His knowledge, likewife, was probably very uncommon for his years; and this, in c rijunction with his other qualities, enabled him to thine in public difputation. But whether his knowledge and learning were accurate or profound, may juflly be queltioned; and it tn:ly equally be doubted whether he would have arifun to any extraordinary degree of eminence in the literary world. It will always be reflected upon with regret, that his early and untimely death prevented this matier from being brought to the teft of experiment."

From the portraits which remain of Crichton, it appears that in his face and form he was beautiful and elegant, and that his body and limbs, though not mulcular or athletic, were well proporioned, and ditted for feats of agility. The following catalorrue of Crichton's work is given by Demplter: 1. Orad ad Latrentiam Maflam flures. 2. Laudes Patroinx, Carmen exteretore effulem, cum in Jaiobi Moyfi Cornelii elomo experintulum ingenii ioram tota Academia frepucntix, non fine multorum flupore, faceret. 3. Ignorationis Laudatio, extemporcale Thema ibidem redditum, pofefex bovarum dijputationes, ut prafentes Sominia potius fovere quam iem fe veram videre aifinnurint, ait Manutius. 4. De Sppulfu fuo Venotias. 5. Oda ad Aldum Manutiun. 6. Díillola ad Divoryos. 7. Prafationes Jolemmes in omnes Scientias Jacras at profarme. 8. Fudicium de Pbilofophis. 9. Errores Alighotelis. 10. Srma an Literc prajaint, Controvesfa oratoria. 11. Kefutatio Mathematicorum. 12. A Comedy in the Italian language.

CRICK, among farriers, is when a horfe eannot turn his neck any manner of way, but holds it fore right, infomuch that he cannot take his meat from the ground without greai pain.

CRICli:T, in zoology. See Gryilus.
Cricker is alfo the name of an exercife or game, with bats and a ball.

Mole Ceriexfy. See Grybeotalpa.
CKICKL, ADE, a borough-town of Wilthire, fituated on the liver Ifis, about 26 miles fouth-weft of Oxford. It funds two members to parliament. W. ${ }^{\circ}$ Lohg. 1. 55. N. Lat. 51.35.

CRICOARYTANOIDFUS, in anatomy, a name given to two mufcles of the laryn. See Anatomy, no 116 .

CRICOIDES, in anatomy, a cartilage of the laryux, calied alfo the annular cartilage. It occupies the lowett part by way of bafe to the rell of the cartilages; and to the lower part of it the afpera arteria adheres. See Anatomy, Talle of the mufcles.

CRICOTHYROID RUS, in anatomy, one of the five proper mufcles of the larynx. Ibid.

CRIM-TARTARS, a people of Afia, fo called becaufe they originally came from Crimea. They rove from place to place in fearch of paftures, their houfes being drawn on carts. There are a great number of them about Aftrachan, to which place they flock in the winter-time; but they are not permitted to enter the city: for this reafon, they erect huts up and

Crim, Crime and Prriin ment.
[ down in the open fields; which are made either of
hu!l-rufhes or reeds, being about 12 feet in diameter, of a round form, and with a hole at the top to let out the fmoke. Their fuel is surf or cow-dung; and, when the weather is very cold, they cover the hut with a coarfe cloth, and fometines pafs feveral days without Aliring out. They are generally of fmall flature, with targe faces, little eyes, and of an olive complection. The men are generally fo wrinkled in their faces, that they look like old women. Their common food is fifh dried in the fun, which ferves them inftead of bread; and they eat the flelh of horfes as well as camels. Their drink is water and milk, efpecially mares wilk, which they carry about in natly leathern-bags. Their garments are of coarfe grey cloth, with a loofe mantle made of a black hreep's kin, and a cap of the fame. The women are clothed in white linen, with which likewife they drefs their lieads, hanging a great many Mofcovian pence about them; and there is likewife a hole left to llick feathers in. As for their religion, they are a fort of Mahometans; but do not coop up their women like the Turks.

Crimtartary, or Crimea. See Crimea.
CRIME and Punishment. The difcuflion and admeafurement of crimes and punihments forms in every country the code of criminal law; or, as it is more ufually denominated in England, the doctrine of the plaas of the crown: fo called, becaufe the king, in whom centrea the majefty of the whole community, is fuppofed by the law to be the perfon injured by every infraction of the public rights belonging to that community; and is therefore in all cafes the proper profecutor for evely public offence.

The knowled;e of this branch of jurifprudence, which teaches the nature, extent, and degrees of eveny crime, and adjufts to it its adequate and neceflary pendty, is of the ntmoft importance to every individual in the flate. For no rank or clevation in life, no uprightriefs of heart, wo prudence or circumfpection of conduct, fhould tempt a man to conclude, that he may sot at fome tine or other be deeply interefted in thefe refearches. 'ithe infirmities of the beft among us, the vices and ungovernable paffions of others, the ifftability of all heman affairs, and the numberlefs.unforeieen events which the compais of a day may bring forth, wifl teach is (upon a moment's reflection), that to know with precifion wbat the laws of our country have forbidden, and the deplorable confequences to which a willul difobedience may expofe us, is a matter of univerfal concern.

In proportion to the importance of the criminal law, ought alfo to be the care and attention of the legifature in properly foraning and enfurcing it. It floond be founded upou principles that are permanent, uniform, and univerfal; and always conformable to the dictates of truth and juftice, the feelings of humanity, and the ind olible sights of markind: though it fometimes (provided there be no trarfgreffion of thefe eternal boundaries) may be nodified, narrowed, wo enlanged, according to the local or occafional necuflities of the flate which it is meant to govern. And yet, either from a want of attenticn to thefe principles in the firft concoction of the laws, and adopting in their flead the impetwous diftates of avarice, ambi-

## $545] \quad \mathrm{C} \quad \mathrm{R}$ I

tion, and revenge ; from retaining the difoordant po. Criana ind litical regulations, which fucceffive conquerors or fac. Puurh. tions have eflablihed, in the various revolutions of go. mene. vernment; from giving a lafting effisacy to fanctions that were intended to be temporary, and made (as lord biacn expreffes it) mucty upon the fpur of the occafion; or from, lattly, too haltily employing fuch means as are greatly difproportionate to their end, in order to check the progrefs of fome very prevalent offence; from fome, or from all, of thefe canfes it hath happened, that the criminal law is in every comntry of Europe more rude and imperfect than the civil. We fall not here enter into any minute enquiries concerning the local conftitutions of other nations: the inhumanity and mittaken policy of which have been fufficiently pointed out by ingenious writers of their own*. But even with us in Britain, where our ${ }^{*}$ As, Barn crown law is with jultice fuppofed to be more nearly Mantefadvanced to perfection; where crimes are more accu- 4 icu, Mar rately defined, and penaltics lefs uncertain and are caid, \&o... bitrary; where all our accufations are public, and our trials in the face of the world; where torture is unknown, and every delinquent is judged by fuch of his equals, agaialt whom he can form no exception, nor even a perional diflike; -even here we hall occafion. ally find room to remark fome particulars that feem. to want revifion and amendment. Thefe have chite. ly arifen from too felupulous an adherence to fome rules of the ancient common law, when the rearons have ceafed upon which thofe rules were founded; fronn not repealiag fuch of the old penal laws ds are cither obfolete or abfurd; and from too litte care and attention in framing and pafing new ones. The enacting of penalties to which a whole nation hali be fubject, ought not to be left, as a matter of indifierence, to the paffions or interells of a few, who upon temporary motives may picfer or fupport fuch a bill; but be calmly and maturely confidered by perfons who know what provilions the laws have already made to reme. dy the mulchief complained of, who can from experience forefee the probable confequences of thofe which are now propofd, and who will judge without paffion or prejudice how adequate they are to the evil. It is never ulual in the houfe of peers even to tead a private bill which may affect the property of an individud, without firt referring it io fome of the ham. ed judges, and hearing their report thereon. And furely equal precauion is neceflary, when laws are to be eltablifhed, which may affect the property, the liberty, and perhaps even the lives, of thoufands. Had fuch a 1 ference taken place, it is impuffibl that in the 1 sth century it could ever have been made a capital crime, to break dos:a (however maliciouly) the mound of a fillpond, whereby any finh thall efcape; or to cut down a cherryerce in an orchard. Wiere even a committee appointed but once in an hundrad years to revife the ciminal law, it could not have comtimed to this how a feiony wihnut bentit of cieng: to be feen for one month in the company of perions who call themfelves or are called Egystians.
It is thue, that thefe outrazuens penalies, being feldoin or never inficted, are handy known to be the law by the public; but that rather aggravates the mifclief, by laying a fnare for the unwary. Yet they Blats. camot but occur to the obfervation of any one, who Comizen 3\%. tath

Punfi. nucht. lines of our lav, and tracing them up to their principles; and it is the duty of fuch a one to hint them

With deceney to thoit whofe abilities and flations enable thea to arply the remedy. Froced we now tw confore (ian the fir phace) the geacel nature of ciner.

1. A crime or miflenervour, is an ax conmitad, or curtes, in whation of a public law, eitur furbidciat or commanding it. This enteralculinitun comprhents buth erines and midemenoms; whin, properly 「aking, are mete fympmots terms: though, in commm ufarc, the werd "aimes" is ar:de to de. note fuch offichecs as are of a lecper and mere arocions dye ; white fmaller falte, and onifions of lefs ronchance, are comprized under the gentler name of "miftertanumes" only.

The ditinction of public wrongs from private, of chimes and mifuemeanours from civil inguries, feans finircipally to conift in this: that private wrongs, or civil injuties, are an mfiningenent or privation of the civil riglits which belong to individulals, confidered merdy as individuals; public wrongs, or crines and miflemeanours, are a breach and violation of the public rights and duties, due to the whole community, confidered as a commanity, in its focial aggregate capacity. As if I detain a field from another man, to which the law has given him a right, this is a civilinjury, and not a crime; for here only the right of an individual is concerned, and it is immaterial to the public which of us is in poffeffion of the land: but triafon, murder, and robbery, are properly ranked anong crimes; fince, befides the injury done to individuals, they ftrike at the very being of fucicty; which cannot poffilly fubfilt, where actions of this fort are fulfered to efcape with impunity.

In alleafes the crime includes an injury : wery public offence is alfo a private wrong, and fonen tat more; it affects the individual, and it likewife affects the community. Thus treafon iu imagining the king's death, involves in it confpiracy againit an individual, which is aho a civil injury: but as this epecies of treafon in its confequenees prineipally tords to the difflution of government, and the deftruction thereby of the order and peace of fociety, this denominates it a crime of the highen margnitude. Murder is an injory to the life of an individual ; but the law of fociety confiders priacipally the lofs which the flate funtains by being depived of a member, and the pernicious example thereby fut, for others to do the like. Rohbery may be confidered in the fane view: it is an injury to private property; but, were that all, a cisil futisfaction in damages might atone for it: the problic mifchief is the thing, for the prevention of which cur haws have made it a capital offence. In thefe grofs and atrocious injuries the private wrong is fwallowed up in the ptblic: we feldom hear any mention made of fatisfaction to the individual; the fati, faction to the commonity being fo very great. And indeed, as the publie crime is not otherwife avenged than by forfeiture of life and property, it is impoffible afterwards to make any reparation for the private wrong: which can only be had from the body or groods of the agfrefor. But there are crimes of an inferior nature, in which the public punihment is not fo fovere, bat it
affords room for a private compenfation alfo: and Crime and licerein the dittinction of crincs from civil injuries is puminvery apparent. For inlance; in the caice of battery, ment. or beating another, the argreflor may be indicted for this at the fuit of the hing, for diturbing the public peace, and be punifled criminally by fine and inppifument: and the party beatem nay alfo have his pivate remedy by action of teefials for the injury, which les ia paticular fultane, and neover a civil fitifaction in damages. So alfo, in cafe of a phlie nufance, as digzing a ditch acrofs a highay, this i: punilnate by indecment, as a common siteme to the whole knedom, and all his najedts shbjets : but if any individual furtains any fercill dange thereloy, as haming his horfe, braking his cartage, of the like, the ofuder may be com, thed to mike ample batif. faction, as well for the private ingery as for the p, llice wrons.
11. The nature of crimes and mifucmeanours in grenerel being thus afeetanced and diling uithed, we proced in the next place to contider the gencral nature of punilhmente: Which de evils or inconsenicaces confernent upon crimes and midemeanomes; being deviala, denurnect, and inflicted by haman laws, in confequence of difobediance or niflehaniour in thone, to regulate whofe conduct fuch haws were refpectively made. And herein we will briely contider the foser, the end, and the monfure, of lumam punifuncot.

1. As to the fower of humn pumifhent, or the right of the temporal legifator to inflict diferctionary penalties for crines and miflemeanours. It is clear, Rosens that the right of panifling crimes againt the lav of cominato nature, as murder and the like, is in a thate of mere nature, vetted in every individual. For it matat be velled in fomebody; otherwife the laws of nature would be win and fruitlefs, if none were emp.awered to pat them in execution: and if that power is velted in any one, it mul alfo be vehed in all mankind; fince all are by nature equal. Whereof the firth nurdeter Cain was fo fenfble, that we find him expref. fig his apprehentions, hat wherver fhould find him would flay him. In a late of fuciety this right is transferred from individuals to the fovereiga power; whereby men are prevented fom being judges in their own caufes, which is one of the evils that civil governinent was intended to remedy. Whatever power thercfore individuals had of punifhing offenees againt the law of nature, that is now velled in the masiAtrate alone; who bears the fword of juthice by the confent of the whole community. And to this precedent natural power of individuals mu!! be refictred that right, which fome have argued to belung to every thate (though, in fact, never exercifed by any), of punithing not only their own fubjects, but alfo foreign enbafaciors, even with death ifalf; in cate they have offended, not indeed againt the municipal haws of the country, but agant the divine lans of nature, and become liable thereby to forfeit thei lives for their guil.
As to offences merdy araint the laws of focietry, which are only meld probizian, and not mala in fi; the temporal magillate is atio ermpowered to indict cocrcive palatits for fuch tranfgrefion: and this by the confent of individuals; who, in forming focictios,

## C rl

Crime and did either tacitiy or exprefly invel the fovereign Punsin. puwe with a right of making laws, and of coforcing sene. obedience to them when mak, by exercilings upos
 The lanfulme therfore of panihiog fuch eriminals is founded upot this primedp, that the han by which they futter was made hy their own confent ; it is a pat of the original conerate into which they enterad, when brat the; engaced in fociety; it was calculated for, and has long contributed to, then own fecurity.
'This right thenefore, Leing thasconlemed by aniverlal confent, gives to the thate exactly the fame power, and no moge. over all its members, as cach indiviluat member han matwally over himelf or o. thers. Which has occafioned fome to duabt, how far a human legiflature owtit to inthict capital punifhments for pofitive oflences; whences againt the manicipallaw only, and not agmint the law of nature; fince no individual las, naturally, a power of midicting dedth mon himfolf or others for actions in themftives matinerent. With regard to offences moll in $k$, capital punith ments are in Come inftanes inflicted by the imacdiate command of God himfelf to all mankind; ar, in the celle of muder, by the precept delivered to Noah, their common anceltor and reprefentative, "Whofn " Wheddeth man's blood, be man fhall his blood be "thed." In other intanees they are inilitiod after the exmple of the Creator, in his politive cude of law for the regutation of the Jewith republic: as in the cafe of the crime agand noture. But they are fometimes iallicted withort lueh exprefs warrant or e:ample, at the will and diferction of the hamen legiflature; as for forgery, for theft, and fometimes for offences of a lighter kind. This practice is thas jahified by that great and good man Sir ivathew Hate: "Whan weners grow enorames, freguent, and dan"frerous to a kingiom or Itate, deftructive or hirghy "pernicions to civil frecties, and to the great iofocu" lity and danter of the kinglom or its inhabitants, " Cevere punifuncat and cern doath iffle is necelfayy "to be amexed to laws in many cales by the pru"s dence of lawgivers." It is therefore the emormity, or danerous tendocy, of the crime, that alone can waman any eathy legilatare in puting him to death that commits it. It is not its fiegtency only, or the difliculty of otherwife perenting $i$, that will excute our attempaing to prevent it by a waton dfation of lomata liond. Fur hough the ad of panithant is to deter mata From oftembiag, it never can follow from thence, that it is lawful to deter them at any rate and by ary means; firce there may be mawial methods of enf reing erandince evar ta the jattell lass $E$ -

 fopolitive. He wiỉ ërus a bester luatom for his, fo doing, than thit lure ow which gene ally is given; that it is fomm be fommer oxperiance that no ligetere peonalty will be eifectual. For is it fommel una further experience, that canital punthments are mare cffectaal? Was the wall territury of all the Rufias worle regulated under the late cmpref; Elizabeth, than under her more fanguinary predecetrons? Is it now, under Catherine II. lefs civilized, lefofociai, lefs focure? And yet we are atared, that ncithor ol abl:

Crime and equal fecurity, whether the offender himfelf be a. Punih. ment.
mended by wholefome correction, or whether he be difabled from doing any farther harm : and if the pe-
nalty fails of both thefe effects, as it may do, ftill the terror of his example remains as a warning to other citizens. The method, however, of inflicting punihment ought always to be proportioned to the particular puprefe it is meant to ferre, and by no means to csoced it: thercore the pains of death, and perpetual difability by exile, flavery, or imprifonment, ought never to be inflited, but when the offender appears incorrigible: which may be collected either from a repetion of minuter offenes; or from the perpetration of fome one crime of deep malienity, which of itfelf demondrates a difpofition without hope or probability of amendment: and in fuch cafes it would be croulty to the public to defer the puminnent of fuch a criminal till he had an opportunity of repeating perhaps the worlt of villanies.
3. As to the mequre of human puniflaments. From what has been obferved in the former articles we may collect, that the quantity of punibment can never be abfolutely determined by any tlanding invariable rule; but it mult be left to the arbitration of the legiflature to inflict fuch penalties as are warranted by the laws of nature and fociety, and luch as appear to be the beft calculated to anfwer the end of preaution againft future offences.

Hence it will be evident, that what fome have fo highly extolled for its equity, the lex talionis or " law of retalidion," can never be in all cafes an adequate or permanent rule of punifhment. In fome cafes indeed it feens to be dictated by natural reafon; as in the eale of confpiracies to do an injury, or falfe aecufations of the innocent; to which we may add that law of the Jows and Egyptians, mentioned by Jofephus and Diodorus Siculus, that whoever without fufficient caufe evas found with any mortal poifon in his cullody, fhonld himfell be obliged to take it. But, in general, the difference of perfons, place, time, provocation, or other circumftances, may enhance or mitigate the offence; and in fuch cafes retaliation ean never be a proper meafure of juftice. If a nobleman tlrikes a pealant, all mankind will fee, that if a court of juftice awards a return of the blow, it is more than a juft compenfation. On the other hand, retaliation may fometimes be too eafy a fentence; as, if a man malicioully fhould put out the remaining eye of him who had loft one before, it is too flight a punifhment for the mamer to hefe only one of his: and therefore the law of the Locrians, which domaded an eye for an eye, was in this inftance judicioufly aktered; by decreeing, in imitation of Solon's laws, that he who Rruck ont the cye of a one-eyed man, fhould lole both his own in reounn. Befides, there are very many erimes, that will :a no flape admuit of thefe penaltics, withont manifent abfurdity and wicksenefs. Theft cannot be punifhed by theft, defamation by defamation, forgery by for prey, adultery by adaltery, and the like. And we may add, thac thofe indances, wherein retaliation appears to be ufed, cuen by the divine authority, do not really proceed upon the male of exact retribation, by doing to the criminal the fame hurt he lias done to his seighour, and no more; but this correrpondence betweet the crime and pumbiment is barely a confe-
quence from fome other principle. Death is ordered Crime and to be punithed with death ; not becaufe one is equiva. lent to the uther, for that would be expiation, and not I'unifh. puaifhment. Nor is death always an equivalent for ment.
death: the execution of a needy decrepid affaffn is a poor fatisfaction for the death of a nobleman in the bloom of his youth, and full enjoyment of his friends, his honours, and his fortune. But the reafon upon which this fentence is grounded feems to be, that this is the highet penalty that man can inflist, and $t$ inds molt to the fecurity of the world; by removing: one murderer from the earth, and fetting a dreadful example to deter others: fo that even this grand inftance proceeds upon other prineiples than thofe of retaliation. And truly, if any meafures of pumithment is to be taken from the damage fultained by the fusferer, the punifhment ought rather to exceed than equal the injury: fince it feems contrary to realon and equity, that the guilty (if convicted) thould fuffer no more than the innocent has done before him ; eipecially as the fuffering of the innocent is pall and irrevocable, that of the guilty is future, contingent, and liable to be efcaped or evaded. With regard indeed to crimes that are incomplete, which conflit merely in the intention, and are not yet carried into act, as confpiracies and the like; the innocent las a cliance to fruttrate or avoid the villany, as the confpirator has alfo a chance to efeape his puniflment: and this may be one reafon why the lex tationis is more proper to be inflicted, if at all, for crimes that confit in intention, than for fuch as are carried into act. It feems indeed confonant to natural reafon, and has therefore been adopted as a maxim by feveral theoretical writers, that the punifhment, due to the crime of which one faliely accufes another, fhould be inflicted on the perjured informer. Accordingly, when it was once attempted to introduce into England the law of retaliation, it was intended as a punihment for fuch only as preferred malicious accufations againft others; it being enacted by flatute 37 Edw. III. c. 18. that fuch as preferred any fuggeltions to the king's great council fhould pui in fureties of taliation; that is, to incur the fame pain that the other flould have had, in eafe the fuggeition were found untrue. But, after one year's experience, this punifhment of taliation was rejected, and imprifonment adopted in its tlead.

But though from what has been faid it appears, that there canot he any regular determinate method of rating the quantity of punifments for crimes, by any one uniform rule; but they mult be referred to the will and diferetion of the legiflative power: yet there are fome general principles, drawn from the nature and circumflances of the crime, that may be of fome affiftance in allotting it an adequate pronifhment.

As, frill, with regard to the object of it: for the greater and more exalted the objeit of an injury io, the more care thould be taken to prevent that injury, and of courfe under this aggiavation the puniflament fhould be more fevere. Therefore treafon in ennfpiring the king's death is (in. Britain) punifhed with greater rigour than even actually killing any private fabject. And yet, generally, a defign to tranfgrefs is not fo flagrant an enormity as the actual completion of that delign. For evil, the nearer we approach it, is the more difagreable and hocking;

## C R I

perpetrate an unlawful action, than barely to entertain the thrught of it: and it is an encouragement to repentance and remorfe, even till the laft fayse of any crime, that it rever is too late to retract; and that if a man flops even here, it is hetter for hime than if he proceeds: for which rea on: atn attcmpt to rob, to ravin, or tokial, is far lefo ponal than the actual robbery, rape, or murder. But in the cale of a treafonable confpiacy, the object whele, fis the king's majetty, the bare intention will deferve the highett degree of feserity : rot becaufe the intention is equivalent to the act itfllf; but becaufe the greatefl rigour is no more than adequate to a treafonable purpofe of the heart, and there is no greater lelt to inflat upon the actual extcution itflf.

Again: The viulence of paffion, or temptation, may formetinzes alleviate a cime: as theft, in cale of hunger, is far more northy of compafion, than when committed through avarice, or to fupply one in luxurious excefles. To kill a man upon fudden and violent refentment is lets penal than upon cool deliberate malice. The age, education, and chametel, of the oftender; the repetition (or otherwife) of the offence; the time, the place, the company wherein it was committed; all thefe, and a thouland other iacidents, may aggravate or extenuate the crime (A).

Farther: As puniflments are chiefly intended for the preicntion of future crimes, it is but reafonable that among crimes of difierent natures thofe fhould be mol fevercly punified, which are the molt defructive of the public fafety and happinefs: and, among crimes of an equal malignity, thofe which a man has the moft frequent and tafy epportenities of committing, which cannot be fo cafly guarded againt as others, and which therefore the oflender las the ftronget inducement to commit: according to what Cicero ohferves, Ea funt unimadrocrenda feccata maximu, quad difficlline procacontur. Hence it is, that for a fervint to dob his mafter is in more cafes capital than for a flimager. If a fervant kills his mafler, it is a feecies of treafon; in asother it is only murder. To fteal a handkuchicf, or other trifle of above the value of twelvepence, privately from one's perfon, is made capital; luat to carry off a load of corn from an open fick, though of tifty limes gieater value, is punifhed with tranfportation only. And in the ifland of Man this rule was formerly earied fo far, that to take away an horfe or an ox was there no felony, but a trefpafs, becaufe of the difficulty in that little territory to conceal them or carry them of: but to fleal a pig or a forl, which is eafly done, was a capital mifdemeanour, and the offender was punined with death.
Lafly, as a conclufion to the whole, we may obferve, that puminments of unreafonable feverity, cfipecially when indiferiminauly inflifted, have lefs effect in preventing crimes, and amending the manners of a people, than fuch as are more merciful in general, yet propetiy intermixed with duc dillinctions of feverity.

It is the fentinent of an ingenious writer, who feems Cume and to have well Audied the fprings of human action, that crimes are more effictually prevented by the certainty than by the feverity of punithment; for the excoffise feverity of laws (fays Montefquicu) hinders their exe-
 the public will frequently pefer impunty to it. Thus alfo the Altute I Mar. N. : c. c. , recites in its preo amble, "that the flate of every king cunifits more affurd in in the lowe af the fulject whards their prince, than in the dead of lewis nade whergigores pains; and that 1 we rade for the prefervation of the commonwealth without grat penaltics, are more often obeyed and kept than laws made with extrome puninments." Liappy had it been for the mation if the fubfeguont pactice of that dehuden princefs in materes of religion, had been correfrondent to thefe fentimerts of herfolf and parliament in matters of thate and sovernment! We may further cbfone, that fancuinary laws are a bad fyrptom of the dillemper of any thate, or at leaft of its weak conltitution. 'The laws of the Roman kings, and the twelve tables of the Gecomeiri, were full of enued punifhents: the Purcian law, which exempted all citizens fiom fentence of death, filently abrogated them all. In this perod the republic flonrined: under the emperors fevere puniflments were revived, and then the empire fenl.

It is, moicover, abfurd and impolitic to apply the fanc punifhent to crimes of different malignity. A multitude of fanguinary laws (befides the doubt that may be entertained concerning the right of making them) do likewife prove a manifet defect either in the wifdom of the legilative, or the frength of the executive, power. It is a kind of quackery in govemment, and argues a want of folid fkill, to apply the fame univerfal remedy, the ulimumn fupplicium, to crery cafe of difficulty. It is, it mult be owned, much eafic: to extirpate than to amend nankind; yet that magiftrate muft be efleemed both a weak and a cruel fur. geon, who cuts off every limb which through ignorance or indolence he will not atterapt to cure. It has been therefore ingeniouny propofed, that in every flate a fcale of crimes hould be formed, with a correfponding fale of punifments, defcending from the greatelt to the leaft. But if that be too romantic an idea, yet at leatl a wife legillator will mak the principal divifions, and not affign penaltics of the firf degree to of fences of an inferior rank. Where mea fee no difinetion made in the mature and gradations of punihment, the generality will be led to conclude there is no diflinction in the guit. Thus in Fiance the punifhment of robbery, either with or without murder, is the fame: hrice it is, that though perhaps they are thencfore fubjea to fewcr rolberies, yct they neser rob but they ath marder. In China murderers are cat to pieces, and sobbers nat: hence in that conntry they never murder on the highway, though they ofton roh. And in Briain, beftides the adilitional terrors of a fpeedy corcution, and a fubfequent expofure or diffection, robbers
(A) Thus IDemofhenes (in his oration againt Midia3) finely works up the aggravations of the infults he had received. "I was abufed (fays he) by my enemy, in cold bloud, out of malice. not by heat os. "wine, in the morning, publicly, before frangers as well as citizeus; and that in the temple, whitie: "the duty of my office called nee."
(rn an! w'Jura hare a hope of tranforintion, which fohlom

 (which is all ome) of funering the contures of hatas Houn the comminion of fortided aecs.

All the leveral feas andexcules which proted the eormmiter of a iorbieden act fiom the purnmmont which is wherwfe annesed thercto, may be reduced tu this fingle coufiteration, the want or defest of aid. An involustary act, as it has no dain to merrit, fo :cibhr can it indace any guint the crucurreace of the will, when it has its chaice either to do or to avid She fact in çustion, bsing the only lirg that retders haman actions either praifeworthy or culpable. In$\therefore$ ed, to nake a comphite cinte, cognisatio by hurnan 1. wi, there muit be booh a will and an act. Fur l'ungh, in foro confosmix, a fixed datgra or will to co al urlawid at is atmult as heimous as the commirfis.a of it ; yet as no tempural tribmal can fiat ch the leasto or tathom the irtentions of the and, othewife than as chey are dementirated $\mathrm{L} y$ cutward astors, it therefure cannot panin for what it canat know. Fur Which reaton, ia all tempera! juifuictions, an oved at, or fomz open evidence of an intended cime, is necutay ia of der to demonditio the defravity of the will, betore the man is liable to penthorent. Aand as a vitous will without a vitur att is no civil crime; fo, on the cther hand, an nawarratubie act whitout a vitious will is no crime at all. So that to comitute a crime dgaintl luman laws, there muld be, fillt, a vitious will; and, fecondly, an thawful aet contequent upon fuch vitious wit!,

Now there s.re three cafes in which the will does Crimen. not join with the act: 1. When there is a defoct of underlanding. For where there io no difeemmets, these is no chosies ; and where there is no ctonce, there can be no ač uf the vill, which is nuthing elfe but a deteraimation of we's (labice tos on or to abA: in from a paticular ietion: ler, therefore, that has no underdanding, cen tove no with to ruide !.es conduct. 2. Where there is und.rhaneing and will fufficient reliding in the party, but not called forth and caerted at the time of the action done; which is the cate of all offences commatted by chance or ignorance: Here the will lits neuter, and nctither concurs with the ast nor difagres to it. 3. Where the action is conftamed by fome outward force and riolence. Hare the will countere Ets the deed; and is fo far from ceracurring with, that it loaths and dilagrees to what the man is obliged to ferfoum. Intaney, idiocy, lunacy, and intexicaiion, fall urder the firtt dats; misfortune and ignorance may be reforred to the fecond; and compulam or necelity may proptuly rank in the thide. See Isfaxer, Idiocy, Dprinemness, Misfortunf, Ignorancr, Necessity.

CRADEA, of Cram Tartaliz, anciently the Cher. furties Ticurion, a peninfula fituated dinceity to the foubh of Se Petellourg, between the 5 解and 5 gth degiets of latitude, and in tis of longitude. Its touthern and wethern coats lic in the Euxine, its morthern and eattent in the Rotion Sea and the Palts Motois. It is juirec!, however, to the centinant rn he norih l.y a imall neck of land not more than lix mikes broad. This perinfua has bein lanum more than 3000 gatoro tince the liff navel expedition of the Argnatut: ; a fory, though mised with fatbe, yet well founded in its principai fasts. The montuinous parts were inhatited by the Taui, probably a colony of Scydaians; and ity conals on the weli, the eat, and the foult, by Grecks. The Scothians were drioc: cut by IItimatate; the Grecks ty the Gamatians; ard incie arain by the Alaniand Guti.s, anothern hard of Scytuians. The Hungarian, the Cumak, and Tartars, fucceccied in
 beht a t.mporary and precarions fufkion of the leapuris, which hacy were obliged to yitid to the Pu:ks in 1475. At the pace of 177 f. the Partars of the
 pen'mald wa unied to the Rutian empire.

From the abovementioned intame, on whel is buit the furt:cis of Or-japi a l'erckop, to the fort rinog of the hill at Kumbinatar, the connty is cure
 t. the fummit of the hil, wheh forms the fouth fide of the penimfula and the hore of the Euxine Sea. The fartuce of the foll is ahont ahl of ome kind, a reddingery loam; on liteging, yon find it noore of lefs naixed with a bi ce carth, and the hiils aucund wih marle. The whole llat, from l'crekop to the river Saleir, whet may be an cxtun of 80 miles, is full of filt manhes and likes; from whence the neghbutring Rutida gusern nichis, as well as the Crim ith If, Anatula, ard PuTura'ia, are fupplied with falt. The molt romarkable of thele lakes are five in rumber: Foflof and Fetha, fo called after the towns near which they lie, are very large; the Tiull, about 15 verlts foom Perekop, on the road from Ifeffa; the Red Lake,

Brinca. not far from the laft mentioned; and the Black Lake. Befldes thefe, there are many other fwamps and lakes, from wheace the inhabitants get falt for their own confumption.

Tue greateft part of the peninfula is fo level that a m m may travel over the hal! of i withont meeting with a river, or ceren the fadlef brom. The intabs. tans of the villays, therefore, male a pit in the yord of every houfe for recerving the rain or the water that runs from the hilis. The whole tract is bare of every kiad of tree. Nut a wuh or a brantible is to be feen, and the herbace is catemely fomes. This, however, dows nor procied 0 math from the wifruitfulnofs of the place, as fiona the vad hords of cattle which rove the whete year long from phace to place; by which means all the gide in frime, fumas, or aut mnt, wo foone appers the negh the long drought which fucceds the wainy featom, bar it is imnediately dwomed or trodden down. The univerfal putance of this cuatom of kepping catte to wader up and down, joined to the duthrumels of the Tarans, with their inaptitude and avetion to arriculiure, is the reafon of the total neglect of that fcience here. Otherwife, were the land divided into portions and properly managed, there would be a fuficiency for the catele, and the relt would be frutiful in corn and grain. By this means alone the Criin would beome a fettile country, and no naturel lefegt would be found in opposition to the welfare of its inhabitants. The truth of this is well known by their neighbemers; where, of a hundred Tartars, one perhaps follows humandry, who finds it to anfwer to fo much profit, that he has not only enough for his own ufe, but wherewith to fell to the nincty-nine.

This peninfula, which is indeed but a lite diatie, yet, from the mary advantages conferred upon it by vature, may be eftermed pectiliarly rich, is divided in. to the hilly conntry and the flat. The latter, which extends from Pettliop to Koflof and the river Mulganak, to Karafubafar, Lieffa, and Yicricali, is flrewn here and there with little Tartar villages, maintained by cattle and the pioluce of the falt lakes. The highlands, or hilly coontry, form the fonthern part of the Crim, aiong the fraight cont of the Black Sea, and ftetching weltwad, in a right line from Kefa, to the vicinty of Eelteck. Thefe hills are conpofed of lay. e:s of chalk; which, in the heaclands and promontorics, is foft, but more inland quite hard. The Atrata of the highett hills are like thofe of the promoneorice, and take a direstion from north to fuoth. The fe quahities of the flata preyail not tiroughon the whole bills, but orly in the large and lofty ones; fuch as the two that rife mear Karafubatar, and one very high by Actinetfched, which hears the name of Aktau. The other fandler hills lie fcatered and difperfed, but take the arates of die gleater ones, to which they feem to belong; as the great ridge of Cancafus doves, which extends beyond the Douau, chrough Bulgaria, and are wamed ruhane.

All accounts agree in this, that nature has fivoured thefe highland countries with great advaltares, and belfet then with abundanee of all things. A number of fin ing diat fla from the mounaina form the two conliderable rivers Sillgir and Karafu, waich rua into the Routea sia. The fomer, which takes its rife from a cavern in a high hill near Achatefled, hato
ftraight into the plain below, and waters a great part ciren. of the Crim; the other, commencing lechind Kasafubafar, falls likewife into the plain, and mingles with the Salgir. There are many other little rivers and Atreams, which run caltwand, and citber join the two formentioned, or fall immediatly into the Rotern Sca. All the ftream:, for the whote length of the hills, which bergin at $\mathrm{K}_{\mathrm{K}}$ fara, and proceed in a clain of the fane height, flow to the north or the north-eaft, excenting the one behind Aehmelfond, where the great momain Aktau is, which falls on the other fide: this river, rifing ou the northern fide of this momentin, flowe, as was before of ferved, towards the north-eatt, to the Shlpin and the Roteon Sea; as likewife thenfe which fpring on the wellen fide, take their conrie wetward to the Bulganak, and thence Aaight to the Black sca; which allo roceives all the other litte rivers that arle from thefe halls, as the Amma, the Katfoha, the Delleth, the Rafulisivi, s:c.
The monntains are well covered with woods fit for the purpole of thip buildiog, and contain planty of wild beats. The valleys confith of fine arable land; on the fides of the hills grow curn and vines in great abundance, and the earith is ich in mines. But thele mountaineers are as carchets and negligent as the inhabitants of the deferts; nighting all thefe admantages; and, like their brethren of the lowlands, are fufficienty happy if they are in poffclion of a fat theep and as much bread as ferves them to cat.
About 20 years ago this puninfula was uncommonly full of inhabitants and wealth. They reckoned at that time at lealt 1200 villages; but, from the late troubles in the Crim, it has loft more than a third part of its inhabitants; and now, wherever we turn, we meet with the ruins of large villages and dwellings. The people were compofed of various mations, who lived together under the T'Tartars in the mot unbounded freedom; but in the late Turkifh war they either put themfelves under the Ruffian government, and were transferred to that empire, or fed to Abcafia and the Tichirkaftian hills.
The houres in the towns, as well as the villages, are for the mofl part of fquare timbers, having the internices filled with brick work, if the poffeffor can afFord it, and thofe of the ponter fort with turf. The chinks and cransies are made tight with clay, and then phatlered within and without. The coveriar is commonly either of brick of of turfs. Onfy the medcheds, minatets, and baths, are of fone, and a few extremely handfome of marble. They liave chimnies in the chambers, at which they likewife drefs their wictuls; but thoves ia the Ruftan mamer none. In extreme frolls a great iron pan of charcoal is broughe into the room, lur making it comfortatle. 'Thair cula in is, to lit upon low fofas, winh Turkifh coveriggs and cuhions, or upon a clay feat, fonewhat raifed above the earth, and ipread with a carpet. In thefe rooms are cupbuards aid beells, (aten covered with cuations, to ferve as frats; in which they keep their gold, filve-, and valuables. Such are the imer apatments on lanrans, in which the women generally live; the withers are not fo tine. Thefe contain only a lofa, or a banl: of ch.cy covcled with a carpet, as in the ciamoy roums
The wh Thatars, and their mobily or monens (ew.

Crimea. cepting only fuch as are bout the perfon of the khan), commonly dwell all the year round in the conntry, coming only to town when they have butacts there. There are but few towns in the Cim, at lealt in conparifon of its former population. The Krimkoi Tartars have no tribunal of jutiee, controve fies and quarrels being feldom heard of anong then : and if a difpute fhould anife, it is immediately fected by an arpeal to the Koran. Little differences in the villages inevitably happening about property, or other matters not taken notice of in that code, are amicably adjufted by the eldermen or aheres; but in the towas all weighty concerns, excepting the lingle cafe of murder or homicide, are brought before the kaimakan or commandant, who fettes them abfolutely without appeal.

The refidence of the khans of the Crimea was formerly Bachtichifarai, in which city they held their feat for upwards of 200 years. They went thither from Elki-Crim, or Old Crim, the eapital city of the Genosfe, upea Bengli Ghireikhan's plundering the feaporte, and driving all the Genoele fron their dations. Before ERi-Crim, and indeed upon the fret coming of the Tartars into this peninfta, the fovereign relidence was at Konlof ; but here they remained not long. Under the late khan Shagin Ghirei it was held at Kef$\mathrm{f}_{\mathrm{h}}$, the ancient Theodoha; which is 10 miles diftant from Efki Crim, faid to be the Cimmerium of the ancients.

The principal cities or towns of the Crimea are: 1. Bacbtichi-Siacui, an extenfive and wealthy city, lying in a rale between two high mountains, and furrounded by a number of gardens. From this circumfance it has its name; bachefcbi fignifying in the Tartarian language "a garden," and fumai "a palace." It formerly contained 3000 houfes, and many fumptuous medfohsds The palace of the khans, with its gardens and ponds, were much improved under the government of Khan Kerim Grei, under whofe government the latt Turkifh war took its rife. In this palace is the burial place of all the khans of Crimea, wherein all the khans that have reigred here lie interred. The fine Krimnioi vines, with their large clufters of grapes, grow in great plenty all about this town, and a profufion of other delicious fruits, from whence the neighbouring parts of Ruflia are fupplied. 2. Kiffo, the prolent refidence of the khans, itands on the thote of a large harbour in the Black Sea. Its fire is on the declivity of a long ridge of mountains; and is mantled by a fone wall, fortified by feveral towers, and encompaffed by a derp ditch. On both fides of the city furmerly iood catics, and in the middle of them a lofty turnt for the pupofe of giving fignals by fire. Before the wall were wide extended fulurbs; cuntainings among oher confiderable buildings, medicheds, church. es for the Greck and Armenian worfhp; of all which now enly the veliges remain. The caftes and towers lie alfo in ruins; and not one thisd part of the houlcs of the city ithell are now remaining, and thofe chitfyy bult of matatats taken from the aforefaid rums. They fomerly reckoncd Keffa so contain toco imufes, incluctiog the futubs, with a number of medleheds and Chrittidn chuches; tut this number las been mach dirinithed by the latt I urkifin war. The permithabitants cand molly of '「antars; who cany on : : ..de by uo meano inconliderable, in commodities brought N 9.
from Tukey: The late khan, an intelligent and en. lightered perionage, made this city the plaee of his re. fidence, and brought hither the mint from Bachuchifarai, buili himelf a palace, and ereeted a divan, which affembled ihree times a-week, and the fourth time was held in the palace of the khan, in which he always perfonally affited. Here is alfo a cultomhoufe, the management of which is farmed out. 3. Karafubafar, likewife a very rich ciiy in former times, itands at the herinning of the mountains, about half-way between Keffa and Baohelchifarai. It is a large trading town; contains a confederable number of dwelling. low fes and medrcheds, but the greateit part of them in decay, and many fine gardens. This place is the moft famous in all the Crim for its trade in horfes, and has a market once a-weck for that article of traffic; to which are likewife brought great numbers of buffaloes, oxen, cows, camels, and theep, for fale. Near this city flows one of the principal rivers of the Crim, called the Karoffi, that is, the Black Water. Of this river they have an opinion in Ruffia, that one part of it flows upwards for feveral verts together. But this is in fome fort tue, not enly of the Karalu, but of all the tivers of the Crim that have a ftrong current. The Tartars, who dwell cither in the valleys or on the fides of the mountains (frequently without confidering whether the place is fupplied with water or not), dig eanals either from the fource of the next river, or from that part of it which lies nearell to their particular habitation, about an arfine in breadth, for their gardens and domeltic ufe. From thefe they cut fmaller ones through the villages, to fupply them with water, and not unfrequently to drive a mill. Thefe canals appear, to the imagination of the common people, to run in a contary direction to the current of the river; and in fact thefe canals do lie, in many places for a verit in length, fome tathoms higher than the level of the fream from whence they are fupplied. + . Aibmetfed, a pretty large city not far from Bachtfchifarai ; now made the capital of all the Crimea by the regulations of Prince Potenkin in the fummer of 1785 . 5. Koflof, formerly a very confiderable trading town, lies on the weftern fide of the peninfula, in a bay of the Black Sea; which, as well as the found at Keffa, mighe rather be called a road than a haven. This was the firt town the Tartars pofeffed themfelves of on their firft entrance into the Crim, and eftablifted a cuttomboufe tl.trein, after the example of the Genocie, which is now farmed out.

The other remarkable places are, Suduk, which is built on the hills upen the thore of the Black Sea, at the fouth fide of the peninfula, and is famous for its excollent wine, refembling Champaigne both in colour and Arength; Aluidoi, on the dame dide, among the litls on the fea-fhore; Babdiava, where these is a fine harbour, and perhaps the only one on the Black Sea, containing ample room for a very good flett; Ih. koman may be wriced for its commodious thouth not very large haven, called Achaiar; and Mangup, the old Cherfonalus: which were all formelly very fourihing twhes; Lut are now either in ruins, or dwindled into mati villates.

All thele placts, fo long as the Genoefe scmained matters of the Crim, were well fortified ; but the Tartars, in taking them, demolithed all the works. Whate

## C R I

Crimes they were ander the Turk; they lift the fortrefles of
Keffa, Kertich, and Kufof, and built the fort Arabat on the neck of land beeween th: te of $A$ zof (or Palus Mreotis) and the Roten Sca, wher Perckop alfo is.

In Arabat are but tew houfes; but hete the warlike fores of the khans wele kept. - Perckep, called by the Turks Or-kapi, is a fortrefs of moderate Atrength; flanding about the middle of the neck of land that joins the peninfula with the contineut. This illhmus, which is at leait fix miles broad, is cut through with a wide and deep ditch lined with fone, and reaches from the Black to the Rutten Sca. This was formerly kept without water, bui 11 . $w$ is filled from both feas. On the Crimean fide a bioh wall of earth runs the whole length of it, Atraight from one fea to the other. The people pals uver the ditch by maans of a drawbridge, and through the wall by a gateway. The walls of the fortrefs are fome fathoms from the read fide; of which the ruins are only now diicernible, namely, large brick houfes, with a number of bomb.flhells and cannon balls about them, which were formenly kept in the fortrefs. At $\mathrm{l}_{\mathrm{taft}}$ two miles from this is the pretty populons but miferable place, which was probably the tewn to which this fort belonged. Near the gate is a cuftomhoufe, where all imports and exports pay duty.

This peninfula was formerly extremely populous; the number of its inhabitants, in Tartars, Turks, Gıeeks, Armenians, Jews, and others, amounted to above $200,0 r 0$ men. Since that, however, the greatelt part of the Chriftians have betaken themfelves to the other patts of the Ruffian empire, particularly the govern. ment of Azof; and many other inhabitants, partieulanly Tarrare, lave gone to Taman and Abchalia; fo that the prefent population of the Crim cannot now be reckoned at more than 70,000 men at molt.
The Crim was heretofore divided into 24 kaduliks or dittricts: namely, Yenikali, Kertich, Arabat, Ef-ki-kıim, Keffa, Karalubafar, Sudak, Achmetiched, Yalof, Bachtfchifarai, Balaklava, Mangup, Inkerman, Konfof, Or, Manfur, Tarkan, Sivafch, Tichongar, Sarubulat, Barun, Argun, Sidfchugut, and Schirin. Several of thefe ditricts are named after the town or villdge wherein the murza, their governor, dwells; and many of them are at prefent in a ftate of total decay.

## Crimen falst. See Falsi Crimen.

CRIMSON, one of the feven red colours of the dyers. Sue Dyeng.

CRiNGLE, a fmall hole made in the bott-rope of a fail, by intertwifting one of the divifions of a rope, called a frant, alternately round it felf and throngh the frands of the bolt-rope, till it tecomes threcfold, and affumes the thape of a wreath or ring. The ufe of the cringle is generally to comain the end of fome rope, which is faftened thereto for the purpofe of drawing up the fail to its vard, or of extending the Thirts thy the means of bridles, to ftand upon a fide wind. The word feems to be derived from krinckiden (Belor.) "to run into twills."

CRINUM, asphonel-lit.s: A genus of the mo. nogynia order, belonging to the hexandria clafs of plates; and in the natural method ranking under the $g^{\text {th }}$ order, $S_{p}$ atbecce. The corolla is funnel-fhaped, monopetalus, and fexpartie, with three alternate fegments having hooked appendages; the germen is coVol. V. Part IL.
vered in the boterm of the corchla, the famina fanding afunder. 'Ithey are very beautiful gieen houle planes, rifing $(w$, or three feet high, each of them crowned by a lise molellste chatier of fathaceous, monupetalous, long funnel flaped fowers, bluc, white, or Atiped, having a very fiagrant finell. They are propagated by off-fts.

CRISIS, in medicine, is ufed in different fenfes, both by the ancient and modern phyficians. With fome it means frequently no more than the excretion of any noxious fubtance from the body. Others take the word for a fecretion of the noxious humours made in a fever. Others ufe it for the critical motion itfelf; and Gaten defines a crifis in fevers, a fudden and inAlantanesus change, either for the better or the worfe, productive of recovery or death.

CRISPIN und Crispianus, two legendary faints, whofe feftival, as maked in the kalendar, is on the 25th of October. According to the legend, they were brethren, boin at Rombe; from whence they tra. velled to Suiffons in. France, about the year 303, to propagate the Chritian religion; and becaule they would not be chargeable to othess for their maintenance, they exercifed the trade of fhoemakers; but the governor of the town difcovering them to be Chiriftians, ordered then to be beheaded. From which time the floenakers made choice of them for their tutelar faints.

CRISTA, in furgery, a term for certain excrefeences about the anus and pudenda. See MencineIndex.
CRISTA GALIt, in anatomy, an eminence in the middle of the os et/momides, advancing within the cavity of the cranium ; and to which is faltened that part of the dura mater which divides the brain, called falo. It has its name from its figure, which refenbles that of a cock's comb. In adulto, this procefs appears of a piece with the fiptum narimm.

CRITERION, or Critrriun, a flandard by which propolitions and opinions are comparcil, in order to difonver their thuth or falfehood.
CRITHE, in furgery, commonly called the five, is a fort of tubercle that grows on the cye-lids. When fmall, it is feated on the edge of the eye-lid; but when large, it fpreads further. When they do not fuppu. rate, they become wens. They are apt to diarpear and return. If these is inflainmation, endeavaur to fuppurate it with the white bread poultice: if it is hard, deftroy it with a mixture of equal parts of hog's lard and quickfilver. If the lower cye-lid is afiected, the tumor is more frequently on its infide ; and then it is beft to diffect it, or to make way for it outwardly by applying a cautic on the kin jut upon it.
CRITHMIUM, samphire: A genus of the digy. nia order, belonging to the pentandria clafs of plants: and in the ratural method ranking under the 45 th order, Un $\mathrm{I}_{\mathrm{b} \text { ellatato. The fruit is oval and compreffed, the }}$ florets equal. There are two fptcics, the principal of which is the malitimum, or common maritime famphire. It hath a fibrous penetrating root ; thick, fucculent, branchy lalks riing two feet high; winged flefhy leaves, confiting of many fmall fpear-fhaped Iobes; with round yellow flowers growing in umbels. It is produced naturally on the fea-coafts among the gravel and rocks. Its leaves are an excellent pickle 4 A

Crithomansy il Criticifal
ufed for fauces, and are by many eaten raw in falads. It is of a faltifh relifh, palatable, and comfortable to the flomach. It is not very caflily preferved in gardens. It mult be fown on gravelly or rocky ground, half an inch deep; in which fituation the plants will come up, and latt fome years. The leaves of this plant are fuid alfo to be aperient and diuretic.
CRITHOMANCY, a kind of divination, performed by confidering the dough or matter of the cakes effered in facrifice, and the meal ftrewed over the vic. tims to be killed. Hence, in tegard they ordinarily uled barly-meal in thefe ceremonies, this kind of divination was called crithomancy, from vistn, barley, and çivres, divimation.
CRIICAS, one of the 30 tyranis fet over Athens by the Spartans. He was eloquent and well bred, but of dagerous primciples. He crutlly perfecuted his enemits and put them to death. He was killed about 420 years before the Augukan age, in a batrle again!t thofe citizens whom his oppreffion had banifhed. He had been among the difciples of Socrates, and had written elegies and other cumpolitions, of which fome fragments remain.

CRITICAL days and symptoms, among phyficians, are certaia days and fymptoms in the courfe of acute difeafes, which indicate the patient's thate, and determine him either to recover or grow worfe. See Medicine-Inde:.

CRITICISM, the art of jndging with proprietyconcerning any object or combination of objects. But, in a more limited fenfe, the feience of criticifm is confined to the fine arts. The principles of the fine arts are belt unfolded by fludying the fenlitive part of our nature, and by learning what objects are naturally agreeable and what are naturally difagreeable. The man who afpies to be a critic in thele arts, mult piece thill deeper : he mut clearly perceive what objects are lofty, what low, what are proper or improper, what are manly, and whak are mean or trivial. Hence a foundation for judging of tate, and for reafoning upon it: where it is conformable to principles, we can pronounce with certainty that it is correct; otherwife, that it is incorrect, and perhaps whimfical. Thus the fine arts, like morals, beconse a rational fcience; and, like morals, may be cultivated to a high Jegree of refinement.
Manifold are the advantages of criticiin, when thus fudied as a rational feience. In the firt place, a thorough acquaintance with the principles of the fine arts rctoubles the entertainment thefe arts afford. To the man who refigns limfelf entircly to fentiment or feeling, wihout interpofing any furt of judgment, poetry, mufic, painting, are mere paftime ; in the prime of life, indeed, they are delightful, being fupported by the force of novelty and the heat of imagination : but they lofe their relifh gradually with their novelty; and are generally neglected in the maturity of life, which difpofes to more ferions and more important occupations. To thofe who deal in criticifm as a regular fcience, governed by jut principles, and giving fcope to judgment as well as to fancy, the fine atts are a favourite entertaimment; and in old age maintain that relifh which they produse in the morning of iife.

In the next plaee, a philofophical inquiry into the
principles of the fine arts, inures the reflecting mind Criticion. to the mont enticing fort of logic: the practice of reafoning upon fubjects fo agreeable tends to a habit ; and a liabit frengthening the reafoning faculties, prepares the mind for entering into fubjects more difficult and abftract. To lave, in this refpect, a juft conception of the importance of criticifm, we need but refleet upon the common method of education; which, after fome years fpent in acquiring languages, hurries us, without the leaf preparatory difcipline, into the mof profound philoiophy: a more effectual method to alienate the tender inind from abtract fcience, is beyond the reach of invention: and accordingly, with refpect to fuch fpeculations, the bulk of our youth contract a fort of thbgoblin terror, which is fildom, if ever, fubdued. Thole who apply to the arts are trained in a very different manner: they are led, Atep by Rep, from the eafier parts of the operation to what are more difficult ; and are not permitted to make a new motion till they be perfected in thofe which regularly precede it. The fcience of criticifm appears then to be a middle link, connecting the different parts of education iuto a regular chain. This fcience furniheth an inviting opportunity to exercife the judgment : we delight to reafon upon fubjects that are equally pleafant and familiar ; we proceed gradually from the fimpler to the more involved cafes: and in a due courfe of difcipline. cuitom, which improves all our faculties, bettows acutenefs upon thofe of reafon, fufficient to unravel all the intricacies of philofophy.

Nor ought it to be overlooked, that the reafonings employed upon the fine arrs are of the fame kind with thofe which regulate our conduct. Mathematical and metaphytical reafouings have no tendency to improve focial intercourfe; nor are they applicable to the common affairs of life: but a juft tafte in the fine arts, derived from rational principles, furnithes elegant fubjects for converfation, and prepares us finely for alting in the focial !tate with dignity and propriety.

The fcience of rational criticifm tends to improve the heart not lefs than the underfanding. It tends, in the firf place, to moderate the felfifh affections: by fweetening and harmonizing the temper, it is a flrong antidute to the turbulence of paffion and violence of purfuit ; it procures to a man fo much mental enjoyment, that, in order to be occupied, he is not tempted in youth to precipitate into hunting, gaming, drinking; nor in middle age, to deliver himlelf over to ambition; nor in old age, to avarice. Pride and envy, two dif* gufful paffions, find in the conflitution no enemy more formidable than a delicate and difcerning talle: the man upon whom nature and culture have betowed this bleffing, feels great delight in the virtuous difpofitions and actions of others: he loves to cherifh them, and to publifh them to the world: faults and failings, it is true, are to him not lefs obvious; but thele he avoids, or removes out of fight, becaule they give hims pain. On the other hand, a man void of tatle, upon whom the moft friking beauties make but a faint impreffon, has no joy bitt in gratifying his pride or envy by the difcovery of errors and blemiffers. In a word, there may be other paffions, which, for a feaSon, difurb the peace of fociety more than thofe men. tioned ; but no otber paffion is fo unwearied an anta-
goait

eriticifan gonift to the fweets of focial intercourle : thefe pafII Crizze: ling. man terpeng in ons on man perpetually in oppolition to others; and difpofe

Ihis was the fault of a peculiar fort of glafs made in O:fordflire and lome other places, of black Alints, a cryftallized fand, and a large quantity of nitre, tarta, and borax. 'I'he glafs thus made is very beautiful, but, from the too great quantitics of the falte in the mixture, is fubject to crizzel; that is, the falts in the mixture, from their too great proportion, are fubject, either from the adventitious nitre of the air from without, or from warm liquors put in them, to be cither incrated in quantity or diffolved, and thereby induce a fabrities or rough. nefs, inrecuverably clonoing the tranfarence of the glafs. This is what was called crizzelling; but by ufing an Italian white pebble, and abating the proo portions of the falts, the manufacture is now carried on with advantage, and the glafs made with thefe falts is whiter than the finelt Venetian, and is fubject to no faults.

CROATIA, a part of the ancient Illyricum, is bounded on the eaft by Sclavonia and Bolnia, on the fouth and fouth-welt by Morlachia, and on the north by the Diave, which Ceparates it from a part of Scid. vonia. It is about 80 miles in length and 70 in breadth, and was once divided between the Hungasians and Turks; bur now the greatelt part of it is fubject to the houfe of Auftria. The Croats derive their origin from the Sclavi; and their language is a dialect of the Sclavonian, approaching very near to that of the Poles. The comntry is divided into two parts, viz. that under, and that beyond, the Save. In the late wars between the empres queen and the king of Piufia, no lefs than 50,000 men were raifed out of this fmall territory. Both horfe and foot are good foldiers, elpecially the former. The foil, where cultivated, is fruitful in wine andoil, sec. but being a fron. lier country, and much expofed to inroads, it is not fo well cultivated as otherwife it might $b=$.

CrOCODILE, in zoology. See Lacerta.
Fofile Choconse, one of the greatelt cariotities in the fuffile world which the late ages have produced. It is the ikeleton of a large crocodile, almolt entire, found at a great depth under ground, bedded in ftone. This was in the pofferion of Linkius, who wroce many pieces of natural hittory, and particularly an accurate defeription of this curious fotitile. It was found in the fide of a large mountain in the midland part of Germany, and in a ftratum of black foffile fone, fomewhat like our common thate, but of a coarfer texture, the: fame with that in which the foflile difh in many pats of the world are found. 'Ihis fkeleton had the back and ribs vely plain, and was of a much deeper black than the rell of the thone; as is alfo the cale in the foffile tifhes which are preferved in this manner. The part of the tone where the head lay was not found this being broken off jufl at the floulders, but that irregulatly; fo that, in one place, a part of the back of the head was vilible in its natural form. The two thoulder-bones were very fair, and three of the fect were well preferved; the legs were of their natural thape and hae, and the feet preferved even to the extremities of the tive toes of each.

Crocodile (cracodilus), in rhetoric, a captious and fophillical kind of argumentation, contrived to feduce the mawary, and draw them Epeciouny into a fuare. It has its name croccdile from the following occafion, invented by the poets. A poor woman, begging a cro$4 \Delta 2$
codile

Crralia, Craconti!
him more to relim bad than good qualities, even in compraion. How different that difpolition of mind, where every virtue in a companion or neighbour, is, by refinement of talke, fet in its ftrongelt light; and defects or blemifhes, natural to all, are fuppreffed, or kept out of view!

In the next place, delicacy of tafte tends not lefs to iavigorate the focial affections than to moderate thofe that are felifh. To be convinced of this tendency, we need only reflect, that delicacy of tate meceffarily heightens our fenfibility of pain and pleafure, and of courle our fympathy, which is the capital branch of every focial paftion. Sympathy, in particular, invites a communication of joys and forrows, hopes and fears: fuch exercife, foothing and fatisfactory in itfelf, is meceffarily productive of mutual good-will and affection.

One nther advantage of rational criticifm is referved to the laft place, being of all the molt important ; which is, that it is a great fupport to morality. No occupation attaches a man more to his duty than that of cultivating a talte in the tine arts: a juft relith of what is beavtiful, proper, elegaut, and ornamental, in writing or painting, in atchitecture or gardening, is a fine preparation for the fame jult relin of thefe qualities in character and behaviou:. To the man who has accuired a tafte fo scute and accomplifhed, every action wrong or improper malt be highly difgufful: if, in any infance, the overbearing power of pafion fuay him from bis duty, he returns to it upon the finf rellection, with redoubled rufolution never to be fwayed a fecond time: he has now an additional motive to virtue, a conviction derived from experience, that happinefs depends on regularity and order, wand that a difregard to jutice or propriety neverdfails to be punithed with hame and remorfe.

For the rules of criticifm applicable to the fine arts, and derived from human nature, fee Arcuitecture, Beauty, Congruity, Comparison, Grandeur, \&c.

CRITO, an Athenian philofopher, flourifhed 400 years before Chrifl. He was one of the molt zealous difciples of Socrates, and tupplied him with whatever he hanted. He had ieveral feholars who proved great men, and he compofed fone dialogues which are loll.

CRITOLAVAB, a citizen of Tegea in Arcadia. He with two brothens fought againft the three fons of Demoftracens of Pheneus, to put an end to a long war between their refpeetive nations. The brothers of Critolaus were bth killed, and he alone remained to wihfland his three bold antagonifts. He conquered them; and when at his return his fifter deplored the death of one of lis antagonitls, to whom fhe was betrothed, he killed ber in a fit of relentment. The offence deferved capital punifhment; but he was pardoned on account of the lervices he lad renderted his country. He was afterwards general of the Achæans; and it is faid that be poifoned himfelf becaufe he had been conquered at Thermopylie by the Romans, about I4 6 years before the Auguitan age.

CRIZZELLING, in the glals trade, a kind of roughnefs arifing on the firface of fome kinds of glafs.

## CR O [ 556 ] C R O

Crocts. cocile that had caught her fon walking by the riverfide to fpare and reftore him, was anfwered, that he would reflore him, provided the fhould give a true an. fwer to a gueftion he thould propofe : the quettion was, Will l reftore thy fon or not? ''o this the pnor wo. man, fufpecting a deceit, forrowfully anfwered, Thou wile not : and demanded to have hin reflored, becaule the had anfwered truly. Thou lyeft, fays the crocodile ; for if I reftore him, thou haft not anfwered truly: I cannot therefore reflore him without making thy anfwer falfe. Under this head may be reduced the propofitions called mentientes or infolublics; which deftroy themfelves. Such is that of the Cretan poet: Ommes ad unum Cretenfes formper nientiuntur: "All the Creians, to a man, always lie." Eicher, then, the poet lies when he afferts that ihe Cretans all lie, or the Cretans do not all lie.

CROCUS, saffrox: A genus of the monogynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the oth order, Enfotic. The corolla is fexpartite and equal ; the Itigmata convoluted or rolled fpirally inwards. Modern botanits allow only one fipecies of this genas, which, however, comprehends many beautiful varicties. This hath a fmall ruandifh, brown, bulbous ront, compref. fed at the bottom. Directly from the root iffue many long narrow leaves, of a deep green colour; and amidit them che flowers all protruded from a thin univalvular radical ffatha; the tube of the flower is long, flanding on the root, and ferving as a foot falk to the limb or upper part, which is crect, fix-parted, widens gradually upward, and grows from about three to tive or fix inches high. The varicties of this foecies may be divided into two claffes, the autumal and fpring flowering.

The varieties of the firt are the crocus optimalis, or faffron of the fhops; for the properties of which, and its cultivation for tale, fee the article Saffron. This hath a long-tubed bluih purple flower, with, three figmata of a tine golden colour. Other varieties are the autumnal fmall blue crocus; deep blue, thy-blue, whitifh blue, many flowered whitifh blue, purple, large rufh leaved purple, autumnal white crocus, and antumnal yellow crocus. The varities of the vernal crocus are, the fmall and large, and golden yellow crocufes, and the yellow black-ltriped, the yellow pur-Fle-ftriped and double cluth of gold ones; the white, white purple-friptd, white purple bottom, white black-Ariped, whitifh cream coloured, whitifl ath-coloured, little narrow-leafed white, and white blueAtriped crocufes. Befides thefe there are a great many others of a blue and purple colour finely variegated.

The autumnal crocufes flower about the beginning of October, but never ripen their feeds in this country. They are very beautifal if fown in patches in the front of borders, or in beds by themfelves, and vesy proper ornaments for gardens of every extent, as coming up at a time when moft other flowers are on the decay. They grow freely in any kind of foil, and may be propagated by offsets. The vernal kinds flower in Fcbruary, March, and April. They alfo are very urnanental, and are fo hardy that they will grow almoft any where. They are propagated by feeds, which the plants produce in plenty.

Crocus, in chemiidry, denotes any metal calcined to a red or deep yellow colour.

Crocn:
Cirocis Aftulitorum, an emetic preparation of antimony and nitre. See Chemistry Index.

CRESUS, the lall king of Lydia, remarkable for his riches, his conquefts, his temporary profperity, and the fad reverfe of his fortme. He fubdued the Fhirygians, Myfians, Paphlagonians, Thracians, and Carians; amafted together immenfe riches; and becane one of the moft powerful and magnificent princes in the world. He drew the learned to his comt, and took a pleafure in converfing with them. Thales of Miletus, Pittacus of Mitylene, Bias of Priené, Cleobulus of Lindus, and moth of the other "wife men," as they are emphatically tlyled, who lived in that age. as well as Rifop the labulitt, and the elegant Greek puets of the times, were bountifully received at the court of Cruelus. There is 11 ill on record a memorable converfation between that prince and Solon, which feemed to predist the fubfequent events of his reign, and which had a late but important influence on the character and fortune of the Lydian king. Crefus having entertained his Atteman gueft, aconding to the ancient fafhion, for feveral days, before he alked him any queftions, oftentationily flowed hin the marrnificence of his palace, and particularly the riches of his treafury. After all had been difplayed to the be!t advantage, the king complimented Solon upon his curiofity and love of knowledge; and afked him, as a man who had feen many commeries, and reflected with much judgment upon what he had feen, Whom of ail men be ellecmed molt happy? By the particular occation, as well as the trimpptiant air with which the queftion was propofed, the king made it evident that he expected fiattery rather than information. But Soton's characier had not been enervated by the debilitating air of a court; and he replied with a manly freedom, "Tcllus, the Atheniar." Croclus, who had fearcely learned to dittinguifh, even in imagination, between wealh and happinefs, inquired with a tone of furprie, why this preference to Tellus? "Tellus," rejoined Sulun, "was not contpicuous for his riches or his grandeur, being oaly a limple citizen of Athens; but he was deicended fron parents who deferved the firt houours of the repoblic. He was equally forthnate in his childien, who obtained univerfal etteem by their probity, patriotifn, and every ufeful quality of the mind or bouy : and as to limfelf, he died fighting gatlantly in the fervice of his country, which his valoar rendered vietorious in a doubtful combat; on which account the Athenians buried him on the fpot where he fell, and ditinguifhed him by every honour which public gratitude can confer on illuitrious merit:"

Cioflus had little encouragement, after this anfwer, to afk Solon, in the fecond place, Whom, next to Tellus, he deened moot happy? Such, however, is the illunon of vanity, that he fill vertured to make this demand; and tall, as we are informed by the mot circumitantim of hiltorians, entertained hopes of being favourably anfivered. But Sulon replied with the fame freedom as before, "'The brothers Cleobis and Biton; two youths of Argos, whofe flerngth and addrefs were crowned with repeated victory at the Olympic games; who deferved the affection of their parents, the gratitude of their cosutry, the admiration of Greece; and

## C R O

who, having ended their lives with pecullar felicity, were cominemorated by the molt fignal mo tunents of imniortal fame." "And is the happinefs of a kiug, then," faid Crafus, "fo fittle regarded, O Grecian ftranger! that you prefer to it the mean condition of an Acthenian or Argive citizan?" The reply of Sollon fufficiently jutified his reputation for wildom. "The life of man,"" faid he, "c confifts of 7 O years, which make 25,550 days; an immenfe nuinber: yet in the longeth life, the creats of any one day will not be fould exactly alike to thofe of another. The aff木irs of men are Jiable to perpetual vicififitudes: the Divinity who prefides over vur fate is envious of too much profperity ; and ill hunaian life, if not condemned to calamity, is at ieaft liable to accident. Whoever has uninterruptedly enj yyd a proferousus tide of fuccefs may juitly be called fortunate: but he cannot before his deatli be intitled to the epithet of bappy."
The events which foon followed this converfation, prove how litile fatisfaction is derived from the poffeffien of a throne. Vittorious in war, unurivalled in wealth, fuppeme in power, Crofius felt and icknowledged his unlappinefs. The wameft affections of his foul centered in lis fon Atys, a youth of the moof promining hopes, who had often fought and conquered by his fide. The flength of his attachment was accompanied with an excefs of paternal care, and the anxicty of his waking hours difturbed the tranquillity of his rect. He dreamed that his beloved ion was llain by a dart; and the folicitude with which he watched his fafety, preventing the youth from his alual ocenpations and amufements, and thereby rendering him too cager to enjoy them, moll probably expofed him to the much-deaded misforcane. Reluctantly permited to engage in a party of hunting, the javerile ardour of Atys, increafed by the impatience of long reltraint, made him neglect the precautions neeffiary in that manly amufement. He was flain by a dart aimed at a wild boar nf monftrous fize, which had long fpread terror over the country of the Myfians. The weapon came from the hand of Adratus, a Phrygian prince and fugitive. whom Crefus had puritied from the involuntary gult of a brother's blood, and long dillin. guifhed by peculiar marks of bounty. To the grate. ful protection of the Parygian, Crefus recommended, at parting, the fafety of his beloved fon. A mournful proceffion of Lydians brought to Sardis the dead body of Atys. The ill fated murderer followed behind. When they approached the royal prefence, Adrallus ftepped forward, and intreated Ciofus to put hiin to death; thinking life no longer to be endured afier killing, tirt his own brother, and then the fon of his benefictor. But the Lydian king, notwibltanding the excefs of his afliction, acknowledged the inno. cence of Adraftus, and the power of fote." "Straviger, your action is blamelets, being committed withont defign. I know that my fon was dettinet to a premature death." Adrafus, though pardoaed by Crafus, could not pardon limefelf. Whicn the mouriters wete removed, he privately returned, and perifind by his own hand on the tonib of Atys.
Two years Creefus remained difconfulate for the lofor of his fon; and might have continued to iudulge his unavailing aftiction during the remainder of life, had not the growing greatncfis of Per lia, whiius threatend
the fafcety of his dominions, roufed him from his dream of matiog. (Sce L.pma.) - He marched againt Cyras with a great aroy, tut was deleated; and retreating to his capital Sords, was there betieged. I're city was take: by afiaut ; and as a Perfan folderer wa going to kill Crofus, that prince's only furviving fon, who had hitherto been dumb, territied at his danger, cried, Stop, foldicr, and touch nut Cirefias. But though delivered by this extraodinary accident from the flind rage of the foldier, he feemed to be referved for a hadder fate. Dragged into the prefence of his eonqueror, he was loaded with irons; and the feem, untelent. ing Cyrus, of whofe humane temper of mind we have fo beautiful, but fo flattering, a picture in the phitofophical romance of Xenophon, ordered him, with the melancholy train of his Lydian atteadants, to be commited to the flames. An immenie pile of wood and other combutlibles was erected in the mott fpacious part of the city. The milerable victims, bound land and foot, were placed on the top of the pyie. Cyrns, furrounded by his gemerals, witneffed the dreadful fpectacle, either from an abominable principle of fuperltition if he had bound himfelf by a vow to facrifice Cowfus as the firft fruit of his Lyclian victory, or from a morive of curionty, equally cruel and intions, to try whether Creafus, who had fo magnificently adarned the tenaples and enriched the ininitters of the gods, would be helped in time of need by the miract.. lous interpotition of his much honoured protectors, Meanwhile the unformnate Lydian, oppreffed and confounded by the intulerable weight of his pretent calamity compared with the lecurity and fplandor of his former Aate, recollected his memoratie converfation with the Athenian fagc, and uttered with a deer groan the name of Solon. Cyrus afked by an interpreter, " Whole name he invoked :" "His," replied Closfus, emboldened by the profpect of certain dea:h, " whofe words ought ever to fpeak to the heart of kings." This reply not being fatisfactory, he was commanded to explain at full length the fubjece of his thoughts. Accordingly he related the important difcourle which had pafled between himfelf and the Athenian, of which it was the great moral, That no man cond be called happy till his death.

The words of a dying man are fitted to make a frong impretfion on the heart. Thofe of Crofus deeply affected the mind of Cyrus. The Perfian confidered the fpetch of Solon as addreffed to himfalf. He repented of his intended cruelty towards an unform tunate prince, who had formerly enjoyed all the pompof profperity : and dreading the concealed vengeance that might lurk in the bofom of fate, gave orders that the pyre hould be extinguithed. But the workmen who had been employed to prepare it, had performed the ir talk with fo mach care, that the order could not fpeedily be obeyed. At that moment, Crocfus calling on Apullo, whele favourite fhrine of Delpha had experitnced his generoms munificence, and whofe perfidious orack had nade him fo angratiful a return; the god, it is faid, feat a plenifinl fower to extinguifh the pyie. 'Thisevent, which faved the life, and which fufficiently atteited the piety of Croefus, flrongly recommended him to the credulity of his conqueror. It lecmed impofible to pay too much reipuet to a man who was cuadeutly the favourite of heaven. Cyrus gave orders
that he frould be feated by hisfide, and thenceforth tieated as a king; a revolution of fortune equally fud den and unexpected. But the mind of Creftus had undergone a till more important revolution: for, tutord in the ufeful feliool of adverity, he leamed to think with patience and to act with prudence, to govern liis own paffions by the diceates of reafon, and to repay by wholefome advice the generous behaviour of his Perfian matter.

The firf advantage which he derived from the change in Cyrns's difpofition towards him, was the perniffion of fending his fetters to the temple of Delphian Apollo, whole fiatering oractes had encouraged him to wage war with the Perfians. Behold," were his meffengers inftructed to fay, " the trophies of our promifed fuccefs! behold the monuments of the unerring veracity of the god!" The Pythia heard their seproach with a fnile of contemptuous indiguation, and anfwered it with that folemn gravity which the was foc carefully taught to aftume: "The gods themfelves camot avoid their osen deltiny, much lefs avert, however they may retard, the determined fates of men. Cuefus has fuffered, and julty fuffered, for the crime of his anceltor Gyges; who, entrufted as chief of the guards, with the perfon of Candaules, the laft king of the race of Hercules, was feduced by an impious woman to murder his malter, to defile his bed, and to ufurp his royal dignity. For this complicated guilt of Gyges the misfortunes of Croflus have atoned; but know, that through the favour of Apollo, thefe misfortunes have happened three years later than the fates ordained." The Pythia then proceeded to explain her anfivers concerning the event of the war againt Cyrus, and proved, to the conviction of the Lydians, that her words, if properly underttood, portended the deftruction, not of the Perfian, but of the Lydian empire. Crcefus heard with relignation the report of his ineffengers, and acknowledged the jutice of the Delphian oracle, which maintained and increafed the luftre of its ancient fame. This fallen monarch furvived Cyrus. The manner of his death is not known.

CROFT, a little elofe adjoining to a dwellinghoufe, and inclofed for "paflure or arable land, or any other purpofe.-In fome ancient deeds, cirffte ocurs as the Latin word for a "croft;" but cym tof tit es crofo tis is more frequent. Croft is traulated in Abbo Floriacenfis, by pradium a "farm".

CROISADE, or Crusade, a name given to the expeditions of the Chriftians againt the iufidels for the conqueft of Palcitine.

Thefe expeditions commenced in the year 1c06. The foundation of them was a finperliticus veneration for thofe places where our Saviour performed his miracles, and accomplifhed the work of man's redemption. Jerufalen had been taken, and Paleftine cun-- Eice Ara- quered, by Omar the fucceftor of Abu Becr *, who \{ia, $\left.\mathrm{u}^{2}\right)^{6}$. fucceeded Mahomet hinfelf. This proved a contiderable interruption to the pilgrims, who flocked from all equartes to perfirm their devotions at the holy fepulchre. They had, however, thill been allowed this liberty, on paying a fimall tribute to the Saracen califhs, who were not much iaclined to molett them. But, in 106 , this city changed its maters. The Turks took it foom the Sarateas; and being mach more ferce and bathanons chan the ferner, the pil
grims now found they could no longer perform their Croilade, devotions with the fame fafety they did before. An opinion was abont this time allo prevalent in Europe, which madu thefe pilgrimages much mose frequent than formerly. It was lomehow or other imagined, that the thouland years mentioned in the zoth chapter of the Revelations, were fulfilled; that Chrift was foon to make his apparance in Paleftine, to judge the world; and confequently that journeys to that country were in the highelt degree meritorious, and even abfolutely neceflary. The multitudes of pilgrims which now flocked to Patefine mecting with a very rough reception from the Turks, filled all Europe with complaints againft thofe inficels who profaned the holy city by their prefence, and derided the facred myllerics of Chriftianity even in the place where they wetc fulfilled. Pope Cregory V'Il. had formed a detign of uniting all the primces of Chrittendom againt the Ma. hometans; but his exorbitant encroachments upon the civil power of princes had created hiun fo many enemies, and rendered his fehemes fo fulpicious, that he was not able to make great progrefs in this undertaking. The work was referved for a meaner inftus. ment.

Peter, commonly called the hermit, a native of A . miens in Picardy, had made the pilgrimage to Jerufalem; and being deeply affected with the dangers to which that act of piety now expofed the pilgrims, as well as with the oppreffion under which the eaftern Chriftians now laboured, formed the bold, and, in all appearance, impracticable defign of leading into Alia, from the farthelt extremities of the Wett, armies fufficient to fubdue thofe potent and warlike nations that now held the Holy Land in flavery. He propofed his feheme to Martin II. who then filled the papal chair; but he, though fenfible enough of the advantages which mut accrue to himfelf from fuch an undertaking, refolved not to interpufe his authority till he faw a greater probability of fuccels. He fummoned, at Placentia, a council contiting of 4000 ecclefiafics and 30,000 feculars. As no hall could be lound large enough to contain fuch a multiiude, the affembly was held in a plain. Here the Pope himfelf, as well as Peter, harangued the people, reprefenting the difmal fituation of their brethren in the Eaft, and the in dignity offered to the Chaillian name in allowing the holy city to remain in the hands of the infidels. Thefe fpeeches were fo agreeable to thofe who heard them, that the whole multitude fudicoly and violently declared for the war, and olemnly devoted themfelves to perform this fervice, which they beliered to be fo merituious :n the fight of Cod.

But thugh Italy feemed to have embraced the defign with ardour, Martin, et thought it meceliary, in order to iufure perfect fuccels, to engage the greater and more warlike nations in the fame enterprize. Having therefore exhorted Peter to vilit the chief cities and foverei rus of Chrittendors, he fummoned another council at Clemont in Auvergae. The fame of this grat and pious defign being now univerfally diffufed, procured the attendanee of the greatelt prelates, nobles. and princes; and when the Pope and the hermit renewed their pathetic exhortations, the whole aflembly, as if impelled by an immediate infpiration, exelaimed with one voice, "It is the will of God! it is the witt

## C R O

sitade. of God!" Thefe words were deemed fo memorable, and fo much the effect of a divine impulfe, that they were employed as the fignal of rendezvous and batcle in all future exploits of thefe adventarers. Men of all ranks now few to arms with the utnoft ardour, and a crofs was affixed to their right fhoulder by all who inlifted in this holy enterprize.
At this time Europe was funk in the molf profound ignorance and fuperfition. The ecclefialtics bad gained the greateft afcendant over the homan mind; and the people, who cormitted the matt horrid crimes and diforders, kucw of no other expiation than the obfervances impofed on them by their feiritual paftors.

But amidf the abject fuperfition which now prevailed, the military firit had alfo univerfally diffured ittelf; and, though not fupported by art or difcipline, was become the general paffion of the nations governed by the ferdal law. All the great lurds poffefted the right of peace and war. They were engaged in continual hoftlities with one another: the open country was become a fcene of outrage and diforder: the cities, Aill mean and poor, were neither guarded by walls nor protected by privileges. Every man was obliged to depend for fafety on his own furce, or his private alliances; and valour was the only excellence which was held in efteem, or gave one man the preeminence above another. When all the particular fupertitions, therefore, were here united in one great object, the ardour for private hoflilities took the fame direction; "and all Europe (as the princels Anna Comnena expreffes herfiff), torn from its foundations, feemed realy to precipitate itfelf in one united body upon Afia"

All orders of men, now deeming the croilades the only road to heaven, were impatient to open the way with their fwords to the holy city. Nobles, artifans, peafants, even pricft, inrolled their names; and to decline this forvice was branded with the reproach of impiety or cowardice. The nobles who inlifted them. felves were moved, by the romantic fpirit of the age, to hope for opulent eflablifhments in the Eaft, the chief leat of arts and commerce at that time. In purfuit of thefe chimerical projects, they fold at the loweft pice their ancient cafles and inheritances, which bad now lolt all value in their eyes. The intirm and aged contributed to the expedition by prefenta and money : and many of them, not fatisfied with this, at tended it in perfon, being determined, if poffible, to treathe their lat in fight of that city where their Sa. viour had died for them. Women themfelves, concealing their fex under the difguife of armour, attend. ed the camp: and commonly forgot their duty fill more, by proflituting themfelves to the army. The greateft criminals were forward in a fervice which they confidered as an expiation for all crimes; and the molt enormous difonders were, during the courfe of thefe expeditions, committen by men inured to wickednefs, enconraged by example, and imetled by necefiry. The mulitude of adrenturers foon became fo great, that their more fagacious leaders becane apprebicnfive left the greatuifs of the armament would be the caufe of its own difappoinment. For this reafon they permitted an modifciplined mut. it ude, computed at 300,000 men, to go before them under the command of plicr
the hermit, and Gautier or Walter, furnamed the Croifato moneylefs, from his being a foldier of fortunce. Thefe took the road towards Conflantinople throtgh Hungary and Bulgaria; and, truting that heaven, by fupernatural affillance, would fupply all their neceffities, they made no provilion for fublifence in their march. They foon found thenfelves obliged ro obtain by plunder what they vainly cxpected from miracles; and the enraged inlatitiants of the countries through which they paffed, attanked the difordely multitude, and תaughtered thon without refifance. The move difciplined aunics followed after; and, pafling the ftraits $3 t$ Confantinople, they were muftered in the plains of Afin, and anounted in the whole to 700,000 men.
This rage for conquering the Holy Land did not ceafe with this expedition. It continual for very near two centuric, and eight different croifades were fet on foot, me after another. The firk was in the year Iog6, as alrcady obferved. The princes cngaged in it were, Hugo, count of Vermandois, brother to Philipl. king of France; Robert, duke of Nornandy; Robert carl of Flanders; Rainond, carl of Touloufe and St Giles; Godfrey of Bouillon, duke of Lorrain, with his brothers Baldwin and Euftace; Stephen, earl of Chartres and Blois; Hugro, count of St Paul; with a great number of other lords. The general rendezvous was at Conlantinople. In this expedition, the famous Godfrey befieged and took the city of Nice. The city of Jerufalem was taken by the confederated army, and Godfrey chofen king. The Chriltians gained the famons battle of Afcalon againit the foldan of Egypt; which put an end to the firit croifade.

The fecond croifade, in the year it 44 , was headed by the emperor Conrad MII. and Louis VII. king of France. The emperor's army was citlucr deftroyed by the enemy, or perifhed through the treachery of Manuel the Greek emperor; and the fecond army, through the unfaithfuluefs of the Cluritians of Syria, was forced to break up the fiege of Damaicus.

The third croifade, in the year $t 188$, immediately followed the taking of Jerufalem by Saladin the foldan of Egypt. The princes engaged in this expedition were, the emperor Frederic Barbarofla: Froderic duke of Suabia, his fecond font; Leopald duke of Auftria; Berthold duke of Moravia; Herman marquis of Baden; the counts of Nalfar, Thuringia, Miffern, and Holland; and above 60 wher princes of the cmpire ; with the bifhops of Befançon, Cambray, Mun itcer, Ofnaburg, Miffen, Paffu, Viturg, and feveral others. In this expedition, the emperor Frederic defeated the foldan of Iconium: his fon Frederic, joined by Guy Lufignon king of Jerufalem, in rain endeavomed to take Acre o: Ptolemais. During which trenfactions, Philip Augufus liug of France, and Rjchard H. king of Fngland, joined the croifade; by which means the Chritt an ariny confifed of 300,600 Fighting mea: but great difputes happeniny, between thic kings of France and England, the former quitted the Liny Land, and Richard concluded a peace witla
Saladin.

The fourth croifade was madertaken, in the year i: 95, by the emperor Henry VI. after Saladin's death. In this expedition the Chrilims ganced feveral battles againt

## C R O $\quad\left[\begin{array}{ll}560\end{array}\right] \quad \mathrm{C}$ R O

Ernifuc arainf the infidels, took a great many towns, and Com were in the way of fuceds, when the death of the emperor ohliged them to quit the Woly Land, and return into Germany.

I he fifth croifade was publifhed, by order of pope Innoccot IlI. in ilg8. 'lhofe enagaged in it made fruitiefs efforts for the recovery of the IIolj $_{j}$ Land : for, though John de Neule, who commanded the fleet equipped in Flanders, arrived at Polemais a little after Simon of Montfort, Renard of Dampierre, and cthers; yet the plague detroying many of them, and the roft either returning or engaring in the perty quarrels of the Chillian princes, there was nothing done; fo that the foldan of Aleppo eanly Jefeated their trocps in 1204.
The fixth croifade began in 1228 ; in which the Chiflans took the town of Damietta, but were forced to furrender it again. The next year the emperor Fiederic made peace with the foldan for 10 years. About 1240 , Richard carl of Cornwal, and brother to Henry III. king of England, arrived in Paleftine at the head of th.e Englifh croifade; but findins it moft advantageous to conclude a peace, he reembarked, and flcered towards Italy. In 1244 , the Karalmians being driven out of Perfia by the Tartars, broke into Palcfline, and gave the Chriftians a general defeat near Gaza.

The feventh croifade was headed by St Lewis, in the ye- 1249 , who took the town of Damietta: but a focknefs happening in the Chiftian army, the king endeavoured a retreat ; in which being purfued by the infidels, moft of his arm were miferably butchered, and himielf and the nobility taken prifoners. Then a truce was agreed upon for 10 ycars, and the king and louds fet at liberty.

The eight croifade, in 1270 , was headed by the fame prince, who made himfelf matter of the port and cafle of Carthage in Africa; but dying in a chort time, he left his army in a very ill condition. Soon after, the king of Sicily coming up with a good fleet, and joining Philip the Bold, fon and fucceftor of Lewis the king or Tunis, after feveral engagements with the Chriftians, in which he was always worlted, defired peace, which was granted upon conditions advantageous to the Chritians: alter which both princes embatked for their own kingloms. Prince Edward of England, who arrived at Tunis at the time of this treaty, failed towards Ptolemais, where he landed with a fmall body of 300 Englith and French, and hindered Jendocdat from laying fiese to Piolemais: but beina obliged to quit the Holy Land ro take pufffion of the crown of England, this croifade ended without contributing any thing to the rccovery of the Ifoly land. In 120 g , the town of Acre, or l'tolemais, was taken and plundered by the fildan of Egypt, and the Chrillians quite Jriven out of Syria. 'Tnere has been no croifade dince that time, though feveral popes have attempted to ftir up the Chritions to fach an undertakins; particulardy Nicholas IV. in 1292 and Cl -ment V . in 1311.

Thangh thele conifads were fiteds of the mat abfurd fupertition, they tended greatly to promote the food of Eurofe. Mukitudes indeed were deikruyed. DFI. Voltaire computes the people who perifhed in the different expeditiong at upsards of two millions. Many there were, howcrer, who returned; and thefe, haN: O.
ving conraried fo lorg with people who lived in a Croifak much more magnificent way than themfelves, began to eatertain fome tate for a refined and polifhed way of life. Thus the barbarim in which Eirope had been fo long immerfed, began to wear off foon after this time. The princes alfo who emained at home, fuund means to avail themffives of the frenzy of the people. By the ablence of fuch numbers of reflefis and martial adventurers, peace was eftablifhed in their dominions. They alfo took the opportunity of annexing to their crown many confderable fiefs, either by purchale, or by the extinction of the heirs; and thus the mifchiefs which muit always attend fendal governmento were confiderably leffened

With regard to the bad fuccefs of the croifaders, it was fcarce poffible that any other thing could happen them. The emperors of Contantinopie, inftead of affilting, did all in their power to difconcert their fcherres. They were jealous, and not without reafon, of fuch an inundation of barbarians. Yet, had they confidered their true intereft, they would rather have affited them, or at leaft food neuter, than entered into alliances with the Turks. They bollowed the latter method, however, and were often of very great differvice to the weftern adventurers, which at laft secafioned the lofs of their city *. But the woilt enemies the croifaders had, were their own internal fantinople, feuds and diffentions. They ncither could agree $n^{x} 144$. while marching torether in armies with a view to conqueft, nor could they unite their conquefts under one government after they had made them. They fet up three fmall fates, one at Jurufalem, another at Antioch, and another at Edefla. 'Thele flates, inftead of affiting, made war upon each other, and on the Greek emperors; and thus became an ealy prey to the common enemy. The horrid cruelties they committed alfo were fuch as muft have infpired the Turks with the mofl invincible hatred againft them, and made them refit with the gratell ubltinacy. They were fuch as could have been cummitted only by barbarians inflamed with religions enthofrafm. When Jerufalem was taken, not only the nnmerousgarrifun were put to the fword, but the inhabitants were maffacred withont mercy and without diftinction. No age nor fex was fpared, not even fucking children. According to Voltaire, fome Chrittians, who lad been fulfered by the Turks to live in that city, led the conquerors into the molt private caves where women had concealed themfelves with their children, and not one of them was luflered to elcape. What eminently fiows the enthufafm by which thefe conguerors were animated, is their behaviour atier this terrible @aughter. They marched over heaps of dead bodies towaris the holy fepulche; and while their hands wore pet polluted with the blood of fo many innocent perfons, fung, anthems to the common Saviour of mankind. Nay, fo far did their relugious enthafialn overcome their fary, that thefe ferocious conquerors now burf into tears. If the abfurdiy and rickednefs of this conduct can be excected by any thing, it muft be by what follows. In the year 120\%, the fronzy of croifading feized the children, who are cuer ready to imitate what they fee their panents engage themelves in. Their childing folly was encourayed by the monks and fchoolnanters; and thoufands of thofe imnocents were couducted from

## C R O

thic houfes of their parents on the faith of the fe words, "Out of the mouth of babes and fueklings haft thou perfected praife." Their bafe conductorsfold a part of them to the 'Turks, and the rell perifhed niferably.

CROISES, or Cronzes, in Englifh antiquity, pilgrims bound for the Holy Land, or fuch as had been there; fo called from a badge they wore in imitation of a crofs. The knights of St John of Jerufalem, ereated for the defence and procection of pilgrims, were particularly called crifiss.

CROISIERS, a religious order fonded in honour of the invention or difcovery of the erofs by the emprefs Flicna. They are difperfed in leveral parts of Curope, paticularly in the Low Ciuntries, France, and Bohemia, thofe in Italy being at pefent fupprefed. Thefe religious follow the rule of St Augutline. They had in Enghand the name of croucled foriens.

CROIX (Frances Petis dela), Cecretary and intelpreter to the king of France in the Turkifh and Arabic languages, died November the 1695 , in his $73^{\text {d }}$ year ; after having executed this employment for the face of $4+$ years. And it appears, that he executed it with as much integrity as abilities: for, when the Algerines fonght for peace of Lonis XIV. conditions were offered, by which they were required to reimburle to this monarch 600,000 franks. The tem, being thought exorbitant, they had recourfe to ftratagem : and they offered a lagge fum to La Croix, who was the incerprecer of all that paffird, if he would put into the treaty "erowns of Tripoli," inftead of "French erowns;" which would have made to the Algerices a difference of more than 100,000 limes. But the integrity of the interpreter triumphed over the temptation ; which however was the greater, as it was next to impoffible he thould be difcovered. Befides the Turkifh and the Arabic, the Perfian and the Tar. tarian, he alfo underfood the Ethopian and Armenian languages. He is well known to the learned world by many works. He tandated the "Hiltory of Franes" into the 'T"urkißh language. He digefted the three volumes of "Voyages inio the Eaft Indies" of M. Thevenot. He made an aceurate catalogue of all the Turkith and Perfan books which are in the king's library. He compoled two complete Dictionaries for the French and Turkih languages: and, when he was dying, he was about to prefent the world with the hiltory of Genghifcan. He undertook this hitory by the order of $M$. Colbert: for this minifer, eltogether intent upon aggrandizing his mater, was accuftomed every week to call together, either in the king's library or his own, certain of the learned, whom, according as they excelled in their $f_{s} v e r a l$ departmunts inliterature, heconttantly fet to work. This hiftory, which coll La Croix more than ten years labour, is uleful, not only to the learned who are curious io know pall events, or to geographers who had hitherto been greatly ignorant of Grand Tartary, but likewife to ail who trade to Chiva, Perfia, or other eattern parts of the world. There is a good map of northern Alia drawn by M. de l'Me, acempanying the work; whieh M. Petis de la Croix, the author's fon, not only revifed, but, to render it more curious, added to it an abridgement of the lives of all thofe authors from whom it was extracted. It was tranfatedinto Englifh, and publifhed at London, 1722, Sio.

Vol. V. Partll.

CROMARTY, the capital of the fire of Cromarty, in sicoland, with an cacellent and fafe harbour capable of contaning the greatelt Hects. W. Long. 3.40. N. L.it. 57.54

CROMLECH, in britiMantiquities, arehuge, bread, flat fones, railed upon other tones fet up on end for that purpole. Thity are common in Anglesy; under which artiele a very large one is diferibed. Sce Plate CL.
'Thefe monuments are fooken of largely by Mr Rowland, by Dr Botlate, and by Wormius, under the nane or Ara or altar. Mr Rowland, however, is clivided in his opinion; for lie partly inclines to the nution of thecihaving been altars, pately to their haviug been fepulchres: he luppofes them to have been orizinally tomli, but that in after cimes facrifices were performed upen them to the heroes depofited wihin. Mr Keiller preferves an aceount of King Hanold having been interred beneath a tomb of this kind in Denmark, and Mr Whight difecvered in Ireland a ficeleton deposited under one of them. 'The great fimilarity of the monuments throughout the north, Mr Penuant obferves, evinces the fame religion to have been fpread in every part, perhaps with fome fight deviations. Many of there monuments are both Britih and Danifh; for we find them where the Danes never penetrated.
'The cromlech, or eromleh. chiefy differs from the K ist-raph, in not being clofed up at the end and fides, that is, in not fo much partaking of the chefl-like figure; it is alfo generally of lasere dimenfions, and fometimes confifts of a greater number of fones: the terms cromleb and kigl-qaen are howter indiferiminately ufed for the fame monument. The termacromech is by fome derived from the Amorie word cram, "crooked or bowing," and teb "Itone," alluding to the rescrence which perfons paid to them by bowing. Rowland derives $i$ from the I Iebrew words caremaluach, lignifying a "devoted or confecrated tlone." They are called by the vulgar coctue Actlor, or Aithur's quoits, it being a cuftom in Wales as well as Cornwal to alcribe all great or wonderful objects to prinee Arthur, the hero of thofe countries.

CROMWELL ('Thomas), earl of Effex, was the fon of a blackfmith at Putney, and born in 149 S . Without a liberal education, but endowed with a flong natural genius, he confidered travelling as the proper means of improving his underfanding; and to this early token of his found judgment he food indehted for the high rank and diftinguifhed honours he afterware's enjoyed. He became by dregrees the confidential favounte and paime miniller of Henry VIII.; and from the moment he aequired any authority in the cabinet, he employed it in promoting the reformation, to his zeal for which he became a viction; for, the more firmly to Cecure the Proteltant eaufe, he contrived to mary the king to Ann of Clever, whole friends were all Lutherans. Unfortunately Henry took a difgut to this lady, which brought on $\mathrm{C}_{1}$ omwell's ruin; the king, with his ufual cruclty and caprice, taking this oppostunity to faerifice this minifter to the Roman Catholic party, to whom he feemed defirous of reconciling hinsfelf as foon as he had Catharine Howard in view. Crumwell was a great politician, and a good man; but, like molt ftatefmen, was guilty of great errors. In his zeal for the new reli$+13$
gion,

## Cromacell.

Cromweil. gion, he had introduced the unjullifiable mone of attainder in cafes of treafon and herefy; and his enemies, who were numerous (confilting of two clafles, the ancient nobility and gentiy, who were enraged to fee the higheft honours beflowed on a man of his mean extraction, and the Roman Catholics, who detefled hin), having preferred many complaints againft him, availed themfelves of his own lax. He wes atainted of trealon and herely, convittec unheard, and beheaded in 1540 . He was the ehief intrument of the fuppreffion of the abbeys and monafteries, and of the sieftruction of images and relics; to him alfo we are indebted for the inftitution of parifh-regilters of births, marriagts, and burials.

Cromvell (Oliver), fylld Jiord Protector of the commonwealth of England, one of the mof extraordinary perionages mentioned in hiftory, was the fon of Mr Nobert Cromwell of Hirchinbrooke in the county of Huntingdon. His anceflors were of very honourable extraction : hut no ways elated to 'Thomas Cromwell earl of Effex, the prime minifter and favourite of Henry VIII. He was born in the parifh of St John, Huntingdon, where his father moftly lived, c.13 the 24 th or 25 th of April 1599 , and educated at the free ichool of that town. Little is known concerning him in his younger years, or indeed concerning lis belaviour in pirvate life. It is, however, related by authors of unfufpected veracity, that when at fehool he gave many figns of a very turbulent and reftefs difpolition. $H e$ is alfo faid from his early years to have been fubject to the hypochondriac diforder, and to many deceptions of the imagination. He had a very remarkable one while at fehool. It lappened in the day time, when he was lying melancholy upon his back in bed. A fpectre, as he thought, approached him, and told him that he foonld be the greateft man in the kingdum. His fatter, being informed of this, was very angry, and defired his maAter to corred him feverely. This, however, prodaced no effect Oliver perfited in the truth of his flery, and would fometimes nention it though his uncle told him "it was too traiterous to be repeated."From this fchool Oliver was removed to Sidney-college in Cambridge, where he was admitted in 5616. His progrefs in his fudies is uncertain; but he lpent much time in playing at foot ball, cricket, and other robuft exercifes, at which he was very expert. His father dying after lae had been about two years at colege, Cromwell returned home; but the irregularity of his life gave fuch offerce to his mother, that, by the advice of fome friends, hee fent him to London, and placed him in Lincoln's-inn. This expedient by no means anfivered the purpofe; her fon gave himfelf up to gaming, wine, and women, fo that he quickly diffipated all that was left him by his father. This diffpation, however, could be but of very foort comtinuance; for be was manied, before he was 21 years of age, to Elizabeth daughter of Sir James Bouchier of Effex. Soon after his marriage he returned to the sountry, where he led a very grave and fober life. This fudden reformation has been afcribed to lis falling in with the Puritans; but it is certain, that Mr Cromwell continued then, and for fome time after, a zealous member of the church of England, and formed a clofe friendifip with feveral eminent divines.

He continsed at Huntingdon where lie fettled after Cromwelt. his marriage, till an eftate of between L. 400 and L. 500 per annum devolved to him by the death of his uncle Sir Thomas Stuart. This induced hinn to remove to the ine of Ely where the eftatelay, and here he embraced the puritanical dectrines. He was elected a nember of the third parliament of Chasles I. which neet on the 20th of January 1628; and was a momber of the committee for religion, where lie diftinguithed himfelf by his zeal againit popery". After the diffolution of that parliament, he returned again into the country, where the continued to exptels much concern for religion, to keep company with filenced minifers, and to invite them often to lectures and fermons at his houfe. Thus he brought his afiairs again into a very indifferent fituation; fo that, by way of repairing the breaches he made in his fortune, he took a farm at St Ives, which he kept five years. But this fcheme fucceeded fo ill, that he was obliged to give it up; and at laft, chagrined with his difappointinents, and made uneafy by the treatment his party at that time received, he formed a defign of going over to New-England. In this, however, he was difappointed; the king iffued out a proslamation againf all fich emigrations, and Cromwell was obliged to remain in England againft his will.

In 1638 , Cromwell had fitit an opportumty of get. ting himfelf publicly taken notice of. The earl of Bedford, and lone other perfons of high rank, who had eftates in the fen country, were very detirous of having it better crained; and though one project of this fort had failed, they fet on foot another, got it countenanced by royal authority, and fettled a part of the profits upon the crown. This, though really intended for a public benefit, was oppofed as injurious to private property : and at the head of the oppofers was Mr Olivet Cromwell, who had confacrable influence in the fe parts. The vigour he fhowed on this occation recommended him to his friend and relation Mr Hampden ; who afterwards characterized him in parliament, as a perfon eapable of contriving and conducting great defigus. But for all this he was not very fucceisful in his oppolition; and as his private affairs were ttill declining, he was in very neceliftous circumfances at the approacl of the long parlizment. In this critical fituation he got himfelf elected nember of parliament in the following manner. In the puritanical mectings which he conftantly frequented, Oliver had molt eminently ditlinguithed himfelf by his gi/ts of praying, preaching, and expounding. At one of thefe meetings, he met with one Richard 'Tims, a tradefman of Cambridge. This man was fo much taken with Oliver, that he tock it into his head to attempt getting him chofen burgefs for the approaching partiament. Being himfelf one of the common-council, Tims imagingd this defign might be brought about; and with this view went to Mr Wildbore a relation of Cromwell's, to whom he communicated his intention. Wildbore agreed as to the fitnefs of the perfon; but told him the defign was impracticable, becaufe Oliver was not a freeman. Tims next addreffed one Evett on the fame fubject, who alfo made the fame objection. He recollected, however, that the mayor had a freedom to beflow, and a fcheme was imnediately lad for fecuring this freedom to Cromwell. On apo
plication
plication to the mayor, however, he tuld them that the frecdom was already difpofed of to another; but this objection being obviated by promifing that perfon a frecdon from the town, the mayor being iuformed that Cromwell was a man of great fortunc, fignified his intention of bellowing the freedom upon him. Our hero, being iuformed of the good offices of his friends, made his appearance in the court dreffed in fearlet richly liced with gold, and having provided plenty of clarct and fweatmeats, they were fo fiedy circulated anong the conporation, that Mr Mhyor's freeman was unammonfly declared to be a very civil worthy genteman. When the election came on, the mayor difcoverci lis miftake, but it was now too late; the party amons the burgeffes was front cnourg to choofe him, and accordingly did fo at the election next year.

When Cromwell firf came into partiment, he affected great phinnefs, and even cartefficfs, in his drefs. His attention to farming had entirely rulticated him, fo that he made a very uncouth appearance. "Who (fays Dr South) that had behold fuch a bankrupt, begrarly fellow, as Cromwell, firt entering the parliament houfe, with a thread-bare torn coat and greafy hat, and perlaps neither of them paid for, eould have fufpeced, that, in the fpace of fo few years, he foould, by the murder of one king, and the banithment of another, afeend the thronc, be invelted with the royal robes, and want nothing of the Atate of a king but the ehanging his hat into a crown?" Cromwell was very active in promoting the famous RemonArance*; which in reality laid the foundation of the .civil war. He declared afterwards to Lord Falkland, that if the remonitrance lad not been carried, he defigned to have converted the frall remains of his eftate into ready money the next day, and to have left the kingdom by the firt opportunity. His firmnefs on this occafion fo effectually recominended him to Hampden, Pym, and the other leaders of the popular party, that they took him into all their councils; and here he acquired that clear infight into things, and that knowledge of men, of which he afterwards made fuch prodigions ufe. His exploits during the civil war, his murder of the king, and ufurpation of the Kingdom, are related under the article Britain, $\mathrm{n}^{\circ} 139$, $-188$.

With regard to the character of Cromwell, Mr Hume expreffes himfelf as follows: "The writers attached to this wonderful perfon make his eharacter, with regard to abilities, bear the air of the moft extravagant panegyric: his enemies form fuch a reprefentation of his moral qualities as refenbles the moft rirulent invective. Both of them, it mult be confeffed, are fupported by fueh flriking circumftances in his fortune and conduct, as beftow on their reprefentation a great air of probability. 'What can be more extraondinary (it is faid), than that a perfon of private birth and education, no fortune, no eminent qualities of body, which have fonetimes, nor thiming qualities of mind, which have often, raifed men to the higheft dignities, fhould lave the courage to attempt, and the abilities to execute, fo great a defign as the fubverting one of the moft ancient as well as teft eftablifhed monarclies in the world? That he fhould have the power and boldnefs to put his prince and
matter to an open ard infamous death? fhould Lanif: Cronwell. that numerons and Ilrougly allied fanily? Cover all thefe temerities under a feeming obedience to a parliament, in whofe fersice he pretended to be retained? Trample too upon that palianent in their turn, and foomfully expel them as form as they gave lim ground of diffatisfastion? Erect in their place the dominion of the faints, and give reality to the molt vifionary idea which the loated imagination of any famatic was ever able to entertan? Supprefe again that monfer in its infancy, and openly fet himfelf up above all things that ever were called forereign in England? Overcone tirt all his enemies by arme, and all his friends afterwards by atifice? Sericall parties patiently for a while, and afterwards conmand then vicuriounty at lalt ? Over-run caeh corner of the three nations, and fubdue with equal facility both the riches of the fouth, and the poverty of the north? lae feacdand courted by all princes, and adopted a brother to the gods of the eartin: Lall tugetier parliaments with a word of his pen, and fatter theon again by the breath of his mouth? Reduce to fubjection a warlike and dif. contented nation ly means of a mutinous army? Comnm mo a mutinores army ly means of feditions and factions officers? fe humbly and daily petitioned, that he would be pleafed, at the rate of millions a-year, to be hircd as mafter of thofe who had formerly hired him for their fervant? Have the ellates and lives of three nations as much at his difpofal as was once the hittle inheritance of his father, and be as noble and liberal in the Jpending of then? And, lally, (for there is no end of emmerating every particular of his glory), with one word bequeath all this power and fplendor to his pofterity? Die poffiffed of peace at home, and triumph abroad? Be buried among kiags, and with more than regal folemnity? And leave a name behind him not to be extinguifhed but with the whole world ; which, as it was too little for his praife, fo it might have been for his conquetts, if the thort line of lis mortal life could have flretched out to the extent of his minortal defigns?
" My intention is not to disfigure this picture drawn by fo materly a hand: I fhall only endeavour to remove from it fomewhat of the marvellons; a circumtance which, on all occations, gives much ground for doubt and fufpicion. It feems to me that the circumftance of Cromwell's life in which his abilities are principally difcovered, is his rifing, from a private flation, in uppofition to fo many rivals, fo much advanced before him, to a high command and authority in the army. His great courage, his fignal military talents, his eminent dexterity and addrefs, were all requifite for this important acquilition. Yet will not this promotion appear the effect of fuperuatural abilities, when we confider that Fairfax himfelf, a private gentleman, who had not the adrantage of a feat in parliament, had, through the fame fteps, attained even to a fuperior rank; and, if endued with common capacity and penctration, had been able to retain it. 'T'o incite fuch an army to rebellion againt the parliament, required wo uncommon art or indultry: to have kept them in obedience had been the more difficult enterprize. When the breach was once formed between the military and civil powers, a fupreme and ablolute authority, from that moment, is devolved on

Crnmwel. the general ; and if he is afterwards pleafed to cmploy artifice or policy, it may be regarded on mof occafons as great condefcenfion, if not as fuperfluous caution. That Cromwell was ever able rally to blind or uver-reach cither the king or the republicans, does not appear: as they poffeffed no means of relilling the force under his command, they wele glad to teuporize with him ; and, by feeming to be deceived, to wait fir an opportanity of frecing themfelues from his dominion. If he feduced the military fatatiof, it is to be confidered, that their intereft and his evidently conrurred; that their ignorance and low education expufded them to the erofedt impolition; and that he himfelf was at bottom as frantic an enthotialt as the worft of them ; and, in ouder to obtain their conliduce, necded but to difplay thofe whgar and riviculous hebits which he had enty acquired, and on which he fit fo high a whe. An army is foforsible, and at the fame time fo coarfe a weapon, that any hand which wields it, may, without much duxtericy, perform any operation, and attain any afendant in human fociety.
"The domefic adminitration of Cromwell, though it difoovers great ability, was conducted without any plan cither of liberty or arbitrary power: perhaps his dificult fituation admitted of neither. His foreign anterprifes, though full of intrepidity, were pernicious to national intereft ; and feem more the refult of inmpetuous fury or narrow prejudices, than of cool forefight and deliberation. An eminent perfonage, however, he was in many refpects, and even a fuperior senius; but unequal and irregular in his operations: and, though not defective in any talent except that of clocution, the abilities which in him wese mof admirable, and which contributed moif to his marvellous fuccefs, were the magnanimous refolution of his enterprizes, and his peculiar dexterity in difeovering the characters and prattiling on the weaknefles of mankind.
"If we furvey the moral charadter of Cromwell, with that indulgence which is due to the blindnefs and infirmities of the human fpecies, we hall not be inchined to load bis memory with fuch violent reproaches as thofe which his enemies ufually throw upon it. Amidtt the pafiions and prejudices of that time, that he thould prefer the parliamentary to the royal caule, will not appear extraordinary ; fince even at prefent many men of fenfe and knowledge are difpofed to think, that the queltion, with regard to the juftice of the quartel, may be regarded as duubtful and ambiguous. The mudder of the king, the mont atrocious of all his actions, was to him covered under a mighty cloud of republican and fanatical illufions; and it is not imporfible but he might believe it, as many others did, the moft meritorious action which he could perform. His fubfequent ufurpation was the effect of neceffity, as well as of ambition; nor is it eafy to fee how the various factions could at that time have been reltrained without a misture of military and arbitrary authority. The private deportment of Cromwell as a fon, a hufband, a father, a friend, is expofed to no confiderable cenfure, if it does not rather merit praife. And, upon the whole, his character does not appear more extraordinary and unufual by the mixture of fo much abfurdity with fo much penetration, than by his temper-
ing fuch violent ambition and fuch enraged fanaticifm Cromwell: with fo much regard to juftice and humanity."

That Cromwell continued a molt complete and bigotted enthultaft to the very laft, appears from his behaviour in his layt dicknefs. His difeafe, which at firit was a kind of flow fever, brourht on by the cates and anxiety of his mind, foon degenerated into a tertian ague. For about a weck the diforder continued without any dancrerous fymptoms, infomuch that every other day he watlied abroad ; but one day after dinner his five phyfuinas coming to wat upon him, one of them having folt his pulfe, faid that it intermitted. At this Cromwell uas furpiled, turned pake, fell into a cold fiweat, and, when he was amott funting, ordered himflef to be carried to bed; where, by the alfftance of cordials, being brought a little to himfelf, he made his will with refpect to his private affurs. The next murning when one of his phylicims cance to vint him, Chomwell afked him, why he looked fo fads and when anfwer was made, 1 hat fo it became every one who had the weighty charge of his hife and litalth upon lim, "Ye phyficians (fays Cromwell), think í Thall dic: Itell you 1 thall nut die this bout, I am fure of it. Do not you think (faid he to the phylician, looking move attentively at him), do not think that I an mad: I feak the words of tuth upon furtr grounds than your Hippocrates or Galen ean furnifh you with. God Almighty himfelf hath given that anfwer, not to my prayers alone, but alfo to the prayers of thofe who entertain a dricier commerce and greater intereft with him. Go on cheerfully, banihing all fadnefs from your looks; and deal with me as yous would do with a ferving man. Ye may have a kill in the nature of things; yet nature can do more than all phyficians put together, and God is far more above nature." As this phyfician was coning out of the chamber, he accidentally met with another, to whom he expreffed his fear that the protector was turning hight-headed. But the other informed him that the chaplains, being difperfed the preceding night into different parts of the houle, had prayed for the protector's recovery, and manimouny received for anfwer that he fhould recover. Nay, to fuch a degree of madnefs did they at laft arrive, that, a public falt being kept it Hampton-court, they did not fo much pray to God for the protector's health, as return thanks for the undoubted pledges they had of his recovery. On this account, though the phyficians perceived his diftemper increafing every hour, they took no notiee of his danger, till it became neceffary fur him to appoint a fueceffor while he had any breath remaining. But being then in a lethargic fit, he anfwered from the purpole; upon which he was again afied w!ether he did not name his eldelt fon Richard? and to this queftion he anfwered, Yes. Being then afked where his will was which he had formerly made conceraing the heirs of the kingdom; he fent to look for it in his clofet and other places, but in vain; for fonebody had either tole it, or he himfelf had burnt it. Soon after, he expired, on the 3 d of September 1658 , aged fumewhat more than 59 years and four months. This day of September he had always reckoned to be the molt fortunate for him in the whole year. A violent tempelt, which immediately fucceeded his death, ferved as a fubject of difcourfe to the vulgar. His patizans, as well as his opponents,

## C R O

-smwell. were fond of remarking this event: and each of them endeavoured, by forced inferences, to interpret it as buf fuited their particular prejudices.

It has been imngiaed by fome, that Oliver Cromwell was poifoned; but for this there feems to be no realonable foundation. His body was npenced by Dr Bates. Ife found the brain fo newhat overcharged with blood, and the lungs a little infimed; but what he reckoned to have been the primeipat carde of his diforder was a total degeneracy of the fubtiance of the fpleen into a mater tefanbling the lees of oil. This, be thought, alfo accounted for the hypochondriac difpofitions to which Cromwell had from his infancy been fubject. Though the bovels were taken out, and the body filled with fpices wrapped in a fourfold cere-cloth, put tirll into a confin of lead, and then into one of wood, yet the corruption was fo great that the humour wought it elf through the whote, and there was a necelity of metring the body before the foremuity of the funcral. A very pompons faneral was ordered at the public expence, and perforned from Somerfet-houfe, with a fplendor not only equal bur fuperier to that beftowed upon crowned heads. Sume have related that his body was depofited in Naleby. field: others, that it was wrapped in laad, and funk in the deepeft part of the Thames, to prevent any infult that might afterwards be offered to it. But it feems beyond doubt that his body was interred at WeitminIter; as we are informed, that on the order to difinter him after the refloration, his corpfe was found in a vault in the middle aifle of Henry VII.'s chapel. In the infide of the coffin, and on the brealt of the corple, was laid a copper plate finely gilt, inclofed in a thin cale of lead. On one fide of this plate were engraven the arms of England impaled with thofe of Oliver, and on the reverfe the following legend: Oliverius Protecior Reipublice Anglis, Scotia, et Hiternix, natus 25 Aprilis 1599, inueguratus 16 Decembris 1653 , mortuus 3 Septembris amn. 1658, bic fitus ef.

Cromwell was of a robult frame of body, and of a manly, though not agreeable afpect. His nofe being rema.kably red and fining, was often made the fubject of ridicule. He left only two fons, Richard and Henry: and three daughters; one married to Ceneral Fletwood, another to Lord Fauconberg, and a third to Lord Rich. His mother lived till :iter he was protector; and contravy to her orders lie buried her with great pomp in Weftminter Abbey. She conld not the perfuaded that ever his power or his perfon was in fafety. At every noife the heard fhe would exclaim that her fon was murdered; and was never fatisficd that he was alive if the did not rective frequent vilits from him. Slue was a decent woman; and by her frugality and induftry had raifed and educated a numerous family upon a fmall fortune. She had even been obliged to fet up a brewery at Huntingdon, which fhe managed to good advantage. Hence Cromwell, in the invectives of that age, is often ftigmatized with the name of brewer. Ludlow, by way of infelt, mentions the great acceffion which he would receive to his royal revenues upon his mother's death, who poffefed a jointure of 60 pounds a-ycar upon his eftate. She was of a good family, of the name of Scuart; and is by fome fuppofed to have bien remotely ailied to the royal family.

Cromwell (Richard), eldeat fon of Oliver Crom- Cromweli well, was by hiss father appointed fucceffor to the protectorlaip, but very foon dipofed by the army *. They difcharged his debts, took all the houcehold ttuff, plate, \&e. gave him a protection for fis months, and to the retired. He was by no means qualifed to fupport the ftation gained by the alpiring taients of his father. Ho was of a moderate temper, and untainted with that fanatical firit which his father had fo fuccefofully cultivated. On the refforation he went abroad ; but returned in 1680 under the aftumed mane of Clark, and fettled at Chethont in Iferifordhire, where he lived privately, and disd in 1712 , aged 86 .

CRONENBURG, a town of Gernany, in the circle of the upper Rhine, and in the landgravate of IIET: Catel, with a Etrong cafle. It is fated at the foot of a hish monntain, on a fertile fotio and is furrounded with a doulle wall. E. Long. 8.15. N. Lat. 50. 15.

Cpnvenbupg, a flroug fortrefs of Dennark, in the ifle of 2 ealand, at the entrance of the sound, where the Danes take toll of fuch fhips as are bound for the Battic. It was very richly funtithed, but pillaged by the Swedes in 1658 , who took away the furniture, annong which were fome thatues of mafly filver. It is built upon piles. E. Long. 12. 50. N. Lat. 56. o.
CRONIUS, in chronology, the ancient name of the Athenian month Hecatombeon ; which was the firf of their year, and anfwered to the latter part of our June and beginning of July.-There were featts called Cronienes celtbrated at Athens in this mouth, in honour of Saturn, anfwering to the Saturnalia of the Romans.

## CRONSLOT. See Cronstadt.

CRONSTADT, a fea-port town of Ruffia, where the greateft part of the navy is fituated. It itands upon the ifland of Retufari in the Gulf of Finland; and was founded by Peter I. as being provided with the fafer harbour in thefe parts, and as forming a ftrong bulwark by fea for the defence of the new metropolis. The only paffage by which fhips of burden can approach Peterfburgh lies on the fouth fide of Retufari, through a narrow channel; one fide whereof is commanded by Crooftadt, and the oppofite by Cronflot and the citadel. Cronflot, which ftands upon a fmall illand of fand, is a circular wooden buildine, and furrounded with fortifications of wond that jut into the water. It contains a garrifon of 100 men. The citadel is another fmail wooden fontrefs, conflretted alfo upon an adjacent fand-bank, and capable of hillding abont zo foidiers. All large veffels mult fail between Cronltadt and thefe two forireffes expoled to the lire of the oppofite batteries; for the other parts of the gulf are only foom one to cleven feet in dipth. All thefe fortifications ucre, at the time of the ir confruction, efteened places of confiderable thength; but now they derive their confequence more from their pafi impurtance than from any retinanee they could make againft the attack of a powerful flect.

Cronttadt is built upon the fonth caftern extremity. of the ifland, and is defended towatds the fica by wooden piers projciting into the water, and towards the land by ramparts and battions. It is a very ilraggling place; and oceupies, like all the Rulian towns. a Lurger fpace of g' wand than the ramber of hatord-

## C R O [ 560 ] C R O

Cronfadt tions feem to require; the houles are noftly of wood, excepting a few fronting the harbour, which are of brick ftuccoed white. Among the latter are the imperial hofpital for failors, the barracke, and the acsdeny for marines and officers of the navy. That feminary ufualiy contains between three and four hundred caders, who are cicthed, maintained, and tanght at the expence of the crown. They are admitted at the age of five, and are fuffered to remain uatil they reach their feventeenth year. They learn accounts, mathematics, drawing, fortifcation, and navigation; and have mafters in the French, German, Englifh, and Swedifh languares. They are trained to naval affirs, and make an annal cruife in the Baltic as far ao Revel. Crontadt has a feparate havenappropriated to the men of war, and another to merchant hips Clofe to the haven for merchant hips is a canal and feveral dry docks, begun in 1719 by Peter 1 . for the purpofe of refitting the men of war. This ufeful work was neclected under his fucceffors. and was not completed until the reign of his daughter Elizabeth. I has been Alll further beantifird and improved by the prelent empreis; and is now applied for building as well as careening thips of the line. At the extremity of thefe docks is a great refervoir, 568 feet in length, which coatains water fefficient, and half the quantity over, to fupply all the docks; which is pumped into it by means of a fire engine, the diameter of whofe cylinder is fix feet. The length of this work, fro- the beginning of the canal to the end of the latt dock, is 4221 feet. The fides of the docks are faced with fone, and the bottom is paved with granite. They are 40 feet deep and 105 broad; and are eapable of containing nine men of war upon the Rocks.

CRONSTAT, a town of Tranfylvania, near the frontiers of Moldavia, fubject to the houfe of Auftria. E. Long. 25.O. N. Lat. 47. 0 .

CROP, the highent part or end of any thing cut off. It is particularly ufed for the corn gathered off a field in harvef. See Agriculture, Part II.

CROSIER, or Crozier, a thepherd's crook : a fymbol of paftoral authority, confifting of a gold or filver faff, crooked at the top, carried occafionally before binops and abbots, and held in the hand when they give the folemn benedictions. The cultom of bearing a pattoral faff before bihops is very ancient, as appears from the life of St Cxfarta of Arles, who lived abort the year 500. Among the Greeks none but the patriarchs had a right to the ctofier. The crofiers were at firt no more than fimple wooden ftaves in form of a $T$, ufed to reft and lean upon. By degrees they were made longer; and at length arrived to the form we now fee them of. Regular abbots are allowed to officiate with a mitre and croficr.

Crosier, in aftronomy, four flars in the fouthern hemifphere, in the form of a crofs, ferving thofe who fail in fouth latitudes to find the antarctic pole.

CROSLET, in heraldry, is whern a crofs is croffed again at a fmall diflance from each of the ends. Upton fays it is not fo often borne by itfelf in arms as other crofl"s a:e, but often in diminutives, that is, in fmall croflets featered abouit the field. See Heraldry.

CROSS, a gibbet made with two pieces of wood placed crofswife, whether they crofs with right angles
at the top like a T , or in the middle of their length like an X . The crofs to which our Saviour was faltened, and on which he died, was of the former kind; being thus reprefented by old monuments, coins, and croffes; and St Jerom compares it to a bird flying, a man fwimming, or praying with his arms extended. The punithent of the crofs was common among the Syrians, Egyptians, Perfians, Africans, Greeks, Romans, and Jews.

The death of the crofs was the moll dreadful of all others, both for the thame and pain of it ; and fo fendalous, that it was inflicted as the laft mark of detellation upon the vileft of people. It was the punithment of robbers and morderers, provided that they were llives too; but otherwife, if they were free, and had the privileges of the city of Rome, this wa then thought a protlitution of that honour, and too infamous a punithment for fuch a one, let his crimes be what they would.

The Mufaic law ordained, that the perfons executed flould not be left upon the tree after fun-fet, becaufe he that is hanged in this manner is accurfed of God. Deut. xxi. 22. The Jews believe, that the foult of thofe who remain upon the gibbet, and without buriat, enjuy no peace, and recsive no benefit from the prayers of other pecple; but wander up and down till their bodies are buried: which agrees with the notions that the Greeks and Romans had of this matter, as may be feen in Hom. Il. 子. and $l^{\prime}$ irg. EXneid. 6.

The form of a crofs being fuch as toas been airealy defuribed, the body of the criminal was faftened to the upight piece by nailing the feet to it, and on the other tranferfe piece generally by nailing the bands on each fide. Now, becaute thefe parts of the body, beng the inftruments of action and mation, are provided by nature with a much greater quanticy of nerves than others have occafion for; and becaufe all fenfation is performed by the fpirit contained in thefe nerves; it will follow, as Stanhope obferves, that wherever they abound, the Senfe of pain mult needs in proportion be more quick and tender.
The Jews confefs, that indeed they crucified people in their nation, but deny that they inflicted this punihment upon any one alive. They firt put them to death, and then fattened them to the crofs either by the hands or neck. But there are indifputable proofs of their crucifying men frequently alive. The wormippers of Baal-peor and the king of Ai were hung up alive; as were alfo the defcendants of Saul, who were put into the hands of the Gibeonites, 2 Sam. xxi. 9 .

Before crucifxion the criminal was generally fcourged with cords: fonetimes little bones, or pieces of bones, were tied to thefe fcourges, fo that the condemned perfon might fuffer more feverely. It was alfo a cultom, that he who was to be crucified hould bear his own crofs to the place of execution. After this manner we find Chirit was compelled to bear his own crofs: and as he funk under the burden, Simen the Cyrenian was conftrained to bear it after him and with him. But whereas it is generally fuppofed that our Lord bore the whole crofs, $i$. $\varepsilon$, the long and tranfverfe part both, this feems to be a thing impolfible; and therefore Lipfius (in his treatife De Supplicio Crucis) has fet the matter in a true light, when he tells us that

# C R O 

yofs. Jefus only carricd the tranfverfe beam ; becaufe the long beam, or the body of the crofs, was either fixed in the ground before, or made ready to he fet up as loon as the prifoner came: and from hence he obferves, that painters are very much millaken in their delcription of our Saviour carrying the whole crols.

There were feveral ways of crucifying ; fometimes the criminal was falloned with cords to a tree, fometimes he was crucifech with his head cownwards. This way St Peter chofe ont of refpect to his matler jefins Chitl, not thinking himfell worthy to be crucifed like him; though the common way of erucifying was by faftening the criminal with mats, one through each hand, and one through both feet, or one through each of them: for this was not atways performed in the lame manner; the ancients fouctimes reprefenting Jefus Chrif crucified with four mails, and fonctames with three. The criminal was fixed to the crofs quite waked; and in all probalnitity the Saviour of the world was not ufed with any greater tencernefs than others upon whom this pronifoment was iaticted. The foldiers divided his cluaths among them, and catt lets for his tanic, which is an under gatanent wom urer the fleh like a flurs.

The text of the Gofpel hows clearly, that Jefus Chrift was faltened to the crols with nails; and the Plalmit (xxxii. 17.) had foretold lones lefore, that they fhould pictce lis hands and his feet: but there are great difputes concerning the number of the fe nalls. The Greeks reprefent our Saviour as faltened to the crofs with four nails; in which particular Gregory ot Tours agrees with them, one at each hand and foot. But feveral are of opinion, that our Saviour's hatids and feet were pierced with thrce nails only, vir. one at each hand, and one thmugh buth his feet: and the cultom of the Latins is rather for this lat opinion; for the generality of the old crucifixes made in the Latim church have only three nails. Nonnus thinks that our Saviour's arms weae beides bound falt o the crols with chains; and st Hilary fpeaks of the cords wherewith be was tied to it.

Sonetimes they who were fafened upon the crofs lived a good while in that condition. St Anobew is behered to have continued three days alive upon it. Eufebius fpeaks of certain martyre in Egypt who were kept upon the crols till they were farved to death. Pilate was amazed at Iffus Chrilt's dying fo foon; becaufe naturally he math have lived longer, if it had not been in his power to have laid down his life and to ake it up again. The thighs of the two thieves who wete erucifed together with our Saviour were broken in order to haften their death, that their bodies might not remain unon the crols on the Sabhath day (John xix. $3^{1,} 32,33$ ), and to comply with the law of Mofes, which forbide the bodies to be left there after fun-fet. But among other nations they were fuffered to remain upon the crofs a long time. Sometimes they were devonred ahive by birds and bealts of prey Guards were appointed to oblerve that none of their fiiends or relations thould take them down and bury them. The ftory of the Ephefian matron and the foldier who was fet io guard the crofs, is very well known. The Roman foldiers who had crucified Jelus Chrif and the two thievea continued near the croffestill the bodies were taken down and buried.

Crofles were whally, in former times, ereeted on
the tops of houfec, by which tenants pretended to ctaim Crof. the privileges of the Templans Hofpitallers, to at fend - Cr-a themelnes agatint their rightul hords. This was condemed by the Itatute Wil. IJ. e 37. It was afoal alfo, in thofe days. to fut up eactess in places where the erpfe of any of the nobitity retted is it was carnied to be buided, that a trombinatius pro ejus animo depore cetur. Crolles, \&ec. are forbiden, to be brongkt into England by $x_{3}$ Eliz. c. 2 . on pain of a frambition, Sc.

Inzertion of the Cross, an ancient fenit, fultemnized on the third of May, in memory of St Helena's (the mucher of Condantine) Inding the true crofs of Chrit deep in the ground on mount Calvary; where the erected a chuch for the prefervation of part of it: the retl being torought to Rume and repolited in the church of the Holy Ciofs of Jerulalem.

Theoduret mentions the tinding of three crofes; that of Jefus Chift and thofe of the twor thices; and that they dithingrifhed between them by means of a fok woman, whe was immediately liealed by tonch. ing the tue crofs. The place is laid to have been goneted ont to her by Sc (uiriacus, then a Jew, atter. wards converted and canomzed.

Exultation of the Cross, an ancient feaft, held on the 14th of September, in momony of this, that Heraclitus refored to mount Calvaty the true crofs in 6.42 , which had been carried ofl it yeara betore by Cofroes king of Perlia, mpon his taking Jerufalem from the emperor Phocas.

The adoration of the crofs appears to have been practifed in the ancient church; indmuch as the Heathens, parciculaly Julian, reproach the primitive Chrithens with it. And we do not hand that their apolugitts dilchamed the clarge. Morray, indeed, aftetted, that this had been done by St Cjril, hut conld rout fupport hisadlegation at the conference of Fontainbleau. Si Helena is had to have reduced the ado ation of the crofs to its juft principls, fince the adored in the wood, not the woud itlelf, which had been diect idolatry and Heathenifn, but lim who had been nalled to this wood. With fioh modifications fone Protehants have been induced to admit the aduration of the crols. John Hufs alowed of the phrafe, provided it were expreisly added, that the adoration was relative to the perfon of Chrit. Lut however Roman Catholies may íemi to triumph by virtue of fuch ditinction and mitigations, it is well known they have mogreat place in their own practice. Imbert, the good prior of Sateony, was fevertly profecmed in 683 for telling the people, that in the ceremony of adoring the crofs, practifed in thet. church on Crood Friday, they were not to adore the wood, but Chrit, who was crucitied on it. The curate of the parifh told them the contrary: it was the wood! the wood! they were to adore. Imbert replied, it was Clurift, not the wood: for which he was cited before the archbithop of Bourdeaux, fufpenced from his functions, and even threatened with chains and perpetual imprifonment. It little avaikd kinn to cite the bifhop of Meaux's dittinction ; it was anfwered, that the church allowed it not.

Cross-Bearer (port-creie, cruciger), in the Romifi. church, the chaplain of an archbifhop or a primate. who bears a crofs before him on folemn cecafions.

The pope has the crofs borne before him every where: a patriarch any where out of Rome; and pri.

## $C \quad \mathrm{R}$

Gragory XI. forbad all patriarchs and prelates to have it borne in prefence of carcinals. A pitate bears a fingle crofs, a patriarch a double crofs, and the pope a triple one on their arms.

Cross-Bearars alfo denote cerian officers in the in. quifition, who make a vow before the inquititors or their viears to defend the Catholic faith, though with the lofs of fortune and life. Their bufinefs is to prowide the inquifitors with noceflaries. They were formerly of great ufe; but in procefs of time fome of their conifitutions were changed, and they were called of the penance of St Donimic.

Pequoral Ceass, is a crofs of gold or filver, or other precious materials, often entiched with diamonds, which the bithops, archtihops, \&e. and regular abbeffes, weat hanging from the neck.

Order of the Cross, or Croifacte, an order of ladies inftituted in 1668 by the emplefs Eleonora de Gonzagua, wife of the emperor Leopold; on oceafion of the miraculons recuvery of a litite golden crofs, wherein were inclofed two pieces of the true crofs, out of the afhes of part of the palace. It feems the fire had burat the calc wherein it was inclofed, and melted the crytal, yet the wood remained untouched.

Mudids of the Cross, a community of young women inftisuted in 1265 at Roye in Picardy, and fince difperfed to Paris and other towns. They inlruct young perfons of their own fex. Some take the three vows of pocerty, chattity, and obedience; others retain their liberty. They are under the direction of a fupedicr.

Cross, in heraldry, is defined by Guillim, an ordinary compoled of fourfold lines; whereof two are pergendiculat, and the other two tranferfe; for fo we mate conccive of them, though they be not drawn throughont, but mect by couples, in four right an gles, near the feflpoint of the efcutchena. See Heraldri:

This beatiag wias tirtt Boftuwed on fuch as had performed, or at leaft undertaken, fome fervice for Chrit, and the Chrillian profetfion ; and is held by divers the moft honourable chargein all heraldry. What brought it into fuch frequent ufe, was the ancient expecitions into the Holy Land; and the holy war pilgrims, after their pilgimare, taking the crofy for their cognizance; and the entign of that war being the crofs. In thofe wars, fays Mackenzy, the Scots carried St Andrew's coofs; the French a crofs argent; the Englith a confs or : the Germans, fable; the ltalians, azure; the Spaniards, gules.

St Gorge's cizoss, or the red crofs, in a fied aro Gut, is now the itandard of England; that faint being the reputed patron of this nation,

Nor is it only in crofes that the variety is fo great: the like is found in many other beanings, and particularly in lions, and the parts of them; whencof Colombicre gives us nolefs than go varieties. Leigh mentiona but 46 feveral cront; Solvanus Morgan, 26; Upton, 30 ; Johannes de Bado Aureo, 12; and to others, whom it is needlefs to mention. Upton owns he dares not profume to afeertain all the various crofles ufed in arms, for that they are at prefent almoft innumerable; and therefore he only takes notice of fuch as he had feen ufed in his own time.
$\mathrm{N}^{\circ} 95$.

Cross, in mining, two nicks cut on the fuperficies of the earth, thus + , which the miners make when they take the ground to dig for ore. This crofs gives the miners three days liberty to make and to fet on flones. As many of the fe croffes as the miner makes, fo many mears of ground he may lave in the vein, provided he fet on thones within three days after making lis crofs or croffes. Rut if he make but one crofs, and a Rander-by makes the fecond, and a ftranger makes the third, every one is ferved with the next mear, according as they have firt or latt, fooner or later, made their crols or croffes upon the ground.

Cross. in coins, a name given to the right hide or face, the other teing called the file or reverfe. It has teen a common error, that the reverfe was meant by the crofis; becaufe at this time, with us, it is marked with figures difpofed in that form: but the famping the head of the prince in thefe kingdoms on the right fide of the coin, was preceded by a general cuifom of Atriking on that part the figure of a crofs ; while the other, called the file, contained the arms, or fome other durice.

Cross, infead of a fegnature to a deed, sce. is derived from the Saxon practice of athing the fign of the crofe, whether they could wite or not.

Cross-Bar Shot, a bullet with an iron bar palfing through it, and itanding fix or eight inches out at both fids. It is ufed at fea for deftroying the enemy's riggirg.

C foss-Bill, in ornithology. See Loxia.
Ckoss-Fill, in chancery, is an original bill, by which the deferdant prays relief agaiatt the plaintiff.

Cross-Bozus. See Bows and Archery.
$C_{\text {Ross-grained }}$ Stuff, in joinery. Wood is faid to be crofs.grained, when a bough or branch has fhot ou: of it ; for the grain of the branch liooting forward, runs athwart that of the trunk.

In wood well grown this defect is fcarce perceivable, except in working; bue in deal-boards thefe bouphs make knots. If the bough grew up with the young trunk, inftad of a lenot is found a curling in the tuff, very fenfible under the plane.

Cross- $-\mathcal{J}^{\prime} c k$, pronounced croject, a fail extended on the lower yard of the mizen-matt, which is hence called the crofojack yard. This fail, however, has generally been found of little fervice, and is therefore very feldom uied.

Cross-Piace, a raii of timber extended over the windlafs of a merchant-hhip from the kuight heads to the belfry. It is stuck full of wooden piris, which are wied to falten the running riggung as occalion requires. Ser Windlass.

Cross-Tining, in hubandry, a method of harrowing land, contiting in drawing the harrow up the interval it went down before, and down that which it was drawnup.

Cross-Trees, certain pieces of timber, fupported by the checks and trelle-trees, at the upper enod of the lower matts, athwart which they are laid to fuftain the frame of the top.

Ckoss-Tree Yaril, is a yard fanding fquare, juft under the mizen top, and to it the mizen-top is fatened below. See Cross- Fack.

Cross-IITort, in botany. See Valentia.
Ordal of the Choss, a fpecies of trial frequently pratifed in the days of fuperfition. See Ordeal.

CROSS,

CROSS, an İnglif artil, famous only for eopying, in the wigns of Chialles I. and Charles 11 . Of this taFent there io a fory current, more to the credit of his fill than of his prokity. He is faid to have been emfloyed by Charles 1. to copy the celcbated Madona of Raphact in St Mark's church at Venice ; ant that, having ohtained lo ve of the ftate for that purpofe, he executed his piece fo well as to bring away the origimat and leave his copy in the place of it. The deception was not detceted mintil it was too late to recover the lofs: and this piece was bought in Oliver's time ly the Spanifh ambalfidor for his matter, who placed it in the Efcurial.

CROSSEN, a handfome town of Silcfia in Germany, and capital of a principality of the fame name. It is lituated at the confluchee of the rivers Butar and Oder, in a fettile country abounding in wine and fruits. There is a bridge over the Oder which is fortified. E. Lonc. 15.20. N. Lat. 52. 5.

Ciocsosily. Us, in botany: A senus of the polyandria order telonging to the monade? !hia ctafs of plants. The caly x is a quadrangular, gmatiad, turbinated perianthinin: the corolla conifils of fur elliptical petals: the ftemina are 20 flififonn flaments, almoth the length of the calys ; the anthere finall and roundin; the pericarpium an hemifpherical, unilucular berry, with many itrie on its upper part; the feed's numerons and roundih.

CROTALARIA, Rattle-wort: A genus of the decandria order, belonging to the diadelphia clafs of plants: and in the natural method ranking under the 32 d order, Pagifionacat. The legumen is turgid, inflated, and pedicellated; the filments are coalited with a liffune on the back. There are 11 fpecies, all of them natives of warm climates. They rife from is inches to 5 feet in height, and are alorned with flowers of a blue or ycllow colow. The molt remarkable feecies is the retura, with fomple oblong wed red leares. It is a native of the idland of Ceylon and fone other parts of the Eaft Indies: The flowers are ycllow, the puis frooth, eylindrical, inflated, and placed horizontaly : they are filled with feeds, which, when dried, and thaken by the flightett wind, emit a rattling mife: and this, by the rude inhabitants of the countries where the phat is antive, is attributed to the devil, who is thon he to deliver his oraeles in this whimlieal nataner

LROTALO, an inflrument of military mufic, like that defribed in the mext article. The Turks are the fist. anong the moderns, who introdiced the ufe of it for then troops. It is now common in flan. dens and Fonence, and other territories on the comipent. It has why one tone; hut its effeet in marking time may be diftintly licard through the noife of forty drums. 'Ilais is the fante intrument with the ancieat cymbatum.

CROT, ILUNS, an ancient kind of caragnetti, or mufical inftument, found on medals, in thic hands of the piects of Cybele. The crotalum differed from the ithoun; though authors frequenty: confound the two. It confitich of two little brafs plates or rode, which were thaken in the hand, and in litiking againt each other made a noift.

It was fometimes alfo made of a reed fplit lengthVol. V. Part II.
wife; one part wharenf theyfrock araind the other: and as this mate in mife fomewhat like that of a crances himb, they called that bisd ermathon, aldayer on the cro tala : and Arillophanes call arsat talker a croatum.

Clements $A$ lesandmans attributes the incention to the Sicilians: and forbids the ufe theresf in the Chriftians, becoufe of the indecont manions and gettures that accompary it.
 gemus betonging to the order of amphimia feppentes; CXis. the chataters of which are thefe: the betly is fumithed with fouta, and the tail has both foutd and feakes but the priacipal charactertitic of this genus is the rattle at the ched of the tail. The rathes confid of feverad articulated crullacemes, or rather bomy, bages whith make a confiderable ratting noife when the creature moves, and ferves to wara people of their approach. 'lloce are five fpecies; and the bite of every one of them is fo himhly puifonous, that it genemally kills in a thort time. Of thefe we have no accombe that can be depended upon, except that given by MIr Catefly of the horridts, or Ancrican ratte-fnake. This growis fometimes to the length of $S$ Rect, and weigh between \& and 9 pounds. The colon of the head is brown ; the eye red; the upper part of the body of a chlowith-hown colour, tanfverfely inarled with ineggar broad black fills. The rattle is of a brown eolour, compoted of fevemal horny, membranous, cells, of an undulated pramichal fisure. Thele ate articulated within one mother in fuch a manner that the point of the firt cell reaches as far as the bahis of the protuberant ring of the thord, and fin on : which articulation, being rery loofe, gives libery to the parts of the cells that anc inclofed whin the watwad rings to Arike againft the fides of them, and in to cade the rathing noife which is head when the frake hakes its thil. 'lhis is the mot inactive ams flow mowing of all the frakes, and is never the agsen for cscent in what it preys upon. The above rentleman is of minion that no remery is yet difonvered for the bice of this amimal. He had frequenty aceels $t$, fec Imdians bit by it, and abways thought that thofe who recovered were curd more timough the furce of nature, or by reafon of the niglatnels withe bite, that by the remedies ufed. He tulls us, that the Indian; know their celliny the moment they are bit ; and if the bite happens to be on any of the large veins, they apply no remedies, as knowing them to be entirely ufelefs. He belions the reports of the fafcinatin? power of this ferpent, though he never lad an epports: aity of fecing it. Sice the articles Possus and Smepent.

CRODALTBTRI最, in antiquity, a kind of morice dancers, admittes to entertaiments, in order in divert the company with their dacing an phayithy on an intrument called croblum, whance they had their mane.
(ROTCFIET, in mutic, one of the notes or cha. racters of time, cqual to half a minim, and donble of a quaver.

Crutchets are alfo marks or characters, ferving to indofe a word or fintence which is difinguinted from the $\mathfrak{r a}$, heing gencrally in this form [ ].

CROlO, or Canoron, (anc. grog.), a noble city of the Lruttii, built by the Acheans; ais hundred an! ${ }_{4} \mathrm{C}$

Crose. fifty fadia to the north of Lacinium, and in the neighbourhood of Metapontum. It was twelve miles in compafs before the arrival of Pyrrhus intoItaly; but after the defolation produced by that war, fcarce half of it was imhabited. The citadel on one fille hung over the fea, on the cther towards the land. It was naturally ftrong from its fituation, but alterwads walled round; on which hide it was taken by Dionyfius by fratagem, by means of the recks behind it.
Is thagoras, after his long peregrinations in feareh of kimitelge, fixed his relidence in this place, which fonne authors think his native one, at leatt that of his parents, fuppofing him to have been born in the ith of Somos, and not at fume town of that name in 1ualy. This inconiparable fage fpent the latter part of his lif in training up difciples to the rigid exercife of fublime and moral virac, and intructing the Crotonits in the true arts of government, fach as alone can infure lappinefe, glory, and ind pendence.

Under the influence of this philofoply, the Crotonites inured their bodies to frugality and hardhips, and their minds to felf-denial and patriotic difinterefednefs. Their virtues were the admiration of Greece, where it was a current provelb, that the laik of the Crotonites was the infl of the Greeks. In one Olympiad, feven of the victors in the games were citizens of Croton ; and the name of Nilo is almoll as famous as that of Hercules. The vigour of the men and banty of the nomen wese alcribed to the climate, which was believed to be endowed with qualities pecul anly favourable to the human fyttem. Their plyficians were in high repate; and anong thefe, Alemeon and Democikes rendered themfelves moft confyicuous. Alenzon was the firt who dared to amputate a limb, in order to fave the life of a patient; and dio the hifl writer who thenght of inculcating moral precepts under the amuing cloak of apologues. This invention is more commonly attributed to Elop, as the was remarkably ingenious in this fpecies of compoIntion. Demociles was famous for his attachment to his native foil. Though carefled and enriched by the king of Perfia, whofe queen he had fnatched from the jaws of death, he abandoned wealth and honours, and by fratagem efcaped to the humble comforts of a frivate life at Cruton. - The Pythagoreans are faid to have difeovered that difpofition of the folar fyftem, which, with fome modifications, has been revived by Copernicus, and is now miverfilly received, as being moft agreable to nature and experiment. Theano, the wife of Pythagoras, and many other women, emulated the virtues of their humbands.

In thofe furtunate days the llate of Croton was mont Rouriming. Its walls inclofed a circumference of :2 milcs. Of all the colonies fent out ficm Grecce, 1.i. alone furnificel fuccour to the mother-country "Ben navad by the Perfians. By its avenging arms the :hybatites were puained for their hameful degeucracy; hut victory proved fatal to the conquerors, Fur ritines, and all theif pernicions attendants, infinuaof themfles into Croton, and feon contaminated the purity of its principles. Indecd, the very conilitation of human nature militates againt any long con: innance in fuch higid practices of virtue; and therefoee it is as wonk if the Crotonites fell by degrees
into the incorularities they once abhorred. Not long after, the Locrians, who were lefs corrupted, defeated them on the banks of the Sagra, and reduced the republic to dillefs and penmy. This reflored the remaining Crotonites to their prifine vigour of mind, and enabled them to make a brave, though unfuccers. ful, refitance, when attack ed by Diosyfius of Syracufe. They fuffered much in the war with Pyrrhus, and, by repeated misfortunes, decreafed in Arength and numbers, from age to age, down to that of LIamibal, when they could not mufter 20,000 inhabitants. This fmall population being incapable of manning the extentive works erected in the days of profperity, Crotom was taken by the Carthayinians, and its citizens tranfported to Locri. The Romins fent a chany hither 200 years before Chrits. In the Gothic war, this city rendered itfelf confpicuous ly its fidelity to Juftinian, and Totila befieged it long in vain.

CROTON, Tildricinus: A genus of the adelphia order, belonging to the monccia clafs of plants; and in the natural method ranking under the 3 8th order, Tricocia. The male calyx is cylindrical and quinquedentated, the corolla is pentapetalous; the flamina from 10 to 15. The female calyx is polyphyllous; no corolla; three bifid ityles; the capfule trilucular; one feed. There are $2:$ fpecies; of which the moft remarkable are, i. The tinctorium, or plant from which the French turnfole is made. This grows naturally in the fouth of France: it is an annual plaut, rifing about 9 inches high, with an herbaceous branching ilalk, garnihed with irregula: or rhomboidal figured leaves, which are near two inches long and an inch and a quarter wide in their widett part. Thefe itand upon flender foottalks near four inches long. The flowers are pooluced in thort fpikes from the fides of the ftalks, at the end of the branches; the upper part of the fpike is compofed of male flowers, having many flamina which conlefce at the bottom; the lower part hath fumale flowers, which have each a roundifh, three-cornered, ermen; thefe afterwards become a roundilh capfule with three lobes, having three cells, each including one roundifh feed. This flowers in July; but unlefs the plants are brought forward on a hut-bed, they do not ripen fieds in this comtry. From this plant is made the turnfole ufed for colouring wines and jellies. It is made of the juice which is lodged hetween the empalement and the feeds; which, if rubbed on cloths, at firil appears of a lively green, but afterwards changes to a bluifh purple colour. If thefe cloths are put into water, and afterwards wang, they will dye the water to a claret colour. The rags thus dyed are brought to this country, and fukd in the druggits thops under the name of turnfole. 2. The febifera, or tallow-tree, with rhomboidal eggfhaped leaves, pointed, fmooth and very entire. It is about the height of a cherry-iree; its leaves in form of a heart, of a dcep, thining, red colour, and its bark very fmooth. Its fruit is enclufed in a kind of pod, or cover, like a chefrout, and contills of threc round white grains, of the fize and form of a fuall nut, each laving its peculiar capfula, and within that a little thone. This tone is encompaffed with a white pulp, which has all the propertics of true tallow, as to coulitlence, colutir, and even frncll: and accordingly the Chi:-

## $\mathrm{C} R \mathrm{O} \quad\left[\begin{array}{ll}571\end{array}\right] \quad \mathrm{C} R \mathrm{O}$

Croton Chinefe make their candles of it ; which would doubtlefs be as good as thofe in Europe, if they knew how to purify their vegetable tallow as will as we do our animal kind, and to make their wieks as well. 3. The aromaticum, with heart-flatped ferrated leaves, and an arborefeent ftem. The bark of this thee is the lame as the cafcarilla and eleutheria; though thefe have been condidered by fone as diltinet barks, and fold in the thops as different productions. It is a hot, acrid, aromatic bitter, refembling in appearance the Peruvian bark, but is more bitter and pangen, though not fo rough and allringent. It was first introduced into Europe about the end of the laft century, and feems firft to have been uled in Germany, where it is Itill in very high efteem. There it is frequently employed againit common intermittent fevers, in preference to the Persvian bark, as being lefs fubject to fome ineonveniences, which the latter on aecount of its great altringency is apt to occafion. It is alfo faid to have been employed with great fucecfs in fome very dangerous epidemic fevers attended with petechie; and it is frequently employed with advantage in flatulent colics, internal hemorrhagies, dyfenteries, diarrheas, and fimilar diforders. In Britain it has been ufed by fome practitioners, particularly by the late Dr Keir of London, who was of opinion that it was by no means employed fo generally as it deferved to bc. Its virtues are partially extracted by water, and totally by rectificd fpirit, but it is molt effectual when given in fubflanec. 4. The cafcarilla, deferibed by Linneus as producing the officinal bak of that name, is, according to Dr Wright $\dagger$, the wild rofemary fhrub of Jamaica, the bark of which has none of the fenfible qualities of the true eafearilla or cleutheria above deferibed.

CROTONA, a town of Italy, in the kingdom of Naples, featerien the gulph of Taranto, with a bithop's fee and a eitadel. E. Long. 17. 27. N. Lat. 39. 10.

CROTOPHAGA, in ornithology, a genus of birds belonging to the onder of piex; the characters of which are: The bill is thin, eomprefled, greatly arched, half oval, and cultrated at top; the noftrils are round; the tongue flat, and pointed at the end; the tail confilts of ten feathers ; and the toes are placed two and two. The moll semarkable fpecies is the ani, which is about the fize of a blackbircl: the eolour of the whole bind is black, in fonse parts gloffed with purple, and about the neck faintly tinged with green on the margins: the bafe of the bill is furnified with black britles, which turn forwards: the eye-lids have long hairs like eye-laftes: the tail is fix inches long, and moch cuncared; and the logs are black. This fpeeies is found in Jamaiea, St Domingo, and other iflands in the Welt Indies; alfo at Cayenne and other paits of South America. Contrary to all other birds, they have the fingolarity of many laying in the fame neft; to make which, they all mite in concest, and after laying their cges, fit on them clofe to cach other in order to hatch them, cach unanimoully Atriving to do the befl for the general gool; and when the young are hatched, the parents, withont refowe, do the beft to feed the whole flock. Still a greater fingularity occurs, which is, that as foon as each female lays her eggs fhe covers them with leaves, doing the fame thing whenever me is mliced to leave the
nelt for food: this might be neceftary in a cold elimate ; but why it mould be wanted in a hot ore leems not clear, efpecially as it has not been obferved in Croufa. other birds. It generally has two broods in a year, except accidents happen; in which eafe it has been known to make three neffs. The eges are about the fize of thofe of a pigcon, of a fea-green colour, fpotted at the ends. Their food is varions; worms, infecta, fruits, and grain, according to the feafon. There is a variety called the greater ani, which is sbout the fize of a jay, difiering 1:o otherwife from the former but in fize. They ought, however, to be confidered as two dilkinct fuecies: for they nevel mix toryther, though each have the fame mansers, with this difier ence only, that the fmaller frequent the upen Gavannas, the larger only the falt-marhes near the fea-coatts It is faid that they are eafily made tame, and will leam to talk like parrots. The male and female are bools alike. Both ipecies are eafy to be thot, notheing! wild as maty other birds; but are known to chster much on the fight of a man, though they do not fly to a great diltance; bence are not well relimed by fportimen, as, like the jays in England, they are the occalion of hindering his fort in refpect to oilier game, without making him amends in their own flefh, which is never fought after for food, being rank and unfavoury.

CROTOY, a town of France, is Picatdy, and $: n$ Ponthieu. The fortifications are demolifoed. It is feated at the mouth of the river Somme. E. Lome. 1. 45. N. Lat. 50. 15.

CROUCHED friars. See Crmisurs
CROUP, in medicine. Sce Medicine-Indec:
Crou'p of a Horfe, in the manege, the extremity of the reins above the hips.

CROUPADE, in the manege, a leap, in which the horfe pulls up his hind legrs, as if the drew them up to his belly.

Croute, Sour Croute, or Kroute. As this preparation of cabbage has been found of fovereign efficacy as a prefervative in long voyages from the fafouryy, it may not be unacceptable to give a concife account of the procefs for making it, according to :he information communcated by an ingenious Geman gentleman.

The foundeft and moft fulid cabbages are felected for this $u f$, and eut very fmall, commonly with an inftrument made for this purpofe, not unlike the plain which is ufed in this country for ficing cueumbere. A knife is ufed when the preparation is made with greater nicety. The eabbage thus mioned is put into a tarel in layers, hand high, and over each is frew:d a handful of falt and earraway feeds; in this manner it is ramered down with a rammer fretum fuper firatum, till the barrel be full; when a cover is put over it and prefled down with a heary weight. Afier tianding fome time in this tate it begiss in ferment; and it is not till the furmentation has entirely fubfided that the head is fitted to it, and the barrel is finally fhut up and preferved for ufe. There is not a drop of vinegaremployed in this preparation. The Cermans wite this preparation in the following manner: Sater hatut, or faucr kobl; that is, in their language, "four licrb, or four eablage."

CROUSAZ (Jhm Peter do ), a leamed phibrontat 4 C ? and mathematician, was korn in 1663 : having made great progerefs in the mathematics and the phifofoply of Des Cartes, he trar. Hed to Geneva, HoMand, and France; was fucet hisely profefor in feveral waverfities; and at length was chofen gorernor to Prince Frederic of H. fr Caffich, nephew to the king of Sweden. He wote many wolls; the mott etteemed of which are, 1. His Lugie, the bofteditun of which is that of $17+1$, in 6 wots 8 en. 2. A Tr atifen Beauty. 3. A Treatife on the Efucati $n$ of Chudren, 2 wils 12me. 4. S verl Treation on Philwethical and Mathematical Suhjuis, \&ic. Tle dicd at Lauranne in $37+8$

CROTT, in omith logy. Se Cosvus.
Csow, in mechinis. a kint of irnn lever, with a claw at one end and a tharp point at the other; ufed for heavint or purdhatres ureat wei hes.
 for duawing brallets and thor forsign bodies out of wounds.

Cosor's rest, in the military art, machines of iron, having four peirtis, colle abont threce on four inctes lons, fo made, that whatever way they fall there is ftill a p int up : shay are thown upon oreacles, or in
 very traideluae, by iuming into the horie's feet and laminer thes.
 conds Cortading ont from a long block, like the fmalior Fatts which estend from the back bone of a hening (Pate CL.). It is ufed to fufpend the oumings ; or t keep the tup-fails from thiking viulently, and fretting asaint the tnps.

Coor-Ner, is an invention for catching wild-fowl in the winter fealon, and may be ufed in the day-time. This net is made nt dowble wrad, or fine pack thread; the menes thould be two inches wide, theleng th about ten yards, and the depth three; it nult be verged on the fide with good throng cord, and areteled out very Aiff on lone poles prepared for that puppote. Then you are come to the place where fou would fpread your i.ct, open it, and lay it out at its Eull lengith and breadth; then faflen the luwer end of the net all along the giound, fo as only to move it up and down ; the reper end of the net mult hand extended on the long cord: the further end there f beine flaked irft to the earth by a Arong cord about live yards dilant from the set. Place this cord in an sten line with the lower edge of the net. The orlmer end mat be at leat 25 yaris dilant to reach into Come natural or artificial fhelter, by the moans of which you may he concealed from the fowl, otherwife no ginod luceefs can be expected. The net mult be placed in fuch exact order that it may give way to play on the fowl on the leaft pull of the corl, which muit be done fmartly, heit the fowl hond prove too quick for you. This net may be wied fir pigeons, croms, or other birds, on connfitlds $r=a l y$ fown; as alfo in futhble-fitlds, provided the fti't coneralo the te: from the birds.

CROWD, is a gentral fufe, ifgities a number of peopit aferrbied is a place fouce big enough to hold them all.

To C:ONX, in the rad-hnauge, is to cary an exgraodinary furce of fatl upur a dive, in order to ac-
celerate her courfe on fome important occafion; as in purluit of, or Bisht from, an enemy; to efeape any

Crowland, imm-diate damer, sec:

CROWLAND, a town in Lincolnhire, feated in the fens, in a dity luil, and had fomerly an abbey of very great nore. Thete is no coming at it but by narrow caufeway, which will not admit a cart. It has three flreets, feparated from eacin other by watereomfes, vilufe tanks are liopoited by piles, and fet with willow tres. 'Their chicf trade is in fith and fowl, which at in great plenty in the adjacent pools and marhes. Wr. Long. O. IO. N. Lat. 52. 40.

CROWN, an undamelit worn on the head by kings, fovercign princes, and noblemen, as a mats of their dignity.

In frripture there is frequent mention of crowns, and the nif of them feems tu lave ueta bry common amone the H brews. The hish priet wore a conwn, which was a fikt of er lid placed $u_{5}$ on the forchead, and tied with a ribton of hyacinth colour, or azure blace. It feemo cin as if private priets, and cwen common Ifratite, wore allo a foit of crown, fance Gid command. Eicekiel not to take off his crown, nor aflume the marks of one in mourning. This crown vas no mome than a ritbon or nillet, with which the Jews and reveral people is the eale girt their leads. And ind ed the firl crowns were no more than a bandelet drasu round the head, and tied behind, as we Alill he it reprefented on medals round the licads of Jupiter, the ${ }^{2}$ colemies, and kiags of $S_{y}$ ria. Afterwards they cunffed of two bandelets; by degrees they took hranclies of erecs of divers kinds; at length the $\boldsymbol{y}$ added fowers, infomuch that Clandius Sturninus fays, there was not any plant whereof erowns had not bien inade. The woods and groves were farched to find different crowns for the fereral dcities; and they were ufed not only on the tanes and images of the gods, by the pricts in facrifieing, and by kings and empetors, but alfo on altars, templei, doors of boules, facred vefils, vietims, haps, Sce.

The אuman emperors had four kinds of crowns, ftill feen on medals, viz. a crows of laurel, a radial or radiating crown, a crown adorned with pearls and precious tlones, and the fourth a kind of bonnet or cap, fomething like the mortier.

The Romans had allo various kinds of crowns, which they diftributed as rewards of military atehieve. ments; as, 1. The oval crown, made of mytte, and bethowed uoon vencrals, who were intitled to the honours of the leffor triumph, called ovation. 2. The naval or roltral erown, compoled of a circle of gold, with ornaments reprefenting beaks of mips, and given to the captain who fint grappled, or the foldier who firft boarded, an enem's thip. 3. The erown called in Latin vallaris, or cafreafis, a circle of geld raifed with jewels or paliades; the reward of him who tirlt forced the themy's entrenchments. 4. The mural crown, a cirele (.feld indented and embattled; given to him who hrit monnted the wall of a befieged place, and there lodged a fandard. 5. The civic crown, mace of the branch of a green oak, and given him who had faved the life of a citizen. 6. The triumphal crown, confiting at fitf of wreaths of laurel, but afterwards made of gold; proper to fuch generals

Cremm. as had the honour of a triumph. 7. The crown cail- gain fome hill or adrantareous pot, and cover the ed oblefinatis, or graminea, male of grafs growine on the place: the rewand of a gene:al who had delivered a Roman army from a liege. 8. The radial crown, given to princes at their trantation among the gods. We meet alfo, with the eorona aures, often beftowed on foldie's, without any 'ther additional term; athletic comens, and crowns of lanel, deftined to crown vicains at the public games, pocts, orators, Ec. All the crem:s wee marks of mobility to the wearers; and upon conpetitious with rivals fir rank and digniifs, often determisel the preference in their favour, Sice slate CL. For an account of modern crowns, fee Hyraldry.

Cronem is alb wied to lignify the poffemonand dimnity of aking. The crown of Eugland, accorting on Sii Willam Blackitone, is, by common law and contatutional cultw, horchtary; and this in a manner peculiar so itfelf: but the diuth of inheritance may from time to time be changed or limited by ate of pardiment, meter which limitations the crown lill contimper hereditary. Sbe Succlassion.

Plews of the Chomn. See I'leas.
Crown, in conomerce, is a gencral name for coins, both foreigen and domettic, of or near the value of live fhillings Sterling. In its limited fenfe, crown is only applicable to that popular Englih woin which bears the nane, and which is equivalent to bixty Englith pence or five hillings, or to fix livres French monty. But, in its extenfive lenfe, it takes infeveral others; as the Prench ecu, which we call the Erench crown, thruck in $16+1$ for fixty fuls, or three lives; alf, the patagon, dollar, ducat on, rixdslar, and piattre or piece of eight.

Crown, in an eccletratical lenfe, is ufed for the clerical tonfure; which is the mark or character of the Romith erclefiaties. This is a little circle of hair fhaved off fiom the crown of the head; more or lefs bread, according to the quality of the orders received: That of a mere clock is the fmallell; that of pritits and monks the langeft. The clerical crown was anciently a round litt of hair, thaved off around the head, reprefenting a real crown: this is eafly obfervable in feveral ancient tatues, \&ze. The religiots of St Dominic and St Franeis Itill retain it.

Crown, among jewellers, the upper work of the rofe diamond, which all centres in the point at the top, and is bounded by the honizontal ibs.

Coown Office, an office belonging to the king's bench court, of which the king's coroner or attorney is commonly maller. In this ©fies, the attorntyogeneral and cletz of the crown feverally exhitit iatormations for crimes and mifdemeanours at common law, as in the cafe of batcries, confpiracies, libelling, Eic. on which the offender is liable to pay a fine to the king.

CromeGlafs, denotes the fneat fort of window. glafs. Sek Gilass.

Cromn Scabs, in farmery. Sce there, f xxavi. $z$.
Crown-Ib'sel of a "Iatch, the upper wheel next the balance, which by its monion drives the balance, an! in royal pendulums is called the foung-whid.

Cooisn Inperidel, in butany. See Eritillaria.
CRorrv-H'ork, in fortification, is an ont-work runsing into the field; defigned to keep off the cnemy,
other works of the phace. The cown-w, th connifis of two demi-battious at the extromes, atd ath ention ballon in the midale, with contains.

CROWNE (Juhn), a cobthated damatic writer, bern in Nova Scotia, where hiv father was a minilder. Beine impatient of the glomey relkraine of that eounury, be came to England, where he was reabecal ro thter into the denvice $0^{\prime}$ an whlady: of bhish las was loon as weary as he had been of America. Ite then had recowfe to his pen, which quickly picuared him fovour at court ; but this hind of itwothence proving precarious, he ventured to foncit Chanl: Il. for fone ellablithment. Charkes promile i is phovide fur him, but infilled firft on having another combly: at ${ }^{1}$ fuspelted to him the plan of a Spanitio play, fina which Crowne prodnced the comady of Sar Cozon', Niac: but the indden deah of the king on the lat day of the reheard, plunged him at once from his pleafue expectations into dilappointment and ditrefs, aud ictic him no refource but his wits. He died fome thac about the year 1703 ; and lefe behind him 17 aragedees and comedies, fome of which are acted witt great fincels. His chicf execllency lay in concedy; yet his tragedics are far from bring contemptible. His plats are tor the molt part his own invention; his characters are in genceal ftrongly coloured and highly finithed ; and his di.alopue lively and lipirited, attentiveby diverlified, and well adaped to the feroal lpeaker:y. So that on the whole he may affuredly be allowed to Anad at leat in the third rank of our damatic writers.

CROWNING, in architecture, is andertood, in the gencral, of any thing that terminates or hathes a member or decoration. Thus, a corniche, a pediment, Ác. are called crownings. Thus allo the abacus is laid to crown the capital; and thes any mamber or monlding is faid to be crombe! when it has a fillet over it ; and a niche is crowned when it is covered with a capital.

Crowning, in fea-language, denotes the famining part of a knot made ai the end of a rope. It is per:formed by interweaving the ends of the diflerent ltrands artfully among t each orher, fo as that they may not beeome loofened or untwited. They are ufeful in a!s kinds of lluppers.

## CROWTHH, or Cruth. See Cruth.

CROXAL (Samacl), an ingenious Eaglih divine, who in his youth wrote the celebrated poxm intitled The Fair Circuflum. He had the livmers of Hunpton in Middlefex; and the united parithes of Si Muy Somerfet, and St Mary Mounthaw, in London; both which he beld till his dath in 1751. II publifher many other poems and tranflations, with an entire Englifa cdition of Efop's Fables. In conlequence of bis attachenent to Whig principhs, he enjoyed fome other preforments, and wails chaplain in undinary to Georse II.

CROYDON, a town in Surry in Englad. Its fitudion is low, neat the fpring-head of the riser? Wandel, and it is in a manner furrounded with hills. It is pretty large, and is chistly noted for being the feat of the archbifhop of Canterbory. It has a large handrome church, an hofpital, and a fice fehool. W. Long. O. 5. N. Lat. 5 t. 22.

Cricial CRUCIAL incision, in furgery, an incinon mado
CRUCIANELLA, petty madner: A qenus of the monogynia order, belonging to the tetrandria clais of plants; and in the matural method raking under the 4 th order, Stellatio. The corolla is monopetalons and funnel-haped, with the tube fiiiform and the limb unguiculated, or having an infexed fegment on the top of each fegment; the caly $x$ is diphyllows, and there are two linear fetds. Thlere are five fpecies, natives of the fonthern parts of Europe; but nons of them poliefled of any renarkable quality.

CRUCIBLE, a chemical veffil made of earth, and for tempered and backed as to endure the greatet ine. They are whed to melt metals, and to flus minerals, ores, \&ec. See Chemistry-Imden.

CTRUCIFIX, a crofs upun which the body or Curit is faflened in eringy. Ufed by the Roman Catholics to cxcite in their minds a drong idea of our Savion's paficon.

They efeem it an elletital cincumance of the religions woifhip performed at the aitar; and on Goud Friday they perform the ceremony of adoring it, which is tone in thefe words, $O$ crux ave, firs unica; "Hail, thou crofs, our only hope." The officiating prief uncowers the crucinx, elevatcs it with both his hands, and fays, Lice libman cracis; " Behold the wood of the crofs." The people anfiwer, in quo falus mandi pependit; " on which the Saviour of the world fuffered death." Then the whole congregation bow with great reverence, and devoutly kifs the holy wood.

CRUCIFLXION, a captital punilhment by mailing the criminal to a crefis. See Cross.

CRUCIFORM, in gencral, fomething difpofed crofs-ways; but more efpecially ufed by botanilts, for fiowers confifing of four petals difpofed in the form of a crofe.

CRUCITA, in botany, a senus of the digymia order, belongiag to the tetrandria clafs of plants, and in the natural method ranking with thofe the order of which is doubtful. The interior calys is tetaaphyllous, the exterior calyx tiphyllous; there is no cormila, and ouly ore feed.

CRUDE, an epithet given to fomething that has not paffed the fire or had a proper degree of coctiun.

CRUDITY, among phyficians, is applied to undigefled fubftances in the ftomach; to hunours in the body which are unconcocted, and not prepared for exfrlfion; and to the excrements.
 To crofe to and fro, to fail up and down within a certais fpace of the fea, called the cruffry latitude, in queft of veffel, or fleets of an enemy, ece.

CRUISERS, in the navy, are fmall men of war sade ufe of to and fro in the chanm, and elfewhere, on tecure our inerchant hips and veffels from the enery's fmall frigate and trisateers. They are geneWhy fuch an fill well, and are commonly well man. veri: and inked the farity of the tradu in the chanan, and upand duma formdit. fond anther places, Abchutly reguies the contant keeping mut anh hips
nifhed with a pouch or bag, wherein to receive their young in time of danger; as the opolfum. See DtDelerys.

CRUOR, fometimes fignifies the blood in gencral; fonetinues only the venous blood; and fometimes extravafated or coagulated blood; but is moit frequent. ly ufed for the red globules of the blood, in contrad.flimetion to the limpid or ferous part.

CRUPPER, in the manege, the bittocks of a horfe, the rump; alfo a thong of leather put un ler a horfe's tail, and drawn up by thongs to the buckle behind the faddle, fo as to keep him from calling the faddle furwards on his neck.

CRURAUS, or Crurevs, Muficulus, is anatomy, a flethy mafs, covering almoft all the fretide of the os fenoris, between the two valti, which likewife cover the edges of this mufcle on each fide. See Anatomy, Talle of thy Mufcles.
CRURAL, in anatomy, an epithet given to the artery which conveys the blood to the crura or legs, and to the vein by which this blood returns towards the heart. See Anatomy, p. 75I.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes.
CRUSADO, in commerce, a Portuguefe coin, ftruck under Alphorifus V. about the year 1457, at the time when pope Calixtus fent thither the bull for a croifade againft the infidels. This coin has a crofs on one fide and the arms of Portugal on the other.

CRUSCA, an Italian temm fignifying lan, is in wfe amongt us to denote that clebrated academy called delli Crufca, eftablifted at Florence for purifying and perfecting the Tufcan language. See Academy, $n^{10} 11$. The academy took its name from its office, and the end propofed by it; which is, to refine the language, and as it were to feparate the bran from it. Accordiugly, its device is a fieve ; and its motto, Il piu lel for ne coglie; that is, "It gathers the finef flow thereof." In the hall or apartment where the academy meets, M. Moneonis informs us, that every thing bears an allufion to the name and device: the feats are in form of a baker's baket; their backs like a hovel for moving of corn; the cathions of grey fatLin, in form of facks or wallets; and the !ranches where the lights are placed refembling facis. The vocabulary Difla Crifica is an excellent Italan dictionary, compused by this academy.
CRUSTA lactea, in medicine, the fame with Achor.

CRTSTACEOZS fISH, in ntiural hitory, are thone coverel with follis, conniting of feveral piowes or fciles: an thofe of crabs, lobiters, ic.

Thefe are ufually fofter than the foclis of the seftaceous kind, which conft of a fingle piece, and itnesalle mach thicker and thronger that the fomer; fuch as thof: of the oytler, feallop, cockle, \&c.

Dr Woodward obferves, in his Nateral Hitum, that of all the fands found in beds of all the different matthes dug out of the carth, there are farce any of the cuntaccoss kind: the rafon he gives for it is, that thefe being much ligiter than the ret, mult have floated on the furface at the time of the deloge, when all the frata wese formes; and there have corrupted and periticu.

CRUTHE,

CRUTH, or Crowth, a kind of mufncal infrument formony in we among the common poone in Wales. It is of the fidicinal kind, fomewhet reform-- bling a violin, 22 inclies in length, and an inel and an half in thicknefs. It has lix trings furported by : 1 bridge, and is played on with a bow: the bridre differs from that of a violin, in that it is flat and not consex on the top; a circumfance from which it is to be inferred, that the Atrings are to he ftruck at the fame cime, fo as to afford it fuccemion of concordi. The bridece is not placed at rivht angle with the frows of the inftrment, but in an oblique direction: and, whel is further to be remarked, one of the feet ot the bridge goes through one of the found holes, which are circular, and refts on the infide of the back; the other foot, which is proportionably thorter, retling on the bedly before the other found-hole. Of the frings, the four firl are conducted from the bridge down ine finserbond, as in a common violin; but the fifth anci fixth, which are about an inch longer than the others, leave the fimall end of the neck about an inch to the riglit. "The whole fix are wound upe either by wooden pegs in the form of the letter ' I , or by iron pins, which are turned with a werd like thofe of a harp or fpinct. Of the tuning, it is to be remarked, that the fifth and tistla flings are the unifon and octave of $G$; the fourth and fifth, the fame of $C$; and the fecond and firt, the fame of D; fo that the fecond pair of trings are a fourth, and the third a fifth, to the firit. See Plate CL.

Conceming the antiquity of this inftrment, there is but little written evidence to carry it further back than the time of I cland; neverthelefs the ppinion of its ligh antiquity is follrong among the inhabitant: of the country where it was ufed, as to afford a probable ground of conjecture, that the ceath might be the protutype of the whole fidicinal fpecies of mufical indruments. Anothor evidence of its antiquity, but which tends alfoto prove that it was not peculiar to Whes, arifes from a diforery latcly made and commanicated to the fociey of antiquarians, sefpecting the abbeychurch of Melrofe in Sicotland, fuppofed to have beea built about the time of Edwari Il. It feems that a. mong the ontwle ornaments, of that chumeh thore is the reprefentation of a chith, iory little dificrent from the deferiztion above given. Wle intrument is now difufed, in fo much that Sir John lawhins, from whom we extract, ulls as, that diere is hut one ferfon in the whole mincipatity of larth Vales that can play upon it; and as he vas at that time war 6o years of a.c, the fucceftion of perfomen is pobably naran end.

 are unalerathe in the fire, in whirh they wether lofe their harducf, tranfarency, now cobour, whe the quatz lofes the fame yualitices, and is roluced by it to a white and opaque carth. He calles the rock-cryftals,I. According to their form, orz. I. Infulated hesagonal eryflals conding in pyramids of ix faces, which have a double refraction, or thow two images of the fame object when looked through. 2. Hexagomad crytteds unitud, having one or two points. 3. Tetraedal, dodecadral, fatted crytha; and which, though hexagemal, have neverthetels their planes irregular: 4. Crytals in large maffes, from the illand of Madagafear, which have a fimple refraction.
II. With regard to their colow, as being cither diaphanons, redulh, fruw, or blackifin.
III. With recard to accidutal changes, fome are hollow; fome conain wate within one or mone cavities; fome are caled one within the other: fome are of a round form, as the pebbles of the thine: fome have a cruft of metallic calces or of a pryites; fone are found crythalized in the infide of a casity ; white fone feem to contain amianthus or afteflus; and others contain fhirls. The fane author rcckons anong cryflals the oriental topaz, the hyacinth, the oriental fapphire, and the amethyt. Mr luaventon has always looked upou this lait as a quartz of a crytal.

When the rock-crytals are femitranfparent or intermixed with opaque vins, they are calied by the Swedim lapidaries milk-crybals. When they are found in the form of round pebies, which is vecafioned by their being tuffed abont and rubbed againf one another by floods or by the fea, they are called by the Englifi lapidaries poble-cryphls. They cone from the Ludies, Siberia, and other places,

According to Bomare, the rock-crytals are generally formed upon or among quart/, which fhows their great afinity, and are to be found in :lll parts of the world. The greatelt quantity of them is brought from Mount Saint Gothard in Switzerland. Large pieces of the fe, weighing from 5 to 800 pound, were found there at Grimflberg ; another of about $1=00$ pounds weight was found fome years ago at Fibbach in the Wallais; and a piece fix fot hag, four wide, and equatly thick, was found in the inland of Badarafcar, where thefe manal produciuns are of the mote extraordinary fize and perfection.

In the imperial collection at Tienna, there is a pyramidal cryitai vafi two clls in height, cut wholly out of one picce. Is is ufual with the langet crytals of the Getman monntains to be full of cracks and haw, and un be fo cominucud internally as to flow all the prima ic colour:; but the above mentioned ones were cinte free from the ie blemithes, and refembled colums of the pure it glafs, only much clearer than any ghats. can be masio. Cryttal is alfo found in many pats of Shitain ard Ireland. About Drithol it is found of an amethettine tinge. In Silefa and Bohemia in Germany it is found itained with the colours of the ruby, fapphire, emotad, and topaz; in which cafe jowlicrs take grat adrantage of it, felling it under the name of a watal faphaire.

The caders of pure erythl are threc: The firt is $\therefore 95$.
perfect columnar cryftals, with double pyramids, compuftul if is planes, in an hexangular column, terminated by an hexangular pyramid at each end: the fecond order is that of perfect eryitals, with double pyramds, without a column, compofed either of 12 or of 16 plancs, in two hexangular pyramids, joined clufely bafe to bafe, without the intervention of any column: the third order is that of imperfect eryfals, with fingle pramids, compofed either of 12 or 10 planes, in an hexangular or pentangular column, ainixed irvegularly at one end to fome folid body, and terminated at the other by an hexangular or pentangular pyramid.
'Thefe are all the general forms into which crytal, when pure, is found concreted: but under thefe there are almod infinite varieties in the number of angles, and the length, thicknefs, and other accidents of the columns and pyramids.

When cryilal is blended with motalline particles at the time of its formation, it alfumes a variety of figures whully different from thefe, conllituting a fouth order, pader the mame of motalline arphe's: when that metai is hat, the crylal affomes the form of a cubs; when it is tin, of a quadrilatemal pyranid, with a broad bate; when iron, the erglal is found conceted in thomboidal figures: thefe cyytals are viry common about mines; but the common fpars, which areliable to be itffuenced in the fame manner by the metals, and to appear in the very fame form, are to be carefully dithanaitsed from them. There is one sery caly tell for this parpofe, which is, that all fpars are fubject to be diffolved by aquafortis, and effervice vivintly only on its tonching them: but it has no fuch efficts on crytal.

The pcbiblecryftal is common enough in all parts of the world: but int which is formed of hexangular columas, atfeed to a folid bafe at one end, and terminated ly a hexauguher column at the other, is infimitely more fo: this is what we call prig or rod ayhhe, and is the feccies decribed by mot authurs water the name of ocis.ll of the jogn, or that kept for mes cinal uies.

With regard to the formation of crytals, it is certain that they mut have been once in a fuft itate, fince fone are found to have water in their cavities. Profefir bergman ubtained 13 regular formed crydale, by fufering the powder of quate to remain in a veflel with Anor acid for two yaas. Thefe were about the lize of finall peas, and were leits hard than quart. Mr Marchan informs as, that he received from Mr Achard tow crytials, on of the fpary kind, and the other as land and tranparent as reck-cryfal. The firt be pencured by mans of calcareous canth, and the later from the carth of alum, toch chatued in water impregnated with fond air, the water therating very now thongh a forons butum of butad chay. The appatatus is deferibed by the author in the Gournat or Fhyfue for Jumary $17-8$ : but though the proceis was attempted by No Hiagellan, and afterwards ato. cond time by Nif Achard himedf, wither of them wer. able to finceed. Mr Morveau, however, in the firl whlume of the Dijun Demoirs for $1-85$, aferts that he has produced a very fmall antificial cryatal; and gives the proper method for fucceeding in the procels.

## C R Y

Ciyftal. In the natural way many of the more compound foffile bodies are formed chiefly cither of cryital, or of fpar, a body in many things refembling it. The original formation and coalefecnce of thofe bodies of which fpar is the bafis, we know, may lave been but of yefterday, fince we have evident proofs that fpar is concreting to this day, and that fparry bodies are furning every moment. This is evident from the fparry flalactix in the arches of modern buildings, particularly in one fo lately built as the new bridge at Wettminter; the roofs of the arches of which were filled with thefe fpars within a year after they were built. It is alfo demonitrable that the fpars are not formed of matter exfuding from the fonc, fince brick arches abound equally with them; and the brick vaut which fupports part of the grand terrace at London, was fome time ago fo full of them that there was not room to walk. Thefe obfervations fufficiently demonftrate the growth of fpar; but the vegetation of eryital remained dubions till Dr Hill thowed by fome experiments that crytal, as well as fpar, is difolved in every kind of water, even fuch as appears to be moft pure and elear. This is alfo probable from an obfervation of Neumann's, who tells us, that he has feen leaves, thalks of plants, hay, ftraw, hogs b, ittles, \&ec. inclofed in fprigs of crytal. From the regular forms in which thefe natural cryitals are found, the regular arrangement of falts into different figures takes the name of crypallization, and both are probably owing to the - Sce Cry- fame caufe *. Henckel gives us a remarkable aecount fullizstion. of the formation of cryftal out of human urine. He once filled a large round glafs-veffel half way up with the reecnt mine of a young lad, and tying a bladder over the mouth of the velfel, fet it in a tove for four years together, never firring it during that whole time. At the end of this time he found a number of finall white ftones growing to the infide of the glafs; they were of the lize of an oat-feed, of a prifmatic figure, and tolerably pellucid: they fluck fo falt to the fides of the glafs that they could not be wafhed off by the fhaking about of the arine; and when taken out thad no faline tafte, and were not foluble evea in hot water.
Cryftal is frequently cut ; and luftres, vafes, and toys, are made of it as of other beautiful Itones. For this purpofe it is to be elofen perfectly elear and tranf. parent. It is to be tried by aquafortis, or by drawing it along a pane of glafs. The genuine cryftal will not be affected by the acid, and will cut glafs almof like a diamond. When any piece of workmanhip of matural cryftal is become foul and dark, the following method is to be ufed for recovering its brightnefs without lurting the polifh. Mix togetlier fix parts of common water and one part of brandy; boil thefe over a brikk tire, and let the eryfal be kept in it, in a boiling ftate, a quarter of an hour ; then take it out and rub it carefully $y$ over with a bruh dipped in the fame liquor; after this it is to be wiped with a napkin, and by that means its furface will be perfectly cleaned, and rendered as bright as at firf, without any injury to the points of the cutting or the polith of the planes or faces, which would probably have happened had the cleaning been attempted by mere rubbing with a eloth.
Natural cryftal may be reluced by calcination into
Vol. V. PattI,

## 577 ] C R Y

a flate proper for making glafs with allaline foits, and CryRu. thus hecomes a very vahable fritt. The method of duing it is as follows : calcine natural eryital in a crucible; when it is red-hot, throw it into cold water. Repeat this cight times, covering the crucible that no duft or athes may get in anong the eryllal. Dry this calcined mafs, and reduce it to an impalpable powder.

Colouring Cerstat, for the initation of gems. See Doublet.

Crystab is alfo ufed for a factitious body, caft in glafs-houfes, called crypal-ghas; being in fact nu mure than glafs earried, in the compolition and manmfacture, to a greater perfection than the common glafs.

The beft kind of glafs-eryflal is that called I'eniceayplal, made at Moran near Veniee. See Glass.

Iflund or lcelinul Cirstat, a tranfparent fiffile fone, brought from Iecland, foft as talc, elear as roek-ctyflal, and without colour ; remarkable for its unufual refractions.

It is there found in great abundance all over the country, beit is particularly plentiful in a mountain, not far from the bay of Roezfiord, where the finctit and mott pellucid pieces are found on digging. The mountain lies in 65 degrees latitude, and has its whole outfide made up of it ; but though this makes a very bright and glittering appearance, it is not fo fine as that which lies at a litele depth, and is met with on opening the furface. This is generally taken up out of the earth in maffes a foot long, and its cerners very frequently are terminated in thefe large maffes, by a fort of eryftals, very differcut in figure and qualities from the reft of the mafs. The fone itfelf is of a parallelopiped figure; but thefe exerefeences are either fingle pyramids, affixed to columns like common crytal, or double pyramids with or without columns between. The ftone itfelf is foft; thefe are hard, and eut glafs : the fone caleines to lime in the fire; the fe run into glafs: in fhort, the fone itfelf is true fpar, and thefe are true eryilal. Befide thefe, there fometimes grows out of the ends of the larger maffes a pure fine afbetos. This likewife is the eafe fometimes in the fpar found about Barege in France, and flows how nearly together the formation of bodies, wholly different from one another, may happen. The general figure of the ttone is parallelopiped; or, as fome exprefs it, rhomboide; and it retains this not only while whole, but alfo when broken to pieces. Every fragment it naturally falls into, though ever fo fmall, being truly of that thape. But it is remarkable, that in fome places of this mountain, the faine fort of mat. ter is found in form of triangular pyramids, all which have the fame property of the double refraction with the parallelopipeds of the fame fubftance; fo that the original error of fuppofing its qualitics owing to its thape, is refuted by this, as well as by the trials made with other pellucid bodies of the fane figure, which do not how this remarkable property.

The Ieeland cryftal is electrical, and when rubbed will draw up itraws, feathers, and other light fubflanes, in the fane manner that amber does.

The valt maffes of white fpar which are found in the lead mines of Derbyfhire, though they are not externally of the parallelopiped Gigure of the Iceland cryital, nor have any thing of its brightnefs or tranfparence 4 D

## $\mathrm{C} R \mathrm{Y} \quad\left[57^{3}\right] \quad \mathrm{C} R \mathrm{Y}$

Cisha.. in the general lump; yet when they are broken they feparate into shomboidal fragments, and fome of thefe are found to be tolerably pellueid: all thofe which are fo have the property of the Iceland crytal; and being laid upon paper, where a black line is drawn, they all thow that line double in the fame manner as the real Iceland eryftal does.

Iccland eryftal bears a red heat without lofing its tranfoareney; and in a very intenfe heat calcines without fufion: Ateeped a day or two in water, it lofes its natural polifh. It is very foft and eatily foratched with the point of a pin; it will not give fire on being fruck againt fteel; and ferments and is perfectly diffolved in aquafortis. It is found in Iceland, from whence it has its name; and in Franee, Gormany, and many other places. In England fragments of other fpars are very often miftaken for it, many of them having in fome degree the fame property. It has none of the diftinguining characters of crytal; and is plainly a genus of fpars, called from their figure proallelopipadia, which, as well as fome other bodies of a different genus, have the fame properties. Bartholine, Huygens, and Sir Iraac Newton, have defcribed the body at large, but have accounted it either a eryttal or a tale; errors which eould not have happened, had the eriterions of foffls been at that time fixed; finee Sir Ifaae Newton has reeorded its property of making an cbullition with aquafortis, which alone mult prove that it is neither tale nor eryftal, buth thofe bodies being wholly unaffected by that menftrum. It is always found in form of an oblique parallelopiped, with fix fides, and is found of various fizes, from a quarter of an inels to three inehes or more in diameter. It is pellucid, and not much lefs bright than the pureft crytal, and its planes are all tolerably fmooth, though when nicely viewed they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very fingular in the ftricture of this body is, that all the furfaecsare placed in the fame manner, and confequently it will Split off into thin plates, either lorizontally or perpendicularly; but this is found, on a microfeopie examination, to be owing to the regularity of tigure, fmoothnefs of furface, and nice joining of the feveral finall parallelopiped concretions, of whieh the whole is compofed, and to the fame caufe is probably owing its remarkable property in refraction.

The plenomena of this fouse are very remarkable, were firlt fuggefted by Bartholin, and have been examinel with great accuraey by M. Huygens and Sir Iface Newton.

1. Whereas in other pellueid bodies there is only one refraction, in this there are two ; fo that objects viewed through it appear double.
2. Whereas in other tranfparent bodies, a ray falling perpendicularly on the furface, paffes ftraight through, without fuffering any refraction ; and an oblique ray is always diviled; in Iecland erylal, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. One of thefe refradions is, according to the ordinary rule, the fine of ineidenee out of air into eryfal, being to the fine of refraction as five to three; but the other is perfeclly new. The like double refraction is alfo obferved in eryftal of the rock, though much lefs fenfibly. When an incident ray is thus divided, and each moiety ar-
rives at the farther furface, that refracted in the firit furface after the ufual mamer, is refiacted entirely after thie ufual manner at the feeond; and that refracted in the unufual manner in the firt is entirely refracted after the like manner in the fecond; fo that ezeh emerges out of the feeond furface parallel to the lirt incident ray. Again, if two pieces of this eryftal be plaed over each other, fo that the furfaces of the one he parallel to the correfponding ones of the other; the rays refracted in the ufual manner in the firft furface of the firlt, are refracted after the ufual manner in all the other furfaces; and the fame unifurmity appears in the rays refracted after the unufual manner; and this in any inclimation of the furfaces, provided their planes of perpendicular refraction be parallel.

From thefe phenomena Sir Ifaac Newton infers, that there is an original difference in the rays of light; by means whereof fome are here eonflantly refracted after the ufual manner; and others in the unufual manner. Were not the difference origiual, and did it arife from any new modifications impreffed on the rays at their firf refraction, it would be altered by new modifieations in the three following ones; whereas, in fact, it fuffers no alteration at all. Again, he hence takes occafion to filpect, that the rays of light lave feveral lides, endued with feveral original properties: for it appears from the circumflanees, that thefe are not two forts of rays differing in their nature from each other, one conitantly, and in all pofitions, refracted in the ulual, and the other in the unufual manner; the difference in the experiment mentioned being only in the polition of the fides of the rays to the plane of perpendieular refraction. For one and the fame ray is refracted fometimes after the ufual, and fometimes after the unufual manner, aceording to the potition of its fides to the cryftal: the refraction being alke in both, when the fides of the rays are pofited the fame way to both, but different when different. Every ray therefore may be confidered as having four fides or quarters ; two of which, oppofite to each other, difpofe the ray to be refracted after the unufual manner ; and the other two in the ufual. Thele difpolitions, being in the rays before their ineidence on the feeond, third, and fourth farfaces, and fuffering no alterations; for what appears in their paffage through them mult be original and connate.

Father Peecaria eorrects the obfervations of Huygens and Newton eoneerning the refraction of rock or mountain eryital. The donble refraction of the latter happens when a ray pafles through two fides that are inelined to each other, and confequently iffues coloured; whereas that of the Ieeland erymal is made by the paffage of a ray through two parallel fides, and therefore it ifues colourlefs. He fuggetts, that there may be other fubitanees in which there is a manifuld refraction. Gravefande had a prifm of Brafil pebble, which had a double refraction at each angle, but of a different kind from one another. Mr B. Martin prepared feveral prifms of Iceland eryftal, which exhibited not only a double but a multiple refraction. A fingle prifm produced a fix-fold refraction; and by combining feveral prifms, a number of refractions was obtained equal to the product of thofe of the fingle prifims; i.e. a prifm whieh afforded two images applied to one of fix, produced : prifin of twelve images, \&ce. He far-

Cryalline ther obferves, with refpect to Iceland ery tal, that tho the fides of its plane of perpendicular refraction be parallel to une another, a beain of light tranfinitted thro' them will not be colourlefs; in which property it differs from all other known fubllances.

CRYSTALIINE, in general, fomething compofed of, or refembling, cryftal. Siee Crystal.

Cristalina Haturns, in ancient aftronmy, two fpheres, imarined between the primum mobile and the firmanent, in the Ptokmaic $f$ them, which fuppofes the havens fulit, and omly fufceptitle of a tingte notion. Set Astronomy, $\mathrm{n}^{2} 247$.

Cristhome Humom. See Anatomy, p. 767.
CRSSTALLiNA, or Crystallines, ia medicine, are puhlutes tilled with water, and fo called on aceome of their tranfparency. They are one of the worlt fymptoms attendant on a gonorrhoca. They are lodged on the prepuce, without pain; and though calfed by coition, lave nothing of infection attending them. The cante is fuppofed to be a contufion of the lymphatic veffels in the part affeited. Dr Cockburn, who hath defcribed this cafe, recommends for the cure a mixture of three parts of lime-water and two of rectified fpirit of wine, to be ufed warm, as a lotion, three times a-day.

CRYSTALLIZATION, in general, fignifies the naturel formation of any fubftance into a regular fugre, refentling that of erytal. Hence the phafes of cryflallizal orcs, cryfallized falts, \&c. and even the baladtic rocks are now generally reckoned to be effeets of this operation: (See Basaltes and Volcano). 'The term, however, is molt commonly applicd to bodies of the faline kind, and their feparation in regular figures from the wate, or other fluid in which they are difolved, is called their cryfatliaa-
tion *: The word cryfullization is never applied to the freezing of water, or to the confolidation of metals after they have been metted; though it might certainly be applied with as muel juttice to thefe fublances as to any others; for all of them concrete into a certain regular form, from which they never deviate, unlefs diltmbed. When water freezes flowly, it always manner, that the fmaller are inferted into the fides of the greater; and thus thefe compound cryltals have the appearance of feathers, or branches of trees with leaves. The moft remarkable circumftance attending this cryftallization is, that the angle formed by the infertion of the fmaller pieces into the larger is either 60 or 120 degrees. The figures affumed by metals of different kinds have not been fo exactly inveltigated, except in the regulus of antimony, which is ohferved always to take a fellated form. Experience alfo flows, that all kinds of eaths, or other inineral matters, are capable of affuming a cryfthline form, and may eafly be made to do fo by taking away part of the water which diffolves them.

Different falts affume different figures in eryftallization, and are thus molt eafily diftinguilied from one another. The methods of reducing them into this form, for fale, are mentioned under the article Chemastry, $\mathrm{n}^{\circ}$ 573. But befides the large cryfals produced in this way, each falt is capable of affuming a
sery different appearance of the cyytulline kir d, when Cry tatian. only a fingle drop of the faline folution is made ufe of, and the cryilallization viewed through a microforpe. For our knowledge of this fpecies of cryllallization we Micereco. are indebted to Mr llemy Baker, who was prefented pical orywith a gell metal for the difcovery, in the year rity. fals difo. 'Thefe microfeopical cryfals he diftinguifhes from the vereaby larige ones by the name of configurtions; but this term feems inaccurate, and the dillinetion may well enough lee preferved by calling the large nows the common, and the figall ones the mirefiupical, cryftale of the fate. His method of making thefe obfervitions he gives in the fullowing wonds:
$\because$ I diffolve the fubject, to be csumined, in no Hismethos larger a quantity of rain or river water than $[$ am cere of prochtain it is fulticient to faturate. If it is a body eanty bitro hem. diffolvable, I make ufe of cold water ; otherwife I make the water warm, hot, or exen boiling, aceording as I find it ucceffay. After it is perfectly dif. folved, I let it relt for fone hours, till, if overcharged, the redundant faline paticles may be precipitated and fettle to the bortam, or fhoot into eryitals; by which means I am mot bledy to have a folution of the fame flrength at one time as at another ; that is, a folution ft:lly charged with as much as it can hold up, and no more; and hy thefe precautions the configurations ap. pear alike, how often focver tried: whereas, if the water be lefs fiturated, the proportions at different times will be fubject to more uncertanaty; and if it be examined before fuch feparation and precipitation of the redundant falts, little more will be feen than a confufed mafs of cryftals.
"The folution being thus prepared, I tike up a drop of it with a goofe quill cut in falhion of a fooop, and place it on a flat flip of glafs of about three quarters of an inch in width, and between three and four inches long, fpreading it on the glafs with the quill, in either a round or an oval figure, till it appears a quarter of an inch, or more, in diameter, and fo hallow as to rifi very little above the furface of the glafs. When it is fo dippofed, I hold it as level as I can over the chear part of a fise that is not too fierce, or over the flame of a candle, at a diftance proportionable to the heat it requires (which experience only ean direct), and watch it very carefully till I difcover the faline particles beginning to gather and look white, or of fome other colour, at the extremities of the edges. Then (having adjuted the microfeope before-hand for its reception, armed with the fourth glafs, which is the fittelt for molt of thofe experimente), I place it under my eye, and bring it exactly to the focus of the magnifier ; and, after running over the whole drap, I fix my attention on that lide where I abferve any increafe or pufhing forwards of cryltalline matter from the ciro cumference towards the centre.
"This mation is extremely now at the beginning, unlefs the drop has been overheated, but quickens as the water evaporates; and, in many kinds, towards the conclufon, produces configurations with a fwiftnefs inconceivable, compofed of an infinity of parts, which are adjulted to cach other with an clegance, regularity, and order, beyond what the exacteft peneil in the world, guided by the ruler and compalfes, can ever equal, or the molt luxuriant imagimation fancy.

## C R Y [ 580 1 $\quad$ C R Y

Gryfalliza- "When this action once begins, the cye cannot be tivis. taken off, even for a moment, without lofing fome- thing worth obfervation: for the figures alter every intant till the whole procefs is over; and, in many forte, aftur all feems at an end, new forms arife, different entirely from any that appeared before, and which probably are owinis to fome fmall quantity of falt of amother kind, which the other feparates from, and luaves to act after itfelf has done : and in fome fubjects, threc or four difterent fonts are obfervable, fuw or none of them being fimple and homogencous.
"When the configurations are fully formed, and all the water evaporated, muit kinds of them are foon dedroyed again by the muiture or action of the air upon them; their points and angles lofe their thaypnefs, beconte uneven and defaced, and moulder, as it were, away. But fome few are permanent, and being inclofed between glaftes, may be preferved months, or even years, entertaining objects for the microfope.
"It happens oftentimes that a drop of faline folution can hardly be fpread on the flip of glafs, by reafor of the glafs's fmoothere, but breaks into little glo. bules, as it would do if the furface were greafy : this was very troublefome, till I found a way of preventing it, by rubbing the broken drop with my finger over the glafs, fo as to leave the furface fineared with it ; on which fneared place, when dry, another drop of the fulution may be fpread very eafily in what form one pleafes.
" It likewife fometimes happens, that when a heat cd drop is placed properly enough for examination, the obferver finds he can diftinguich nothing: which is owing to faline fteams that, rifing from the drop, cover and obfeure the object-glafs, and therefore mut immediately be wiped away with a foft cloth or leather.
" In all examinations by the microfcope of faline folutions, even though made in the day-time, I always employ the light of a candle, and advife every oblerver to do fo likewife : for the configurations being exceedingly tranfparent, are rendered much more dittinguifhable by the brown light a candle affords, than by the more white and tranfparent day-light; and befides, either by moving the candle or turning the microfcope, fuch light may be varied or directed jult as the object requires."

In this manner were produced the beautiful cryitalof the mi- lizations reprefented Plate CLII. They are vaitly crofeopical different from fuch cryflals of the fame falts as are cryitals of various sals.
their fhapes, and fometimes form in fuch fort as the Coyfalliza* drop reprefents; but if the heat has been tho great, they fhoot haftily into ramifications $v i=y$ numerous and beautiful, but very diffecult to $b$. drawn; and which Mr Baker therefore did not alicmpt. There feems all the while a violent argitation in the fluid, and moll commonly, towards the conclidion, a few octacdra (compored of eight triangular planes, or two quadrangular pyramids, joined bafe to bafi) make their appearance.
2. Blue vitriol, produces cryituls round the elges, very thort at the beginning, but increaling giadn* ally, as reprefented at the figures $1,2,3$, which denote their difference of form, and the progrels of their growth. Thefe crytalline fhoots are holte, regulur, tramiparent, and reflect the light rery beatifully from thar polifhed dides and augles. As the watery part evaporates, numbers of long flemeive bodies like hars are feen here and there, fome lying fide by dide, or crolling each other as at 4 , uthers foraning far-lise figures with m:my radiations $(5,5)$. '1his falt thouts but flowly, and therefore requires patience. At lat the true cryatals begin to appear commonly in the midrlle of the drop, and are very prettily brawhed, as at 6 .
3. Difilled verdigrade, diffolved as above directed, and immediately applied to the microfope, thows abundance of the regular figures, $1,2,3,4,5,6,7$ : but if the folution is fuffered to ftand for a few hours, and a drop of it is then heated over the fire on a flip of glafs, till it begins to conerete about the fides, and then examined, tharp-pointed, folid, figntes, bifected by a line cut through the midde, from which they are cut away towards the edges, begin to appear, and thooting forwards ( $1,1,1$ ). Thefe figures are often Atriated very prettily from the middle line to the edges. obliquely ( 2,2 ); and frequently they arife in clutters; and thooting from a centre $(3,3)$. Thele figures are a long time in growing; and whillt they are doing fo, regular crytals appear forning in feveral parts of the drop, of the moft lovely emerald colour, and reflecting the light from their fides and angles, which are moft exactly difpofed, and finely polifhed. No cryftals are formed in the middle till the water is nearly evaporated; and then they begin to form haftily, for which reafon they muft be carefully attended. Their common figure refembles two long $\iint$ croffing each other in an angle of about $60^{\circ}$, and mooting branches every way: each of which again protrudes other branches from one, and fometimes from both, its fides; making together an appearance like four leaves of fern conjoined by their Italks $(5,5)$. Separate clufters of the fame fharp pointed figures, as thofe at the edges of the drop, are alfo formed in the middle of it (6). Sometimes alfo they put on another form, like the leaves of dandelion (7). Very beautiful figures are likewife produced by a kind of combination. of Sharp points and branches $(8,8)$. All thefe cryfals are of a moft beautiful green colour, but deeper or lighter, according to the time of their production. The deepeft are contantly produced firlt, and the paler ones afterwards. Towards the end of the procefs fome circular figures are formed, extremely thin, and fo fightly tinged, with green lines radiating from: a centre, as to be almolt colourlefs $(9,9)$. When all

## C R Y

Sry filliza-feems in a manner over, bundles of hair-like bodies tion. appear frequently feattered here and there throughout the drop, like thofe of blue vitriol alreally defcribed.
t. Alum. The mieroferpical cryftals of this falt prove more or lefs perfedt according to the illength of the folution and the degree of heat employed in making the experiment. The folution of alum, however faturated with the falt, will not he found overflrong atter ftanding fome days; for in that time many crytals will have formed in it. This feparation will often leave the remainder too weak for the purpofe; but br holding the vial over, or near the fire, the crytlals vill agmin diffolve. After it has thood about half an hour, it may then be ufed. The drop put on the gias, and properly heated, exhibits commonly at lirtt a dark cloud which appears in motion fonsewhere near the edre, and rans pretty fififtly both to the right and left, until it is cither thoped by the intervention of regular cryftals, or clie it proceeds both ways at once, till having furrounded the whole drop, the two ellds ruth together, and join into one ( $a, a$ ). This clondy pant, which feems to be violently agitated while it is running round, appears on a ftrict examination to confitl of faits, fhut entolong and very flender lines, much finer than the fmallett hair, croffing each other at right angles. As they go along, rows of folid cryttals are produced from their internal edges. Thefe are compofed of many oblique plain fides $(b, b)$, and which have all a terdency towards the figures of the regular cryftals to be defribed prefently. But it frequently happens, that, in fome parts of the drop, many minute and circular figures are feen, rifing at fome little diftances from the edge, which enlarging themfelves continualiy, appear at laat of a kar-like form ( $c, c$ ). The cryittals in the middle feldon appear till the fluid feems almoft wholly evaporated; when, on a fudden, many ftraight lines appear puftuing forwards, whofe fides or edges are jagged, and from which other fimilar ftraight and jagged lines fhoot out at right angles with the fir't. Thefe again have other fmall ones of the fame kind fhooting out likewife from themfelves, and compofe altogether a mof beautiful and tlegant configuration (D). Each of thefe lines increafiag in breadth towards its end, appears fomewhat club-headerl $(\rho, \ell, \varepsilon)$. Sometimes, intlead of fending krancles from their fides, many of thefe lines rife pasallel to each other, refembling a kind of palifadoe, and having numberlefs mimute tranfverfe lines running between them (F). But the mofl wonderful part of all, though not producible without an exact degree of heat and right management, is the dark ground work (G). It confifts of an infinity of parallel lines, having others croffing them at right angles, and producing a variety fearce conceivable from lines difpofed in no other manner: the direction of the lines (which are exquifitely ftraight and delieate) being fo frequently and difcrently changed, that one would think it the refult of long ludy and contrivance. During the time this gromd work is framing, certain lucid points prefent themfelves to view molt commonly on one fide. Thefe grow continually larger, with radiations from a centre, and become ftar-like figures as before mentioned. Some of them fend out long tails, which give them the appearance of comets: and at the end of all, a dark lineation in various directions darts frequently through,
and oceupies all or mont of the fpaces between them, Crynallize. making thereby no ill reprefentation, when viewed by candle-light, of a dark fly, illuminated with fars and comets. The regular eryitals are often formed in the fame drop with the others $(f)$.
5. Borax. If a drop of folution of horax is held too long over the firc, it hardens on the flip of glafs in fuch a manner that no cryitals can appear. The belt method is to give it a brifk, leat for about a fecond, and then applying it to the microfoope, the engtials will quickly form themfelves as reprefented in the figure.
6. Sal ammoniac begins with fhooting from the edges great numbers of tharp, but thick and broad, fpiculx; from whofe fides are protruded, as they rife, many 0 thers of the fame thape, but very fhent; paralled to each other, but perpendicular to their main flem (1). Thefe ficule arrange themfelves in all directions; but for the moit part obliquely to the plane from whence they rife, and many are frequently feen parallel to one another ( 1,1 ). As they continue to pufh forwards, which they do without increating much in breadth, fone fhout from them the fmall fpicule only (2); others divide in a fingular marner by the fplitting of the ttem (3); and others banch out into fmaller rantifications (4). Before the middle of the drop begins to thoot, feveral exceedingly minute bodies may be difeerned at the buttom of the fluid. Thefe in a little while rife to the top, and foon dittinguifh their flape as at (5). Their growth is very quick, and for fome time pretty equal; but at lait fome branch gets the better of the relt, and forms the figure (6). The other branches enlarge but little after this, all the attraction feeming to be lodged in that one that firlt began to lengthen; and from this, more branches being protruded, and they again protruding othtrs, the whole appears as at (3). It is not uncommon to fee in the middle of the drop fome cryftals, where, inttead of the tiraight ftems above deferibed, there is formed a kiud of zig-zag, with fpiculx like thofe in the other figures (7).
7. Soll of Lead, or faccharum faturni. A little of this falt diffolved in hot water, which it inmediately renders milky, after ftanding a quarter of an hour to fublide, is in a fit condition for an examination by the microfcope. A drop of it then applied on a llip of glafs, and held over the fire to put the particles in aution, will be feen forming round the edge a pretty even and regular border of a clear and tranfparent film or glewy fubllance (aaaa); which if too finden and violent a heat be given, rutus over the whole area of the drop, and hardens fo on the glafs as not to be got off without great difficulty. But it a moderate warmth be made ufe of, which likewife mult not be too long continued, this border proceeds only a little way into the drop, with a kind of radiated figure compofed of fine lines, or rather bundle; of lines, begimaing from the centres in the interion edge of the border, and fpreading ont at nearly equal diftances from each other every way, towards the exterior ( 6666 ). From the fame centres are producel after. wards a radation inwards, compofed of parallelograms of dificrent lengths and breadths; from one, ard fometimes both the angles of thefe, are frequently feen thootings fo exceedingly flender, that they as $z^{2}$

Cuyn.l"za pehaps the beat poffible reprefentations of a mathematival line. The extrenitics of the parallelograms are gomerally caft off at dight angles; but they are fometimes alfo feen oblique (cacc). Centres with the like radii iffuing from them, and fome of the ghatinous matter for their root, are fometimes formed in the drop, entirely detached from the edges; and in thefe it is very frequent to find a kind of fecondary radii proceeding from fome of the primary ones; and others from them again to a great number of gradutions, forming thereby a very pretty figure (D).
8. Sult of Tin, pructuces at the edges of the drop a number of octacdra, partly tranfparent, fanding on long necks, at fmell dilances from each other, with angular thoots betwecn them ( $n a$ ). At the fame time, folid and regular opaque cubes will be feen forming themfelves in other parts of the drop ( $b b$ ). In the middle of the lame trop, and in feveral other parts of it, very different figures will alfo be formed ; particularly great numbers of flat, thin, tranfparent, hexancular bodies (ccc) ; foms among which are thicker (e), and a few appear more folid, and with fix floping fides rifing to a point, as if cut and polifhed (d). The figure $(f)$ is compoled of two high pyramids united at their bafe. Some in this kind of form are found truncated at one of their ends, and others at both. Several of the hexagonal bodies may be obferved with floping fides, formins a fmooth, triangular, rifing plaue, whofe angles point to three intermediate fides of the hexagon ( g ).
9. Epfom Sult, hegins to floot from the edge in jagged figures (a). From other parts dificrently figured cryitals extend themfelves towands the middle, fome of which have line lines procteding from both fides of a main ftum, in an oblique direction; thofe on one fide fhooting upwards in an angle of about $60^{\circ}$, and thofe on the other downwards in the fame obliquity $(c, f)$. Others produce jags from their fides nearly perpendicular to the main flem, thereby forming figures that refemble fome fpecies of the polipody ( $e$ ); but in others the jags are horter ( $d$ ). Now and then one of the main items continues shooting to a confiderable length, without any branchings from the fides; but at laft fends out two branches from its extremity $(g)$. Sometimes a figure is produced having many tine and minute lincs radiating from a centre (b). The laft thootings in the middle of the drop (b) are not unlike the frame-work for the flooring or roofing of a houfe, but with the angles oblique: and fometimes a form of another kind prefents itfelf (i).
io Sautborough Salt, begins to thoot from the edges: firft of all in portious of quadrilateral figures, much refembling thofe of common falt ; but two of their angles, infead of 90 , are about $100^{\circ}$. They fhoot in great numbers round the borders of the drop, having their fides as nearly paralld to one another as the figure of the drop will allow: fome proceed hut a litthe way, others farther, before they renew the hoot (aa). In fome places they appear more pointed and longer ( $b$ ) ; and fometimes, initead of the diagonal, one of the fides is feen towards the edge, and the other thouting into the middle ( $c$ ). The midule crgtals ( $d e f$ ) feem to be of the vitriolic kind.
if. Glauber's Salt, produces ramifications from the fide of the drop, like the growth of minute plants, but
extremely tranfparent and elegant $(c)$. Some of them, Cryfallizan however, begin to thoot fiom a centre at fome diftance from the edge, and protrude branches from that centre in a contrary direction ( $b$ ). Sometimes they thoot from one, and fometimes from more fides of the eentral point in different varities ( $d$ ). Other figures are prosuced from different parts of the edge of the drop $(a, f, e)$; but the molt remarkable and beautiful cryllellization forms laft of all near the middle of the drop. It is compofed of a number of lines proceeding from one another at right angles with tranfpasent $f_{1}$ paces and divilions running between them, appearing altogether like ftrects, alleys, and fquares, (gg). When this eryltallization begins, it forms with great rapility, affording the obferver a very agreeable entertainment : but its beanty is of very hort duration: in a few moments it diffolves and vanifhes like molsed ice, which renters the drawing of it very diff. cult.

12 Salh of foffiuts bark. The few hootings which this falt produces at the edge of the drop are of no regular tigure (a). The whole area becomes quickly filled with great numbers of rhombi, of different fizcs, extrencly thin and tranfparent (b). Some of the fe eularge greatly and aequire a confiderable thicknef, forming themfelves into folids of many fides (cc). Near the conclulion fome crytals of fea-falt are formed $(d d)$, and likewife a few odd triangular figures ( $e$ ).
13. Sals of Liquorice, begins thooting from the edge with a fort of rhombic fpiculx (a). Some four-branched figures like thofe of viriol conmonly appear, but moulder away before their ramifications are completed, leaving only their ftamina behind (bb). The middle of the drop is ufually overfpread with great numbers of parallelograms, fone exceedingly tranfparent, being mere planes; having fometines one, fometimes more, of the angles canted in fuech a manner as to produce pentagonal, hesagonal, and other figures. Others have much thicknefs, and form parallelopipeds or prilins (c). Some of the plane figures now and then protrude an irregular kind of thootiog which appears very pretty (d).

1f. Salt of Wormwoot. The firt hootings of this falt from the edges of the drop appear of a confiderable thicknefs in proportion to their length : their fides are deeply and harply jagged or indented, being made up of many fomewhat obtufe angles, and their ends pointed with angles of the fame kind (a). But other fhoots frequently branch out from thefe original ones, and they again fend forth others, making altogether a very pretty appearance ( $b b$ ). The cryftals of this falt are very different from each other, confifing of fquares, rohmbi, parallelograms, \&c. (c).
15. Sult of Tovacio. If a moderate degree of heat is given to a folution of this falt, its firft mootings will be from the edges of the drop, in fender tapering figures. euding with very fharp points, but at confiderable diftances from one another. Along with thefe are formed other cryftals, nearly of the fame kind, but entirely detached, and farther within the drop, having the thicker ends towards the centre of the drop, and the flarp points turned towards its edge (a). When a little more heat has been given, other fpiculz are produced from the edge, whofe ends fread on either fide, and then terminate in a point;

## $\mathrm{C} R \mathrm{M} \quad[58 \hat{3}] \quad \mathrm{C} R \quad \mathrm{Y}$

arsfalliza- and which have all along thci: fides thiangular pointed tio.. cryftals, placed alternately fo ds to reprefent a zirzag, with a line drawn through its midale (b). The regular enyftals are produced in the middte of the drop, and are cither hexagons or hombi (c). When the moilture is nearly exhaled, there are fimetimes feen to thoot from, or rather under the fpiculs, upon the plane of the glafs, a reprefentation of leaves very fmall at dueir firt appearance, but gradualiy inercaling (d). A violent agitation may be difcovered in the fluid by the firl magnifier during the whole procelf; but efpecially at the beginaing, and extremely minute cryftals rifing from the buttom.
16. Sult of Harthorn. On the application of a very finall degree of heat, falt of hauthorn fhoots near the edges of the drop into folid figares fomewhat refembling razors or lancets, where the hade turns into the handle by a clafp (d). The cryftals of this falt are produced with great velocity, and are fomewhat opaque, hooting from the edges of the drop, on both fides a main ftem, and with a kind of regularity, rugged branches like thofe of fume furts of coral (a a). But fometimes, inltead of thefe branches, tharp fipicu$1 x$, fome plain, and others jagged, are protruded to a contiderable depth on one tide unly (b). As the fluid exhales, fome one of the branching figures generally extends to a great length, producing on une lide fhoots that are rugged and irregular, and on the other curious regular branches refembling thofe of fome phant (c).
17. Sult of Urine, fhoots from the edges of the drop in long parallelugrams like nitre (a a). But in other places, alung the fides of the drop folid angles are formed, that feem to be the rudinuents of common falt (b). Sone of the parahlograns incruafe much in fize, and fpread thendelves in the midde, fo as to change their firl figure, and bcome three or four times bigger than the retl: and thefe have a dividing line that tuns through their whole length from end to end, whence iffue other flort lines at fmall ditances, oppofite to one another; all pointing with the fame degree of obliquity towards the bafe (cc). Among thefe enlarged figures, fome few hoot hithl forward and tapering towards a point, but, before they form onc, fwell again, and begin as it were anew; and thus they proceed feveral times before their figure is quite finithed (aa). The figures $1,2,3,4,5,6$, are the regular ciyfals of this falt when it is allowed to diffolve in the air, and no heat at all is given.
is. Rheum, or the elear liqu:or which diftils from the noftrils when people catch cold, is Atrongly faturated with falt. A drop of it on a llip of glafs will foon cryltallize in a beautiful manner, either wi:h or without heat; but if beated to about the warmth of the blood, and then viewed through the microfcope, many lucid points will be feen rifing and increating gradually, till their form is fhown to be quadrangular, with two tranfparent diagonals crofling each other $(d d)$. Thefe diagonals fhoot foon after far beyond the fyazre, protruding other lines at rigbt angles from their fides; and thus they go on to form the moft elegant and beautiful cryftals $(b b, c c)$. When a drop of rheum is fet to cryftallize without any heat, inflead of branched cryftals over the whole area, fuch are formed only in the middle; but, about the edges, plant-like figures are
produced footing feveral nems from one point, and Cry nalizarefenbling a kind of featmods (E:).
tion.
19. Catafiere, hough infoluble in water, diffolves very readily in fpirit of wine. A drop of this Colution fpread upon a flip of erlafs crydalizes intlantly in the beatiful mamer reprefented in the figure.
20. Nanna cafily dillolves in water, and a drop of the fulution is a very pretty cbjece. Its firt fhootings are sadiations from points at the very cuge of the drop: the radiating lines feem opaque, but are very nender (aaa). Amongit thefe arife many minute tranfparent columas, whofe end grow wider gradually as they extend in length, and temninate at lat with fome degree ol obliquity ( $b$ ). Some, few higures ra. diating hom a centre every way, and circumforibed by an outline, are produced within the drop ( $d d$ ). But the molt furprifing and elegant configuration is compofed of many cluters of radiations fhooting one from another over great part of the drop, and making all together a ligure not unlike a certain very beautiful fea-lllant (C).

The phenomena of cryitallization have much engaged the attention of modern chemits, and a valt number of experiments has been made with a view to determine exactly the different figures affumed by falts in paffing from a fluid to a folid furm. It does not, however, ap- Excenfive pear, from all that has yet been done, that any certain varicty in zule can be laid duwn in thefecafes, as the figure of faline the forms of crytals may be varied loy the lightell circumftances. cryliais. Thus, fal ammoniac, when prepared by a mixture of pure volatile alkeli with fpirit of falt, fhoots into crylals refembling feathers; but if, inflead of a pure alkali, we make ufe of one jutt ditilled fiom bones, and containing a great quantity of animal oil, we flall, after fome crytallizations of the feathery kind, obtain the very fame falt in the form of cubes.

Such falts as are fublimeable cryfallize not only in the aqueous way by fohation and evaporation, bur alfo by fublimation; and the difference betwixt the figures of thefe cryitals is often very remarkable. Thus fal ammoniac by fublimation never exhibits any appearance of feathery cryfals, but always forms cubes or parallelopipeds. This method of cryttallizing falts by fublimation has not as yet been inveltigated by chemits: nor indeed does the fubject feem capable of inveftigation without much trouble; as the leaft aug. mentation of the heat beyond the proper degree would make the ciyilals sun into a folid cake, while a diminution of it would caufe them fall into powder. In. aqucons folutions, too, the circumftances which determine the flapes of the cryitals are innumerable; and the degree of heat, the quantity of falt contained in the liquer, nay, the quantity of liquor itfelf, and the various conflitutions of the atmofphere at the time of cryfallization, often occafion fuch differences as feem quite unaccountable and furprifing.

Mr Bergman has given a differtation on the various Mr herg. forms of cryflals; which, he obferves, always refemble man'sac. geometrical ligures more or lefs regular. Their varie- count of ty at fint appears infinite; but by a careful examina- thir fortion it will be found, that a preat number of eryat mation. feemingly wery different from each other, may be produced by the combination of a fmall number of original figures, which therefore he thinks may be called prinitiar. On this principle he explains the formation

## 

Eynalliza of the cog failine gems as well as faits; and the refults riun. of his oblervations are as follow.
I. One of the primitive forms is that named $b_{y}$ our author fpatbaceous; and thefe, he fays, properly aggiutinated, may form the great variety of diffimilar bodies
${ }^{7}$ frhuerlace. ols cryfal found among cryftals.

In the calcareous fpar we find a combination of rhombi, whofe obtufe angles contain $101 \frac{1}{\varepsilon}$ degrees, and the acute $78 \frac{1}{2}$. By 20 combination of the fe is formed the calcareous fpar, which appears in the form of a teffera or oblique parallelopiped; but by other combinations of the fame planes, cryfals apparently - of the moft oppofite forms may be generated. Thus, for the formation of an hexaedral pritim, confinting of ix. equal and fimilar parallelograms terminatiny at both ends in three rhombi which form a folid angle, we have only to Cuppofe a continusl addition of rhombi equal, finilar, and parallel to the oblique paralletopiped or eryital of the calcareous fpar. Thus, fuppofe the fi-

8 lonas likewife to fome others of the calcareous tribe. Garnetery- From the fchoerlaceous cryftal that of the garnet is stal. eafily produced by a Itoppage of the accumulation of the planes as foon as the fides of the prifm have acquired a remmboidal digure. Thus a complete dodecahedron is formed, which is always the figure of the garnet whea perfect.
The figure of the garnet is eaflly changed into another, frequently affumed by the hyacinth, by the regular application of equal and fimilar rhombi to each of the folid angles, which angles are formed by four planes. The garnet, when complete, has fix angles compofed of four planes, and eight with three. The formation of this kind of cryttal will be undertood from an infpection of fig. 3. In this operation the four rhombi are changed into an equal number of oblong hexagons; LHAB into LHbalB: and fo of the other rhombi reprefented by the different letters of the 10 figure.
Pyramidal In feme cafes the original planes decreafe according cis Rals. to a certain law; and this, from whatever caufe it may arife, mult neceflarily change the appearance of the terminating planes, and occafionally either augment or diminifh their number. Thus, inftead of a prifm, we fhall have a double pyramid, one tending upwards and the other downwards, as will be eafly onderfood from what has been already faid. This is the form affumed by the calcareous crjftals commonly ealled pistocth by the miners.

If the decreafing feries of nhombi is fopped before they vanif ultimately in a point, the formation of truncated pyramids, of which many examples are to be met with in the mineral kingdom, muft neceffarily take place. In cafes of this kind, it is eafy to fee why the pyramids, if ftruck in one direction, will break aver fmoothly and eafly, but not in another.
$\mathrm{N}^{\circ} \mathrm{g} 5$.

It is not uncommon to find the original eryftals Cryftrelizathemetues imperfect; in which cafe the large crythats, tion. formed by curbining them together, muit deviate more or lefs from the pufect form. Thus, let Deviations ABC1)EFG (fig. 4) reprefent the three rhombifrom a perwhich conlitute the apex of a perfect fchorlaceous fer cryate eryitill ; and let us next fuppofe the thombus A G trun. Line form. eated in the dirceition of the line $a b, \mathrm{C} \mathrm{G}$ along $c d$, and E G alung ef. Thus, the regular hexagonal fi gure of the prifm A BCDEF will be changed into an irrecular one abcd DefF, confiting of nine unequal fites, whofe apex is conquifed of three irregular pentagons, a6BGF, cdDCB, and efFGD. The rough toumalins of ' T yrol and Ceylon particularly arfume this form, though it fometimes belongs to bodies both of the calcarcous and fchoerlaceous kind.

Triangular cryltals may be fuppuled to arife from Triangular thofe of the pentagonal hind; it being obvious, that cryfalis. the periphery of a pentagon, as $a b \mathrm{~B} G \mathrm{~F}$, approaches more nearly to a triangle in proportion as the diftance betwcen al and BF grows lefs: and when theif diflances vaniih entively, a triagonal prifin is formed, terminated by three triangles: if the cutting line ab approach fill wearer to the centre $G$, the form itill remains the fame.

13
Let us now fuppule, that the garnet eryftal, whofe varieties of fhape is reprefented lig. 5 . inftead of compiete shombi, the garnes has others accumulated about its axis, whofe three ex cryithl. ternal angles are truncated; or, which is the fame thing, if the longitudiaal margins of the prifm be cut by plancs parallel to the axis, cryftals will be formed, whofe thape is reprefented by the fmall letters in the figure. Calcareous cryftals are fometimes found of this hape; but generally fo low, that $e$ nearly coincides with $a, c$ with $d, \& c$. and hence the pentagon $a b c d e$ becomes almoft of a triangular ligure, which has been attributed to thefe cryltals by fome authors who did not underfland their true origin. The pyritaceous eryitals fometimes afford initances of this kind comptete. Sometimes the garnet coniifts of 24 fides, by having all the margins truneated; a change which may eafly be undertlood from what has been already mentioned. If the interfection $c d$ of the flanes $e c$ and $c r$ fall without the plane BG, a tigure of a very different kind will be generated.

Sometimes the hyacinthine cryftal aflumes the cru-Cruciform ciform appcarance $A B C D E F G$ HIKLM, fig. 6 . hyaciuthios Here the apes is at C , the figure ABC C ca being all cryital. in the fame inclined plane, which is the cafe with the other three homolugous figures. Now, in order to inveftigate the formation of thefe cryitals, let us fuppofe the rhombi CO, CP, and C C , to be completed, which to an eye placed in the high axis $\mathbf{C}$ will appear like as manny iquares fituated in the fubjacent plane. Thus we may undertand the formation of the crytals of granite as well as of the hyacinth. The former may be fuppofed a quadrangular prifin compofed of four hombi, touching one another only at their apices, and terminated at each end by four rhombi meeting at the apex. When this form is a little protracted, or augmented by applying to the apices fimilar and equal planes, it becomes that of the hyacinth; whence the granite eryital may be called the rudiment of the hyaciath alfo. The variety here mentioned

Cryfalli. zation.

15
Other varicties of the forms of cryitals.
mentioned, of hyacinthine crydtals, is met with in the Hartz mines. Mr Elirlart fays, that they are of a filiceous, and not of a calcareous, mature.

If planes fimilar to one another, but diffimilar to the fundamental ones, be added, a valt varicty of Shapes may be produced, of which it is needlets to give more examples at prefent. Our author appeals to experience for the truth of it ; and afferts, that the loofe texture of calcareous cryfals will clearl; flow their conftruction, if carefully and completely broken. The harder eryitals can fcarcely be broken in fuch a manner as to thow theirftructure; but the fehoerls difcover it very plainly, and even the garnets fhow themfelves to be compofed of laminx.
"Finally (fays Mr Bergman), we may add one particular obfervation concerning prilinatic and hexagonal calcareous crytals truncated perpendicularly; fuch fometimes occur, and they cannot denive their origin, in the manner above deferibed, from the fanthaceous particles, and by no other way can hexagonal prifms be generated. What, then, is the caufe which deftroys their apices? I confefs this to be a queftion which I am wholly unable to anfwer, unlefs we may aftume an accumulation of planes more and more deficient around the axis. We may from hence conclude, that fomething unufinal occurs; as the truncated extremity is opaque, while the relt of the prifm is tranfparent; but the upper hexagonal fection is fincoth and polifhed."

On the whole, our author obferves, that the greatedt varicties may occur in the firures of cryftals, though all of them may be generated from thofe of the fathaceous form, and the fubllance of all may be ultimately the fame; whence we thould be induced to put but little contidence is the figure. "If, then, (fays he), this teft, which undoubtedly is the moft remarkable fo far as externals reach, is of fo little ufe, of what value can the others be? and with what fuccefs can we hope to form a fyttem of mineralogy upon fuch dittinctions? External criteria fhould certainly not be neglected, but he who trufts implicitly to them deceives himfelf."
II. From a condideration of the larger lamelle of which eryitals are compofed, our author naturally proceeds to an inveftigation of their fmaller conftituent parts. Here he is of opinion, that the different extemal appearance of all cryllals is owing to varieties in their mechanical clements. A quetion, however, occurs, Whether thofe very minute molecules, which may, as it were, be called the flamina of crsftals, be naturally poffefted of a determinate angular tigure, or whether they acquire it by cryfallization? In anfwer to this, he mentions the following facts, which he has had an oppormnity of obferving hindelf.
I. "If the imall particies which feparate from limewater, when expofed to the air, be infpeeted with a microfeope, they will be found fpathaccous.
2. "The greater fpathous tefiers, when accurately examined, are frequantly found with fria running diagonally, fuch as often appear in faline cryftals, by which their internal fructure is offoovered.
3. "The cubes of common fait not only exhibit diagonal frixe, but frequently, upon cach fide, flow fquares parallel to the external furface, and gradually decreafing inwands (ig. 7.), by which we difourer their internal fructure: for cvery cube is compuled of Vol. V. Part 11.
fix quadrangular ho:low pyramid", "joined by their apices and external furfaces; each of thefe filled up by others imilar, but gradually decreafing, completes the form. 13y a due orgree of evaporation, it is no difficult matter to obtain the fe pyramids feparate and diftinct, as in fig. 8. or fix of fuch, either hollow, or more or lefs folid, joined round a centre. This is the whole courfe of the operation from beginning to end. This takes place in the falited vegetable alkali, or fal digefivus Syivii; in the cryftallized luna cornea; the galena or fulphorated lead; and quadrangular nitre, which is of the fathaceous form, produces a fimilar congeries of pyramids, and thefe almont equally diftinct with the preceding cubic cryitals. A folution of alum, upon evaporation, generally produces folid octaedra: but fometimes alfo it exhibits hollow pyramids, and upon fuch of them as are complete, the junctures are very diltinctly marked by confpicuous lines.
4. "Sometimes, too, other falts indicate the fame confruction by vifible diagonals. Fig. 9. reprefents a fection of the hexagonal prifm formed by Rochelle falt. The arrangement of the internal particles of this falt cannot be known when the crytal is complete: but when it is formed on the bottom of the veffel, as reprefented fig. 10. the lower fide cannot be perfect; and this parailelogram exhibits two diagonals diftinctly, as reprefented fig. In. This is likewife the cafe with the falt extracted from human urine, called microcofinic foll. Betides, we fhould obicrve of the vertical triangles, that they are alternately tranfparent and opaque in pairs; which plainly points out a difference in the fituation of their elements. Some cryfals of nitre are alfo marked with diaronals; a circuntance which in others is generally concealed by the clofe connection of the particles.
5. "If we examine the hollow pyramid of common falt farther, we fhall find it compofed of four triangles, and each of thefe formed of threads parallel to the bafe; which threads, upon accurate examination, are found to be nothing elfe than a feries of fmall cubes: Therefore, although the above circumfances feem plainly to point out the formation of all cryttals from the union and colretion of pyramids, whofe fides, being different in form and magnitude, oceafion the differences of forms ; it yet remains uncertain whether the fame internal ftructure takes place in thofe whofe minutenefs renders them totally invilible; and whether the primary itamina poffefs a determinate figure, or are compofed by the union of many thapelefs particles. We have long known, that the imallelt concretions which are vinble by a microfeope puffefs a determined figure; but thefe are compounds. In the mean time, until this veil be removed in lome muafure at leath, we carmot avoid comparing the procefs of cryttallization with the congelation of water.
"While the watery particles are concreting, they exert a double tendency: by one of which they are formed into fpicule, by the other thefe fpicule ar" ranged in fuch a maner with refpect to one another as to form angles of 60 degrees: from heace the wrietics obfored in the particles of frow ma: be eatify explained. 'The molt timple figu:e is that where tis equal radii diverge from acentre in the angle above mentiond, as in fig. 12. The fame angle will be prefersed if the extromities of thefe be joned by right lines; which will alfo be the cafe, if cach of the tri+F .
angles
fryitas. angles thius fommed be flled with right lines parallel to 245 Cl .
the bale, as in lig. 13.
" Let ns now fuppofe the partictes which are employed in crytallization enduwed with a tendency to form fpicule, and thefe fpiculse with a tendency to arrange themetres at equal angles of inclination, and we fhall have both the triangles and the pyranids com pofel of them, even although the primary leamima had aot a determiged figure. As the angles of inclination wary, the triangles and pyramids will alfo vary; and lience the different forms of crytals will be produced, which may to a certain degree be invettigated geometrically, the angles being given.
111. Mr Bergman now conticicrs the various ways in which crytals may be produced; which are, 1. By water; 2. By aliquefying heat; 3. By a volatilizing heat.

1. The moft common method of obtaing cryftals is by means of water; as by this medium faline fubftances are very readily taken up, and appear again in a folid form when the liquid is property diminilhed by evaporation. It is not only when diflulved in water that they acquire detcrminate forms; this happens alfo when they are fufficiently attenuated and mixed with it; for fubtances not foluble in water will remain fufpended in it, when, by fufficient divilien, they have acquired as much furface as makes them approach the fpecific gravity of the fluid; and it feems very probable, that many of the earths met with in the mineral kingdom, which have a regular form, have coalefced in this way. We mult, however, carefully difinguilh between mechanical mixture and true folution, even though both fhould agree in weight. When folid budies are mechanically mised with water, they will remain at the bottom of the veffel if laid there in powder, unlefs diffufed by agitation; but foluble fubftances totally and fontancouny diltribute themfelves through the menflruum even without any agitation, though this certainly accterates the folution.
2. Another method of obtaining cryflato is by fufion and flow cooling. Thus fulplar, when melted and cooled, hoots into long frix, acquiring at the fame time an electrical property : bifmuth, zinc, and regulus of antimony, acquire a tefflated appearance; nay, the laft of thefe, when fet to cool in a conical mould, becomes fellated, not only on the upper furface or batis of the mafs, but along the whole axis. Glafs allo, when melted and flowly cooled, will fometimes fhoot into beautiful cryftals. Our author mentions his having fometimes feen the fcoria of furnaces, where iron had been melted with the addition of calcarcous earth, of a regular prifmatic figure ; and when crude iron has been melted with lime, he has fometimes alfo found complete ofaedra in the fooria. In large metallic maffes, however, the under parts are generally fo much greffed by the weight of thofe above, that they thow no figns of cryftallization, though beautiful crylats are often formed on the furface of gold, filver, iron, ixc.
3. The particles of bodies volatilized by heat, if during cooling they are fufficiently at liberty, often obey the laws of attraction, and form cryltals. To this elafs we may refer thofe which are condenfed from the vapours of regulus of antimony, called the fores argensini. The galena which is irequently imerfperfed among the copper-ore at Fahlun fends forth a vapcur which condufes on the upper Atrata, forming hullow
pyramis.3, which are the bafes of the cubes of galena, entircly fimilar to thofe which compofe common falt. In the tieaps of arfenical ore expofed to the fire at Loefa, our author has collected very beautiful cryllals, of white, ycliow, and red colours, partly tetraedral and partly oetardral. Some of the fe exlibit hollow pyranids, whofe fides confint of threads parallel to the bafe, and exaetly fimilar to thofe formed in the moitt way. Thefe cryftals, when complete, frequen:ly how the junctures of the pyramids very diftinetly by ll raight lines; and by careful examination, we may be able to trace the whole procefs through its various fleps, from the very beginaing to the end of the operation.

Prifins of any kind may be formed by the apices of Forivation proper pyramids meeting together in a certain number round the fame point. The apex may allo be formed by a fingle pyramid laving its vertical angle turued outward. Thus, by adding to the cube ABCD the quadrangular pyramids AlBE DCF, we fhall have a four-fided prifm (fig. 16.) ; and thus, thongh very feldom, comanon falt fometimes acquires an apex. If we apply to one or both of the apices of the octacdron ACBD, fig. 17. a hollow pyramid adb, fimilar and equal to the fundamental figure, we will lave a prifm of the fame kind: alum, however, has never been obferved of a prifmatic form by our author, though fometimes conlifting of oitaedra imperfectly joined together, as in fig. I8. Fourffidal pyramids may be comphied of four tetraedra, and confequently 24 of the fame may make up a cube; "and (liays our auther) it has allio a double apex of 32 . Thus we have a new contruction, which undoubtedly fonetimes takes place; for, as I have already faid, arfenical cryttals tometimes take the eetraedral, fometimes the wetachlal, form, which may therefore eafly be mutually exchanged.
" It is with lefs facility that liexagonal prifms are formed of fuch pyramids as liave the fame number of fides, unlefs tetraedra be admitted. In fig. 19. four hexagonal and fix tetragonal pyramids meet; the former are cafily refolved into fix and the latter into four tetraedra (Gg. 20.) ; 48 of which confquently make up the whole mafs, fuppofing this to be the method followed by nature. I have no doubt that this conftuction is probable on many accounts; for it requires only the mott timple clements, and fuch as are conformable to the figures of all cryllals. That tetraedra adapted to this purpofe have fonetimes diffimilar and unequal lides, makes not againft the fuppofition: but what is mott to the purpofe is, ihat fometimes fuch tetraedra are employed without the fmallefl doubt. All thefe circumaricto are of no fmall weight ; but as long as no traces of tetraedra are to be found among the pyramids of ecmmon falt, the laws of found reafoning forbid us to draw any general concluficur. I am perfectly cortain that nature dees frequently employ pyramids in this operation ; it semaius for future experiments to determine whether this be always the cafe."
IV. We come now to conlider the ultimate caufe of ciyllallization, concerning which there bave been many different theories. Some have been of opinion that Difurent there cannot be any cryflallization withoot a faline theorie: of plinciple in fome decrree exilting in the cryfallizing cryilaliza
 Bergman on the following grounds:

1. He fuppoies crytallization to be an effect of at. traction;

## $\mathrm{C} R \quad \mathrm{P} \quad\left[\begin{array}{lll}587 & ]\end{array} \mathrm{C} \quad \mathrm{R}\right.$

Crytali- traktion; confequenty, as all other matters as well as z.lio: Galts are fubject to the laws of that attration, we cinnot confider the regular and fymmetrical form in which they arrange themfelves as peculiar to faline bendics; and hence cryftals are alfo produced by fuch onethods as will fufficiently attennate and ditengage the insegrant parts from each other.
2. The more finole that any faline body is, and the more free from any kind of heterogeneous matter, the more diffient it is to reduce it into a crythal. line form. Thus the pure acids and cauttic alkali cannot be made to affume the form of eryftals without the greateft dificulty.
3. The fimilarity of forms in cryfals, Mr-Bergman obferses, "does not depend upon the acid; as the prifmatic and quadrangular nitre are formed from the fame acid, though joined in leed to different alkalies. Neither is the balis fufficient to determine the figure; for the vegetable, as well as the mineral alkali, when faturated with marine acid, will produce cubieal cryitals. The external appearance, therefore, depends on the mentrum and the bate jointly. We are not, however, to imagine from thence that there is prelent a neutial or middle falt whenever the figure of fuch a one is difcoverable: for not the fmallett particle of alum is found in mickel or lead when united with nitrous acid, though both thefe compounds yield octaedral cryttals." Here we may again remark, that the figure of cryftals depends upon circumfancts altogether unknown, of which Dr Eafon, in a maper on this fubjec in the Manchefter Thanfactions, gives a remarkable intance in gypfum, which is known to he a combination of the vitriolic asid with a calcareous balis; yet this compound is found naturally crytallized in five ways, fo very different from each other, that mineralogits have dittinguifhed them by five diftinet names, viz. I Lapis fpecularis. 2. Striated gypfum. 3. Gypfeous alabatter. 4. Selenites properly fo ealled. 5. A gypfeous fpar frequently adhering to the veins of ore in mountains. All of thefe, when chemically cxamined, exhibit precifely the fame phenomena, and are really noching but different cyyfallizations of the fame compound fait.
4. Mr Bergman likewife obferves, that there is a great variety in the forms of cryltals, though the maticr remains the fame; of which examples have been given in the calcareous cryitals, and in the different kinds of gypfuni juit mentioned. Among the pyrites alfo we meet with cubes friated in a very fingular manner; the lines of one fide being perpendicular io thofe which ditinguifh the different fides, as reprefented fig. If.; but among thefe thete are likesife tetraedra, uctaedra, dodecaedra, and icofaedra, to be met with.
5. A great number of cryftals are either totally deRituse of any faline matter, or poffefs it in luch a fnall domree that no experiments hitherto tried have been d. Le to difoover the fmallen fendibe traces of it. Thos mica fometimes floots into hewangular pifms compofed of parallel lamelle, the elementary fricule of which are difpofed as in fig. $55 . ;$ gems, fchoerls, granites, cul other earchy bodies, are frequently found figured, thoush no faline mater can be difovered by analy fis; and the fame holds goord of gold, flver, lead, tin, bifmath, and zinc, united with nereury, all of whel regular forms, accouding to the quantity of the mercury.
"If we bave recoure (condades Mr Bergrian) ic
the luppofition of an hidden faline fublanee which Cryfutio eannot be difooved by art, it mult firely be unrea. 2atoon. forable to attribuse to fuch a pinciple fo reat a now. or as that of armang the particles in the orier neceffary for cryllatization; a caufe, beyond quetion, nnequal to :he marnitude of the elfect : for how is ic poflible that a faline matter, the prefence of the mallell atom of which cannot be ditcovered by the moll delicate tetts, thall in pase water have yet power to effect the icy cryltallizacion with fuch force as to overcome the frongeft obfacles? How can a faline matter, which by no tell can be difcovered, have power, in an amalgam of gold, to arrange the ponderous particles of both metals in a particular manner? What falt is able to form the llellated regulus of antimony ? What the hexagonal lamelle of mica ?"

On this fuhject we may remark, that whether we All of them afirm or deny a faline principle to be the caufe of cry-infuficione. Atallization, the ultimate power by which it is effected mult be equally unknown. A faline principle can make other bodies cryllallize along with it only by virtue of the difpofition it has of itfelf to affume a cryflalline appeatance; and we mut therefore feek for the caufe of this crydallization of the falt, as well as of the fubflance with which it is mixed. Mr Bergman, as well as others, have endeavoured to account for this on the principle of attraction ; but with little incefs. Sir llaac Newion fuppofes the paricles of falt to be diffufed through the folvent fluid at equal diftances from each other; on which account he concludes that they mult come together in regular figures. Mr Dergman confiders the particles which form faline fubftances as endowed with a $t$ wofold tendency ; one to arrange themfelves in fpiculx, the other for the fpicule to arrange themfelves at certain angles of inclination; and as thefe angles vary, different forms of cryftals muft be produced. Both thefe tfects, he thinks, may be owing to the fame caufe, vir. a mutual attraction between the partieles; which, according to the varions hapes and particular figures of the atons, at one time arranges them in the form of fpiculie, and again connects the fpiculx already formed uncer different angles of inclination.

This feens to be much the fame with what othe: chemilts underfand by the folarity of the faline pare ticles, by which they are arranged in certain directions. All this, however, is totally infuffient to explan the plenomenon. If, accouding to Sir liac Newton's fuppofition, the particles were brought together by a gemeral attraction, after being placed at equal diAlates by the folvent for fome tine, we muit copese to find all kinds of falts crytallized in the fame manner, or rather running into one folid !ump. The ar rangement of the particles, or their tendency to ar. rangement, ailigned by Mr Bergman as a caufe, is undy explaining the phenomenon by itfelf; for it is the couffe of this tendemy whith is the puint in queltio: Now, that the atraction of the falme particles to each. other cannot be the eaufe of crytalline arrangemmes, is evident from the following conlideratione: 1. The cryblals of every kind of falt contain witer as an effen tisl part of their compoftion; atul if deprived of this, they lofe their crytalline form entirely, and fall into Fowder. It is plain, therefore, that the faline particlez astract no: only one another, bat fome part of
the proper hours and months, which were engravcia on a column near the machine. .'This artful invertion gave rife to many improvements; and the modera manner of meafuring time with an hour-glafs is in imitation of the cleplydra of Ctefibins.

CTESIPHON, a celcbrated Greek atchite 2 , who gave the defigns for the famous temple of Eiphefus, and invented a macline for bringing thither the columns to be ufed in that notie fluciture. He flourif. ed $5+4$ B. C.

Ctesifhon (anc. geog.), a large village, or rather a fine city, of Chalonitis, the mof fonthern province of Affyria. It was fituated on the left or eall lide of the Cigris, oppalite to Seleucia on this fide: and built by the Parthians, to rival Seleacia. Here the kings of Parthia pafici the winter (Strabo); as they did the fummer at Ecbatana.

Ctesiphon was allio the name of feveral noted perfons of antiquity. 1. An Athenian, who advifed his fellow.citizens to crown publiely Demollhenes with a golden crown for his probity and virtue. This was oppofed by the otator Elchines, the rival of Demofthenes, who accufed Cteliphon of feditions views. Demothenes undertook the defence of hisfriend, in a celebrated oration ftill extant, and Æfchines was banifhed. 2. A Greek architeat, who made the plan of Diana's temple at Ephefus. 3. An elegiac pott, whom kiug Attalus fet over his poffeffions in E(lia. 4. A Gricek hifturian, who wrote an hiftory of Bueotia.

CUB, a bear's whelp. A mong hunters, a fox and marteon of the frill year are alfo called cubs. See Uksus.

CUlBA, a large and very important illand in the Wedt Indies, belonging to Spain. On the eaft fide it begins at 20.20. N. Lat. touches the toopic of Cancer on the north, and extends from 74 . to 85.15 . W. Long. It lies 60 miles to the weft of Hifpaniola, 25 leagues north of Jamaica, 100 miles to the call of Jucatan, and as many to the fouth of Cape Florida; and commands the entrance of the gulpbs both of Mexico and Florida, as alfo the windward palfages. By this fituation it may be called the key of che Weft Indies. It was difovered by Columbus in 1492, who gave it the name of Ferdinando, in honour of king Ferdinand of Spain; but it quickly after recovered its ancient name of Cuba. The natives did not regard Columbus with a very favourable eye at his landing ; and the weather proving very tempeftuous, he foon Ieft this ifland, and failed to Hayta, now called Hi/paniola, where he was better recenved. The Spaniards, however, foon became mafters of it. By the year 1511 it was totally conquered; and in that time they had deflroyed, according to their own accounts, feveral millions of people. But the poffifion of Cuba was far from antwering the expectations of the Spanuh adventures, whofe avarice could be fatiated with nothing but gold. Thele monllers findiag that there was gold upon the illand, concluded that it muld come from inines; and therefore tortured the few inhabitants they had left, in order to extort fiom them a diteovery of the places where thete mines lay. The miferics endured by thefe poor creatures wore fuch that they alnott enanimoufly refulved to put an end to their own lives; but were prevented by one of $\stackrel{1}{s}$ the Spanith tymanealled Vojco Poriclos. This wretch theratened to bane himfelf alourg with them, that he might have the pleafure, es the faid, of tomenting them in the next work worfe than he had done in this; and [.) truch were they afraid of the Spanards, that this threar diverted there poor favages from their delpertte refolution. In 5511 , the town of Elawannat was built, now the prineipal place on the illand. Tlae howles were at firtl built only or wood; and the t won itivif was for a long time io inconfiderable, that in $1 ; 36$ it was taken by a Irench pirate, who obliged the inhabitans to fay 700 dmeats to fave it from being turnt. The vily day after the piate's departmre, thate Spanif thips arrived from Mexion, arol having ar loaded their cagoes, falith in purluit of the pirate ship. But fuch was the enwardice of the officers, that the piate took all the thew thips, ard returning to the Havanah, olliged the inhabitants to pay 700 duats mone. 'I'o prebent misfortumes of this kind, the imhabitans built their houfes of tome; and the place has fince been fromsly fortifed. seec Hayanман.

According to the NLbe Raynal, the Sparim fettlement at Cuba is very important, on thee accounts: 1. The produce of the country, which is confderable. 2. As being the ftaple of a creat trade; and, 3. As being the key to the Weit Indies. The principal produce of this inand is cotton. 'i'be commodity, howcver, through neglec, is now becone fo fcarce, that fonctimes $\hat{f}$ cveral years pafs without any of it being brought into Europe. In place of cottun, coffee has been cultevated: but, by a fimara nogligence, that is produced in no grat guantity ; the whole produce non exceeding 30 or 35 thonend werght, one-third of which is exported to lera Can, and the rett to DIadrid. The cuitiation of coffer naterally leads to that of Cugar; and this, which is the mof valuable ploduction of America, would of itlelf be fufficient to give Cuba that itale of profpenty for which it leems deligned by natare. Aluliough the furface of the in? and is in gencral meven and monntamous, yet it has dains fuffeicnty extcañe, anci well enough watered, to lup. ply the confumption of the greatelt part of Emope with fugar. Ibe incredible fertility of its new lands, if properly managed, wond enable it to furpals cvery other nation, however they may have now got the thart of it: yet fuch is the fidencuce of the Spaniards, that to this day they have i...t few plantations, where, with the fiuef cantes, they make but a fmall quantity of coarfe fugar at a great expence. This ferves partly for the Mexican market, and paraly for the mothercountry; while the indolent inhabitants are content to import fogar for themelves at the expence of near 220,000 l. ammaily. It has be che expected with probabinty, that the tohacco imperied hom Cuha wutld compentate this lofs; for after furnithing Mexico atod Beru, there was fufficut, with the littie brought from Caraca and Bucuns Ayres, to fupply all Spain. Eut this trade too has éclined thourh the merligence of the ecurt of Blaffid, in not gratifying the general tatle for tobseco frems the I-avannah. The Spmath colonics have an mivelfal tate in frins; and Cuna fupplies annmally abont 10 or 12 thourand. The :ame bei might eanify be irncreated in a country ahounding

tracts of ground, that for want of population can fearee be applied to any other purpofe than thar of breeding eattle. The hundredth part of this iflud is

Cube Cubisu:. not yet cleared. The true plantations are all confined to the beautiful plains of the Havanalı, and one thofe are not what they might be. All the fe plantations tugether may employ about 25,000 male and $f$ mole Gaves. The number of whites, meatees, mulntioes, and fre negroes, mpon the whole ifland, anounts to ahot:t 20,000. The food of the fe different feceies confinto of exeellent park, very bad beef, and caffara trend. The eolony would be more fluarihing if its prodac. tions had not been made the property of a company, whofe exclufive privilege operates as a contant and invariable frinciple of difcumagement. If any thine could fupply the: want of an open trade, and atone for the gitame a oceationed by this monopoly a Cuba, it would be the advantage wheh this ifland has for fuch a long time enjoyed, in being the rendervous of almolt all the Spanith veflels that fail to the new world. 'This practice commened almott with the colony iffli. Bonce de Leon, having made an attempt upon rlorida in 1512 , became aequainted with the now canal of Bahama. It was immediately difcoverd that this was the belt route the hips bulud from Mexico to Europe could puflibly take; and to this the wealth of the illand is principally, if nut al together, owing.

CUBl: in feometry, a fulid body confiting of fix equal fides. See Geometry.

Cres-Root of uny Number Qumbity, is fuch a num. ber or quantity, which, if multiplicel into itflf, and then again the product thence arifing by that number or quantity, being the cube-root, this lalt product fant be equal to the number or quantity wheref it is the cuberoor; as 2 is the cube-root of 8 ; becanfe two times 2 is 4 , and two times 4 is 8 : and $a+b$ is the cubervor of $x^{3}+3$ acal $+3 z^{2} b+\varepsilon^{3}$. See Algfbra.

CUDL13S, in the materia medied, a foll dried frote refembling a grain of pepper, but often fornewhat longer, brought into Europe from the illand of Java. In aromatic warmelh and pungeney, they are far inferior to pepter.

Cubile iquation. SecAigerba.
COBIDIA, a genus of fars. The word is semivel from "sese "a dic;" and is given the from their be. ing of the thape of a common die, or of a cubic $f_{1}$. gure. Thefe bodies owe this mape to an admixtorof kad, and there are only wo keown feceics of the genus. I. A colouilefs cryataline one, with thin fakes, found in the lead-mincs of Yorkllite, and fome other parts of the kingdem: add, 2 A milky whie one with thicker crusts. 'lhis is fomm in the leafmines of Derbyhire and Yorkfare, but is ufact: fmail, and is not found plent fulb:

Cuboidss ing from the elbow to the wrift; otherwife called una, If or the srater foffic. Some ufe the word for all that part of the arm between the cllow and the wrill ; including the ulna or cubitus, properly lo called, and the radius.

CUBOHDES, or Os Ceftrorne, in anatomy, the ferenth bone of the foot; for called from its leing in form of a cube or die.

CUCKING-stool, an engine invented for pumion. ing foolds and unquiet women, by ducking them it water; called in ancient times a iumbrel, and fometimes a trehulloet. In Donefday, it is called catbedra feronis: and it was in ufe even in the Saxons time, by whon it was deferibed to be catbotor in qua rin: ofe muliares fetmies aquis demergumatur. It was anciently alfo a punifmene inflicted upon brewers and bakers tranfreffing the laws; who were thereupon in fuch a lool immerged over head and ears infercore, fome linking water. Some think it a corruption from ducking-flool; others from choaking-fool, quia boc modo demerfic uquis fere fuffocantur. See Castiga. tory.

CUCKOW, in omithology. See Cuculus.
Cuccorr-Spit, the fame with froth-Spit. See Finothspit, and Cicapa.

CUCUBALUS, berry-bfaring chickweed: A genus of the trigynia order, belonging to the decandria clafs of phants; and in the natural method ranking under the 22 d order, Cayyophillie. The calyx is inflated; the petals five, unguiculated without a neetariferous corona at the throat; the caplule is trilocular. There are 13 fpecies, the moft remarkable of which are,

1. The beken, Swedifh lychnis, or gumfepungar, is a native of feveral parts of Europe. The cmpalement of its flower is curioufly wrought like a network, and is of a purplith colour. The leaves have fomewhat of the flavour of peafe, and proved of great ufe to the inlabitants of Minorca in $168 ;$, when a fwarm of locufts had defroyed the haveft. 'The Gothlanders apply the leaves to erybiplatous eruptions. Horfes, cows, theep, and goats, eat this plant.
2. The noetiflora, or night-flowering lychnis, grow naturally in Spain and Italy. It is a peremial plant, rifing with an upright branching faik, a foot and an half high, garnithed with very narrow leaves placed oppolite. 'l'he upper part of the llalk branches very mach; the flowers itand upon long maked footitalise, each fupponting thee or four fowers which have loag tubes with etriped empalements: the petals are large, deeply divided at top, and of a pale-bluifin colour. The flowers are clofed all the day; but when the fur leaves them, they expand, and then cmit a verg agrecable fcent. It may be propagned by feeds fown in the fpring on a bed of licht earth; and when the flants are fit to remove, they thould be planted in a nurferybed at abunt four inches dillance, where they may remair till antums. 'They may then be planted in the bonders where they are to remain, and will Hower the following year.

3- The otiten, or catch-Hy, is a alive of Britain, and other Duropean countries. It hath a taick, flenty, prennial root, which frikes deep into the groum,
from wherec rifes a jointed atalk three or four fect high. At the joints there exfudes a vifcous claminy juice, that fticks to the fingers when haudled; and the imall indects which fettle upon thofe parts of the dalks are thereby fo fatlened that they cannot get off. 'The towers are finall, and of a greenilh colour. The plant is propagated by feeds.

CUCULUS, the CUckow, in ornithology, a genus mate CLI belonging to the order of pice: the characters of which are: 'The bill is fnooth, and more or lefs bending ; the nofrils are bounded by a fanall im ; the tongue is hort and pointed; the feet and tocs formed for climbing. 'llac moft remarkable fpecies are:
I. The canorus, or common cuckow, weighs about five ounces: and is in length iq inches, in breadth 25 . The bill is black, and about two thirds of an inch in length. The head, hiad part of the neck, coverts of the wings and rump, are of a dove colour ; darker on the head and paler on the rump. The throat and upper part of the neck are of a pale grey; the brealt and belly white, croffed elegantly with undulated lines of black. The tail confifts of ten feathers of unequal lengths; the two middle tail-feathers are black tipped with white; the others are marked with white fots on each fide their fhafts. The legs are fort; and the toes difpofed two baekwards and two forwards, like thofe of the wood-pecker, though it is never obferved to run up the fides of trees. The female differs in fome refpects. The neck before and behind is of a brownith-red; the tail barred with the fame colour and black, and fpotted on each fide the thaft with white. The young birds are brown mixed with black, and in that fate have been deferibed by fome authors as old ones.

This bird appears in our country early in the foring. and makes the thortelt lay with us of any bird of paffage. It is compelled here, as Mr Stilingficet ohferves, by that conflitution of the air which caukes the figtree put forth its fruit: though it has been fuppofed that fome of thefe birds do not quit this itland during the winter; but that they feek thelter in hollow trees and lie torpid, unlefs anmated by unufually warm weather. Mr Pennant gives two indlances of their being heard in February; one in 1771 , in the end of that month; the other in 1769 , on the 4 th day; but after that they were heard no more, being probably chilled again into torpidity. There is a remarkable coincidence between the fung of thefe birds and the mackarels continuing in full roe; that is, from about the middle of April to the latter end of June. The cuckow is fifent for tome rime after his arrival; his note is a call to love, and ufed only by the male, who fits perched generally on fome dead tree or bare bough, and repeats his fong, which he lofes as foom as the morous leafou is tuer. His note is So miform, that his name in all danguares feems to have been derived from it ; and in all countrics it is ufed in the fame reprachful fafe:

$$
\begin{aligned}
& \text { The phan"-fure actore grey, } \\
& \text { Whote note foll ! angy man d th mark. }
\end{aligned}
$$

The reproach feems to arife from the cuckow's making ufe of the bed or nell of another to depolite its eggs in, !eaving the care of its young to an impruper parent ; parent ; but Juvenal with more juflice gives the infomy to the bird in whofe nelt the fuppofitions eggs were laid:

> Tu biti nunc co"rluca folazes.

On the natural hiftory of this fingular bird, we have a very curious paper by Mr Jenucr, publiflicel in the
Philufuphical Tranfactions for $1788+$. The fint apparance of cuckows in this country, as already obferved, is about the middle of April; (the 17th, according to Mr Jewner, whofe olfenvations were made in Gloucefterthire). 'The fong of the male, which is well known, foon proclaims its arrival. Clue fong of the female (if the peculiar notes of which it is compoted may be fo called) is widely dilferent, and has been fo little attended to, that perhaps fow are acgrainted with it: the cry of the dab-chick bears fome refemblance to it.

Unlike the generality of birds, cuckows do not pair. When a female appears on the wing, the is often attended by two or three males, who fecm to be carnettly contending for her favours. From the time of her appearance tid after the middle of fommer the nefts of the birds felecied to reccive her egg, are to be found in great abunoance; but, like the other migrating birds, the does not begin to lay till fome wecks atter her arrival.

It is on all hauds allowed, that the curlow does not hatch its own eggs; for which differen reafons have been given, as will be afterwards noticed. 'The hedgefparrow, the water-wagtail, the titlark, the redbrealt, the yellow hammer, the green limet, or the whinchat, is generally the nurfe of the young cuckov: but Buffon enumerates 20 forts of nefls at lealt in which they have depofited their egors. It may be fuppofed, that the female cuckow lays her egge in the ablence of the bid in whofe nell the intents to depolite; as it has been known, that on fight of one of thefe a redbreatt and its mate jointly attacked her on approaching the neft, putting her to Hight; and fo eflectually drove her away, that fhe did not dare to return. Among the birds above mentioned, it generally", according to Mr Jeaner's obfervations, felects the three firft, but fhows a much greater partiality to the hedge farrow. This lan rommonly takc. up four or five days in laying her eggs. During this time (gemerally after fhe has laid one or two) the cuckow contrives to depofite her egg among the reft, leaving the future care of it entirely to the hedge-fparrow. This intrufion often oecafions fome difcompofure ; for the old teedge-fparrow at intervals, whilt the is fitting, not unfrequently throws out fome of her own trign, and fonetimes injures them in fuch a way that they become adlie; fo that it more frequently happens that only two or three hedge-fparrows eggs are hatched with the cuckow's than otherwife. But whether this be the cafe or wot, the fits the fame length of time as if no forvign egre tad been introduced, the cuckow's efg requiring no longer incubation than her own.

When the hedse-fparrow has fat her ufual time, and difengaged the young cackow and fome of har own offspring from the thell*, her own young ones, and any of her egse that remain mhatched, are foon - turned out, the young cuckow remaining poffeflor of the neft, and fole object of her future care. The young birds are not previouny lilled, nur are the esegs
dennlihned; but all are left to perifh together, either Cucuise. cutangled about the buth which contains the ned, or lying on the srownd under it.
"The early late of the young hedse fparrows (Mr Jenner obferves) is a ciremmance that has been noticed by others, but ateributed to wrong caufes. A varicty of conjectures lave been formed unun it. Some have fuppofed the parent cuckow the author of their deftruction; while others, as erronenaly, have prononncel them finothered by the difproportionate fize of thair fellow-nefling. Now the cuckowns est being not much larger than the hedge-fparrow's (as I thall more fully pisint out hercalter), it neceflarily follows, that at firl there can be no great difference in the fize of the bick juit burdt from the fhell. Of the fallacy of the formar affertion allo I was fome jears ago convinced, by having found that many cuckows eggs were hatched in the nefis of other birds after the old cuckow had difappeared, and by fecing the fame fate then atiend the nelling fparrows as during the appear. ance of old cuckows in this country. Put before I proced to the facts relating to the death of the young fparrows, it will be proper to lay before you fome examples of the incubation of the cgg, and the rearing of the yonng cuckow; thoe even the wall-known fact, that this bufinefoisintrulted to the care of other birds, hats been controverted by an author who has lately written on this fubject + ; and fince, as it is a fact fo + The Hon. mutch out of the ordinary courfe of nature, it may ftill Daines prubably be ditbelieved by others.

Darringtan,
"Example 1 . The titlark is frequently feleeted by the cuckox to take charge of its young one; but as it is a bird lefs familiar than many that I have mentioned, its neth is nut io often difcovered. I have, neverthelefs, had fereral cuckows euggs brought to me that were found in titarks nefts, and had one opportunity of feciag the young cackow in the nett of this bird. I faw the old bids feed it repeatedly; and, to fatisfy my [elf tlat they were really titlarks, hot them both, ancl found them to be fo.
"L'xunple 2. A cuckow laid her egg in a waterwagtall's nelt in the thatch of an old cottage. The wagtall fat her ufual time, and then hatched all the egge but one: which, with all the young ones except the cuckow, was tund out of the nell. The yomg bind", confiting of five, were fourd upon the rafter thit projected from under the thate h, and with them was the cgeg not in the leaft injarect. On examining the egg, Ifound the young wagtail it contained quite perfect, and juft in finch a it ite as birds are when ready to be difengaged from the thell. The cuckow was reared by the wagtails till it was nearly capable of Bying? when it was killed by an accident.
"Example 3. A lacdge-fparrow buits her neft in a hawthorn buth in a timber-yayd. if fer the had laid two egges, a cuckow dropped in a third. The fparrow enatinued lying as if nothing hasl happenel, till the had laid live, her what rumber, and then fat.
"June 20. 175G. On infpecting the nelt, I found that the bird hat hatehal this morming, and that ewery thing but the young enckow was thrown out. Under the nett I found one of the voring hedge-fpartows dead, and one cger by the fide of the netl citanghad with the cuarfe woody materials that formed its ontlike coner
 4.

## C U C［ 592$] \quad$ C U C

Curnime fell a little cracked，and coull fee that the farrow it contained was yet alive．It was then reftored to the nef，but in a few minntes was thrown out．The egg being again fufpended by the outlide of the nett， was faved a fecond time from breaking．To fee what would happen if the cuckow was removed，I took out the cuckow，nnd placed the egg contaning the hedge－ fparrow in the nelt ia its ftead．The old birds，da－ ring this time，flew about the fpot，fhowing figns of grat anxiety；but when I withdrew，they quickly came to the neft again．On looking into it in a quar－ ter of an hour afterwards，I fiound the young one com－ pletely hatched，warm，and lively．The hedge－fpar－ rows were fuffered to remain undifturbed with their new charge for three hours（during which time they paid every attention to it），when the cuckow was again put into the neft．The old fparrows had been fo much diflumed by thefe inirufions，that for fome time they fhowed an unvillingnefs to come to it． However，at length they came；and on examining the neft again in a few minutes，I found the young far－ row was tumbled out．It was a fecond tine refored， but again experienced the fame fate．
＂From thefe experiments，and fuppofing，from the feeble appearance of the young cuckow jut difengaged from the fheil，that it was utterly incapable of difpla－ cing cither the egg or the young farrows，I was in－ duced to believe that the old I口arrows were the only agents in this feeming unnatural bufinefs．But I af－ terwards clearly perccived the caufe of this ftrange phenomenon，by difcovering the young cuckow in the act of difplacing its fellow－neflings，as the followiug xelation will fully evince．
＂J June 18． $\mathrm{I}_{7} 8_{7}$ ，I examined the nett of a hedge－ fparrow，which then contained a cuckow＇s and three hedge flarrow＇s eggs．On infpecting it the day fol－ lowing，I found the bird had hatched，but that the nell now contained only a young cuckow and one young hedge－lparrow．The nelt was placed fo near the extremity of a hedge，that I could diftinctly fee what was going forward in it ；and，to my aftomifhment， faw the young cuckow，though fo newly hatched，in the act of turning out the young hedge－fparrow．
＂The mode of accomplithing this was very curious． The little aninal，with the affillance of its rump and wings，contrived to get the bird upon its back：and making a lodgement for the burden by elevating itz ellows，clambered backward with it up the fide of the nett till it reached the tep；where retling for a mo－ ment，it threw off its load with a jerk，and quite dif－ engaged it from the nell．It remained in this fitua－ tion a thort time，feeling about with the extremities of its wints，as if to be convinecd w！ether the bufnefs was properly executed，and then dropped into the nell again．With thefe（the extremities of its wings） I have offen feen it examine，as it were，in egg atd nefling before it began its operations：and the rice fenfility which the fe parts appeared to pullef，sentricd fufficienty to compenfate the want of fight，which as jet it was dellitute of．I atterwards put in an egg； and thic，by a dmiar procers，was concyed to the tage of the ner and thens out．Thate experiments I have hace opeated freest times in different neils， and hace alway found the your cuckow difpofed to ata in the fance tane：io chobig up the neft，it式い。
fometimes drops its burden，and thus is foiled in its Cucelus， endeavours；but，after a little refpite，the work is re－ fumed，and goes on almoft inceftratly till it is effeed． It is wonderfin to lee the extraordinary exertions of the young cuckow，when it is two or three days old． if a bird be put into the neft with it that is too weigh． ty for it to lift out．In this thate it feerns ever rellefs and uneafy．But this difpofition for turning out its companions begins to decline from the time it is two or theree till it is about twelve days old ；when，as far as I have hitherto feen，it ceafes．Indeed，the difpo－ fition for throwing ont the erg appears to ceafe a few days fooner：fur I have frequently feen the young cuckow，after it had been hatched nine or ten days， remove a netling that lad been placed in the nett with it，when it fuffered an egg，put there at the fame time，to remain unnolefted．The fingularity of its thape is well adapted to thefe purpofes；for，different from other newly－hatched birls，its back，from the fcapule downwards，is very broad，with a confiderable depreffion in the middic．This deprefion feems form－ ed by nature for the defign of giving a more feeure lodgement to the egg of the hedge－fparrow or its young one when the young cuckow is employed in removing either of them from the nett．When it is about 12 lays old，this cavity is quite filled up，and then the back allumes the thape of nefling birds in general．
＂Having found that the old hedge－fparrow com－ monly throws out fome of her own eggs after her nelt las reccived the cuckow＇s，and not knowing how fhe might treat her young ones if the young cuckow was deprived of the power of diffoffeffing them of the neft， I made the following experiment．
＂July 9．A young cuckow，that had been hatehed by a hedge－fparrow aloout four hours，was confined in the net in fuch a manner that it could not poffibly turn out the young hedge－fparrows wbich were hateh－ ed at the fane time，though it was almof inceflantly inaling aitempts to effee it．The confequence was， the old birds fed the whole alike，and appeared in every refpect to pay the fame attention to their own young as to the young cuckow，until the 13 th，when the nelt was unfortumately plendered．
＂The fmallnefs of the cuckow＇s egg，in proportion to the fize of the bid，is a circumilance that lintherto， I believe，has efeaped the notice of the ornithologit． So great is the difproportion，that it is in general fmaller than that of the houfe－Sparrow；whereas the difference in the lize of the hirds is nearly as five to one．I have ufed the tem in gensard，becaule egras profuced at diferent times by the fame bird vary very tuth in lize．I have fund a cuckow＇s egs fo light that it weighed only 43 grains，and one fo heavy that it weighed 55 grains．The colour of the cuckow＇s eggs is extremely variable．Some，both in ground and peaciling．very much refernble the houfe－fparow＇s； fome are inditinclly covered with bran－coloured frots； and others are marked with lines of black，refembling， in fume meafure，the equss of the gelow hammer．
＂The circmantance of the young eackow＇s beirs deftined by mature to taruw out the young hedge－ fparrows，feems to account for the parent cuckow＇s droppiag her egg in the aitt of birds fo fmall as thole I have partictharifed．If the were to do this in the nel of a bird which produced a large egg，and confe－
quentry，

## C U C [ 593 ] C U C

Cuculus. quenify a large nefling, the young cuckow would probably find an infurmountable difficulty in folely poffefling the neft, as its excrtions would be unequal to the labour of turning out the young birds. Befides, though many of the larger birds might have fed the nelling cuckow very propaly had it been committed to their charge, yet they could not have fuffered their own young to hase been facrificed for the accommodation of the cuckow in fuch great number as the fimaller ones, which are fo much nore abundant; for though it would be a wain attomp to calculate the numbers of nellings detroyed by means of the cuckow, yet the nighteft obfervation would be fufficient to convinec us that they mull be very large."

Here Mr Jemer remarks, that though nature permits the young cuckow to make this great waft, yet the animals thus deftroyed are not thrown away or rendered ufelefs. At the feafon when this happens, great numbers of tender quadrupeds and repulcs are fecking provifion; and if they find the callur neftings which have fallen victims to the young cuckow, they are furnifhed with fond well adapted to their peculiar flate.

It appears a little extraordinary, that two cuckows eggs flould ever be depolited in the fame nefl, as the young one produced from one of them muft inevitably perifh: yet two intances of this kind fell under our author's obfervation, one of which he thus relates: " June 27. 1787. Two cuckows and a hedge-fparrow were hatched in the fame neft this morning ; one hedgefparrow's egg remained unhatehed. In a few hours after, a contelt began between the cuckows for the pofieffion of the nett, which continued undetermined till the next afternoon. when oue of them, which was fomewhat fuperior in fize, turned out the other, together with the young hedge-fparrow and the unhatched egg. This contelt was very temarkable. The combatants alternately appeared to have the advantage, as each carried the other feveral times nearly to the top of the neft, and then funk down again, opprefled by the weight of its burden; till at length, after various efforts, the frongell prevailed, and was afterwands brought up by the hedge-fparrows."

But the primcipal circunifance that has agritated the mind of the näturalift refpecting the cuckow is, Why, like other birds, it thould not build a net, iucubate its eggs, and rear its own young?
There is no apparent reafon, Mr Jenner thinks, why this bird, in common with others, fhould not perform all thefe feveral offices; for it is in every refpect perfeetly formed for collecting materials and building a neft. Neither its external fhape ner internal Ifructure prevent it from incubation; nor is it by any means incapacitated from bringing food to its young. It would be needlefs to enumerate the various opinions of authors on this fubject from Ariftotle to the prefent time. Thofe of the ancients appear to be cither viFonary or erroneous; and the attempts of the moderns towards its inveltigation have been confined within very narrow himits: for they have gone but little further in their refearches than to examine the conftitution and fructure of the bird; and having found it Foffeffed of a capacious th waich with a thin external covering, concluded that the preflure upon this part, in a fitting polture, prevented incubation. They have
Voz. V. Part IL.
not confaderel that many of the birds which incubate Cucolus. have flomachs analogons to thofe of enckows. The Ahnach of the ow, for cexmple, is proportionably capacious, and is alnoll ats thinly covered with external integuments. Nor have they confidered, that the fomachs of $n$ itlings are always much dillended with food; and that this very part, during the whole time of their confinment to the nell, fupports in a great degree the weight of the whole body' : whereas, in a fitting bird, it is not nearly fo much prefled upon, for the brealt in that cafe fills up chictly the cavity of the net ; for which pupofe, from its uatural convexity, it is admirably well fitted.

Thefe obfervations may be fufficient to how, that the cuckow is not rendered incapable of litting throngh any peculiarity either in the fitvation or formation of the llomach; yct, as a proof thill more decifive, our oblerver adduces the following fact.
"In the fummer of the year 1786 , J faw, in the neft of a hedge-fparrow, a cuckow, which, from its fize and plamage, appeared to be nearly a fortnight old. On lifting it up in the nett, I obfered two hedge-fparrows eggs under it. At firft I fuppofed them part of the number which had been fat npon by the hedge-fparrow with the cuckow's egg, and that they had become addle, as bids frequently fuffer fuch eggs to remain in their netts with their young; but on breaking one of them I found it contained a living foetus: fo that of courfe thefe eggs mult have been laid feveral days after the cuck w was hatched; as the latter now completely filled up the neft, and was by this peculiar incident perfonning the part of a littingbird. At this time I was unacquainted with the fact, that the young cuckow turned out the eggs of the hedze-fparrow; but it is reafonable to conchuke, that it had lot the dipolition for doing this when thefe egge were depofited in the nelt.
"Having under my infpection, in anther hedgefparrow's nett, a young cuckow about the fame fize as the former, I procured two wagtails eggs which had been fat upon a few days, and had them immediacly eonveyed to the fpot, and placed under the cuckow. On the ninth day after thet exors had bua ta, w: fituation, the perfori appninted to fuperinteme whe nelt (as it was fome ditance from the place of my refidence) cane to inf.rm me that the wagtails were hatched. On going to the place, and examining the nell, I found nothing in it but the cuckow and the fhells of the wagtail's eggs. The fact, therefore, of the birds being hatched, I do not give you as eoming immediately under my own eye; but the tutimony of the perfon appointed to watch the nett was corroborated by that of another witnels."

In contidering to what caules may be attributed the fingularities of the cuckow, Mr Jenner fuggelts the following as the moll probable: "The foart refuctice this bird is allowed to make in the country where it is difined to propagute its jpecies; and the call that nature bas ufon it, during that floort refidence, to produce a nunterous progety. The cuckow's lirit appearance here is about the middle of April, commonly on the 17 th. Its egg is not ready for incubation till fome wecks after its arrival, feldon before the middle of May. A fortnight is taken up by the fitting-bird in hatching the erge. The young bird generally centinues three week

## C U C [ 594 C U C

Cuculus. in the neft before it flies, and the fofter-parents feed it more than five weeks after this period; fo that if a cuckow thould be ready with an egg much fooner than the tinse pointed out, not a fingle nettling, even one of the carlieft, would be fit to provide for itfelf before its parent would be inftinctively disected to feek a new refidence, and be thus compelled to abandon its young sne; for old cuckows take their final leave of this country the firf week in July.
"Had nature allowed the cuckow to have faid here as lung as fome other migrating birds, which produce a fingle fet of young ones (as the fwift or nightingale, for example), and had allowed her to have reared as large a number as any bird is capable of bringing up at one time, thefe might not have been fufficient to have anfwered her purpule; but ly fending the cnekow from one nett to another, the is reduced to the fame fate as the bird whofe nell we daily rob of an egg, in which cife the inimulus for mabation is fufpended. Of this we have a familiar example in the common dometic fowl. That the cuckow actually lays a great number of eggs, diffection feems to prove rery decifiely. Upon a comparifon I had an opportunity of making between the ovarium, or racemus vitellorum, of a female cuckow, killed jult as the had begun to lay, and of a pullet killed in the fame fate, no effential diference appeared. The uterus of each cuntained an eqg perfectly formed, and ready for exclution; and the ovarium exhibited a large chather of eggs, gradually adraneed from a very diminutive fize to the greatelt the yolk acquires before it is received anto the oviduet. The appearance of one killed on the third of July was very different. In this I could diftinetly trace a great number of the membranes which had difcharged yolks into the oviduct; and one of them appeared as if it had parted with a yolk the preceding day. The ovariun ftill exhibited a clutter of enlarged eggs, but the moft forward of them was fearceJy larger than a nuflard-seed.
"I would noi be undertood to advance, that every egg which fwells in the ovariun at the approach or conmencement of the propagating feafon is brought io perfection; but it appears clearly, that a bird, in obedience to the dictates of her uwn will, or to fome hidden caufe in the animal economy, can either retard or bring forward her eggs. Betides the example of the common fowl above alluded to, many others occar. If we deltroy the nelt of a blackbird, a robin, or almoit any fmall bird, in the fpring, when fine has laid her uftal number of efges, it is well known to every one who has paid any attention to inquiries of this kind, in how fhort a fpace of time fle will produce a frefofet. Now, had the bird been fuffered to have proceeded without interruption in her natural courfe, the eggs would have been hatched, and the ycung ones brought to a itate capable of providing for them:felves. before the would lave been induced to make another ant, and excited ios produce another Set of eggs from the ovarium. If the bird lad been deltroyed at the tiane the was fitting on her firt laying of eggs, diffection would have thun the owarium containing a great number in an cnlarged Ante, and advancing in the ufual progitfinve ordur. Hence it plainiy appears, that binds can keers back or bring forward (undor certain limitations) their eggs at any
time during the feafon appointed for them to lay; but Cuculus. the cuckow, not being fubject to the eommon interruptions, gues on laying from the time the begins till the eve of her departure from this country: for although old cuckows in general take their leave the firft week in July (and I never could fee one after the 5 th day of that month, though I eonecive it poffible that liere and there a flraggling cuckow may be feen after this time) ; yet I have known an inftance of an egg's being hatched in the nelt of an hedge-fparrow fo late as the 15 th. And a farther proof of their continuing to lay till the time of their leaving us may, I think, be failly deduced from the appearances on diffection of the female cuckow abuve mentioned, killed on the $\hat{3}$ d of July."

Among the many peculiarities of the young curekow, there is one that fhows itfelf very early. Long before it leaves the nedl, it frequently, when irritated, affumes the manner of a bird of prey, looks ferocious, throws itfelf back, and pecks a: any thing prefented to it with great vehemence, often at the fame time making a chuckling noife like a young hawk. Hence probably the vulgar opinion, that this biad cianges into a hawk and devours its nufe on quitling its neft; whence the French proverb, Ingrat camme un coucous. Sometimes, when dillurbed in a fmailer degree, it makes a kind of hifing noife, accompanied with a hea, ving motion of the whule body.

The growth of the young cuckow is uncommonly rapid. Its chirp is plaintiff, like that of the hedgefparrow; but the found is not acquired from the fo-fler-parent, as it is the fame whether it be reared by the hedge-fparrow or any other bird. It never acquires the adult note duing its tay in this country.

The itomachs of young cuckows contain a great variety of food. On diffecting one that was brought up by wagtails, and fed by them at the time it was foot (though it was nearly of the fize and fulnefs of plumarge of the parent-biid), Mr Jenner found in its flomach the following fubtances: Flies and beetles of various kiuds; frnall fnails with their fhells unbroken; grafhoppers; caterpillars; part of a horfebeau: a vegetable fubilance, refembling bits of tough grafs, rolled into a hall; and the feeds of a vegetable that refembled thofe of the goofe-grafs. In the llomach of one fed by hedge-fparrows, the contents were almof entirely vegetable; fuch as wheat, fmall vetehes, ic. "But this (fays our author) was the only inItance of the kind I had ever feen, as thefe birds in gencral feed the yound cuckow with farcely any thing but animal food. However, it ferved to clear up a point which before had fumewhat puzzled me; for haviag found the cuckurv's cgg in the neft of a greenlianet, which begins very early to feed ats young with vegetable food, I was apprehenfive, till I faw this fact that this bird would have bcen an unfit fofter-parent for the young cuchow.
" The titiark, I obferve, feeds it principally with grathoppers.
"But the moll fingular fubtance, fo often met with in the tomachs of young cuckows, is a ball of hair curioully wound up. I have found it of varions Gizes, from that of a pea to that of a fimall nutmeg. It feems to be compofed chiefly of horfe hairs; and froms the refemblance it bears to the infide covering of the

## 

Cumber, net, I conceive the bird fwallows it while a nclling. In the flomachs of old cuckuws are often feen mafles of hair; but thefe had evidently onee formed a part of the hairy caterpillar, which the cuckow often takes for its food."

There feems to be no precife time fixed for the departure of young cuckows. Mr Jenuer believes they go off in fucceflion, prubably as fom as they are capable of taking care of themfelves; for although they flay here till they become nearly equal in lize and growth of plunage to the old cuckow, yet in this very flate the foltering care of the hedge-fparrow is not withdrawn from them. "I have frequently (fays he) feen the young cuckow of fuch a dize that the hedgefparrow has perched on its back, or half-expanded wing, in order to gain fufficient elevation to put the food into its mouth. At this advanced thage, I believe that young cuckows procure fome food for themfelves; like the young rook, for iuftance, which in part feeds itfelf, and is partly fed by the old ones, till the approach of the pairing leafon. If they did not go off in fucceffion, it is probable we fhould fee them in large numbers by the middle of Augult; for as they are to be found in great plenty when in a nelling ftate, they muft now appear very numerous, fince all of them mult have quitted the nef before this time. Lut this is not the cafe; for they are not more numerous at any feafon than the parent-birds are in the months of May and June.
"The fame inttinctive impulfe which directs the cuckow to depofite her eggs in the nells of other birds, directs her young one to throw out the eggs and young of the owner of the nelt. The feheme of nature would be incomplete without it; for it would be extremely difficult, if not impoffible, for the little birds deftined to find fuccour for the cuckow, to find it alfo for their own young ones after a certain period; nor would there be room for the whole to inhabit the nefl."

It is fuppofed, that there are more male cuckows than females; fince two are often feen in difpute where a third has been in fight; which, no doubt, was of the oppofite fex. Mr Pennant obferved, that five male birds were caught in a trap in one feafon; and Mr Latham fays, that "out of at lealt half a dozen that I haye attended to, my chance has never directed me to a female; and it is to be wifhed, that future obferwers may determine whether our obfervations have rife only in chance, or are founded on the general circumftance." He believes that the male birds are more liable to be thot, their note directing the gunner where to take aim, while the fenale is fecured by her filence.

Cuckows may be, and often are, brought up tame, fo as to become familiar. They will eat in this llate bread and milk, fruits, infects, eggs, and fleth either cooked or raw; but in a flate of nature, I believe, chiefly live on caterpillars; which, in the few I have obfersed, were all of the fmooth kind; others have found vegetable matter, beetles, and fmall Itones. When fat, they are faid to be as good eating as a land rail. The French and Italians eat them to this day. The ancient Romans admired them greatly as food: Pling lays that there is no bird which can be compared to them for delicacy.

In migrating, the major part of thefe birds are fuppofed to go into Africa, fince they are obferved to vilit
the ifiand of Malta twice in a ycar, in their paffage backwards and forwards, as is fuppofed, to that part of the wond. They are well known alfo at Aleppo. To the north, it is faid io be common in Sweden; but not to appear fo early by a month as with us. Ruffia is not deditute of this bird; and Mr Lathan has feen a fpecimen brought from Kamtichatka, now in the pollielion of Sir Joleph Banks.
2. The Americanus, or cuckow of Carolina. It is about the lize of a blackbird, the upper mandile of the bill black, the lower yellow; the large wing-feathers are reddifh; the rett of the wing, and all the upper part of the body, head and neek, is of an ath-colour; all the under part of the body, from the bill to the tail, white; the tail long and narrow, compufed of lix long and four morter feathers ; their legs floort and itrong. Their note is very different from the cuckow of this country, and not fo remarkable to be taken notice of. It is a folitary bird, frequencing the darkeft receffes of woods and thady thickets. They retire on the approach of winter.
3. The indicator, or honey-guide, is a native of Africa. The following defeription is given of it by Dr Sparrman in the Philolophicat Trafactions for 1777 . "This curious 色ecies of cuckow is found at a confuderable diftance from the Cape of Good Hope, in the interior parts of Africa, being entirely unk nown at that fettlement. The firit place I heard of it was in a wood called the Groot-wader's Buots, "the Grand-father's Wood," fituated in a defent near the river which the Hottentots call $T^{\prime} k$ nut'kai. 'The Duteh fettlers thereabouts have given this bind the name of boniguyer, or " honey-guide," from its quality of difcovering* wild honey to travellers. Its colour has nothing triking or beautiful. Its fize is conliderably fmalker than that of our cuckow in Europe: but m return, the in . ftinck which prompts it to liek its food in a lingular manner is truly admirable. Not only the I)utch and Hottentots, but likewife a feecies of quadruped named ratel (probably a new pecies of badger), are frequently conducied to wild bee-hives by this bird, which, as it we:e, pilots them to the very foot. 'The honey being its favourice food, its own interelt prompts it to be intrumental in robbing the hive, as fome luraps are commonly left for its fupport. The morning and evening are its times of feeding, and it is then heard calling in a farill tone, chorr, chorr; which the honey-hunters carefully attend to as the fummons to the chace. From time to time they anfwer with a foft whitle; which the bird hearing, always continues its note. As foon as they are in fight of cach other, the bird gradinally flutters toward the place where the hive is lituated, contumally repeating it former call of chorr, cherr: nay, if it flould happen to have gained a condiderable way before the men (who may catily he hindered in the purfuit hy befhes, rivers, or the like), it returns to them again, and redoubles its note, as it were to repnoach them with their inactivity. At lat the $b$ rd is obferved to hover for a few moments over a certain frot, and then likently retiring to a neighbouring bufh or retting-place, the hunters are fure of finding the bees nett in that identical fpot; whather it be in a tree or in the crevice of a rock, or (as is molt commonly the cafe) in the earth. Whilt the lunters are bufy in taking the homey, the bird is ${ }_{4} \mathrm{~F}^{2}$
feen

Cuculue. -rus

Plate CLIY。

## C U C [ 596 ] C U C

Crculus feen locking on attentively to what is going forward, and waiting for its flate of the fpoil. The bee-hunters never fail to leave a fmall portion for their conductor: but commonly take care not to leave fo much as would fatisfy its hunger. The bird's appetite being whetted by this partimony, it is ohlited to commit a fecond treafon, by difcovering another bee's neft, in hopes of a better falary. It is furtlier obferved, that the nearer the bird approaches the hidden hive, the more frequently it repeats its call, and feemsts the more impatient. I have had frequent opportunitics of feeing this bird, and have been witnefs to the deltruation of feveral republics of bees hy means of i.s treachery. I had, however, but two opportunities of fhooting it, which I did to the great iadignation of my Hottentots. It is about feven inches in length, and is of a rufty brown colour on the back, witi a white bradt and belly.:" A net which was hown to Ior Sparrnan for that of this biod, was compofed of flender filaments of bark, woven together in the form of a bottle; the neck and opening hung downwards, and a llring, in an arehed frape, was fufpended acrofs the opening faitened by the two ends, perhaps for the bird to perch on.
4. The Cape cuckow (Buff.), is a trife fmaller than ours: the bill a deep brown; the upper part of the body greenifh brown: throat, cheeks, fore part of the neek, and upper wing coverts, of a deep rufous colour: tail feathers rufous, but paler, tipped with white: the breaft, and all the under parts of the body, white, croffed with lines of black: the legs reddifh brown. It inhabits the Cape of Good Hope; and is mof likely the fame bird whieh is called Edelio, from its pronouncing that word frequently in a low melancholy tone.-Vovagers alfo mention another-cuckorv, which is common to Loango in Afriea. It is bigger than ours, but of the fame colour; and repeats the word cuckow like that bird, but in different inflexion of voice. It is faid that the male and female together go through the whole eight notes of the gamut; the male, beginning by itfelf, founds the three firth, after which be is accompanied by the female through the relt of the octave.
5. The honoratur, or facred cuckow, is fomewhat lefs than our cuckow : the general colour is blackifh ah on the upper parts, marked with two fpots of white on each fcather; beneath white, tranfverfely fpotted with ath-colour: the quills are cineroous, tranfwerfely fpotted with white : the tail is much cuneated, five inches and a half long, and of the fame colour as the quills; the outer feather only three inches long: the legs and claws are of a pale afh-colour. This fpecies inhabits Malabar, where the natives hold it facred. It feeds on reptiles, which, perhaps, may be fuch as are the nof noxious; if fo, this leeming fuperftition may have rife from a more reafonable foundation than many others of the like fort.
6. The fhining cuckow is the fize of a fmall thrufl: the bill is bluif: : the upper part of the body green, with a rich gilded glofs; the under parts are white, tranfverfely waved with green gold: the under tail coverts alrivit white; the quills and tail dufky-brown; the legs are bluifh. This iuhabits New Zealand, where it is ealled Pocso-arowro. See Plate CLI.
7. The vetula is a triffe bigger than a blackbird: the bill above an inch and a half long: the upper
mandible black; the lower whitif: crown of the head Cuculug: brown, the featliers of it foft and filkj; the upper parts of the body and the quills cinereous olive: throat and fore part of the neck whitifh; the reit of the under parts rufous: the tail is much cuncated; the two middle feathers cinereous olive, the others duky black tipped with white; the outer feather very fhort: legs blue-black. This fpecits inhabits Jamaica, where it is frequent in the woods and hedges all the vear round. It feeds on feede, finall worms, and eaterpillars, and is very tame. This bird has the name tucco from its cry, which is like that word; the frit fyllable of this is pronounced hardly, the other following in a full octave lower than dhe firft. It has alfo another cry like qua, qua, qua: but that only when elarmed by an enemy. Bulides infects, it will alfo eat li\%urds, fmall fuakes, frogs, yung rats, and fometimes even finall birds. The fakes they fwallow head formorl, lerting the tail hang out of the mouth till the fore-parts are digetted. This bird, it is molt likely, might be eafily tamed, as it is lo gentle as to fuffer the negro children to catch it with their hands. Its fait is that of leaping, like a magpie; being frequentIy feen on the ground; and its flight but fhort, chicfly from bun to buin. At the time when other birds breed, they likewife retire into the woods, but their nelts have never yet been found; from which one fhould be inclined to think, that they were indebted to other birds for the raring their young in the manner of the common cuckow. It has the name of rainbird, as it is faid to make the greatett noife beforerain. Common all the year at Jamaica. In another fpecies or varity, common in Jamaica, the feathers on the throat appear like a downy beard, whence probably the name of old-nam rain-bird, given it there and by Ray, Sloane, \&c.
8. The nævius, fpotted cuckow, or rail-bird, is about the fize of a ficldfare: the bill three quarters of an inch; the upper mandible black on the top, and rufous on the lides; the under wholly rufous: the general colour of the plumage is rufous in two fhades; the under parts rufous white: the feathers on the crown are of a deep brown, and pretty long, with rufons. tips, and fome of them margined with rufous: the hind part of the neck is a rufous grey; down the fhafts deep brown: back and rump the fame; each. feather tipped with a rufous fpot: on each feather of the throat and neck is a tranferfe brownifh line near the end: the under tail coverts are rufous: the quille are grey brown, edged with rufous, and a poot of the fame at the tips: the tail is near fix inches long, much cuneated; the outer feathers only half the length of the middle ones; colour of it the fame as the quills; fonte of the upper coverts reach to near two-thirds of the leugth of the tail: the legs are ath-colour; the claves greyifh brown. It inhabits Cayenne.-Bulfon mentions a variety of this by the name of rail-birct. It is much the fame in fize, but has lefs rufous, being.grey in the place of that colour: the fide tail-feathers have white tips: the throat is pale grey; under the body. white; the tail a trifle longer than in the other. Whether a varity or different $f e x$, is not known. This is common at Cayenne and Guiana ; and is feen often perched upon gates and rails, whence its name; and when in this fituation continually moves its tatl. Thefe

## Plate ('I.11LL

Cucumber, are not very wild birds, yet do not form themfelves
Cucunis. into troops, although numbers are often found in the fame diltrict: nor do they frequent the thick woods like many of the genus.
9. The cayanus, or Cayerne cuckow, is the fize of a hackhird: the bill is grey brown, above an inch long, and a little beat at the tip: the plamage on the upper parts of the body is purglith chofnnt ; bencath, the fame, but paler: the quills are the fame as the upper parts, tipped with brown : the tail is the fame; near the end black, and tipped with white; it is much cuneated, and above ten inches long: the legs and claws are grey brown. This inhabits Cayenne, where it goes by the name of piaye, or don \% The natives give it that name as a bird of ill omen. The flefh they will not touch; and indeed not without rafon, as it is very had and lean. It is a very tame fpecies, fuffering itfelf to be almont tonched by the hand before it offers to efeape. Its fighat is almodl like that of a king'nhmer; frequents the burders of rivers, on the low branches; feeds on infects; often wags its tail on changing place.

There are 37 other fpecies, which inlabit different parts of the globe, and are principally difinguifhed by the thape of the tail and variations in colour.

CUCUMBER, in botany: Ste Cucumas.
CUCUMIS, the Cucumber: A genus of the fyngenefia order, belonging to the monocia clafs of plants; and in the natural method ranking under the 34 th order, Cucurbitactie. The male calys is quinquedentated, the corolla quinquepartite; the filaments three. The female calyx is quinquedentated, the corolla quinquepartite, the piftil trifid; the fides of the apple fhatp-pointed. In this genus Limereus includes alfo the Melon; (fee that article). There are in feecies, of which the following are the moft remarkable.
I. The fativa, or common cucumber, hath roots compofed of mumerous, long, flender, white fibres; long flender ftalks, very branchy at their joints, trailing on the ground, or climbing by their clafpers, adorned at every joint by large angular leaves on long erect footlalks, with nunerous and monopetalous bellfhaped flowers of a yellow colour, fucceeded by oblong rough fruit. The varieties of this kind are, (1.) The common rough green prickly cucumber; a middlefized fruit, about fix or feven incles long, having a dark-green rough rind, clofely fet with very fmall prickles; the plant is of the hardiett fort, but does not fhow its fruit early. (2.) 'The fhort green prickIy cucumber is about three or four inches long; the rind rather fmooth, and fet with fuall black prickles. It is valuable chiefy for being one of the carlieft and hardict forts. (3.) The long green prickly cucumber, grows from fix to nine inches in length, and is rather thinly fet with prickles. And as there is an early and late cucnmber, it is confiderably the beft variety for the main crops, both in the frames and hand-glafs, as well as in the open ground for pricklers. Of this there is another variety with white fruit. (4.) The early green cluller cucumber is a fhotith fruit, remarkable for growing in clufters, and appearing early: (5.) The long fmooth green Turky cucumber, is a mooth green-rinded fruit, growing from 10 to 15 inches in length, without prickles. The plants are trong growers, with very large leaves. (0.) The long fmooth
white Turky cucumber, is a fmooth rinded fruit, from Io to 15 inches long, without prickles. (7.) The large fmooth green Roman cucumber is a very large and long finooth green firuit produced from a flrong growing plant. (8.) The long white prickly Dutch cacumber, is a white fruit 8 or ro inches long, fet with fmall black prickles; the plants are but bad bearers in this country.
2. The chata, or round-leaved Feyptian cucumber. According to Mr Haffelquit, this grows in the fortile earth near Cairo after the innudation of the Nile, and not in any other place in Egypt, nor does it grow in any other foil. It ripens with the water-melons. The fruit is a little watery; the fleflı idmult of the farne fubfance with the melons; it tatkes fomewhat firect and cool; but is far from being as cool as the water-melons. 'This the grandees and Europeans in Egryp cat as the moft pleafant fruit they find, and that from which they have the leatt to apprehend. It is the mof exccllent fruit of this tribe of any yet knowa.

The four firg varieties of the cucumis fativa are thofe chiefly cultivated in this country. They are raifed at these different feafons of the year: 1. on hot-beds, for early fruit ; 2. under bell, or hand-glaffes, for the middle crop; 3. on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholefone; being raifed wholly by the heat of the duug without the alfiltance of the fun. Thofe raifed in April are good, and are raifed in the following manner.

Towards the latter end of January, a quantity of freh horfe-dung muft be procured with the litter among it ; and a fmall proportion of fea-coal alhes fhould be added to it. In four or five days the dung will begin to heat; at whicb time a little of it may be drawn flat on the outfide, and covered with two inches thicknefs of good earth : this muft be covered with a bell-glafs; and after two days, when the earth is warm, the feeds muft be fown on it, covered with a quarter of an inch of frefh earth, and the glafs then fet on again. The glafs mulk be covered with a mat at night, and in four days the young plants will appear. When thefe are feen, the rell of the dung muft be made up into a bed for one or more lights. This mult be three fect thick, beat clofe together, and covered three inches deep with fine frefh earth; the frame mult then be put on, and covered at night, or in bad weather, with mats. When the earth is hot enough, the young plants from under the bell muft be removed into it, and fet two inches diftance. The glaffes mult be now and then a little raifed, to give air to the plants, and turned often, to prevent the wet from the fteam of the dung from dropping down upon them. The plants mult be watered at proper times; and the water ufed for this purpofe mult be fet on the dung till it becomes as warm as the air in the frame : and as the young plants increafe in bulk, they muft be earthed up, which will give them great additional Atrength. If the bed is not hot enough, fome freh litter thould be laid round its fides: and if too hot, fome holes flould be bored into feveral parts of it with a fake, which will let out the heat; and when the bed is thas brought to a proper coolunfs, the holes are to be fopped up again with fich dung. When thefe plants begin to foot their third or romgta

Cucumis. Icaf, another bed mut be prepared for them like the firt; and when it is properly waun through the earth, the plants of the other bed mult be tiken up, and planted in this, in which there mull be a hole in the middle of each light, about a foot decp, and nine inches over, filled with light and fine freth earth laid hollow in form of a bafon: in each of thefe holes there muft be fet four plants: thefe mull be, for two or three days, haded from the fun, that they may take firm root; after which they mult have all the fun they can, and now and then a little frefh air, as the weather will pernit. When the plants are four or five inches high, they mult be gently pegged down towards the earth, in directions as different from one another as may be; and the branches afterwards produced foould be treated in the fane manner. In a month after this the flowers will appear, and foon after the oudiments of the fruit. The glafles fhould now be earefinly covered at might; and in the daytime the whole plants fhould be gently fprinkled with water. Thefe will produce froit till about midfummer; at which time the fecond erop will come in to fupply their place: thefe are to be raifed in the fame manner as the early crop, only they do not require fo much care and trouble. This fecond crop thould be fown in the end of Mareh or begiming of April. The feafon for fowing the cueumbers of the laft crop, and for pickling, is towards the latter end of May, when the weather is fettled: thefe are fown in holes dug to a little depth, and frlled up with fine earth, fo as to be left in the form of a bafon; eight or nine feeds being put into one hole. Thefe will come up in five or fix days; and till they are a weck old, are in great danger from the fparrows. After this they require only to be kept clear of weeds, and watered now and then. There fhould be only live plants left at firft in each hole; and when they are grown a little farther up, the word of thefe is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

The encumber is taken in great cities by the lower people as noulifhenent; but by the better furt is chiefly ufed as a refrigerant, or condiment, to accompany animal food. They have a bland intipid juice, without acidity or fweetnefs, approaching, as appears by their ripening, to a farinaceous matter. When ufed green they have no nourithment, fo they are only to be ufed in the fummer feafon and by the fedentary. Although cucumbers are neither fweet nor acid, yct they are confiderably acefent, and fo produce flatuleney, cholera, diarricea, \&c. Their coldncfs and flatuleney may be likewife in part attributed to the firmnefs of their texture. They have been difcharged with little chatige fiem the itomach, after being detained there for te hours. By this means, therefore, their acidity is greatly increafed. Hence oil and pepper, the condiments commonly employed, are very ufficul to check their fermentation. We have lately ufed another condiment, vis. the finin, which is bitter, and may therefore fupply the place of aromatics; but flould ouly be wed when young.

Befiles the abure mentioned fpecies which are proper for the table, chis genus affords alfo two articies for the materia medica.

1. The claterium of the thops, is the infpiffed fiecula of the juice of a kind of wild cucumber, called allo the arfs's cucumber. It comes to this country from Spain and the fonthern parts of France, where the plant is very common. It is brought to us in fmall llat whitith humps or cakes that are dry, and break eafily between the fingers. It is of an aerid, bitter, and naufeous talt, and has a ftrong offenfive fmell when newly made: but thefe, as well as its other qualities, it lofes after being kept fome time. Elateriun is a very violent purge and vomit, and is now very feldom ufed. The plant is eommonly called $f_{1}$ irting cucumber, from its cafting ont its feeds with great violence, together with the vifcid juice in which they are lodged, if touched when ripe; from this circunftance it has obtained the appellation of noli me tangere, or " touch me not."
2. The colocynthis, the colocynth, coloquintida, or bitter apple of the fhops, is brought to us from Aleppo and the ifland of Crete. The leaves of the plant are large, placed alternate, almoft romut, and fland upon foottalks four inches long. The flowers are white; and are fucceeded hy a fruit of the gourd kind, of the fize of a large apple, and which is yellow when ripe. The fhelly or hulky outfide inclufes a bitter pulp inicrfperfed with flattifh feeds. If a hole is made in one of thefe ripe gourds, and a glafs of rum poured in, and fufiered to remain $2+$ hours, it proves a powerful purgative. The pulp itfelf dried and yowdered is commonly ufed as a purgative in this country, but is one of the moft drattie and difagreeable we know. If taken in a large dofe, it not only often brings away blood, but produces colics, convalions, uleers in the bowels, and fatal fuper-purgations. The molt effectual corrector of thefe virulemt qualities is to triturate it fincly with fugar or fweet almonds.

CUCURBIT, the name of a chemical veffel employed in dillillation, when eovered with its head. Its name comes from its lengthened thape, by which it refembles a gourd: fome cucurbits, lowever, are fhatlow, and wide-mouthed. They are made of copper, tin, glafs, and ftome-ware, according to the nature of the fubftances to be dillilled. A cucurbit, provided with its capital, conititutcs the veflel for diftillation called an oflentic.

CUCURBITA, the Gourd, and Pompiox: A genus of the fy ngenefia order, belonging to the moncecia clafis of flants; and in the oatural method ranking under the $34^{\text {th }}$ order, Cuturtinuce, The caly x of the mate is quinquedentated; the corolla quinquefid; the filaments three. 'The calyx of the fimale is quinquedentated ; the corolla quiaquetid; the pillii quinquetid; the fects of the aptle with a tumid margin. There are five fpecies.

1. The lagenaria, or bottle gourd, rifes with thick trailing downy thalks, branching into many fpreading rumers. Thicle extend alung the ground fometmes 15 or 20 feet in length. The leaves ane large, roundin, heart-lhaped, indented, and woully. The flowers are large and white, fucceeded by fong incurvated whitio yellow fiuit, ubtainng from about two to five or lix fect in length, and from about nine to 24 inche; in ciremmerence, having a ligncons and durable thell.
2. The papo or pompion, commonly called pump-

II
Cucurbien.

## C U C

Cucarbita kin, hath ftrong, trailing, rough ftalks, branching into numerous runners. Thefe are much larger than the former, extending from 10 to 40 or 50 feet each way. Thefe are gannithed with large, roundifh, lobated, rough laves, and yellow lowers. The flowers are fuccecded by large, round, fmooth fruit, of different forms and fizes; fome as big as a peck, others as big as half a buftel mealure; fome confiderably lefs, and others not exceeding the bulk of an orange; ripening to a yellow, and fometimes to a whitih colour. This fpecies is the mof hardy of any, as well as the moft extenfive in their growth. A fingle plant, if properly encouraged, will overfpread ro or 15 roods of ground, and produce a great number of fruit, which, when young, are generally a mixture between a deep blue and pale white, but change as they increale in bulk.
3. The verrucofa, or warted gourd, hath trailing Atalks very branchy, and running upon the ground 10 or I; feet each way ; large lohated leaves, and yellow flowers, fucceeded by roundifh, knobby, warted white fruit, of moderate fize.
4. The melopepo, erect gourd, or fquafh. This rifes with an erect flong falk feveral feet high, rarely feading forth fide-runners, but becoming bufty upward. It is adorned with large lobated leaves; and the flowers are fucceeded by depreffed knotty fruit, both white and yellow, commonly of a moderate fize.
5. The lignofa, ligneous thelled gourd, often called calabafh. This hath trailing ftalks, branching into runners, which extend far every way; the leaves are large, lobated, and rough ; the Howers yellow, and are fricceeded by roundifh fmooth fiuit of a moderate fize, with hard woody thelis. Of all thefe fecies there are a great many varieties, and the fruit of evecy feceics is obferved to he furprifingly apt to change its form.

Cilture. All the fpecies of gourds and pompions, with their refpective varieties, are raifed from feed fown annually in April or the begiming of May, either with or without the help of artificial heat. But the plants forwarded in a hot-bed till about a month old, produce fruit a month or lix weeks earlier on that account, and ripen proportionably fooner. The firt fpecies particularly will fcarce ever produce telerably fized fruit in this country without the treatment abuve mentioned.

UJis. In this country there plants are cultivated only for curiofity; but in the places where they are natives, they anfiver many important purpofes. In both the Indies, botle-gourds are very commonly cultivated and fold in the markets. They make the principal food of the common people, particularly in the warm months of June, July, and Angult. The Arabians call this kind of gourd charadh. It grows commonly on the nountaius in thele defarts. The natives boil and feafon it with vinegar; and fometimes, flling the fhell with rice and meat, make a kind of puding of it. The lard mell is ufed for holding water, and fome of them are capacions nough to contain 22 gallons; thefe, however, are very uncom. mon. The fruit of the ponpion likewife condlitutes a great part of the food of the common people during the hot monehs, in thofe places where they grow. if gathered when not much bigger than a hen or goofe tgg, and properly feafoned with butter, vincgar, âe.
they make a tolerable good fauce for butcher's meat, Cucurbitaand are alfo ufed in foups. In Eogland they are feldom ufed till grown to maurity. A hole is thon made in one fide, through which the palp, is feooped out ; after being divefted of the feeds, it is mixed with hiced apples, milk, fugar, and grated nutmeg, and thus a kind of pudding is made. The whole is then baked in the oven, and goes hy the name of a pumtin tyye. For this purpofe the plants are cultivated in many places of England by the country people, who mife them upon old dung hills. The third fpecies is alfo ufed in Nurth: America for culinary purpofes. The furit is gathered when about half grown, boiled, and caten as fance to butcher's meat. The fqualies are alfo treated in the fame manner, and by fome people eileemed delicate eating.

CUCURBITACEIE, the name of the 34 th order in Limurus's fragments of a nataral method, confilting of plauts which refemble the gourd in external ligure, habit, virtues, and fenfible qualities. This order comtains the following gener2, viL. gronovia, melothria, pafiffora, anguria, bryonia, cucumis, cucurbita, fevillea, momordica, ficyos, trichofanthes.

CUCURUCU, in zoology, the name of a ferpent found in America, growing 10 or 12 feet long. It is alfo very thick in proportion to its length, and is of a yellowith colunr, it rougly variegated with black fouts, which are irregularly mixed among the yellow, and often have fpots of yellow within them. It is a very poifonous fpecies, and greatly dreaded by the natives; but its fleth is a very rich food, and much efteemed among them, when properly prepared.

CUD, fometimes means the infide of the throat in beafts; but generally the food that they keep there, and chew over again. Sce Comparative folatomy, $n^{\circ} 92-94$.

CUDDALORE, a town on the coaft of Coromandel in India, belonging to the Englifh, very near the place where Fort St David once Rood. N. Lat. I I 30. E. Long. 79. 53.30. This place was reduced by the French in the year 1781; and in 1783 underwent a fevere fiege by the Britifh forces commanded by Ge neral Stuart. At this time it was become the principal place of arms lield by the enemy on that coatt: they had exerted themfelves to the utmoft in fortifying it ; and it was garrifoned by a numerous body of the beft forces of France, well provided with artillery, and every thing neceffary for making a vigorous defence.

Previous to the commenerment of the fiege, they had conftructed frong lines of defence all along the fort, excepting one place where the town was covered by a wood, fuppofed to be inaccuffible. Thaugh this wood, however, General Stuan hegan to cut his way ; on which the befieged begar to draw a line of fortitication within that affo. The Britif commander then determined to attack thefe fortifications beforc they were quite completed; and fur this purpofe a vigorous attack was made by the troons under Gentral Bruce, The grenadiers affailed a redoubt which greatly annoyed them, but were obliged to ratire ; on which the whule army advanced to the attack of the lines. The French defended themfelves with refolution; and as buth parties charged each other with fixed bayoncts, a deadful laughter enfued. At laft the Britihn were obliged

## C U D [ 600 ] C U D

Cudiore ebliged to retreat ; but the French having imprudent. ly come out of their lines to purfue them, were in their turn defeated, and obliged to give up the lines they had couftructed with fo much pains and fo gallantly defended. The lofs on the part of the Britifh amounted to near 1000 killed and wounded, one half of whom were Europeans; and that of the French was not lefs than 600 .

Though the Britifh proved vieterions in this contaf. yet the victory coft fo dear that there was not now a fufficient number to carry on the fiege with any effect. The troops alfo became fickly; and their Atrength diminified fo mueh, that the befieged formed a detign of not only obliging them to raife the fiege, but of totally deftroying them. For this purpofe 4000 men was landed from the fquadron commanded by M. Suffein; and the conduct of the enterprife comnitied to the Chevalier de Damas, an experienced and valiant offiecr. On the 25 th of June 1783 , he fallied out at the head of the regiment of Aquitaiae, fuppofed to be one of the beft in the Frencl fervice, and of which he was colond; with other troops felected from the bravelt of the garrifon. The attack was made by day-break; but though the Britifh were at fritt put into fome diforder, they quichly recovered themfelves, and not only repulfed the canchy, but purfued them fo warmly, that the Chevalier de Danas himfelf was killed with about 200 of his countrymen, and as many taken prifoners.

This engagement was attended with one of the mof remarkable citcumfances that happened during the whole war, viz. A corps of Sepoy grenadiers encountering the French troops oppofed to then with fixed bayonets, and owereoning them. This extraor. dinary bravery was not only noticed with due applaufe, but procined for that corps a provifion for thimfelves and families from the pretidencies to which they belonged. No other operation of any confequence took place during the fiege, which was now foon ended by the uews of peace having taken place between the belligerent powers of Europe.
CUDDY, in a firt-rate man of war, is a place lying between the eaptain lieutenant's cabin and the quarter-deck; and divided into partitions for the mafler and other officers. It denotes alfo a kind of cabin near the ftern of a lighter or barge of burden.

> CUDIVEED, in botany: See Gvaphalium.

CUDWORTH (Ralph), a very l-arned divine of the chorch of England in the F , th century. In January 1557 he was one of the perfons nominated by a comenittee of the parliament to be confulted about the Engith trandation of the Bible. In $16-8$ he publifhed his Frue Intellitual Sy? en of the Unizerfe; a work which met with great orpoftion. He likwife publifhed a tratife, intitled, Deus juflificatus: or, "The divine goodnefs of God vindicated, ayamit the anfertions of ab lite and unconditionate reprobation." He cmbared the mechanical or corpufeular philofophy: but with refrard to the Deity, fprsits, gonii, and ideas, he fullowed the Platonitts. Ife died at Cambridge in 1588. The editor of the new cdition of the Biographat Britamica obteres.s. that it is not eafy to mect with a greater Aore-houfe of ancient literature than the "Intellectual Syftem;" and various writers, we belie:e, have been indebted to it fur an appearance of
learning which they might not otherwife have been Cudwort able to maintain. That Dr Cudworth was fanciful in fome of his opinions, and that he was too devoted a follower of Plato and the Platonifts, will farcely be denied even by thofe who are moll fenfible of his general merit. The reflections that have been eat uponfuch a man as the author, by bigotted writers, are altogether contemptible. It is the lot of diftinguifhed merit to be thus treated. Lurd Shaftefoury, fpeaking on this fubject, has riven an honourable tellimuny to the memory of Dr Cudworth. "You know (fays his lordflip) the common fate of thofe who dare to appear fair authors. What was that pious and learned man's cafe, who wrote the Intellectual Sytem of the Univerfe? I confefs it was pleatant enough to contider, that though the whole world were no leif fatisfied with his capaeity and learning, than with his fincerity in the caufe of Deity; yet he was accufed of giving the upper hand to the Atheift, for having only ftated their reaions, and thofe of their adverfaries, fain ly together."
It is ubferved by Dr Birch, that Dr Cudworth's Intelicctual Syltern of the Univerfe has raifed him a reputation, to which nothing can add but the publieation of his other writiugs tlill extant in manufeript. That thefe writings are very valuable eannot be doubted. We may be affured that they difplay a great compafs of fentiment and a great extent of learning. Neverthelefs, from their voluminous quantity, from the abdrufenefs of the fubjects they treat upon, and from the revolutions of literary tafte and opinion, it is no. rally certain that the publication of them would not be fucceffful in the prefent age. Mr Cudworth's daughter Danaris, who married Sir Francis Mafam of Oates in Effex, was a lady of genius and larning: fhe had a great friendihip for Mr Locke, who reficed feveral years at her houfe at Oates, where he died in $170+$.
CUE, an item or innuendo, given $t 0$ the act 1 , on the Atage what or when to ipeak. See Prompter.
CUENZA, a town of Spaiu, in Now Cattit, and in the territory of the Sierra, with a bihop's fee. It was taken by Lord Peterborough in 1706, but retaken by the Duke of Berwick. It is feated on the fiver Xuear, in W. Long. 1. 45. N. Lat. 40. 10.

CUERENHERT (Theodore Van), a very extraordinary perfon, was a native of Amfterdam, where he was born in 1522 . It appears, that early in life he travelled into Spain and Purtugal ; but the mutives of liis journey are not afeertained. He was a man of fcience, and, according to report, a good poet. The filter arts at firt he confidered as an amufement only ; but in the end he was, it feems, obliged to have recourle to engraving alone for his fupport. And though the different fludies in which he employed his time prevented his attachinent to this profetlion being fo clofe as it cught to have been, yet at lait the marks of genius are difcovetable in his works. They are night, and baftily executed with the graver alonc ; but in an open earelefs Ayle, fo as geatly to refemble defigns made with a pen. Ho wes eflabilihed at Haerlen; and there purfuing liis favourite ftudies in literature, he learned Latin, and was macie fecretary to that town, from whence he was fent feveral times as anbalifador to the Prince of Orange, to whom he addreffed a famous maniffto, which that prince publifhed

Cuerpo, in 566 . Had he flopped leere, it had been well Cuff. but directing his thoughts into a different channel, he undertook an argument as dangerous as it was abfurd. He maintained, that all religious communications were corrupted; and that, without a fupernatural miffion, accompanied with miracles, no perfon had a right to adminifter in any religious office: he therefore pronounced that man to be unwortiyy the name of a Chrittian who would enter any place of public worfhip. This he not only advanced in words, but flrove to fhow the fincerity of his belief by practice; and for that reafon would not communicate with either Proteftant or Papitt. His works were publifhed in three volumes folio in 1630 ; and though he was feveral times imprifoned, and at laft fentenced to banifhment, yet he does not appear to have altered his fentiments. He died at Dergoude in 1590 , aged 68 years. It is no fmall addition to the honour of this fingular man, that he was the inftructor of that juftly celebrated artift Henry Goltzius. Cuerenhert worked conjointly with the Galles and other artills, from the defigns of Martin Hemkerck. The fubjects are from the Old and New Teftament, aud confilt chiefly of middling-fized plates lengthwife. He alfo engraved feveral fubjects from Franc. Floris.

CUERPO. To zualk in cuerpo, is a Spanih phrafe for going without a cloak; or without all the formalities of a full drefs.
CUFF (Henry), the unfortunate fecretary of the unfortunate earl of Effex, was born at Hinton St George in Somerfethire, about the year 1560 , of a genteel family, who were poffelfed of confiderable ethates in that county. In 1576, he was entered of Trinity college Oxford; where he foon acquired contiderable reputation as a Grecian and difputant. He obtained a fellowhip in the above-mentioned college; but was afterwards expelled for fpeaking difrefpeetfully of the founder (A). He was, however, foon after admitted of Merton college; of which, in 1586, he was elected probationer, and in 1588 fellow. In this year he took the degree of matter of arts. Some time after he was elected Greek profeffor, and in $159+$ proctor of the univerfity. When he lef: Oxford is uncertain; nor are we better informed as to the means of his introduction to the earl of Effex. When that noblenran was made lord lieutenant of Ireland, Mr Cuff was appointed his fecretary, and continued intimately connected with his lordfhip until his confinement in the tower ; and he is generally fuppofed to have advifed thofe violent meafures which ended in their mortual deftruction. The earl indeed confffed as much before his exccution, and charged him to his face with being the author of all his misfortunes. Mr Cuff was tried for high-tiafon, convicted, and executed at Tyhurn on the 3 oth of March 560 . Lord Bacon, Sir Hemy Wutton, and Camden, fipeak of him in very harfh terms. He was certainly a man of learning and Vol. V. Part II.

## 6oi ] C U L

abilities. He wrote two books : the one intitled, The Differences of the Ages of Man's Life; the other, De Rebus Geflis in Sando Concilio Nicano. The firlt was publimed after his death; the fecond is ftill in manufeript.

CUJAS (James), in Latin Cujacitus, the beft civilian of his time, was born at Tonloufe, of obfeure parents, in 1520 . He learned polite literature and hifory; and acquired great knowledge in the ancient laws, which: he taught with extraordinary reputation at Toulonfe, Cahors, Bourges, and Valence, in Dauphiné. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him lingular marks of his efteem. Cujas aftes wards refufed very advantageous offers from Pope Gregory XlII. who was defirous of having him teacl at Bologna: but he chofe rather to fix at Bourges, where he had a prodigious number of fcholars; whom he not only took great pleafure in inftructing, but affifted with his fubftance, which occafroned his being called the Fatber of bis Scholars. He died at Bourges in 1590, aged 70. His works are in high efteem among civilians.

CUJAVA, a teritory of Great Poland, having on the north the duchy of Pruffia, on the weft the palatinate of Kalifk, on the fouth thofe of Licici and Rava, and on the welt that of Ploczko. It contains two palatinates, the chief towns of which are Inowloez and Breft; as alfo Uladillaw, the capital of the diftrict.

CUIRASSE, a piece of defenfive armour, made of iron plate, well hammered, ferving to cover the body, from the neck to the girdle, both before and behind. Sume derive the word, by corruption, from the Italian cuore, " heart;" becaufe it covers that part: others from the French cuir, or the Latin corium, " leather;" whence coriactous : becaufe defenfive arms were originally made of leather. The cuiraffe was not brought into ufe till abont the year 1300 , though they were known both to the ancient Greeks and Romans in different forms.

CUIRASSIERS, cavalry armed with cuiraffes, as molt of the Germans are: The French have a regiment of cuiraffiers ; but we have had none in the Britifh army fince the revolution.

CULDEES, in church-hiftory, a fort of monkil priefts, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercites of preaching and praying, they were called, by way of eminence, cultores $D_{t} i$; from whence is derived the word culdees. They made choice of one of their own fratemity to be their fpiritual head, who was afterwands called the Scots bi/hop.

CULEMBACH, a difrict or marquifate of the circle of Franconia, in Germany. It is bounded on the weft by the bihopric of Bamberg; on the fonth by the territory of Nuremberg; on the eaft by the palatinate of Bavaria and Bohemia; and on the north by Voight-
(a) The founder of Trinity college was Sir Thomas Pope, who, it feems, would often take a piece of plate from a friend's houfe, and carry it lome concealed under his gown; out of fun, no doubt. Cuff, being merry with fome of his acquaintance at another college, happened to fay, alluding to Sir Thomas Pope's ofual joke above mentioned, "A pox on this beggarly houfe! why, our founder flole as much plate as would build fuch another." This piece of wit was the caufe of his expulfion. The heads of colleges in thofe days die vot underftand humour. Anthony Wood was told thets flory by Dr Bathurf,

## C U L [ 602 ] C U L

©ulembach, land and part of the circle of Upper Saxony. It is Culcx. about 50 miles in length from north to fouth, and 30 in breadth from ealt to weft. It is full of forells and high mountains; the moft conliderable of the latter are thofe of Frichtelberg, all of then covered with pinetrees. Here are the fources of four large rivers, the Maine, the Sala, the Eger, and the Nab. This marquifate is the upper part of the burgraviate of Nu . remberg.

Culembach, a town of Germany, in Franconia, the capital of the marquifate of the fame nane. It has good fortifications, and is feated at the confluence of two branches of the river Maine. It was pillaged and burnt by the Huflites in 1430 , and by the inhabitants of Nuremberg in 1573. E. Long. 11. 28. N. Lat. 50.12.

CULLEUS, in Roman antiquity, the largelt meafure of capacity for things liquid, containing 20 amphore, or 40 urnz. It contained $\mathrm{t}+3$ gallons 3 pints, Englih wine-meafure; and was 11.005 folid inches.

CULEX, the GNat; a genus of infects belonging to the order of diptera. The mouth is formed by a flexible theath, inclofing brittles pointed like ftings. Plate CLI. The antenne of the males are filiform; thofe of the females feathered. There are feven fpecies. Thefe infects, too well known by the fevere punctures they inflict, and the itchings thence arifing, afford a mot interefting hiftory. Before they turn to flying infects, they have been in fome manner tifhes, under two difBarbut's $G_{c_{-}}$ferent forms. You may obferve in ftagnating waters, ncra of $1 n$ - from the beginning of May till winter, finall grubs fechs.
containing five or fix fpicula of exquifite minutenef ; fome dentated at their extremity like the head of an arrow, others tharp-edged like razors. Thefe fpicula introduced into the veins, act as pump-fuckers, into which the blood afcends by reafon of the fmallnefs of the capillary tubes. The infect injects a fmall quantity of liquor into the wound, by which the blood becomes more foid, and is feen throurl the microfeope paffing through thofe fpicula. The animal fwells, grows red, and does not quit its hold till it has gorged itfelf. The liquor it has injected caufes by its fermenting that difagreeable itching which we experience; and which may be removed by volatile alkali, or by feratching the part newly Itung, and walhing it with cold water; for later, the venom ferments, and you would only increafe the tumor and the itching. Rubbing one's felf at night with fuller's-earth and water, leffens the pain and inflammation. Gnats perform their copulation in the air. The female depolites her eggs on the water; by the help of her moveable hinder part and her legs, placing them one by the fide of another in the form of a little boat. This veffel, compofed of two or three hundred eggs, fwims on the water for two or three days, after which they are hatched. If a ftorm arifes, the boats are funk. Every month there is a frefh progeny of thefe infects. Were they not devoured by fwallows, other birds, and by feveral carnivorous infects, the air would be darkened by them.

Gnats in this country, however troublefome they may be, do not make us feel them fo feverely as the mulketo-flies (culex pipiens) do in foreign parts. In the day-time or at night thefe come into the loonfes; and when the people are gone to bed they begin their difagreeable humming, approach always nearer to the bed, and at laft fuck up fo much blood that they can hardly fly away. Their bite caufes blillers in people of a delicate complection. When the weather has been cool for fome days, the mufquetoes difappear; but when it changes again, and efpecially after a rain, they gather frequently in fuch quantities about the houfes, that their numbers are altonifhing. In fultry evenings they accompany the cattle in great fiwarms, from the woods to the houfes or to town; and when they are driven before the houfes, the gnats fly in whereever they ean." In the greatelt heat of fummer, they are fo numerous in fome places, that the air feems to be quite full of them, efpecially near fwamps and ftagnate waters, fuch as the river Morris in New Jerfey. The inhabitants therefore make a fire before their houfes to expel thefe difagreeable guelts by the fmoke.

CULIACAN, a province of North America, in the audience of Guadalajara. It is bounded on the north by New Mexico, on the eaft by New Bifeay and the Zacatecas, on the fouth by Chiametlan, and on the welt by the fea. It is a fruitful country, and has rich mines.

CULLIAGE, a barbarous and immoral practiee, whereby the lords of manors aneiently affumed a right to the firft night of their valfals brides.

CULLEN, a parliament-town in Seotland, fituated on the fea-coaft of Banff-thire. W. Long. 2. 12. and N. Lat. 57.38 .

CULLODEN, a place in Seotland within two miles of Invernefs, chiefly remarkable for a complete

## C U L [ 603 ] G U L

victory gained over the rebels on the 16 th of April 1746. That day the royal army, commanded by the late Duke of Cumberland, began their march from Nairn, formed into five lines of three battalions each; headed by Major-greneral Huke on the left, Lord Sempill on the night, and Brigadier Mordaunt in the centre ; flanked by the horfe under the Generals Lawley and Bland, who at the fame time covered the cannon on the right and lfft . In this order they marehed about eight mivles, when a detachment of Kingiton's horfe, and of the Highlanders, having advanced before the relt of the arny, difcovered the van of the rebels commanded by the young pretender. Both armies immediately formed in the order and numbers nown in the annexed folleme.

About two in the afternoon the rebels began to cannonade the king's army: but their artillery being ill ferved, did little execution; while the fise from their enemies was feverely felt, and occafioned great diforder. The rebels then made a puth at the right of the rojal army, in order to draw the troops forward; but finding themfelves diappointed, they turned their whole force on the left ; falling chicfly on Barrell's and Monro's regiments, where they attempted to flank the king's front-line. But this defign alfo was in the mean time the cannon kept playing upon them Culiose 1. with cartridge-fiot. General Hawley, with fome High. landers, had opened a paftage through fome ftonewalls to the right for the horfe which advanced on that fide ; while the horfe on the king's right wheeled off upon their left, difperfed their body of referve, and met in the centre of their front-line in their rear; when being repulfed in the front, and great numbers of them cut off, the rebels fell into very great confufion. A dreadful carnage was made by the cavalry on their backs; however, fome part of the foot ftilf preferved their order: but the Kington's honfe, from the referve, galloped up brikkly, and falling on the fugritives, did terrible execution. A total defeat inftantly took place, with the lofs of 2500 killed, wound. ed, and prifoners, on the part of the rebels; while the royalifls loft not above 200 . The young pretender had his horfe thot under him during the engagement; and after the battle retired to the houfe of a fackor of Lord Lovat, about ten miles from Invernefs, where he ftaid that night. Next day he fet out for Fort-Auguflus, from whence he purfued his journey through wild defarts with great difficulty and diftrefs, till at laft he fafely reached France, as related under the article BRו. rain, $11{ }^{\circ} 423$. defeated by the advancing of Wolfe's regiment, while

culm CULM, or Culmus, among botanits, a fraw or haulm; defined by Linnreus to be the proper trunk of the graffes, which elevates the leaves, flower, and fruit.

This fort of trunk is tubular or hollow, and has frequently knots or joints diftributed at proper diftances through its whole length. The leaves are long, fleek, and placed either near the roots in great numbers, or proceed fingly from the different joints of the falk, which they embrace at the bafe, like a theath or glove.

The haulm is commonly garnifhed with leaves: fometinnes, howerer, it is naked; that is, devoid of leaves, as in a few fpecies of cyprefs-grafs. Moit graffes have a round cylindrical falk; in fome fpecies of fchœonus, fcirpus, cyprefs-grafs, and others, it is triangular.

The talk is fometimes entire, that is, has no branches; fometimes branching, as in fohenus aculcatus 8 capenfis; and not feldom confits of a number of feales, which lie over each other like tiles.

Laftly, in a few graffes, the ftalk is not interrupted with joints, as in the greater part. The fpacc contained betwixt every two knots or joints, is termed by botanifts internodium, and ariculus cutmi.

This fpecies of trunk often affords certain marks of diftinction, in diferiminating the fpecies. Thus in the genus eriocaulon, the fpecies are fcarce to be diflinoguifled but by the angles of the culmus or ftalks. Thefe in fome fpecies are in number 5 , in others 6 , and in others 10.

CULMIFEROUS plants, (from culmus, a fraw or haulm ): plants fo called, which have a finooth jointed ftalk, ufually hollow, and wrapped about at each joint with fingle, narrow, hlarp-pointed leaves, and the feeds contained in chaffy hufks; fuch are oats, wheat, barley, rye, and the other plants of the natural family of the grasses.

CULMINATION, in aftronomy, the paffage of any heavenly body over the meridian, or its greateft alitude for that day.

CULPRIT, a term ufed by the clerk of the arraignments, when a perfon is indicted for a criminal matter. See Plest to Inditinent, par. I'.

CULROSS, a parliament town in Scotland, fituated on the river Forth, about 23 miles north-welt of Edinburgh. Here is a magnificent houfe with 13 windows in front, built about the year 1590 by Edward Lord Kinlofs, better known in England by the name of Lord Bruce, flain in the noted duel between him and Sir Edward Sackville. Some poor remains of the Ciftercian abbey are fill to be feen here, founded by Malcolm earl of Eife in 1217. The church was jointly dedicated to the Virgin and St Serf confeffor. The revenue at the diffolution was 768 pounds $S$ cots, beffdes the rents yaid in kind. The number of monks, exclufive of the abbot, were nine. W. Long. 3. 34 . N. Lat. 56.8.

CULVERIN, a long flender piece of ordance or artillery, ferving to carry a ball to a great diftance. Manege derives the word from the Latin colubrina; others from coluber, "fnake;" either on account of the length and flendernefs of the piece or of the ravages it makes.

There are three kinds of culverins, viz. the extra-
ordinary, the ordinary, and the leat fized. I. The Culverta culverin extraordinary has $5 \frac{1}{2}$ inches bore; its length 32 calibers, or 13 fect; weighs 4800 pounds; its load above 12 pounds; carries a flot $5 \frac{\pi}{\text { P }}$ inches diameter, weighing 20 pounds weight 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces ; caliber $5^{\frac{1}{2}}$ inches; its weight 4500 pounds. 3. The culverin of the leaft fize, has its diameter 5 inches; is 12 feet long; weighing about 4000 pounds; carries a hot $3 \frac{3}{4}$ inches diameter, weighing 14 pounds 9 ounces.

CULVERTAILED, among hipwrights, fignifies the faltening or letting of one timber into another, fo that they camot flip out, as the corlings into the beams of a hip.

CUMA, or CUnte (anc. geog.), a town of ※olia in Alia Minor. The inhabitants have been accufed of ftupidity for not laying a tax upon all the goods which entered their harbour during 300 years. They were called Cumani.

CUMEX, or Cuma (anc. geog.), a city of Campamia near Puteoli founded by a colony from Chalcis and Cuma of Æolia before the Trojan war. The inhabitants were called Cumai. One of the Sibyls fixed her refidence in a cave in the neighbourhood, and was called the Cumean Sibyl.

CUMberland, Cumbria, fo denominated from the Cumbri or Britons who inhabited it; one of the moit northerly counties in England. It was formerly a kingdom extending from the vallum of Adrian to the city of Dumbritton, now Dumbarton, on the frith of Clyde in Scotland. At prefent it is a county of England, which gives the title of duke to one of the royal family, and fends $\mathfrak{t w o}$ members to parliament. It is bounded on the north and north-weft by Scotland ; on the fouth and fouth-eaft by part of Lancahiire and Weftmoreland ; it borders on the ealt with Northumberland and Durham; and on the well is wanhed by the Irifh fea. The length from north to fouth may amount to 55 miles, but the breadth does. not exceed 40. It is well watered with rivers, lakts , and fountains; but none of its ftreams are navigable. In fome places there are very high mountains. The air is keen and piercing on thefe mountains towards the north; and the climate is moilt, as in all hilly countries. The foil varies with the face of the country; being barren on the moors and mountains, but fertile in the valleys and level ground bordering on the fea. In general the ealtern parts of the fhire are barren and defolate; yet even the leaft fertile parts are rich in metals and minerals. The mountains of Copland abound with copper: veins of the fame metal, with a mixture of gold and filver, were found in the reign of queen Elizabeth among the fells of Derwent; and royal mines were formerly wrought at Kefwick. The county produces great quantities of coal, fome lead, abundance of the mineral earth called black-lead, feveral mines of lapis calaminaris; and an inconfiderable pearl-fifhery on the coaft near Ravenglafs.

Cunberland (Richard), a very learned Englifh divine in the latter cud of the 17 th century, was fon. of a citizen of London, asd educated at Cambridge. In 1672, he publifhed his excellent Treatife of the Laws of Nature; and in 1686, An Effay toward the

Jewilb

## C U N <br> 605 C IT N

Cuminum Jewifh Weights and Meafures. After the revolution 11 he was nominated by king William to the bifhepric Cunculus. of Peterborough, without the leait folicitation on his part. He purfued his itudies to the latt; and the world is obliged to him for clearing up feveral difficulties in hiftory, chronology, and phitofophy. After the age of 83, he applied himfelf to the ttudy of the Coptic language, of which he made himfelf matter. He was as remarkable for humility of mud, benceolence of temper, and imocence of life, as for his extenGive learning. He died in 1718 .

CUAINUM, cumin: A genus of the digynia order, belonging to the pentandria chafs of plants; and in the natural method ranking under the 45 th order, Umbellatia. The fruit is ovate and Ariated; there are four partial unibels, and the involucra are quadrifid. There is but one ipecies, viz the cyminum. It is an anmal phomt, perifhing foon after the feed is ripe It rifes 9 or to inches high in the warm countrics where it is cultivatecl; but feldom rifes above four in this country. It has fometimes flowered very well here, but never brings its feeds to perfection. The leaves are divided into long narrow fegments, like thofe of fenmel, but much fmather: they are of a deep green, and generally turned backward at their extremity: the flowers grow in fnall umbcla at the top of the flalks: they are compofed of tive unequal petals, of a pale bluifl colour, which are fucceeded by long, chamelled, aromatic feeds. The plant is propagated for fale in the iflind of Malta. In this country the feeds muit be fown in fnall pots, and plunged in a very morkrate hot-bed to bring up the plants. Thiefe, aiter having bcen gradually inured to the open air, turned out of the pots, and planted in a warm border of good earth, preferving the balls of earth to their roots, will flower pretty well, and may perhaps even perfect a few feeds in warm feafuns. Thefe feeds have a bitterifh warm tafte, accompanied with an aromatic flavour, not of the moft agreeable kind. They are accounted good carminatives; but not very often made ufe of. An effential oil of them is kept in the thops.

CUNFUS (Peter), born in Zealand, in 3586 , was diftinguifhed by his knowledge in the learned languages, and his fkill in the Jewith antiquities. He alfo fludied law, which he taught at Leyden, in 615 ; and read politics there till his death, in 1638 . His principal work is a treatife, in Latin, on the republic of the Hebrews.

CUNEIFORM, in general, an appellation given to whatever refembles a wedge

Cunejform-Bone, in anatomy, the feventh bonc of the cranium, called alfo os bafilare, and os jpheraides. See Anatomy, ni 16.

CUNEUS, in antiquity, a company of infantry drawn up in form of a wedge, the better to break through the enemy's ranks.
CUNICULUS, in zoology. See Lepus.
Cuniculus, in mining, a term uled by authors in diftinction from puteus, to exprefs the feveral forts of paffages and cuts in thefe fubterranean works. The curiculi are thofe direct paflages in mines where tbey walk on horizontally; but the putei are the perpendicular cuts or defcents. The miners in Germany call thefe by the mane follen, and fobachts; the firf word
experfing the horizontal, and the fcond the perpendicular cuts.

CUNHLA, in botany: A genus of the monogynia order, belonging to the monandria clafs of plants; and in the natural method ranking under the the 42.1 order, $l^{\text {rericillatit. }}$ The corolla is ringent, with its upper lip crect and plane; there are two filamenta, callrated, or wanting antherx; the feeds are four. 'There are three fpecies, none of which has any remarkable property.
CUNINA, in mythology, a goddcifs who had the care of little children.
CUNITZ (Mary), one of the greatell geniufes in the 16 th century, was born in silefia. She learned languages with amazing facility; and undertood Polifh, German, French, Italian, Latin, Greek, and Hebrew. She attained a knowledge of the fcicuces with equal eafe: the was fkilled in hiftory, phyfic, poctry, painting, mofic, and playing upon inftruments; and yet thefe were only an amufement. She more particularly applicd herfelf to the mathematics, and efpecially to aftronomy, which the made her principal itedy, and was ranked in the number of the moft able attronomers of her time. Her Aftronomical Tables acquired her a prodigious reputation: fle printed them in Latin and German, and dedicated them to the emperor Ferdinand 111. She married Elias de Lewin, M. 1).; and died at Pittehen, in 166

CUNNINGHAM, one of the four bailiwicks in Scotland: and one of tbe three into which the thire of Air is fubdivided. It hies north.ealt of Kyle. Its chief town is Irvin.

Cunningamm (Alexander), author of a Hiftory of Great Britain from the revolution to the acceflion of George I. was born in the fouth of Scotland about the year 1654 , in the regency of Oliver Cromwcll. His father was miniter at Ettrick, in the prefbytery and thire of Selkirk. He was educated, as was the cuftom among the Scottiih prefbyterian gentlemen of thofe times, in Holland; where he imbibed his principles of government, and lived much with the Englifh and Scots refugees at the Hague before the revolution, particulaly with the earls of Argyle and Sundenland. He came over to England with the prince of Orange, and enjoyed the confidence and intimacy of many leading men among the whig party, that is, the friends and abettors of king Willian and the revolution. He was employed, at different times, in the character of a travelling companion or tutor; firft, to the earl of Hyndford, and his brothe: Mr William Carmichacl, folicitor general, in the reign of queen Anne, for Scotland ; fecondly, with the lord Lorne, afterwards fo well known under the nane of Golm duke of Argyle ; and thirdly, with the lord vifcount Lonfdale. In his travels, we find him, at the German courte, in company with the celebrated Mr Jofeph Addifon, whofe virtues he eelebrates, and whofe fortune, like that of our author, compelled him to
"A tra"lirg tutor to a fquire."

Lord Lorne, at the tine he was under the tuition of Mr Cumningham, though not feventeen years of age, was colonel of a regiment, which lis father, the earl

Cunnirg. of Argyle, laat raifed for his majely's ferviee in Flank.am.
of Argyle, with whom he had the honour of maintaining an intimacy as long as he lived, together with the opjortunities he enjoyed of learning, in his travels, what may be called military geography, naturally tended to qualify him for writing intelligibly on military affairs.

Mr Cunningham, both when he travelled with the nul!eman above mentioned, and on other oceations, was employed by the Englib minitry in tranfaitting fecret intelfigence to them on the molt important fubjefts. He was alfo, on fundry occafions, employed by the generals of the confedcrate armies, to earry intellipenee, and to make reprefentations to the court of Britain. In Catlares's State-papers, publifhed by Dr Macormick principal of the united college of St Andrew's in $177+$, there are two letters from on author, dated Paris the 22d and 26th of Auguft 1701, giving anl account of his conferences with the marquis de Torey, the French miniter, relative to the Scots trade with France. This commercial negociation, from the tenor of Cunningham's letters compared with has hifury, appears to have been the only oltenfible object of his attention; for he fent an exact account to king William, with whom he was perfonally aconainted, of the military prepatations throughout all France.

Mr Cunningham's political friends, Argyle, Sunderland, Sir Robert Walpole, \&ee. on the acceffion of George I. fent him as Britih envoy to the republic of Venice. He arived in that city in 1715 ; and continued there, in the character of refident, till the year 1720, when he returned again to London. He lived many years after, which he feems chicfly to have paffed in a ltudious retirement. In 1735, he was vifited in London by lord Hyndford, by the direction of his lordhip's father, to whom he had been tutor, when he appeared to be very old. He feems to have lived about two years after; for the body of an Alexander Cunningham lies interred in the vicar chancel of St Martin's church, who died in the 83 d year of his age, on the 15th day of May 1737; and who was probably the fame perfon.

His "Hintory of Great Britain, from the revolution in 1688 to the aceeffion of George f." was publifhed in two volumes 4 to, in 1787 . It was written by Mr Cunningham in Latin, but was tranflated into Englin by the reverend William Thomfon, L. L. D. "The original manufeript came into the poffeffion of the reverend Dr Hollingberry, archdeacon of Chichefter, fome of whofe relations had been connected with the author. He commanicated it to the earl of Hardwicke, and to the reverend Dr Douglas now' bifhop of Carlifle, both of whom recommended the publication. In a fhort preface to the work, the archdeacon fays, " My hirt defign was to have produced it in the original ; but knowing how few are fufficiently learned to undertand, and how many are indifpofed to read two quarto volumes in Latin, however interelting and entertaining the fubject may be, I altered my purpofe, and intended to have fent it into the world in a tranflation. A nervous fever depriving me of the power, deffated the feheme." But he afterwards transferred the undertaking to Dr Thomfon; and Dr Holling-
berry obferves, that Dr Thomfon "has expreffed the Cunning. fenfe of the author with fidelity." 'The work was unduubtedly well deferving of publication. It contains the hiftory of a very interefting period, written by a man who had a confiderable degree of autheutic information, and his book contains many curious particulars nist to be found in other liitories. His chiracters ate often drawn with judgment and impartiality: at other tines they are formewhat tinctured with prejudice. This is particularly the eafe with refpect to bilhop Burnet, againft whon he appears to have conceived a itrong perfonal difike. But he was manifelly a very attentive obferver of the tranfuctions of hiis own time; his work contains many jull political remarks; and the facts which he relates are exhibited with great perfpicuity, and often with much animation. Throughout his book he frequently interfperfes iome accomint of the literature, and of the molt eminent perfons of the age concerning which he writes; and he has alfo adorned his work with many allufions to the claffies and to ancient hiftory.

Alexander Cunningham, the author of the hiftory of Great Britain, has been fuppofed to be the fame perfon with Alexander Cunniugham who publilhed an edition of Horace at the Hague, in two volumes 8 vo , in 1721 , which is highly elleemed. But from the beft information we have been able to collect, they were certainly different perfons; though they ware both of the fame name, lived at the fame time, had both been travelling tutors, were both faid to have beeneminent for their fkill at the game of chefs, and both lived to a very advanced age. The editor of Horace is generally faid to have died in Hollard, where he taught both the eivil and canon laws, and where he had collected a very large library, which was fold in that conntry.

CUNNUS, in anatomy, the pudendum muliebre, or the anterior parts of the genitals of a wonsan, including the lalia puldendi and mons veneris.
CUNOCEPHALI, in mythology, (from*var,"dog," and xet $\langle\lambda n$, "head,"), a kind of baboons, or animals with heads like thofe of dogs, which were wonderfully endowed, and were preferved with great veneration by the Egyptians in many of their temples. It is related, that by their affitance the Egyptians found out the particular periods of the fun and moon; and that one half of the animal was often buried, while the other half furvived; and that they could rcad and write. This Itrange hifory, Dr Bryant inagines, relates to the priefts of Egypt, Alyled saben, to the novices in their temples, and to the examinations they were obliged to undergo, before they could be admitted to the priefthood. The Egyptian colleges were fituated upon roeks or hills, called caph, and from their confecration to the fun, capb-el; whence the Greeks deduced $\times$ sq $\alpha \lambda$ r, and from caben capph-el they formed xuvox*qaros. So that caben-caph-el was fome royal feminary in Upper Egypt, whence they drafted novices to fupply their colleges and iemples. By this etymology he explains the above hiflory. The death of one part, while the other furvived, denoted the regular fucceffion of the Egyptian prietthood. The cunocephali are alfo found in India and other parts of the world. Thefe and the aceplali were thus denominated from their place of refidence and from their worthip.

CUNO-

## C U P [ 607 ] C U P

Cunodintes

CUNODONTES, a people mentioned by Solinus and Ilidorus, and by them fuppofed to have the teeth of dogs. They were probably denominated, fays Dr Bryant, from the object of their worlhip, the deity Chan-Adon, which the Greeks expreffed Finoosur, and thence ealled his votaries Cumolontes.

CUNONIA, in botany: A genus of the digyaila order, belonging to the decandria clafs of plants: and in the natural method ranking with thofe of which the order is doubtful. The corolla is pentapetalous; the calyx pentaphyllous; the capiule bilocular, accuminated, poly permous; the tyles longer than the flower.

CUOGOLO, in natural hitory, the name of a flone much ufed by the Venetians in glafs-making, and found in the iver Fefino. It is a fmall ftone of an impure white, of a fhattery texture, and is of the flape of a pebble.

CUP, a veffel of capacity of various forms and materials, chichly to drink out of. In the Ephem. German. we have a defeription of a cup made of a comnon pepper-com by Ofwald Neilinger, which holds 1200 other ivory cups, having cach its feveral handle, all gilt on the edges; with room for 400 more.
$\mathcal{C}_{u p}$ in botany. See Calyx.
Cup-Golls, in natural hitory, a name given by anthors to a very fingular kind of galls found on the leaves of the oak and fome other trees. They are of the figure of a cup, or drinking-glafs without its foot, being regular cones adhering hy their point or apex to the leaf; and the top or broad part is hollowed a little way, fo that it appears like a drinking-glafs with a cover, which was made fo finall as not to clofe it at the mouth, but fall a little way intoit. This eover is flat, and has in the centre e very fmall protuberance, refembling the nipple of a woman's breatt. This is of a pale green, as is alfo the whole of the grall, excepting only its rim that runs round the top: this is of a fcarlet colour, and that very beautiful. Befides this fpeeies of gall, the oak leaves furnifh us with feveral others, foone of which are ohlong, fome round, and others flatted; thefe are of varions fizes, and appear on the leaves at various feafons of the year. They all contain the worm of fome finall fly ; and this creature pafles all its changes in this its habitation, heing fometimes found in the worm, fomctimes in the nymph, and fometimes in the fly-ftate, in the cavity of it.

CUPANIA, in botany: A genus of the adelphia order, belonging to the monceria clafs of plants; and in the natural method ranking under the 38 th order, Tricocca. The calyx of the male is triphyllous; the corolla pentapetalous; the ftamina five. The calyx of the female triphyllous; the corolla tripetalous: the ftyle trifid; and a pair of feeds. There is but one fpecies, a native of America, and which poifeffes no remarkable property.

CUPEL, in metallurgy, a fmall veffel which abforbs metallic bodies when changed by fire into a fluid fcoria; but retains them as long as they continue in their metallic flate. One of the moft proper materials for making a veffel of this kind is the athes of animal bones; there is fearcely any other fubflance which fo ftrongly refitts vehement fire, which fo readily imbibes metallic feorix, and which is fo little difpofed to
be vitrified by the:n. In want of thefe, leme inathe ufe of vegetable athes, freed by boiling in water from their faline matter, which would caufe them melt in the fire.

The bones, burnt to porfect whitenefs, fo as that no particle of coaly or inflammable matter may remain in them, and well wathed from lilth, are ground intom moderately line powder; which, in order to its beine formed into cupets, is moiltened with jult as mucha water as is fufficient to make it hold torgether whens Itrongly preffed between the fingers; fome direct gla. tinous liquids, as whites of egys or gum-water, in order to give the powder a greater tenacity: but the in . Hammable matter, however fmall in quantity, which accompanies thefe fluids, and cannot be ealily burnt out from the iaternal part of the mafs, is apt to revive a part of the metallic feoria that has been abforbed, and to occafion the veffel to burlt or crack. The ces pel is formed in a brafs ring, from three quarters of an inch to two inches diamicter, and not quite fo deer. placed upon fome finooth fupport: the ring being filled with moiftened powder, which is preffed clofe,with the fingers; a round-faced pettle, called a monk, is ftruck down into it with a few blows of a mallet, by which the mafs is made to cohere, and rendered fufficiently compact, and a fhallow cavity formed in the midde: the figure of the cavity is nearly that of a fphere, that a finall quantity of metal melied in it may run together into one bead. To make the casity the fmoother, a little of the fame kind of a hes levigated into an impalpable powder, and not moitlened, is commonly fprinkled on the furface, through a fmall fine fieve made for this purpofe, and the noonk again ftruck dawn upon it. The ring or mould is a little narrower at bottom than at top; fo that by prefling it down on fome of the dry powder fpread upon a table, the cupel is loofened, and forced upwards a little; after which it is eafily pufhed out with the finger, and is then fet to dry in a warm place free from duit.
CUPELLATION, the act of refining gold or it ver hy means of a cupel. For this purpofe another vefel, called a mulith, is made ufe of, within which one or more cupels are placed. The muffe is placed upon. a grate in a proper furnace, with its mouth facing the door, and as clofe to it as may be. The furnace being flled up with fuel, fonse fighted charcoal is thrown on the top, and what fuel is afterwards nieceffary is fupplied through a door above. The eupels are fet in the muffle ; and being gradually heated by the fueceffive kindling of the fuel, they are kept red-hot for fome time, that the mointure which they itrongly retain may be completely diflipated: for if any vapours flould iffue from them after the metal is put in, they would occafion it to fputter, and a part of it to be thrown off in little drops. In the fides of the inufle are fome perpendicular nits, with a knob over the top of each, to prevent any fmall picees of eoals or affes from falling in. The door, or fome apertures made in it being kept open, fur the infpection of the cupels. frefh air enters into the mufle, and paffes off through thefe flits: by laying fome burning charcoal on an iron plate beforc the door, the air is heated before its admifion; and by remoring the elarcoal or fupply-

Cupel, Cupela. $\underbrace{\text { tion. }}$

## C U P [608] C U P

Cupe'ld ing more, the heat in the eavity of the muffe may be tion. fornewhat diminifhed or increafed more fpeedily than can be effected by fuppreffing or exciting the fire in
the furnaee on the outhide of the muffe. The renewal of the air alfo is neeeffary for promoting the fcorification of the lead.

The cupel being of a full red heat, the lead caft into a fmooth bullet, that it may not feratch or injure the furface, is laid lightly in the eavity: it immediate$1 y$ malts; and then the gold or filver to be eupelled are eautiounfy introduced cither by means of a finall iron ladle or by wrapping them in paper, and dropping them on the lead with a pair of tongs The quantity of lead fhould be at lealt three or four times that of the fine metal: but when gold is very impure, it requires 10 or 12 times its quantity of lead for cupellation. It is reckoned that copper requires for its feorification about 10 times its weight of lead; that when copper and gold are mixed in equal quantities, the copper is fo much defended by the gold as not to be feparable with lefs than 20 times its weight of lead; and that when copper is in very fnall proportion, as a 20 th or 30 th part of the gold or filver. upwards of 60 parts of lead are neceflary for one of the copper. The cupel mult always weigh at leaft half as much as the lead and copper; for otherwife it will not be fufficient for receiving half the feoria; there is little danger, however, of cupels being made too finall for the quantity of a gold aflay.

The mixture being brought into thin fufion, the heat is to be regulated according to the appearanees; and in this confifts the principal nicety in the operation. If a various coloured llin rifes to the top, which, liquefying, runs off to the fides, and is there abforbed by the cupel, vifibly faining the parts it enters; if a fren feoria continually fucceeds, and is abforbed nearly as faft as it is fommed, only a fine circle of it remaining round the edge of the metal ; if the lead appears in gentle motion, and throws up a fume a little way from its furface; the fire is of the proper degree, and the procefs goes on fuccefffully.

Such a fiery brightnefs of the cupel as prevents its colour from being diftinguifhed, and the fumes of the had rifing up almoft to the arch of the mufte, are marki of too itrong a heat: though it mult be obferved, that the elevation of the fumes is not always in proportion to the degree of heat; for if the heat greatly cxcceds the due limits, both the fumes and ebollition will entirely ceafe. In thefe circumftances the lire muft neceffarily be diminifhed: for while the lead buils and fmokes vehemently, its fumes are apt to camy off fome part of the gold; the cupel is liable to crack from the haily abforption of the fcoria, and part of the gold and filver is divided into globules, whith lying diticontinued on the cupd after the procers is tiaincel, cannot eatily be collected: if there is no ebutLition or fumes, the fcorification does not appear to go on. Too weak at heat is known by the dull reducfs of the cupel; by the fume net rifing from the furface of the lead; and the feoria like bright drops in languid motion, or accumbiated, or growing confifent all over the metal. The form of the furface affords alio an wfeful mark of the degree of heat; the Itronger the fire, the more convex is the furface; and the weaker, the more flat; in this point, however, regard nuft be N゙g6.
had to the quantity of metal ; a large quantity being Cupelling always flater than a fmall one in an equal fire.
Towards the end of the procefs, the dire nuft be increafed; for greatelt part of the fufible inctal lead being now worked off, the gold and filver will not continue melted in the heat that was fufficient before. As the laft remains of the lead are feparating, the rainbow colours on the furface become more vivid, and varioully interfect one another with quick motions. Soon after, difappearing all at once, a fudden luminous brightnefs of the button of gold and filver Ihows the proeefs to be finifhed. The cupel is then drawn forwards towards the mouth of the muffe; and the button, as foon as grown fully folid, taken out.
Cupelling furnace. See Cupelling Fernice.
CUPID, in pagan mythology, the god of love. There feem to thave been two Cupids; one the fon of -Jupiter and Venus, whofe delight it was to raife fentiments of love and virtue; and the other the fon of Mars and the fame goddef, who in-〔pired bafe and impure defires. The firt of thefe, called Eros, or true love, bore golden arrows, which caufed real joy, and a virthous affection; the other, called Anteros, had leaden arrows that raifed a paffion founded only on defire, which ended in fatiety and difguit. Cupid was always drawn with wings, to reprefent his inconfaney; and naked, to flow that he has nothing of his own. He was painted blind, to denote that love fees no fauli in the object beloved; and with a bow and quiver of arrows, to fhow his power over the mind. Sometimes he is placed between Hercules and Mercury, to fhow the prevalence of eloquence and valour in love; and at others is placed near Fortune, to fignify that the fuccefs of lovers depends on that inconftant goddefs. Sometimes he is reprefented with an helinet on his head and a fpear on his fhoulder, to fignify that love difarms the fiereef men; he rides upon the backs of panthers and lions, and ufes their manes for a bridle, to denote that love tanes the molt favage beafts. He is likewife pietured riding $u$ in a dolphin, to fignify that his empire extends over the fea mo lefs than the land.

CUPOLA, in architecture, a fpherical vault, or the ronad top of the dome of a church, in the form of a cup inverted.

CUPliNG, in furgery, the operation of applying cupping- laffes for the difcharge of blood and other lamours by the bin. See Surgery.

CUPRESSUS, the cypress-tree: A genus of the monadelphia order, belonging to the monacia clafs of plants; and in the natural methed rankiag under the 51 th erder, Coniferic. The male calys is a fale of the catkin ; there is no corolla ; the antherex are four, feffle, and without flaments. The calyx of the female is a fcale of the Atrobilus, and uniforus; inftead of thyes there ate hoilow duts; the fruit is an angulated nct. There are fix fpecies; the mof remarkable are the following: 1. The fempervirens, with an upright Itraight ftem, clofely branching all around, almut from the bottom upuards, into numerous quadrangular branches; , iinug in the different varieties from 15 to 40 or 50 feet in height, and very clofely garnithed with fmall, natrow, ercet evergreen leaves, placed imbricatim; and flowers and fruit from the fides of the branches. 2. The thymides,

Cuperf.s, throides, or evcrgreen American eyprefs, communly Cuprum. called white cedar, hath an upright item, branching
ont into numerous two-edged brancbes, rifing 20 or. 30 feet ligh, ornamented with lat ever-green leaves imbricated like arbor vita, and fimall blue cones the fize of juniper-berries. 3. The ditticha, or deciduous American cyprefs, lath an erect trunk, retaining a large bulk, branching wide and regular ; grows 50 or 60 feet high, fully garminhed with fmall, fpreading deeiduons leaves, arranged dittichous, or along two fides of the branclies. All thefe fpecies are raifed from feeds, and will fometimes alfo grow from cuttings; but thefe raifed from feeds prove the handfomed plants. The feeds are procured in their cones from the feedfmen, and by expofing them to a moderate heat, they readily open, and difcharge the feeds freely. The feafon for fowing them is any time in March; and they grow freety on a bed or border of common light earth: efpecially the firt and thiod fpecies. The gromd mult then be dug, well broken, and raked fnooth, then drawing an inch of earth cyenly from off the furface into the alley, fow the feeds moderately thick, and directly fift the earth over them, half an inch decp. If in April and May the weather proves warm and dry, a very moderate watering will now and then be neceflary, and the plants will rife in fis or eight weeks. Duriug the fummer they mult be kept clear from weeds, and in dry weather they mult be gently watered twice a-week. la winter they mut be oceafonally fhatered with mats in the time of hard frof. In two years they will be fit for traniplanting from the fechbed, when they may he fet in nurfenyrows two feet afunder; and in three or four years they will he fit for the flrubbery.

The wood of the firfl fpecies is faid to refift worms, moths, and putrefaction, and to lath many centuries. The coffins in which the Athenians were weat to bury their heroes were made, fays Thucedides, of this wood; as were likewife the chefs containing the Egyptian mummies. The doors of St Peter's church at Rome were originally of the fame materials. Thefe, after latling upwards of 600 years, at the end of which they did not difcover the fmallef tendency to corruption, were removed by order of pope Eugenius IV. and gates of brafs fubleituted in their place. The fame tree is by many eminent authors recommended as improving and meliorating the air hy its balfanic and aromatic cxhalations; upon which account many ancient phyficians of the eaftern countries ufed to fend their patients who were troubled with weak lungs to the ifland of Candia, where thefe trees grew in great abundance; and where, from the falubrious air alone, very few failed of a perfect cure. In the fame inand, fays Miller, the cyprefs trees were folucrative a commudity, that the plantations were called cos filif; the felling of one of them being reckoned a daughter's portion. Cyprefs, fays Mr Pococke, is the only tree that grows tomarrds the tup of momit Lebanon, and being nipped by the cold, grows like a finall oak. Noah's ark is commonly fuppoied to have been made of this kind of wood.

CUPRUM Ammonicale. See Chemistry, N 103t. This peparation is recommended in fume kinds of fpafmodic difeafes, given in the dofe of one or two grains.

CURACOA, or Curas:on, one of thelarger Antilles iflands, folvect to the butch: fitmaterl in $\mathrm{IV}^{\text {. }}$. 1005. 69.30. N. 1.nt. 12. 30. This illand is litite elfe than a have rock, abont ten leapnes loner and tive hroad; lying three leagues off the cuat of Veneaucla. It has an excellent hamour, bat the entrance is diffcult. The bafon is extremely large, amal convenient in every refpect; and is defonded hy a fort kilfolly conftructed, and always kept in repair. The reafon of foming a lettlement upon this baren fpot wat to carry on a contraband trade with the Spanifh ewhones on the continent ; but after fome time the method of managing this trade was changed, Curafow itfelf became an immenfe magazine, to which the Spaniards reforted in their boats to exchange rokd, filwer, vanilla, eocon, cochineal, bark, fiins, and muler, for negroes, linen, filks, India itufls, fpices, laces, ribband;, quick-filver, fleel, and iron-ware. Thefe voyasea, though continuat, did not prevent a number of 1)utch floops from pafling from Curafow to the continent. But the modern fublitution of regiller-thips infers of galleons, has made this communication lefe frepnent : but it will be revived whencer, bu the intervemmen of war, the commmication wint tle spanifimain finll be cut off. The difpute: hetween the comrts of london and Verfailles allo prove favourable to the trade of Curahow. At the te limes it fumblthes provifions to the forthern perts of $S t$ Domingo, and iakes of all its produce. Even the Freach privateces, from the nindward illands, epair in great mambers to Curaffow, notwichatanding the ditance. The reafon is, that they find thate all kinds of neceffary fores for their velleds ; and frequently Spanifh, but alwoys Earopean goods, which are univerfally ured. Englifh privatcers feldom cruize in thefe parts. Every commodity without execption, that is landed at Curaftow, pay ne fer con: port-duty. Detch goods are never taxel higher: but thofe that are mipped from other Enapean pats pay nine fer comt. more. Foreign coffee is fubper to the fame tax, in order to promote the fale of that of Surinan. Every other production of America is fubject only to a payment of three per cent. ; but with an exprefs Atipulation that they are to be conveyed diredty to fome port belonging to the republic.

CURATE: the lowett degree in the chureh of England; he who reprefents the incumbent of a church, parfon or vicar, and officiates divine fervice in his itead : and in cafe of pluralities of hivings, or where a clergyman is old and inhm, it is requifite there fhouid be a curate to perform the cure of the church. He is to be licenfed and admitted by the bithop of the diocere, or by an ordinary having epifcopal jurifdiction: and when a curate lath the approbation of the bihop, he ufually appoints the falary too: and in fuch cale, if he be not pad, the curate hath a proper remedy in the ecclefatical court, by a ferquetration of the profits of the bencfice; but if the curate is not licenfed by the bihop, lie is put to his remedy at common law, where he mult prove the agreement, sec. A curate having no fixed ettate in his curacy, not being inflututed and inducted, may be removed at pleafure by the bitbop or incumbent. But there are perpetual curates as wedl as temporary, who are appointed where tithes are im propriate, and no vicarage endowed: thefe are not 41 I
removeable,

## C U R [ 6:0 ] C U R

Caratella removeable, and the improprietors are obliged to find 1 Curculin. them; fome whereof have certain portions of the tithes fettled on them. Erery clergyman that officiates in a church (whether incumbent or fubftitute) in the liturgy is called a carate. Curates muft fubforibe the ceclaration according to the att of uniformity, or are liable to imprifonment, \& c.

CURATELLA, in botany: A genus of the digynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is pentaphyllous; the petals four: the fyles two ; the capfule bipartite, with the cellis difpermnus.

CURATOR. among the Romans, an officer under the emperors, who regulated the price of all kinds of merchandize and vendible commodities in the cities of the enipire. They had likewife the filperintendence of the cutoms and tributes; whence alfo they were called logyifin.

Curaror, among civilians, a trultec or perfon nominated to take care of the affairs and intereits of a perfon emancipated or interdicted. In countries where the Roman law prevails, between the age of 14 and $2+$ years, minors lave curators affigned them; till 14, they have tutors.

Curator of an Univerfity, in the United Provinces, is an elsetive office, to which belongs the direction of the affairs of the univerfity; as, the adminiftation of the reven:es, the infection of the profefors, \&c. The curators are chofen ly the Hates of each province: the univerfity of Leyden has three; the burghernaters of the citr have a fourth.
CURB, in the manege, a chain of iron made fat to the upper fart of the branches of the bridle in a hole called the eye, and running over the horfe's beard. It confifts of thefe three parts; the hook, fixed to the sye of the brauch ; the chain of SS's or links; and the two rings, or mailes. Large curbs, provided they be romid, are always moft gentle : but care is to be taken, that it reft in its proper place, a little above the beard, otherwife the bit-mouth will not have the effict that may be expected from it.

Engliih wateriug bits have no curbs; the Turkih bits, called gecthes, have a ring that ferves inteaf of a carb. Sce Gemprtes.

Curb, in farriery, is a hard and callous fwelling on the hind part of the hock, attended with fiffnefs, and functimes with pain and lamenefs. See Spavis.

CURCAS, a name given in Egypt to an efculent root, approaching to the tafte and virtues of the colocafia. It is alfo a name ufed in Malabar for a fmall fruit of the fhape and fize of an hazel nut. Both thefe things have the credit of being flrong provocatives; aind it is very propable that the curcas of the Eat Indies may be the fruit called bol by A vicenna, Whil disu to poitís the fane virtues. Garcias has been fed into a vely geat error by this fimilarity of names and virtues: and fuppotes the curcas of Egypt the fume with that of the Eai Indies.
Flute CLi
CURCULIO, in zoology, a genus of infects belonging to the order of coleoptera. The feelers are fubclazated, and rett uron the fnout, whel is promipont and hony. Thofe intets are divided into the frluring fumilies. 1. Thufe which have the roltrum lunger than the thorax, and whofe thighs are fimple.

2 Thofe which have the roftrum longer than the tho- Curculto. rax, and the thighs thicker and made for leaping. 3. Thofe which have the roftrum longer than the thorax, and the thighs dentated. 4. Thofe which have dentated thighs, and a roftrum morter than the thoras. 5. Thofe whofe thighs are without teeth or fpines, and the roftrum thorter than the thorax. There are no lefs than 95 fpecies, principally ditinguilhed by their colour.

The larve of the curculiones differ not from thofe of mort colcopterous infeets. They bear a refemblance to obl-ng foft worms. They are provided anterior'y with fix fcaly legs, and their head is likewife faily. But the places where thofe lave dwell, and their tranfformations, aford fome fingularities. Some fpecies of them, that are dreaded for the mifchief they do in graaries, find means to introduce themfelves, while yet inall, into crains of corn, and there make their abode. It is very diflicult to difcover them, as they lie concealed within the grain. Thete they grow at leifure, enlarging their dwelling-place as they grow, at the expence of the interior meal of the grain on which they feed. Corn-lofts are often laid watte by thefe infects, whofe numbers are fometimes fo great as to devour and deftroy all the corn. When the infect, after having eat up the meal, is come to its full fize, it remains within the grain, hidden under the empty hufk, which fubfifts alone; and there transformed, it becomes a chryfalis, nor does it leave it till a perfect infect, making its way through the huff of the grain. It is no eafy matter to difcover by the cye the grains of corn thes attacked and hollowed out by theie infeets, as they outwardly appear large and full : but the condition the curculio has reduced them to, renders them much lighter ; and if you throw corn infefted by thefe infects into water, all the tainted grains will fwim, and the refl fink to the bottom. Other larve of curculiones are not fo fond of corn, but fix in the fame manner on feveral other feeds. Beans, peafe, and lentils, that are preferved dry, are liable to be fpoiled by thefe little animals, which prey upon the inward part of the grain, where they have taken up their habitation, and do not come forth till they have completed their transformation, by breaking through the outward hufk of the grain: this is difcoverable by cating thofe grains into water; thofe that fwim are generally perforated by the curculiones. Other fpecies are lodged in the infide of plants. The heads of artichokes and thiftes are often bored through and eaten away by the larve of large curculiones. Another fpecies finaller, but fingular, pierces and inwardly confumes the leaves of clms. It frequently happens that almoft all the leaves of an elm appear yellow, and as it were dead towards one of their edges, while the whole remainder of the leaf is green. Upon infpecting thofe leaves, the dead part appears to form a kind of bag or finall bladder. The two laminx or outward pellicles of the leaf, as well above as below, are entire, but ditant and feparated from each other, whilt the parenchyma that lies between them has been confumed by feveral finall larve of the curculio, that have made themides that dwelliay, in which they may be met with. After their transformation they come forth, by piercing the kind of bladder, and give being to a curculio that is brown, finall, and hard to catch, by

## C $U R$

Cursun:a reafon of the nimblenefs with which it leaps. The pro$\|$
curees. Curetec. perty of leaping, allotted to this fiagle fpecics, depends on the hape and length of its hinder legs.
CURCUMA, turmeric: A genus of the monogynia order, belonging to the monandria clafs of plants; and in the natural mothod ranking under the eighth order, Scitaminea. It has four barren flamina, with a fifth fertile. The feecies are,

1. The rotunda, with a round root, hath a flefhyjointed root like that of ginger, but round; which fends up feveral fpear-fhaped oval leaves, which rife upwards of a foot high, and of a fea-green colour. From between thefe arifes the flower-ftalk, fupporting a loofe fpike of flowers of a pale-yellowifh colour, inzclofed in feveral difierent fpathx, or theaths, which drop off. The flowers are never fucceeded by feeds in this country. 2. The longa, hath long fechy roots of a deep ycllow colour, which \{pread under the furface of the ground like thofe of ginger; they are about the thicknels of a man's finger, having many round knotty circles, from which arife four or five large fpearflaped leaves, flanding upon long foot-ftalks. The flowers grow in loofe caly fikes on the top of the foot-ftalks, which arife from the larger knobs of the roots, and grow about a foot high; they are of a ycllowith.red colour, and haped fomewhat like thofe of the Indian reed.

Thefe plants grow naturally in India, from whence the roots are brought to Europe for ufe. They are very tender; fo will not live in this country unlefs kept conitantly in a fove. They are propagated by paiting the roots. The root communicates a beautiful but perifhable yellow dye, with alum, to woollen, cotton, or linen. In medicine it is eftemed aperient, and emmenagogic; and of fingular cfficacy in the jaundice.

CURDISTAN, a country of Afia, feated between the Turkih empire and Perfia, lying along the eaffern coalt of the river Tigris, and comprehends great part of the ancient Affyria. Some of the inhabitants live in towns and villages, and others rove from place to place, having tents like the wild Arabs, and are alfo robbers like them. Their religion is patly Chriftian, and partly Mahometanifm; but they are very loofe in regard to cither.

CURDLING, the coagulating or fixing of any fluid body ; particularly milk. See the article Chefse.

Paufanias fays, that A riitxus fon of Apollo, and Cyrene daughter of the river Peneus, were the firft who found the fecret of curdling milk.

At Florence they curdle their milk for the making of cheefe with artichoke flowers; in lien of the renuet ufed for the fame parpofe among us.

The Bifalte, a people of Macedonia, Rochfurt obferves, live wholly upon curdled milk, i. e. on curds. He adds, that curds are the whole food of the people of Upper Auvergne in France, and whey their only drink.

CURETES, in antiquity, a fort of priefts or people of the ine of Crete, called alfo Corybantes. Sce Corybantes and Crete. The Curetes are faid to have been originally of mount Ida in Phrygia; for which reafon they vere alfo called fdai Dactyli. Sce Dactye.

## $\mathrm{C} U \mathrm{R}$

Lucian and Diodorus Siculus reprefent them as veri expert in calting of darts: though other authors give them no weapons but bucklers and pikes: but all agree in furnihing them with tabors and caltanettas; and relate, that they ufed to dance mueh to the noife and claning thereof. By this noik, it is faid, they prevented Saturn from hearing the cries of young fupiter, whereby he was faved from bcing depreyed.

Some authors, however, give a dilierent account of the Curetes. According to Pczron and others, the Curctes were, in the times of Saturn, \&c. and in the countries of Crete and Phrygia, what the druids were. afterwards among the Gauls, \&c. i. c. they were priefts who had the care of what related to religion and the. workip of the gods. Hence, as in thole days it was fuppofed rhere was no communication with the gods. but by divinations, auguries, and the operations of magic; the Curetes palled for magicians and enchanters: to thefe they added the Aludy of the itars, of nature, and poefy; and to were philofophers, aftronomers, \&c.
Voffus, de Idolat. diltinguilhes three kinds of Curetes ; thofe of Aitolia, thofe of Phrygia, and thofe of Crete who were originally derived from the Phrygians. The firft, he fays, took their name from $x y p x$. tonfure; in rcgard, from the time of a combat wherein the enemy feized their long hair, they always kepr it cut. Thofe of Phrygia and Crete, he fuppofes, were fo called from keper, young man; in regard they were young, or becaufe they nurted Jupiter when he was young.

CURFEW; or Courfew, a fignal given in citipy taken in war, \&c. to the inhabitants to go to beth Pafquin fays, it was fo called, as being intended to alvertife the people to fecure themfelves from the rubberics and debaucheries of the night.

The moll eminent curfew in Lingland was that eftablifhed by Willian the Conqueror, who appointed, under fevere penalties, that, at the ringing of a bell at cight o'clock in the evening, every one thould put out their lights and fires and go to bed: whence, to this day, a bell rung about that time is called a curjezwbell.

CURIA, in Roman antiquity, was ufed for the fe-nate-houfe. There.were feveral curise in Rome; as the curia calabra, haid to be built by Rowulus; the curia boflilia, by Twllus Hollilius; and the curia pomperia, by Pumpey the Great.
Curia alfo denoted the places where the curie ufed to affemble. Each of the 30 curise of uld Rome had a temple or chapel affigned to them for the common performance of their dacrifices, and other offices of. their religion; fo that they were not unlike our parifhes. Some remains of thefe little temples feem to . have fubfitted many ages after on the Palatine-hill, where Romulus lirit built the city, and always relided.

Curia, among the Romans, alio denoted a portion or divilion of a tribe. In the time of Romulus, a tribe contifted of ten curix, or a thoufand men; each curia being one hundred. That legiflator nade the dint divifion of his people into thirty curix. Afterwards, curia, or demas curialis, becane ufed for the place where each curia held its allemblics. Hence alion curia palled to the fenate-houfe; and it is com hance

Varro derives the wod from curd, "care:" q. d. an afimbly uf people charged with the care of public affatus. Otheis duduce it frou the Greeks; maintainine, that at Athens they called xupa the place where the magiftrate held lis affics, and the people ufed to afion ble: xuow, again, may come from xupa, attbority. 多的er; becaule it was here the laws were made.

Ceria, in our ancient cuftoms. - It was ufuad for the kings of Einctand to fummon the thithops, peers, and grat men it the biagdom, to fome particular place, at the chief fettivals in the year: and this aftembly is called by our hiforians com ; becaufe there they confulted about the weighty aflans of the nation: whence it was fometinus alforalled fannis conde, senc-
 Whteneh-Mut.

Cu'Rlat Baronum. Sce Col'rt-Baron.
Cetrat Chmondu, is a writ that hes againf him who found fence and indole the ground, but refufes or defers to do it.

CLRLNTII, three brothers of Aiba, maintained the anterces of theis conntry againt the Remans who had declared war wain? thofe of Alba. The two armics being equal, thre brothers on each fide were chufen ©o dade the contult : the Curiatii hy thoie of Alba, and the Humati by the Romans. The three firt were wounticl, and two of the latter kilied: but the third, jcinitg policy in valour, an away ; and having thus fired the Curiati, he wek then one after another and sillide thm all thace.
©URNXC: a iom whad for the preferving fifh, fefr, did otine anablal fubtances, ly means of certain additions of thinges to prevent putrefaction. One gicat method of doing this, is by finoking the bodies with the moke of wous, or rubbing them with falt, nitre, s.c.

CURIO, the chicf and prief of a curia.-Romuius, aporb dividing the people into cmix, gave tach divinion a chief, who was to be prictl of that curia, under the title of curio and flumencurialis. His bulinefs was to provide and officiate at the facriaces of the curia, which were called cartoria: the coria furniming him with a fum of money on that corfideration, which penfion or appointment was called curionium. Each divifion had the election of its curia; but all thefe particubar curios were under the direction of a fuperior or gentral, called curiomaximus; who was the head of the boty, and clected by all the curios affembled in the ecmitia curalis.

All thefe intlitutions were introduced by Romalus, and confirmed by Numa, as Ifulitarnafeus relates it.

CURIOSUS, an officer of the Loman empire darimg the midule age, appointed to take care that no frauds and irregularitiss were committed; particularly no abufes in what related to the pofts, the roads, Se. and to give intelligence to the court of what paffed in the provinces. This made the curiof people of im portance, and put them in a condition of doing more harm than they prevented; on which account, Honorius cafliered them, at kafl in fome parts of the emsire, amba +15 .

The curios came pretty near to what we call con-
trolltrs. They had their name from cura, " care;" quad curis agendis EO coccionitus curfus publici infpiciondis operam darent.

CURLEW, in ormithology. See Scolopax.
CURMI, a name given by the aneients to a fort of malt liquor or ale. It was made of barley, and was dronk by the people of many nations inftcad of wine, according to Diofcordes's account. He accufes it of cautiog pains in the head, generating bad juices, and difordering the nerwas fytem. Le alfo fays, that in the wettern part of Iberia, and in Britain, fuch a fort of liquor was in his time prepared from wheat inflead of barley. Sec Alle.

CURNOCK, a meafure of com containing four buArels, or latf a quarter.

CURRANS, or Currants, the fruit of a fuecies of groffalaria. See Geossularia.

The white and red fort are mofly ufed; for the hakk, and chicfly the leaves, upon hift coming out, are in ufe to flasour Englifh fpirits, and counterfeit French brandy. Currants greatly afuage drought, cool and fortify the thomach, and help digetion; and the jelly of black currants is faid to be very effeacious in curing inflammations of the throat.

Currants alfo hignify a fmaller kind of grapes, brought principally from Zant and Cephalonia. They are gathered off the bumes, and laid to dry in the fun, and fo put up in large butts. They are opening and pectoral ; but are more ufed in the kitchen than in medicine.

CURREN'T, or Courant, a term ufed to exprefs the prefent time. Thus the year ago is the cument year, the 20 th eurrent is the zoth day of the month now ruming.- With regard to commerce, the price current of any merchandife is the known and ordimary price accuftomed to be given forit. The term is alfo ufed for any thing that has courle or is received in commerce ; in which fenfe we fay, current coin, sic.

Current, in navigation, a certain progreffive novement of the water of the fea, by which all bodies floating therein are compelled to alter their courfe or velocity, or both, and fubmit te the laws impofed on them by the carrent.

In the fea, currents are either natural and general, as arifing from the diurnal rotation of the earth about its axis; or accidcntal and particular,-caufed by the waters being driven againft promontories, or into gulphs and fraits, where, wanting room to fpread, they are driven back, and thus dillurb the ordinary flax of the fa. Currents are various, and directed! towards different parts of the ocean, of which fome are condlant, others periodical. The mot extraordinary current of the lea, is that by which part of the Atlantic or African Occan moves about Cuinca from Cape Vead towards the curvature or bay of Africa, which they call Fernando Poo; wiz. from welt to eaft, contrary to the general motion. And fuch is the force of the current, that when Mips approach too near the thore, it carries them violently towards that bay, and deceives the maniners in their reckoning. There is a great vaiety of haitting currents which do not laft, but retmon at certain periods; and thefe do, moll of them, depend upon and fullow the anniverfary winds or monfoons, which by blowing in one place may caufe a current in another. Varenius informs os, that at

## C U R

Current. Java, in the fraits of Sunda, when the monfoons blow from the weit, aiz. in the monh of May, the currents fet to the callward, contrary to the general anution. Betwecn the illand of Celthes and Madura, when the weltern munfouns fet in, giz. in Decmber, January, and Febriary, or when the winds blow fiom the north-well, or butween the north and wett, the currents $\delta_{\text {at }}$ to the foutheaft, or between the fouth and eatt. At Ceylon, from the middle of March to Octuber, the currents fet to the fuuthward, and in the other parts of the year to the nurthward; becaule at this time the fouthern monfoons blow, and at the other the nurthern. Between Cuchin China and Malacca, when the wothern nonfoons blow, ziz. from April to Augun, the currents fet eaftward againt the general mution; but the rest of the year they fet weltward, the monfoon confpiring with the general notion. They nun io throngly in thefc fas, that unexperienced fitlors mithake them for waves that beat upon the rords, haow adually by the name of lreaters. So fur fome months aftur the 15th of February, the curche fot from the Mallives turards India on the eath, againh the general motion of the fea. On the flore of China and Cambodia, in the months of October, Novenber, and Decerber, the currents fet to the north-well, and from Janaary to the fouth-weft, when they run with fuch rapidity about the fhoals of Pareel, that they feem fwifter than an arrow. At Pulo Condore, upon the coaft of Cambodia, though the monfoons are ihifting, yet the eirrents fet Arongly towards the caft, even when they blow to a contrary point. Along the coafts of the Bay of Bengal, as far as the Cape Romania, at the extreme point of Malatea, the current runs fouthward in Nuicmber and December. When the monfoons blow from China to Malacea, the fea runs fwiftly from Pulo Cambi to Pulo Condore on the coalt of Cambodia. In the Bay of Sans Bras, not far from the Capc of Good Hope, there is a current particularly remarkable, where the fea runs from ealt to weft to the landwand; and this more vehemently as it is oppofed by winds from a contrary direction. The caufe is undoubtedly owing to fone adjacent fhore which is higher than this. In the Atraits of Gibraltar, the currents almolt comfantly drive to the callward, and carry Chips into the Mediterrancan: they are alfo found to drive the fame way into St George's channel.

The fetting or progreflive motion of the current may be either quite down to the bottom, or to a certain determinate depth. As the knowledge of the direction and velocity of currents is a very naterial article in navigation, it is highly neceffary to difoover buth, in order to afcertain the Mip's fituation and courfe with as much accuracy as pollible. The moft fuccefoful method which has been hitherto practifed by mariners for this purpofe is as fullows. A common iron pot, which may contain four or five gallons, is fufpended by a fnall rope faltened to its ears or handles, fo as to hang ditetly upright, as when placed upen the fire. This rope, whith may be from 70 tu 100 fathoms in length, being prepared for the experiment, is coiled in the boat, which is hoifed out of the fhip at a proper upportunity, when there is little or no wind to rufle the furface of the fea. The fut being then thruwn overboard into the water, and
imnediately finking, the line is flackened till :hout -0 or 80 fathoms of the line run out; after which the line is faftened to the buat's ftem, by which the is accondingly rettrained, and rides as at an anchor. The velocity of the carrent is then eatily tried by the $\log$ and half-minute glafs, the ufual method of difcovering the rate of a mip's failing at fea. 'The courfe of the Atcom is next obtained by the compafs provided fue this operation. IFaving thes found the fotherg an! drift of the current, it next remains to apply this ex. periment to the purpofes of Navigasiot; fur whin lee that atticle.

Under-Curafits are diftinct from the upper or ap. parent, and in duffernt places fet or drive a cons. trary way. Dr smith makes it highly probable, that in the Downs, in the traits of Gibraltar, \& 8 . there is an under-current, whereby as much water is carried out as is brought in by the upper-currents. This he argues from the uffing between the north and fouth Foreland, where it runs tide and lalif-tide, i.e. it is either ebb or Hood in that part of the Downs three hours before it is fo off at fea: a eertain fign, that though the tide of flood rans aluft, yet the tide of ebb runs under-funt, i.e. clofe by the ground ; and fo at the tide of ebb it will fluw ander-foot. This he confirms ly an experiment in the Baltic Sound, communicated to him by an able feaman prefent at the making it. Being there then with one of the king's frigates, they went with their pinnace into the midAtream, and were carried violently by the current. Soun after that, they funk a balket with alarge cannon bullet to a certain depth of water, which gave check to the boat's motion; and finking it Alll lower and lower, the boat was driven a-head to the windward againit the upper current, the curent aloft not being abuve four or five fathom deep. He added, that the lower the balket was let down, the ftronger the under current was found.

From this principle, it is eary to account for that continual in-draught of water out of the Athatic into the Meditcranean through the fraits of Gibraltar, a paffage about 20 miles broad; yet without any fen fible rifing of the water along the coalts of Barbary, \& $r$. or any ovatlowing of the lands, which there lie veiy low.-Dr Halley, however, fulves the curicuto fetting in at the thraits without overfowing the baus by the great evaporation, without fuppufing any undetcurrent.

CURRICULUS, in our ancient wriers, denot:s the year or courfe of a year. Attum of hac chnaria; Dominice incarnationis quater quinguagethis quisurice, quinis fufrir, 要 tribus curviculus; i.c. In the year 1028 : for four times fifty makes two hundred, and hive tinco two hunded makes one thouland; five lathes ane twenty-five years, and thrte curriculi are three yatrs.

CURRIERS, thofe who drefs and colour leathes after it comes from the tan-yard. See Tanning.

CURRODREPANUS (formed of currus, " cta. rict," and detr vov, "fcythe" or "fickle"), in antiquity, a kind of chariot arned wish feythes. The driver of thefe chariots was obliged to ride on one of the horfes, as there was no other feat for him; the ufual place for him being all armed with knises, as was likewife the hinder part of the chariot. There were no feythes pointing duwn to the earth either

## C UR $\quad\left[\begin{array}{lllll}614 & \text { C U R }\end{array}\right.$

Curseing, from the beam or axle-trec; bat there were fixed at Curning the head of the axle-tree in fuch a manner as to be moveable by means of a rope, and thereby conld be raifed or let down, and drawn forward or let fall backward, by relaxing the rope.

CLRRYING, the method of preparing leather with oil, tallow, \&c.

The chief bufinefs is to foften and fupple cow and calve-Rins, which make the upper-leathers and quarters of thoes, covering of faddles, coaches, and other things which muft kecp out water. 1. Thefe fkins, after coming from the tanner's yard, having many athy filbes on them, the currier foaks them fome time in common water. 2. He takes them out and fretches them on a very even wooden horfe: then with a paring-knife he forapes off all the fuperforous fefh, and puts them in to foak again. 3. He puts them wet on a hurdic, and tramples them with his heels till they begin to grow fof and pliant. 4. He soaks thereon train-oil, which by its unetuous quality is the belt hiquor for this purpofe. 5 . He fpreads them on larect tables, and faftens them at the ends. There, with the belp of an indtrument called a pummel, which is a thick piece of wood, the under-fide of which is full of furrows eroffing each other, he folds, fquares, and moves them forwards and backwards feveral times, under the tecth of this inftrument, which breaks their too sreat ftiffnefs. This is what is properly called curying. The order and number of thefe operations is varied by different curriers, but the material part is always the fame. 6. After the fieins are curried, there may be occafion to colour them. The colours are black, white, red, fellow, gree:1, \&e. the other colours are given by the flinners, who differ from curriers in this, that theyapply their colours on the flef fide; the curriers on the latir fide. In order to whiten flins, they are rubbed with lumps of chalk or whitelead, and afterwards with pumice-ftone. 7. When a化in is to be made black, after having oiled and dried it, he palfes over it a puff dipt in water impregnated with iron; and after his firtt wetting, he gives it another in "water prepared with foot, vinegar, and gum-arabic. Thefe different dyes gradually turn the thin black, and the operations are repeated till it be of a himing black. 'The grain and wrinkles, which contribute to the fupplenefs of calves and cows kather, are made by the reiterated folds given to the fitin in every direction, and by the care taken ro forape off all hard paits on the colour fide.

CURSING and Swearing, an offence againft God and religion, and a fin of all others the moft extravagant and unaccountable, as having no benefit or advantage attending it. Iy the laft ftatute againft this crime, is Geo. II. which repeals all former ones, every labourer, failne, or foldier, profanely curting ne fwearing, fhall forfeit 1 s ; every other perion under the rank of a gentleman, 2 s. : and every getuteman ol perfon of fuperiner rank, 5 s. to the pour of the parith; and, on a fecoud conviction, double; and, for every fubfequent ofence, treble :he fum firt forfeited, with all charges of consiction : and, ia Jetant of payment, thall be fent to the home of competion fus 10 dave. Any jultice of tle peace nssy comist upon his cirn

contable or peace oficer, upon his own hearing, may fecure any offender and carry him before a juftice, and there convict him. If the juftice omits his duty, he forfeits 51 . and the conftable 40 s . And the act is to be read in all parifh churches and public chapels the Sunday after every quarter-day, on pain of 51 . to be levied by warrart from any juitice. Befides this punifhment for taking God's name in vain in common difcourfe, it is enacted, by ftat. 3. Jac. I. c. 2 I . that if in any fage-play, interlude, or thow, the name of the Holy Trinity, or any of the perfons therein, be jeftingly or profanely ufed, the offender hall forfeit rol.; one moiety to the king, and the other to theinformer.

CURSICOR, a clerk belonging to the court of chancery, whofe bufinefs it is to make out oriminal writs. In the itatute is Edw. III. they are called clerks of courfe, and are 24 in number, making a corporation of themfelves. To each of them is allowed a divifion of certain counties, into which they iflue out the original writs required by the fubject.

CURTATE distance, in altronomy, the diftance of a planet from the fun to that point, where a perpendicular let fall from the planet meets with the ecliptic.

CURTATION, in aftronomy, is the interval between a planet's diftance from the fun and the curtate diftance.

CURTEYN, Curtana, was the name of Edward the Confeffor's fword, which is the firlt fword carried before the kings of Encland at their coronation; and it is faid the point of it is broken as an emblem of mercy.

CURTIN, Curtain, or Courtin, in fortification, is that part of the rampart of a place which is betwixt the fianks of two baftions, bordered with a parapet five feer high, behind which the foldiers fand to tire upon the covered way and into the moat.

CURTIUS (Marcus), a Roman youth, who devoted himfelf to the gods manes for the fafety of his country, about 360 years before the Auguftan age. A wide gap had fuddenly cpened in the formm, and the oracle had faid that it never would clofe before Rome threw into it whatever it had molt precions. Curtius immediately perceived that no lefs than an human facrifice was required. He amed himfelf, mounted his horfe, and iolemaly threw himfelf into the gulf, which inflantly clofed over his head.

Curtius (Quintris), a Latin hilorian who wrote the life of Alexander the Great in ro brooks, of which the two firt are not indced extant, but are fo well fupphed by Freinhemins, that the iofs is feareely regreticd. Where this writer was born, or even when he lived, are points no one pretends to know. By his Ayle he is fuppored to have lived in or nemar the Alugiftan age; while fome are not wanting, who imagine the work to have been compofed in Italy about 300 years ago, and the name of equatus Curtius to be lictitionly added to it. Cardinal du Prron was liogteat an admiter of this work, as to deciare one page of it to be worth $30^{\circ}$ of Tacituz; yet M. le Clere, at the end of his Art of Criticim, has charged the writer with great ignorance and many contradictions. He !.ain meverthelefs many qualitios as a writer, which will alwas make him admires and anolauded.

## C U I [ 615$] \quad$ C U S

Turvature
CETRY名UURE af a Line, is the peculiar manner of its bensing or flexure, by which it becomes a curve of fuch and fuch peculiar properties.

CURVE, in geometry, a line which running on continually in all directione, may be cut by one right linc in mare points than one. See Comic Sections and Fluctions.

CURVET, or Corvet, in the manege, an air in which the houfe'slegs are raifed higher than in the demi wolt; being a kind of leap up, and a little forwards, whercin the horfe raifes both his fore:legs at once, equally advanced, (when he is going ftraight firward, and not in a circle), and as his fore-legs are falling, he immediately raifes his hind-legs, equally advanced, and not one before the other: fo that all his four leas are in the air at once; and as he fets them down, he marks but twice with them.

CURVILINEAR, or Curvilineal, is faid of figures bounded hy enrves or crooked lines.

CURVIROSTRA, in ornithulogy. See Loxia.
CURULE снalr, in Roman antiquity, a chair adorned with ivory, wherein the great magiftrates of Rome had a rioht to fit and be carried.

The curule magilnates were the xililes, the protors, cenfors, and confuls. This chair was fitted in a kind of charist, whence it had its name. The fenators who had borne the offices of aediles, pretors, \&c. were carried to the fenate-hon: in this chait, as were alfo thofe who triamphed, and fuch as went to adminifter jultice, \&c. S e 乍dile, \&c.

CURZOL A, an ifland in the gulf of Venice, lying on the coat of Dalmaria. It is about 20 miles long, and has a fmall nown of the fane name, with a bifhop's fee. It belongs to the Venetians. E. Long. 1 . 15. N. Lat. 436.

CUSA (Nicholas de), a learned cardinal, born of mean parentage, and named fiom Cufa, the place of his birth. He was made a cardinal in $144^{8}$; and being appointed governor of Rome by Pope Pius Il. during his abfence at Mantua, he was the chief concerter and manager of the war againft the Turks. He founded a church, and a nuble library of Creek and Latin authors, at Cufa; and left many excellent works behind him, which were collected and publifhed in three volumes at Bafil in 1565 . In thefe he has made no fcruple to detect the lying traditions and fophifities of the Poman church.

CUSCO, a large and handfome town of South $A$. merica in Peru, formerly the refuence of the Incas. It is feated at the for tof a mountain, and is huike in a fquare form, in the middle of which there is the beft market in all Ancricn. Four large frects terminate in this fquare, which are all as fraight as a ne, and regard the four quarters of the world. The Spaniards tell us wonderful things of the richnefa of the loca's palace, and of the temple of the fun ; but mure fober: travellers, judging from what remains, think mof of them to be fabolous. At prefent it contains eight lange parifhes, and five religious houfe, the bell of which belongs to the Jefrits; and the number of the inhabitants may be about 50,000 , of which thete-fuetho ate the origmal natives, Americans. From this town there is a very long road, which runs alogg the Cordekim; and, at certain dillances, there are fantl houfes for relling places, fome paits of which are fo antwicially
wrought, that it is farprifing low a people who had no iron tools could perform fuch workmanfhip. There areftreams of water yun through the town, which are a great convenience in fo hot a country where it never rains. It is 375 miles caft of Lima. W. Long. 74. $37 \cdot$ S. Lat. i 3. o.

CUSCUTA, nODDER: a genus of the digymia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under thote of which the order is donbtful. The calyx is quadrifid ; the corulla monopetalous; the capfule bilucular. 'There are two fpecies ; cne of which is a native of Britain, viz. the Europta, dodder, hell-wetd, or devil's guts. I'his is a very fimgular plant, almofl doftitute of leaves, parafitical, crecping, fixing itfelf to whatever is next to it. It decays at the root, and afterwards is nowrithed by the plant which fupports it. Hops, flax, and nettles, wre its common fupport; but principally the common nettle. Ita iheffors are white. As loon as the thoots have twined about an adjacent plant, they fond out from their :nner furface a number of little veficles or papille, which attach themfelves to the bark or rind of the flant. By degrees the longitudinal vefiels of the failk, which appear to have accompanitd the veticles, hoot from their extremities, and make their way into the fofter plant, by dividing the veffels and infmuating themfelves into the tendereft part of the italk ; and fo intimately are they united with it, that it is eafer to break than to difengage them from it. The whole plant is bitter. It affords a pale reddifh colour. Cows, theep, and fwine, eat it; horses refufe it; goats are not fond of it.

CUSH, the eldelt fon of Ham, and father of Nimrod; the other fons of Cuth were Scba, Havilah, Sabtah, Raamah, and Sabtecha. Gen. x. 6-8. Though we know of no other perfon of feripture that is called by this name, yet there are feveral countries that are called by it; whether the fame man may have dweit in them all at different times, or that there were fome other men of this name, we are ignorant.

The Vulgate, Scoragint, and other interpreters, both ancient and modern, generally tranflatc Cuih, Ethiopia: Lut there are many paffages wherein this tranfation cannot take phace.

Cufl is the name of the country watered by the Araxes. They who in tranflating the fitation of Eden, have made Cuf/ Ethiopia, gave rife to that unwarrantable opinion which Jofephes and feveral oo tlers have eateriained of the siver Gihon's being the Vile. In this place (Gen. ii. 13.) the LXX tranflation renders the word $C u / b$ ley the name of Ethiopia; and in this miftake is not oaly here followed by our Englifh verion, but in the fame particular in feveral ctiaer places.

Cuth is the fane as Cufh. The Chaldees geacrally pu* the to: where the Hehrews we the folin: they fay min, inftead ct cogh. See Cuth.

Bu: Sthiopia is frequently in the Ircbere called Cu/h; and Jufephers fays, that they ecitled thenfelves by this name, ind that the fane name was given them ny all Afo. St ferom tells nus, that the I I-brews c:lll the Foniophas by the fume name, and the oxptuagiot give thom nouther. formiah (xiii. 23.) fays, "Em the Cumaern, or I:thopian, change his colour." Ir Exeliel (xxix. 10.) the lator theatms to reduce "Eg? ${ }^{4}$.

Curcura Cuh.

## C U S [ 616 ] C U S

Cupion "Egypt to a defart, from the towne of Syenc even
Cu! ! 11 ar $1 \mathrm{Ha} \mathrm{a}^{1} \mathrm{t}$. unto the border of Cufh, or Sethiopia;" and in lamat, (xi.1.. ) he fays, "he will teconer the remant of his prople, which fhall be left from Affyria, and from Egypt, and Pathros, and from Cuth.'" All thete marks ayree with Ethiopia properly fo calld, which lies to the fouth of Egrpt.
Fochart has thown very cleanty that there was a country called "the land of Coyl" in Arabia Petres, Bordering upon Egypt ; that this coustry extended dielf principally upin the caflem thore of the Redtiea, and, at its extremity, to the point of this fca, inclining towards Esypt and Palatine.

Thus there are three conntrics of the name of Cufle, defcribed in feripture, and all confounded by interpreters under the general name of Ethinpia.

CUSHION, in engraving, is a hag of leather filued with fand, commonly about nine inches Egtare, and three or four thick, ufed for fupporting the plate to be cigraved.

Cushon, in gilding, is made of leather, foftened to a fquare board, from 14 inches fquare to 10 , with a handle. The vacuity between the leather and buard is fulfed with fine tow or wool, fo that the outcr furface may be flat and even. It is ufed for receiving the leaves of gold from the paper, in order to its being cut into proper fizes and figures.
CUSI, in natural hiltory, a name given by the people of the Philippine iflands to a very fmall and very beantiful ípecies of parrot.

CUSP, cuffis, properly denotes the point of a fpear or fword; but is ufed in atronomy to experds the points or horns of the moon, or any other luminary.

Cusp, in altrology, is ufed for the firlt point of cach of the 12 houfes, in a ligure or fcheme of the heavens. See Housr.
CUSPIDATED, in botany, are fuch plants whofe leaves are pointed like a fpear.

CUSPINIAN (John), a German, was bornat Sweinfurt in 1473; and died at Vienna in 1529. He was firt phyficiau to the emperor Masimilian I. and employed by that prince in feveral delicate negotiations. We have of his in Latin, 1 . A hiflory of the Roman emperors from Julius Ceffar to the death of Maximilian I. Degory Wheare, in his Mertbotus Letgende Hiforic, calls this "luculemum fane opus, © omminn lectiome dinnifimum." 2. An biftory of Auttria; being a kind of continuation of the preceding. 3. An hithory of the origin of the Turks, and of their crueltics towards Chriftians. Getard Volfus calls Cufpinian magnum fun aren bijgoris lunert.

CUS'TOM, a very comprehenfive term, denoting the manners, ceremonies, and fafhions, of a poople, which having turned into a habit, and paffed into ufe, chtain the force of laws; in which fenfe it implies fuch ufages, as, though voluntary at firit, are yet by practice become neceflary.

Cufom is hence, both by lawyers and civilians, defind lix no: ferithta, "a law or right not written," ethablithed by king ufage, and the confent of onr anceflors: in which fenfe it flands oppofed to the hex firipta, or "the written law." Sce Law, Part II. $n^{\circ} 38-41$.

Cestoni and Habit, in the human economy. The former is often confounded with the latter. By ca$\mathrm{N}^{\prime}{ }_{9} 6$.
ft m we monn a frequent reiteration of the fame act ; fuftom and ly horif, the effect that cuftom has on the mind and Hahie or body. 'llis curious fubjeet falls to be confidered firth in a morai, and fecondly in a phytical, light.

1. I.efunace of Culfom and Häthit on the Niand, Exc. Cullom hath fuch inlluence upon many of our feelings, by warping and varying them, that its operations demand the attention of all who would be acquainted with human nature. The fubject, however, kumas's is intricate. Some pleafures are fortined by cultom: flemerts of and yet cuftom begets familiarity, and confeguently ciritisjon. indifticrence:
If ail the year were pla ing holiday;
To fport wrould be ane edioninas co: <nk:
Lut when they feliam o me they wifh'l.foreme,
And nothing pleafeth but sare accidents. $\quad$ "had $\%$.

In many inftances, fatiety and difgult are the confequences of reiteration: arain, though cuftom blunts the edge of ditrefs and of pain; yet the want of any thing 10 which we have been long accuflomed is a furt of terture. A clue to guide us through all the intricacies of this labyrinth, would be' an accoptable prelent.

Whaterer be the caufe, it is certain that we are much influenced by cuftom: it hath an effect upon our pleafures, upon our actions, and even upon our thoughts and fentiments. Halsit makes no figure during the vivacity of youth: in modde age it gains ground ; and in old age governs without control. In that period of life, generally fpeaking, we eat at a cortain hour, take exercife it a centain home, go to refl at a certain hour, all by the direction of habit: nay, a particular feat, table, bed, comes to be effichtial; and a habit in any of thefe cannot be controled without uneafinefs.

Any fight or moderate pleafure, frequently reite. rated fir a long time, forms a peculiar connection betweon us and the thing that caufes the pleafure. This connection, termed babit, has the effert to awaken our defire or appetite for that thing when it returns not as uftal. During the courfe of enjoyment, the pleafure rifes infentihly higher and higher till a habit be eftablilhed; at which time the pleafure is at its height. It continues not, however, flationary: the fame cuIlomary reiteration which carried it to its height, brings it down again by iafenfible dearees, even lower than it was at firf: but of that circumitance afterward. What at prefent we have in view, is to prove by experiments, that thofe things which at firit are but moderately agreeable, are the aptat to become hahimal. Spintuous liquors, at firt fearce agreceable, readily procuce an habitual appetite : and cuftom prevails fo far, as even to make nis fond of things originally difagreeable, fuch as coffee, affafoctida, and tobaceo.

A walk upon the quarter-deck, though intolerably confined, becomes however to agreeable by cultom, that a failor in his walk on thore confines himfelf commonly within the fame bounds. The author knew a man who had relinquithed the fea for a country-life: in the corner of his garden he reared an attificial monnt with a level iumsit, refembling moll accuratity a quarter-deck, not only in chape but in fize: and here he generally walked. In Minorca governor Kanc made an excellent road the whole length of the ifland;

The fane obfervation holds with refpect tw all objeds that being extiemely agreeable raife violent paffions: fuch paffions are incompatible with a habit of any fort ; and in particular they never produce affection nor averfion: a man who at firil fight falls violently in love, has a frong defire of eujoyment, but no affecion for the woman (a): a man who is furprifed with an unexpected favour, burns for an opportunity to exert his gratitude, without having any affection for his benefactor: weither does defire of vengrance for an atrocious injury involve averfion.

It is perhaps not cafy to fay why moderate pleafures grather flemgth ly cullom: but two caufes enncur to prevent that effect in the more intenfe pleafures. Thefe, by an original law in our nature, increafe quickly to their full growth, and decay with no lefs precipitation: and cultorn is too llow in its operation to overcome that law. The other catife is not lefs powcrful: exquifite pleafurc is extremcly fatiguing; occationing, as a naturalift would fay, great expence of animal firits; and of fuch the mind camot bear to frequent gratification, as to fuperinduee a habit: if the thing that raifes the pleafure ret urn before the mind have recovered its tone and relifh, difguft enfues inftead of plafure.

A habit never fails to admonifl us of the wonted time of gratification, by raifing a pain for want of the object, and a deffre to have it. The pain of want is always firlt felt: the defire naturally follows; and upon prefinting the object, both vanifh intlantaneouny. Thus a man accullomed to tobacco, fects, at the end
(A) Violent love, without affection, is finely exemplified in the following flory. When Contantinople was taken by the 'Turks, Irene, a young Greek of an illatrious family, frll into the lands of Mahomet J1. who was at that time in the prime of youth and glory. His favage heart being fubdued by her charms, he thut himfe!f up with her, denying accefs cven to his minifters. Love obtained fuch afcendant as to make him frequently abandon the arny, and by to his lrene. War rclaxed, for victory was monger the monarch's favourite pafDien. 'The foldicre, accuftumed to bouty, began to murmur, and the infection fpread cen amony the commanders. The Bafha Mutapha, confuting the fidelity he owed his matter, was the firt who durt acquaint him of the difourfes held puidicly to the prefudice of his glory. The fultan, after a gloumy finence, furmed his refofution. He ordered Multapha to alfiemble the troops next moming; and dien with pecipitaninu retiod to Irene's aparment. Never before did that princefs appear fo charming ; never before did the prince beflow fo trany wam careffes. To give a new tullo to her beaty, he exhorted her women next morning to hetow their utmoft art and care on her drefs. He took her by the hand, !ed her into the indtle of the army, and pulling off her vail, demanded of the tathas with a lierce look, whether they hat ever beheld fach a beanty? After an awful paufe, Mahomet with one hand laying hold of the gomir Greck by her bedutiful locks, and with the o. ther pulling out his fimitar, ferered the head from the body at one fioke. 'Thentaming to his grandees, with ejes wild and furions, "This fword (fays he), when it is my will, knows to cut the bands of love." However ftrange it may appear, we learn from experience, that defie of cnjoyment may contifl with the mof hrutal averfion, directed both to the fame woman. Of this we have a noted example in the frit book of bulty ' 3 Memoirs; to which we chowe to refer the reader, for it is too grofs to be tranfuibed,

Cuform of the ufual interval, a confufed pain of want; which and Habit, at firft points at nothing in particular, though it foon fettles upon its accultomed object: and the fame may be obferved in perions addicted to driuking, who are often in an uneafy reflefs flate before they think of the bottle. In pleafures indulged regularly, and at equal intervals, the appetite, remarkably obfequious to cultom, returus regularly with the ufual time of gratification; not fooner, even though the object be prefonted. This pain of want ariling from habit, feems directly oppofite to that of faticty ; and it mult appear fingular, that frequency of gratification fhould produce effects fo oppofite, as are the pains of excefs and of want.

The appetites that refpect the prefervation and propagation of our fpecies, are attended with a pain of want fimilar to that occafioned by habit: hunger and thirft are uneafy fenfations of want, which always precede the defire of eating or drinking; and a pain for want of carnal enjoyment, precedes the defire of an object. The pain being thus felt independent of an object, cannot be cured but by gratification. Very different is an ordinary paffion, in which defire precedes the pain of want ; fuch a pafion camot exift but while the object is in view; and therefore, by removing the object out of thought, it vanifheth with its defire and pain of want.

The natural appetites above mentioned, differ from habit in the following particular: they have an undetermined direction toward all objects of gratilication in general; whereas an habitual appetite is direcked to a particular object : the attachment we have by habit to a particular woman, differs widely from the natural palion which comprehends the whole fex ; and the habitual relith for a particular difh, is far from being the fame with a vague appetite for food. That difference notwithtanding, it is till remarkable, that nature lath enforced the gratifacation of certain natural appetites effential to the fyccies, by a pain of the fame fort with that which habit produceth.

The pain of habit is lefs under our power than any otler pain that arifes from want of gratification: hunarer and thinf are more eafily endured, efpecially at firlt, than an unufual intermiffion of any habitual pleafure: perfons ave often heard declaring, they would forego flecp or food, rathor than tobacco. We muft not however conclude, that the gratification of an habitual appctite affords the fame delight with the gratifation of one that is natural: far from it ; the pain of want only is greater.

The now and reiterated acts that produce a habit, Aucngthen the mind to enjoy the habitual pleafure in preater quintity and more frequency than originally ; and by that means a habit of intemperate gratification is often formed: after unbounded acts of intemperance, tise hathitual relih is foon rellored, and the pain for want of enjoyment returns with frefh vigour.

The caules of the prefent emotions hitherto in view, are either an individual, fuch as a companion, a cersain dwelling-place, a certain amufenkent; or a particular Species, fuch as cofiee, mutton, or any other food. But habit is not confined to fuch. A conftant train of trifling diverfons may form fuch a habit in the mind, that it carnut be eafy a moment without anulement: a variety in the abjects prevents a habit
as to any one in particular; but as the train is uniform Cunom with refpect to amulement, the habit is formed accor- and Habit. dingly; and that fort of habit may be denominated a generie balit, in oppolition to the former, which is a fpecific balit. A labit of a town-life, of country-fports, of folitude, of reading, or of bufinefs, where fufficiently varied, are infances of generic hahits. Every fpecific habit hath a mixture of the generic ; for the habit of any one fort of food makes the tatte agreeable, and we are fond of that tafte wherever found. Thus a man deprived of an habitual object, takes up with what molt refembles it; deprived of tobacco, any bitter herb will do rather than want: a habit of punch makes wine a gool refource: accuftomed to the fweet fociety and comforts of matrimony, the man unlappily deprived of his beloved object, inclines the fooner to a fecond. In general, when we are deprived of a habitual object, we are fond of its qualities in any other object.
'l'e reafons are affirned above, why the caufes of intenfe pleafure become not readily habitual: but now we Cifor, that the fe reafons conclude only againt fpecifis fuitits. In the cafe of a weak pleafure, a habit is formed by frequency and uniformity of reiteration, which, ia the cafe of an intenfe pleafure, produceth fatiety and difguft. But it is remarkable, that faticty and difgult have no effect, except as to that thing fingly which occations them: a furfeit of honey produceth not a loathing of fugar ; and intemperance with one woman produceth no difrelith of the fame pleafure with others. Hence it is eafy to account for a generic habit in any intenfe pleafue: the delight we had in the gratification of the appetite, inflames the imagiuation, and makes us, with avidity, fearch for the lame gratification in whatever other object it can be found. And thus uniform frequency in gratifying the fame paffion upon different objects, producetli at length a generic habit. In this manner one acquires an habitual delight in high and poignant fauces, rich drefs, fine equipages, crowds of company, and in whatever is commonly termed pleafure. There concurs at the fame time, to introduce this habit, a peculiarity obferved above, that reiteration of acts enlarges the capacity of the mind, to admit a more plentiful gratification than originally, with regard to frequancy as well as quantity.

Hence it appears, that though a fpecific habit cannot be formed but upon a moderate pleafure, a generic labit may be fomed upon any fort of pleafure, moderate or immoderate, that hath variety of objects. The only difference is, that a weak pleafure runs naturally into a rpecific habit; whereas an intenfe pleafure is altogether averfe to fuch a habit. In a word, it is only in fingular cafes that a moderate pleafure produces a generic habit; but an intenfe pleafure cannot produce any other habit.

The appetices that refpeet the prefervation and propagation of the Cpecies, are formed into habit in a peculiar manner; the time as well as meafure of their gratification are much under the power of cuftom; which, introducing a change upon the body, occafions a proportional change in the appetites. Thus, if the body be gradually formed to a certain quantity of food at ftated times, the appetite is regulated accordingly; and the appetite is again changed, when a different 3
habit

Cuftom habit of body is introduced by a different practice. and Habit. Here it would feem, that the change is not made upon the mind, which is commonly the cale in paffive habits, but upon the body.

When rich food is brought down by ingredients of a plainer tafle, the compolition is fufceptible of a fpecific habit. Thus the fwect tafte of fugar, rendered lefs peignant in a mixture, may, in courfe of time, produce a feecific habit for fuch misture. As moderate pleafures, hy becoming more intenfe, tend to generic habits; fo intenfe pleafures, by becoming more moderate, tend to fpecific habits.

The beauty of the human figure, by a fpecial recommendation of nature, appears to us fupreme, amid the great varity of beautcous forms beftowed upen animals. The various degrees in which individuals enjoy that property, render it an object fometimes of a moderate, fometimes of an intenfe, paffion. 'I'he moderate paffon, admitting frequent reiteration without diminution, and occupying the mind without exhanting it, turns gradually dronger till it becomes a habit. Nay, iultances are not wanting, of a face at firt difagreeable, afterward rendered indifferent by familiarity, and at length agrecable by cuftom. On the other hand, confummate beauty, at the very frrt glanee, fills the mind fo as to admit no increafe. En. joyment leffens the pleafme; and if often repeated, ends commonly in fatiety and difgult. The impreffions made by confummate beauty, in a gradual fucceffion from lively to faint, contitute a feries oppofite to that of faint impreffons waxing gradually more lively, till they produce a fpeeific habit. But the mind when accultomed to beauty contracts a relifh for it in seneral, though often repelled from particular objects by the pain of fatiety; and thus a generic habit is formed, of which inconftancy in love is the neceffary confequence ; for a generic habit, comprehending every beautiful object, is an invincible obftrnction to a fpecific habit, which is confined to one.

But a matter which is of great imporiance to the youth of both fexes, deferses more than a curfory vicw. Though the pleafant emotion of beauty differs widely from the corporeal appetite, yet when both are directed to the fame object, they produce a very ftrong complex paffion : enjoyment in that cafe mult be exquifite ; and therefore more apt to produce faliety than in any other cale whatever. This is a ne-ver-failing effect, where confurmmate beauty in the one party, mects with a warm imagination and great fenfibility in the other. What we are here explaining, is true withour exaggeration ; and they muf be infenfible upon whom it makes no impreffion: it deferves well to be pondered by the young and the amorons, who, in forming the matrimonial focicty, are too often blindly impelled by the animal pleafure merely, inflamed by beauty. It may indeed happen after the pleafure is gone, and go it muft with a fwift pace, that a now connection is formed upon more dignified and more lafting principles: but this is a dangerous experiment; for even fuppoling good fenfe, good temper, and internal merit of every fort, yet a new connection upon fuch qualifications is rarely formed : it commonly, or rather always happens, that fuch quaLifications, the only folid foundation of an indiffoluble
conncetion, are renderes altoxether invibible by faticty of enjoyment ercating difgnt.

One eftect of cuttom, different from any that have been explained, mult not be omited, beeaufe it makes a great fisme in homan nature : though cuftom ang. ments moderate pleafure, and leflens thofe that are intenfe, it has a different cffect with refpect to pain; for it bhants the edge of every fort of pain and difert:, fant or acute. Unintermpied mifery, therefore, is attended with one grood efficet: if its toments be inceffant, cullom hardens us to bear them.
'l'he changes made in forming labits are curions. Moderate pleafures are angmented graduaily by rite. ration, till they become habitual; and then are at their height: but they are not long hationary; for from that point they gradorlly decay, till they vanih altogether. The pain occafoned by weat of gratitication, runs a different courfe: it increafes miformly; and at bat becomes extreme, when the pleafure of gratification is reduced to nothing.

$$

The effect of cuftom with rclation to a fpecific habit, is difplayed through all its varieties in the ufe of tobaceo. The tatte of that plant is at firft exaremely umpleafant : our difgut leffens gradually, till it vanifh altogether; at which period the tate is neither agreeable nor difagreeable: continuing the ufe of the plant, we begin to relifh it ; and our relih improves by ufe, tall it arrive at perfection: from that period it gradually decars, while the habit is in a ftate of increment, and confequently the pain of want. The refult is, that when the habit has acquired its greateft vigour, the relifh is gone; and accordingly we often fmoke and take fnuff habitually, without fo much as being confcious of the operation. We mult except gratification after the pain of want ; the pleafure of which gratification is the grcatelt when the habit is the moft vigorous: it is of the fame kind with the pleafure one feels upon being delivered from the rack. This pleafure however is but occafonally the effect of habit ; and however exquifite, is avoided as much as pofible becaufe of the pain that precedes it.

With regard to the pain of want, we can difeover no difference between a generic and a fpecific habit; but thefe habits differ widely with refpect to the pofitive pleafure. We have had occation to obferve, that the pleafure of a fpecific habit decays gradually till it turn imperceptible: the pleafure of a generic habit, on the contrary, being fupported by variety of gratifica. tion, fuffers little or no decay after it comes to its height. However it may be with other generic habits, the obfervation certainly holds with refpect to the pleafures of virtue and of knowledge: the pleafure of doing good has an unbounded fcope, and may be fo varioully gratilied that it can never decay; feience is equally unbounded ; our appetite for knowledge having an ample range of gratification, where difcoveries are recommended by novelty, by varitty", by utility, or by all of them.

In this intricate inquiry, we have endeavoured, but without fuccefs, to difeover by what particular means it is that culton hath influence upon us : and now nothing feems left, but to hold our nature to be fo framed as to be fufceptible of fuch inftuence. And fuppoling it purporely to framed, it will not be difficult to find out feveral important final caufes. That the power of cultom is a lappy contrivance for our gond, cannot have efeaped any coe who rekcets, that bufinefs is our province, and pleafure our relasation only. Now fatiety is neceflary to check exquilite pleafures, which otherwife would cagrofs the mind and unqualify us for bufinefs. On the other band, as buinefs is femelimes painful, and is never pledifant beyond moderation, the labitual increafe of moderate pleafure, and the converfion of pain into pleafure, are admirably contrived for difappointing the malice of fortune, and for reconciling us to whatever courfe of life may be our lot:

> How ure dntin bre et a halitin a man!
> I'his fhadnow defert, unfrequented won's,
> I beter lonok than flourming icoplest towns.
> Here I can it alone, anfeen of any,
> A: d to the nichergale's emplaining notes
> Tune my diftiefles, and recoid my woen.

Two Gentlemen of Vrirona, uE 5.fi.4.
As the foregoing diftinction between intenfe and moderate, hold in pleafure only, every degree of pain being foftencd by time, cuftom is a catholicon for pain and diftrefs of every fort; and of that regulation the final caufe requires no illultration.

Another final caufe of euftom will be highly relifhed by every perfon of humanity, and yet has in a great meafure been overlooked; which is, that cuftom lath a greater influence than any other known caufe, to put the rich and the poor upon a level: weak pleafures, the fhare of the latter, become fortunately froager by cultom; while voluptuous pleafures, the thare of the former, are continually lofing ground by faticty. Men of fortune, who poffefs palaces, fumptuous gardens, rich fields, enjoy them lefs than paffengers do. The goods of Fortune are not unequally diftributed; the opulent poffefs what others enjoy.

And indeed, if it be the effect of habit, to produce the pain of want in a high degree while there is little pleafure in enjoyment, a voluptuous life is of all the leaft to be envicd. Thofe who are habituated to high feeding, eafy vehicles, rich furniture, a crowd of valets, much deference and flattery, enjoy but a fmall fhare of happinefs, while they are expofed to manifold diftrefes. To fuch a man, enflaved by eafe and luxury, even the petty inconveniences in travelling, of a rough road, bad weather, or homely fare, are ferious evils: he lofes his tone of mind, turns peevih, and would wreak his refentment even upon the common accidents of life. Better far to ufe the goods of Fortune with moderation: a man who by temperance and activity hath acquired a bardy conftitution, is, on the one hand, guarded againft external accidents; and, on the other, is provided with great varicty of enjoyment ever at command.

We fhall clofe this branch of the fubject with an article more delicate than abfrufe, viz. what anthority cultom ought to have over our talte in the fine arts. One paaticular is certain, that we cheerfully abandon
to the authority of cuftom things that nature hath left Cuftom indifferent. It is cultom, not nature, that hath elta- and Habit. blifhed a difference between the right hand and the left, fo as to make it aukward and difagreeable to ufe the left where the right is commonly ufed. The various colours, though they affect us differently, are all of them agrecable in their purity: but cu'fom has regulated that mater in another manner; a black fkin upon a human being, is to us didagrecable; and a white flin probably not lefs fo to a negro. Thus things, originally indiferent, b come agrealle or difa greeable by the force of culfom. Nor will this be furpifing after the difeovery made ahove, that the original agrecablencefs or difagreeabiences of an object, is, by the influence of cuftom, often converted into the oppofite quality.

Procecding to matters of talle, where there is naturally a preference of one thing before another; it is certain, in the firl place, that our faint and more delicate feelings are readily fufeeptible of a bias from cutom; and therefore that it is no proof of a defective talte, to find thefe in fome meafure influenced by cultom: drefs and the modes of external behaviour, are regulated by cuitom in every country: the deep red or vermilion with which the ladies in France cover their cheeks, appars to them beantiful in firite of nature; and Atrangers cainot altogether be jutified in condemning that pratice, confidering the lawful authority of cuftom, or of the fafbion as it is called : it is told of the people who imabit the lkirts of the Alps facing the north, that the fwelling they univerfally have in the neck is to them agreeable. So far has cultom power to change the nature of things, and to make an object originally difagreeable take on an oppofite appearance.

But as to every particular that can be denominated proper or improper, right or wrong, cultom has little authority, and ought to have none. The principle of duty takes naturally place of every other ; and it argues a fhameful weaknefs or degeneracy of mind, tofind it in any cafe fo far fubdued as to fubmit to cuftom.

1I. Effeas of Cuffom and Habit in the Animal Econony. Thefe inay be seduced to five heads. 1. On the finnple folids. 2. On the organs of fenfe. 3. On the moving power. 4. On the whole nervous power. 5. On the fyltem of blood-veffels.

1. Effects on the Simple Solids. Cuftom determincs the degree of flexibility of which they are capable. By frequently repeated flexion, the feveral particles of which thefe folids confitt are rendered more fupple and moveable on each other. A piece of catgut, $c$. $g$. when on the Aretch, and having a weight appended cillen's Lere to its middle, wiil be bended thereby perhaps half antures or the inch ; afterwards, by frequent repetitions of the fame Mat. Mcd weight, or by increafing the weight, the flexibility theuit. will be rendered donble. The degree of flexibility has a great effect in determining the degree of ofcillation, provided that elafticity is not affected; if it go beyond this, it prodnces flaccidity. Again, cuttom determines the degrec of tenfion; for the fame elaltic chord that now ofcilldtes in a certain degree of tenfion, will, by frequent repetition of thefe ofcillations, be fo far relaxed, that the extenfion mult be renewed in order to pruduce the fame tenfon, and confequently the fame

## C U S $\quad[62 \mathrm{I}] \quad \mathrm{C}$ U S

Cunont vibrations, as at fift. This appears in many inftances and Habit. in the animal economy, as when different mufcles con-
cur to give a fixed point or tenfion to each other: and thus a weakly child totters as it walks; but by giving it a weight to carry, and by thus incrafing the tention of the fyitem, it wallhs more ftadily. In like manner the fidnefs of the fyitem gives flength, by dathending the veffets every where, and fo giviag tenfion: lience a man, by good nourifhment, from being weak, acequies a great increate of iftergth in a few days: and, on the uther hand, evacuations weaken by taking of the tenfon.
2. Effects on the Oraans of Senfe. Repetition gives
